Like all other parts of this mighty continent, Congo abounds in wild animals; among which may be enumerated lions, elephants, leopards, buffaloes, antelopes, wild-hogs, porcupines, and a great variety of monkeys, the principal species of which are of a large size, and have black faces. The rivers abound with those monsters, the hippopotamus and the crocodile. The lower part of it contains also plenty of excellent fish. Domestic animals are but of few species and scarce. Those chiefly used for food, are hogs, goats, fowls, Muscovy ducks, and pigeons. They have also a few sheep, for the most part spotted, and having hair instead of wool.

Congo is exempted from many of the noxious insects, &c. which generally swarm in hot climates. Their principal pests of this sort are bugs, fleas, and ants.

The vast and overwhelming armies, spoken of by the Catholic missionaries, Carli, Merolla, &c., have existed only in the fertile brains of their historians, unless we can conceive, that in the space of two centuries, pestilence, famine, and the slave trade, have swept not only them, but even their very memory away from their native shores. Instead of the hosts of marions, which could be counted only by hundreds of thousands, the prince who can now rally to his standard 200 troops, and furnish even half of these with muskets, becomes an object of terror and consternation to all this part of Africa. According to the statements put forth by the missionaries already mentioned, the population of Congo would place it on a level with the most prosperous countries of Europe. Captain Tuckey, however, found the country but very thinly inhabited: the most considerable banza, or town, he visited, was Cooloo, which did not contain above 100 huts, and the population did not exceed 600. Embomma, another town, consisted of sixty huts, and 500 inhabitants; and Inga, of seventy huts and 300 inhabitants. The principal town of the country is called Congo, and is situated about six days' journey in the interior.

The villages and towns of Congo are, generally, placed amidst groves of palm, and the beautiful *adansonia*. Their huts are constructed with large mats, woven together by the fibres of plants, or a reedy kind of grass which flourishes here in great abundance. An habitation of this kind can be erected in the course of a few minutes,

and at so moderate an expense, that a few fowls or ducks are generally considered an equivalent for a house composed of six pieces. The dwellings of the chenoo or chief, are, however, more elaborately formed; they consist of palm leaves very ingeniously matted together, and are, sometimes, enclosed within a fence of reeds. Their household furniture, like that of all uncultivated tribes, is extremely simple. Their beds and baskets are formed solely from the leaves and fibres of the palm: gourds and calabashes form their bowls and bottles. They manufacture rude earthen vessels for cooking their food, and wooden spoons for eating it. Their only clothing is a piece of baft, or grass matting, bound round their loins; the women use rings of brass or iron, bracelets of beads, cowries, seeds of plants, or lions' teeth by way of ornament; and so great is their love of finery, that but very few females are seen without having their arms, legs, or necks, graced with one or more of these articles.

The state of society in Congo, appears to be nearly the same as that which prevails amongst all negro nations; though, in their moral and physical character, they ought perhaps to be placed low in the scale of African civilisation. The Congoese may be divided into five classes:—the chenoo, and his family; the mafooks, or collectors of the revenue; the foomoos, or yeomanry; the fishermen and laborers; and, lastly, the slaves. The sovereignty of the chenoo is hereditary in the female line; thus no son of the chenoo can succeed his father unless his mother be of royal blood. The *atlia* is little distinguished either by dress or accommodations from that of the subject:—a small staff of black wood, inlaid with lead or copper, is the official ensign of the chief. The daughters of the chenoo are allowed to choose their own husbands, over whom they become most absolute mistresses, and can even extend their prerogative to the selling of a refractory spouse to slavery; it will, therefore, be easily believed, that the honor of a royal alliance is a matter but of little emulation amongst the gallants of the Congoese court. There is a vast number of petty chiefs scattered throughout the territory, but all of these acknowledge a supremacy to the Blindy N' Congo, or general sovereign of the country, who resides at Congo, which is most probably the St. Salvador of the Portuguese:—this city, however, has not been visited by any recent traveller.

The Congoese are of middle size; their features are not so strongly marked, nor their color so deeply dyed, as those of the more northern tribes of negroes; and their physiognomy is said to express great openness, simplicity, and innocence. On Captain Tuckey's party first entering the river Zaire, they discovered a quantity of burnt human bones and skulls, hanging on the branches of some trees, which naturally led to the suspicion of the inhabitants being cannibals; it was subsequently found, however, that this was their place of public execution, and that nothing could be more abhorrent from their practice than the disgusting enormity of eating human flesh; it fact, it is a matter of great doubt, whether a negro cannibal at the present day exists. Indolence, the besetting vice of the

continent of Africa, appears to be their greatest hindrance to improvement. They make but little use of domestic animals for draught and agriculture. The women alone cultivate the land, carry the produce to market, range the forests to provide food and firing, and oftentimes, in their canoes, formed from the excavated trunks of the cotton-tree or bombax, skim the bosom of the most dangerous lakes to procure fish for their unnatural masters, while they supinely recline under the shade of the wide-spreading adansonia, the monarch of the forest wearing out the lazy hours stringing cowrie shells, or strumming on some musical instrument: or if they exert themselves at all, it is in dancing by moonlight, or indolently sauntering about their habitations. They are represented, however, as lively and good natured, hospitable, and at all times ready to share their miserable pittance with the stranger or passing sojourner. They are also said to be very honest; the rights of property are strictly observed, and the division is sometimes carried to so fine a point, that three, four, or six persons occasionally claim a right in a single fowl or pig. Every man in Congo has wives according to his degree or rank in society. The chenoo has as many as fifty, and some of the mafooks from ten to twenty. The females belonging to the highest dignitaries were offered to captain Tuckey's party on terms, and in language the most disgustingly obscene, for the most trifling consideration. The chenoo himself estimated the virtue of any of his wives or daughters, simply at the rate of a few beads or a glass of rum. The females, on their part, did not appear averse to these arrangements, but manifested much indignation when the offers of their husbands or fathers were despised or rejected by the Europeans. It is but justice to presume, however, that this disregard of modesty is unknown in those parts where the European slave merchant has not intruded; for, as captain Tuckey advanced farther up the river, he met with no recurrence of this offensive custom. Adultery amongst the natives is punished by the slavery of both the offenders; and, if one of the parties be the wife of a chenoo, the paramour is liable to suffer death. An atrocious crime, singular from the simple form of their society, prevails amongst the Congoese; it is that of poisoning. Amongst a people so little enlightened, it is matter of no wonder that superstition should be so prevalent. The Portuguese missionary Carazzi, a Capuchin friar, stated the principal body of the natives to be good Catholics; but the English who have lately visited Congo, found but few or no vestiges of the benefits of that civilisation and conversion so much extolled by the Romish church.

At Loando, the natives exhibited their relics, rosaries or crosses and Agnas Deis, jumbled together with their domestic fetiches. The fetiche may, indeed, be said to form their only religion, and there is nothing so vile in nature or art, that is not regarded by the negroes as fit for this potent charm against evil. The horn-hoof, hair, teeth, or bones, of the most savage animal that prowls through the forest; the feathers, claws, beaks, skulls, and bones, of the meanest bird that flies in the air; the shells and fins of fishes; the

heads or skins of the filthiest snakes or reptiles that crawl on the earth; pieces of old copper, iron, wood, seeds of plants, are severally used to form a fetiche, and sometimes it consists of a mixture of them all. The priests are the usual artificers of these fetiches, and are said to derive considerable emolument from the sale of them. These charms are considered by the negroes as a protection against every danger 'flesh is heir to'; and if it should so happen that the wearer perish, through the very means against which the fetiche had been adopted; it is not for want of protective potency in the charm, but for some offence, real or imaginary, of which the possessor has been guilty.

CONGRATULATE, *v. a. & n.* Fr. *congratuler*, *n. s.*
 CONGRATULATION, *n. s.* } *gratuler*,
 CONGRATULANT, *adj.* } *Ital. con-*
 CONGRATULATOR, *n. s.* } *gratulare*;
 CONGRATULATORY, *adj.* } *Span. con-*
gratular; *Lat. congratulari*. To express joy to another that he has experienced any thing which contributes to his welfare; to compliment on any fortunate event; to rejoice in conjunction with; to felicitate ones' self. It is the opposite of condolence. Sometimes, says Johnson, it has the accusative case of the cause of joy, and *to* before the person. He might have added, that this usage is obsolete.

He sent Hadoram his son to king David, to congratulate him, because he had fought against Hadarezer, and smitten him. *1 Chron. xviii. 10.*

Nothing more fortunately auspicious could happen to us, at our first entrance upon the government, than such a congratulate. *Milton.*

Forth rushed in haste the great consulting peers,
 Raised from the dark divan, and with like joy
 Congratulant approached him. *Id. Paradise Lost.*

I think the little I have enough, and do not desire to live higher, or die richer, than I am; and therefore you have reason rather to pity the folly, than congratulate the fortune, that engages me in the whirlpool. *Locke.*

An ecclesiastical union within yourselves, I am rather ready to congratulate to you.

Spratt's Sermons.
 The subjects of England may congratulate to themselves, that the nature of our government, and the clemency of our king, secure us.

Dryden's Preface to Aurengzebe.
 I cannot but congratulate with my country, which hath outdone all Europe in advancing conversation.

Swift.
 I congratulate our English tongue, that it has been enriched with words from all our neighbours.

Watt's Logic.
 I must be tolerably sure, before I venture publicly to congratulate men upon a blessing, that they have really received one. *Burke.*

The effect of liberty to individuals is, that they may do what they please; we ought to see what it will please them to do, before we risque congratulations which may be soon turned into complaints. *Id.*

To my inexpressible surprise, I found them in a sort of public capacity, by a congratulatory address, giving an authoritative sanction to the proceedings of the national assembly in France. *Id.*

Madam, a stranger's purpose in these lays
 Is to congratulate and not to praise.
 To give the creature the Creator's due
 Were sin in me, and an offence to you. *Cæsar.*

Peace ensues.

But spurious and shortlived; the puny child
Of self-congratulating Pride, begot
On fancied Innocence. Again he falls,
And fights again; but finds his best essay
A presage ominous, portending still
Its own dishonour by a worse relapse. *Id.*

With all my follies of youth, and, I fear, a few
vices of manhood, still I congratulate myself on hav-
ing had, in early days, religion strongly impressed on
my mind. *Burns.*

All the cities you have taken, all the armies which
retreated before your leaders, are but paltry subjects
of self-congratulation, if your land divides against it-
self, and your dragons and executioners must be let
loose against your fellow citizens.

Byron. Speech on the Frame-breaking Bill.

CONGREGATE. *Fr. gre.* To agree together;
to unite harmoniously. Not in use.

For government,

Put into parts, doth keep in one concert,
Congrecing in a full and natural close.

Shakespeare. Henry V.

To CONGREG'ET, *v. n.* From con and greet.
To salute reciprocally. Not in use.

My office hath so far prevailed,

That face to face, and royal eye to eye,
You have congreged. *Shakespeare. Henry V.*

CONGREGATE, *v. a. v. n. & adj.* } French
CONGREGATION, *n. s.* } congreger;
CONGREGATIONAL, *adj.* } Ital. con-
CONGREGATIONISTS, *n. s.* } gregare;

Span. *congregar*; *Lat. congregare*, from *con* and *grer*. A flock. To collect into one spot: to as-
semble in numbers; to meet. Congregation signi-
fies the act of collecting together; a collected
mass of persons or things; an assemblage of
persons who are met for the public worship of
God. Congregate is collected; compact;
closely pressed together. Congregational is
public; general; and, more commonly, apper-
taining to an assembly of such Christians as hold
every congregation to be a separate and inde-
pendent church.

Take ye the sum of all the congregation of the chil-
dren of Israel, after their families, by the house of
their fathers, with the number of their names, every
male by their polls. *Numbers i. 2.*

Than by counsel of his wife Prudence, this Meli-
beus let

Callen a great congregation of folk.

Chaucer. Cant. Tales.

Any multitude of Christian men congregated, may
be termed by the name of a church. *Hooker.*

The words which the minister first pronounceth,
the whole congregation shall repeat after him. *Id.*

He rails,

Even there where merchants most do congregatē,
On me, my bargains.

Shakespeare. Merchant of Venice.

This brave overchanging firmament appears no
other thing to me, than a foul and pestilent congrega-
tion of vapours. *Id.*

Tempests themselves, high seas, and howling
winds,

The guttered rocks and congregated sands,
As having sense of beauty, do omit
Their mortal natures. *Id. Othello.*

These waters were afterwards congregated, and
called the sea. *Raleigh's History of the World.*

The means of reduction by the fire, is but by con-
gregation of homogenous parts. *Bacon.*

Where the matter is most congregatē, the cold is
the greater. *Id. Natural History.*

The dry land, earth; and the great receptacle
Of congregated waters, he called seas;
And saw that it was good. *Milton's Paradise Lost.*

'Tis true (as the old proverb doth relate)
Equals with equals often congregatē. *Denham.*

The practice of those that prefer houses before
churches, and a conventicle before the congregation. *South.*

Heat congregates homogenous bodies, and separates
heterogenous ones. *Newton's Opticks.*

If those preachers who abound in epiphonemas
would look about them, they would find part of their
congregation out of countenance, and the other asleep. *Swift.*

Every parish has a congregational or parochial pres-
bytery for the affairs of its own circle. *Warton.*

My subject is only general congregational psalmody. *Mason.*

All fares the traveller now, and he that stalks
In ponderous boots beside his reeking team.

The wain goes heavily, impeded sore
By congregated loads adhering close
To the clogged wheels; and in its sluggish pace
Noiseless appears a moving hill of snow. *Cooper.*

Compared with this, how poor religion's pride,
In all the pomp of method, and of art,
When men display to congregations wide
Devotion's every grace, except the heart. *Burns.*

Explore the caverns dark and drear
Mantled around with deadly dew,
Where congregated vapours blue,
Fired by the taper glimmering near,
Bid dire explosion the deep realms invade.

Huddisford.

CONGREGATION, in the Romish church, is prin-
cipally used for assemblies of cardinals, ap-
pointed by the pope, and distributed into cham-
bers, for the discharge of certain functions and
jurisdiction.

CONGREGATION is also used for a society of
religious cantoned out of an order; and making
a subdivision of it. Such are the congregations
of the oratory of Cluny, &c. among the Bene-
dictines.

CONGREGATIONALISTS, in ecclesiastical his-
tory, is a name sometimes given to those Pro-
testants who reject all church government, ex-
cept that of a single congregation, under the
direction of one pastor, with deacons, assistants,
or managers. It is equivalent to the modern
term independents.

CONGRESBURY, an ancient town of Som-
mersetshire, situated under the Mendip Hills,
six miles from Axbridge, and 134½ from London.
It is said to derive its name from St. Conger,
the son of an eastern emperor, who founded in
this place a cell for twelve canons. It was for-
merly a market town, but now ranks only as a
village.

CONGRESS, *n. s.* } *Lat. congressus.* A
CONGR'ESSION, *n. s.* } coming together; shock;

CONGR'ESSIVE, *adj.* } conflict; a meeting of
diplomatists, to settle affairs between different
nations; the legislature of the North American
states. Congression is synonymous with con-
gress, in the first of the foregoing senses. Con-
gressive denotes coming together.

If it be understood of sexes conjoined, all plants are female; and if of disjointed and *congressive* generation, there is no male or female in them.

Brounè's Vulgar Errors.

Here Pallas urges on, and Lausis there;
Their congress in the field great Jove withstands,
Both doomed to fall, but fall by greater hands.

Dryden's Æneid.

We sent out a solemn embassy across the Atlantic Ocean, to lay the crown, the peacage, the commons of Great Britain, at the feet of the American congress. That our disgrace might want no sort of brightening and burnishing, observe who they were that composed this famous embassy.

Burke.

SIR BENJ. In short, her face resembles a table d'hôte at Spa—where no two guests are of a nation.

CRAFT. Or, a congress at the close of a general war—wherein all the members, even to her eyes, appear to have a different interest, and her nose and chin are the only parties like to join issue.

Sheridan. School for Scandal.

There is, therefore, no absurdity in believing that the most simple animals and vegetables may be produced by the congress of the parts of decomposing organic matter.

Darwin.

CONGRESS, AMERICAN, the legislative power of the United States, consisting of a senate and house of representatives. See AMERICA.

CONGREVE (William), a younger brother of an ancient family in Staffordshire. His father was steward of the earl of Burlington's estate in Ireland, where our author was born in 1672. When he first came to England he began to study the law, but his bias was towards polite literature and poetry. His first performance was a novel, entitled *Incognita, or Love and Duty Reconciled*. He soon afterwards began his comedy of the *Old Bachelor*, the composition of which had been his amusement during a slow recovery from a fit of illness. When brought on the stage, in 1693, it met with such universal approbation, that Congreve, though only nineteen years of age, was hailed as the support of the declining stage, and obtained the decided patronage of lord Halifax. In 1694 he produced the *Double Dealer*; which, however, did not meet with so much success as his former play. In 1695, when Betterton opened the theatre in Lincoln's-Inn-Fields, Congreve, joining with him, gave him his comedy of *Love for Love*, which was so well received, that Betterton immediately offered the author a share in the management of the house, on condition of his furnishing to it one play yearly. This offer he accepted; but, whether through indolence or fastidiousness, his *Mourning Bride* did not come out till 1697, nor his *Way of the World* till 1699. The indifferent success this last met with, completed that disgust to the theatre, which a long contest with Jeremy Collier, who had attacked the immoralities of some of his pieces, had begun, and he determined never more to write for the stage. It is probable, however, that he might not so soon have given way to this disgust, had not the easiness of his circumstances rendered him totally independent of the caprice of the town. The earl of Halifax had made him one of the commissioners for licensing hackney-coaches; and soon after, bestowed on him a post in the customs worth £600 per annum. In 1718 he was appointed

secretary of Jamaica; so that his income, at this period, was upwards of £1200 a-year, and the last twenty years of his life were spent in ease and retirement. When Voltaire was in England, he waited upon Mr. Congreve, and passed some compliments upon the merit of his works. Congreve thanked him; but said that he did not choose to be considered as an author, but only as a private gentleman. Voltaire, with the readiness so peculiar to him, replied, that if he had never been anything but a private gentleman, in all probability he had never been troubled with that visit. He died January 19th, 1729, aged fifty-seven; and, on the 26th following, was buried in Westminster Abbey.

CONGRUË, *v. n. & adj.*

CONGRUËNCE, *n. s.*

CONGRUËNCEY, *n. s.*

CONGRUËNT, *adj.*

CONGRUITY, *n. s.*

CONGRUOUS, *adj.*

CONGRUOUSLY, *adv.*

CONGRUMENT, *n. s.*

Lat. *congruere.*

‘*ἔρπαιος, grus*; a crane; unde *congruo*; à *gruibus*

tractum; quæ se non egregant, sive cum volant, sive cum pascuntur; to come together in flocks, like cranes, who never separate; also to agree; to unite.’ The verb, which is not in use, means to be in agreement, or consistent with; suitable to. Congruity is fitness; correspondence; consistency. The same idea is common to all the kindred words. Congruement, which Johnson has admitted into his dictionary, Mr. Todd believes, and apparently with reason, to be a press error in some of the editions of Ben Jonson's works. He agrees with Mr. Whalley in reading congruent, and this reading undoubtedly improves the passage.

With what congruity doth the church of Rome deny, that her enemies do at all appertain to the church of Christ?

Hooker.

A whole sentence may fail of its congruity by wanting one particle.

Sidney.

Our sovereign process imports at full,

By letters congruing to that effect,

The present death of Hamlet. *Shakspeare. Hamlet.*

The congruement (*congruent*) and harmonious fitting of periods in a sentence, hath almost the fastening and force of knitting and connexion.

Ben Jonson's Discovery.

For humble grammar first doth set the parts

Of congruent and well-according speech;

Which rhetoric, whose state the clouds doth reach,

And heavenly poetry, do forward lead. *Davies.*

This conjecture is to be regarded, because, congruously unto it, one having warmed the bladder, found it then lighter than the opposite weight.

Boyle's Spring of the Air.

Congruity of opinions to our natural constitution, is one great incentive to their reception. *Glanville.*

The existence of God is so many ways manifest, and the obedience we owe him so congruous to reason, that the light of a great part of mankind give testimony to the law of nature. *Locke.*

Wit lying most in the assemblage of ideas, and putting those together with quickness and variety wherein can be found any resemblance or congruity, thereby to make up pleasant pictures, and agreeable visions, in the fancy; judgment, on the contrary, lies quite on the other side, in separating carefully, one from another, ideas wherein can be found the least difference, thereby to avoid being misled by similitude, and by affinity, to take one thing for another.

Id.

Motives that address themselves to our reason, are fitted to be employed upon reasonable creatures: it is no ways *congruous*, that God should be always frightening men into an acknowledgement of the truth.

Atterbury.

The faculty is infinite, the object infinite, and they infinitely *congruous* to one another.

Cheyne's Philosophical Principles.

These planes were so separated as to move upon a common side of the *congruent* squares, as an axis. *Id.*

It is an act of reasoning of which we are unconscious, except by its effects in preserving the *congruity* of our ideas. *Darwin.*

CONI, a considerable town of Italy, in Piedmont, and a bishop's see; seated at the confluence of the Gesso and the Stura. It is said to have been first founded in 1520, during the pontificate of Celistus II. The inhabitants being divided into two factions, it surrendered to the French in 1641, but restored to Savoy soon after. It was again besieged by them in 1744, without being taken; but, on the 26th April,

1796, it surrendered to the republican troops under Buonaparte, previous to the peace with the king of Sardinia. It is strong by nature and art, and its trade is considerable, being the repository for all the traffic between Turin and Nice, and Lombardy, Switzerland, and Germany. Its principal articles of commerce are corn and hemp; but silk is the only manufacture. It lies thirty-five miles south of Turin, and thirty-four north of Nice, and has a strong citadel. Population about 10,000.

CONICA SCABRITILES. See BOTANY.

CONICHTHYODONTES, or PLECTRONITE, in natural history, the fossile teeth of fishes, so called from their resembling a cock's spur. They are of an oblong conic figure, broad at the base, narrow at the point, and a little crooked, and from one-tenth of an inch to two inches long. They are often found in England, in strata of stone or clay, with part of the jaw-bones; but it is not certain to what fish they belong.

CONIC SECTIONS.

INTRODUCTION.

CONIC SECTIONS are the figures formed by cutting a cone by a plane. They are five in number, corresponding to the different positions of the cutting plane; viz. a triangle, a circle, an ellipse, a parabola, and an hyperbola. The last three of these only are peculiarly called conic sections.

The more ancient mathematicians, before the time of Apollonius Pergæus, admitted only the right cone into their geometry, and they supposed a section made of it by a plane perpendicular to one of its sides; and as the vertical angle of a right cone may be either right, acute, or obtuse, this method of cutting these several cones produced all the three conic sections. The parabola was called the section of a right angled cone, the ellipse the section of the acute angled cone, and the hyperbola, the section of the obtuse angled cone. But Apollonius, who, on account of his writings on this subject, obtained the title of the Great Geometrician, observed that these sections might be obtained in every cone, both oblique and right, and that they depended on the different inclinations of the section to the cone itself.

There have been two methods employed in treating of the conic sections: by the one they are considered as cut out of the solid cone, which is the method of the ancients, and of some of the most elegant writers of the moderns; and by the other method certain curves are defined, either from some property by which any number of points may be found in them, or else by which they may be described mechanically upon a plane; or they are defined by means of an algebraical equation, and in either case these curves are shown to have the very same properties as those which are formed by the intersections of a plane and cone. Each of these methods has its

advantage; although some of the demonstrations of writers who have treated the subject geometrically, by the latter, be short and perspicuous, yet there are others, upon which depend some of the principal properties, that are tedious and difficult. The demonstrations of writers who have pursued the first method are free from this objection, being generally plain and concise; but they have been obliged to introduce so many previous propositions concerning the properties of lines touching and cutting conical surfaces, in order to arrive at the principal properties of the three sections, that it requires a considerable portion of time and resolution for a beginner in mathematical studies to go through them.

Some writers, who have treated the subject algebraically, have reduced the whole into a narrower compass; but, in their eagerness to avoid prolixity, they have fallen into another more exceptionable fault. The method in which they have deduced some of the properties, particularly the relations of the abscissæ and ordinates, is extremely operose and inelegant; each step in the process is so little connected with the preceding one, that it is scarcely possible to retain them in the memory.

The conic sections are of great use in physical, and plane, astronomy, as well as in all the physico-mathematical sciences, and, therefore, they have been much cultivated ever since their great importance in these sciences was known. The *abbé* Boscovich has deduced the properties of the conic sections in a very elegant manner from a property common to them all, and the same method has also been followed by the Rev. T. Newton, of Jesus College, Cambridge, in a very neat treatise upon the subject, published in 1794. We shall now proceed to demonstrate some of the most material properties of these figures, availing ourselves chiefly of the work of the last mentioned ingenious writer.

SECT. I.—OF THE RELATION BETWEEN THE ABSISSÆ AND ORDINATES IN ALL THE SECTIONS. PROPERTIES OF TANGENTS DRAWN TO THE CURVES, &c.

DEFINITIONS. See plate I. fig. 1, 2.

I. Let a point, S, be assumed anywhere without a straight line DX, given by position, and let a point P be supposed to move always in such a manner, that PS, its distance from the given point, may be to PE, its distance from the line DX, in a given ratio, the curve described by the point P is called a conic section; which will be a parabola, an ellipse, or an hyperbola, according as PS is equal to, less, or greater than PE.

II. The indefinite straight line, DX, is called the directrix.

III. The point S is called the focus.

IV. The given ratio of SP to PE, is called the determining ratio.

V. If a line SD be drawn through the focus, perpendicular to the directrix, which is produced indefinitely, it is called the axis of the conic section.

VI. The point A, where the axis meets the curve, is called the vertex.

VII. A straight line LST, drawn through the focus parallel to the directrix, and terminated by the curve in the points L and T, is called the principal parameter, or the latus rectum.

COROLLARY 1. Fig. 2. SP being greater than PE in the hyperbola, two curves will be described, one on each side of the directrix; which are called opposite hyperbolas.

COR. 2. When the line SP comes into the position SAD, SP PE will be equal to SA, AD; therefore SA is to AD in the determining ratio.

COR. 3. When SP comes into the position SL, or ST, the distance of P from the directrix will be equal to SD, and SL or ST will be to SD in the determining ratio, therefore LS = ST.

COR. 4. The latus rectum in the parabola is equal to twice the distance of the focus from the directrix, or to four times its distance from the vertex. For $SL = SD$, and $SA = AD$, therefore $LT = 2SD = 4SA$.

PROPOSITION I. Fig. 3, 4, 5.

If two straight lines, DQ, Dq, be drawn from the point D, where the axis meets the directrix, through L and T, the extremities of the latus rectum, which are produced both ways in the hyperbola; and through any point P in the conic section, a line QPp be drawn parallel to the directrix, meeting DL and DT in Q and q; the segment QN, which is intercepted between either of the lines and the axis, will be equal to SP, the distance of P from the focus.

The triangles DNQ, DSL, are similar, therefore $NQ : ND :: SL : SD$, (that is Cor. 3. Def.) $:: SP : ND$. Hence $NQ = SP$, and in the same manner it may be proved that $Nq = Sp$.

COR. 1. If KAG be drawn through the vertex, parallel to the directrix, SA will be equal to AK or AG.

COR. 2. The lines DQ, Dq, touch the conic section in the points L and T. For the triangle SNP being right angled, SP or QN is always

greater than PN, except when P is at L, where they coincide, therefore DQ meets the curve only in one point L. In like manner it may be shown that Dq touches the curve at T.

PROP. II. Fig. 3, 4, 5.

If from the point G, where the straight line KG, which is drawn through the vertex, parallel to the directrix, meets either of the tangents DQ, Dq, a line GR be drawn through the focus S, and produced both ways in the hyperbola, it will be parallel to the other tangent DQ in the parabola; it will meet it somewhere in g in the direction GSg in the ellipse, and in the opposite direction in the hyperbola.

Let SG meet the directrix in X. The triangles SAG, SDX, are similar, now $SA = AG$, Cor. 1. Prop. 1, therefore $SD = DX$, but in the parabola, fig. 3, $SL = DS$, therefore SL is equal and parallel to DX; and consequently XS is equal and parallel to DL. In the ellipse, fig. 4, SL is less than SD or DX, and therefore the lines DL, XS, must meet when produced in the direction XGS. In the hyperbola, fig. 5, SL is greater than SD or DX, and therefore the lines must meet when reduced in the direction SGX.

COR. 1. Because the triangles GAS, SNR, are similar, SN will be equal to NR.

COR. 2. Fig. 4, 5. Hence where Q coincides with g, in the ellipse or opposite hyperbola, QN will be equal to gM or SM; therefore SP will be equal to SN; and therefore SP will coincide with SN, and the curve will meet the axis in the point M.

COR. 3. Hence the whole ellipse, fig. 4, is contained between the lines GK, gk, on one side of the directrix.

COR. 4. In the parabola, fig. 3, NQ being always greater than NR, except at the vertex, SP is greater than SN; therefore the curve will meet the axis only in one point A, and it will extend without limit on one side of the directrix.

COR. 5. In the hyperbola, fig. 5, NQ being greater than NR, except at A and M, SP is greater than SN, and the two curves will be extended without limit, on opposite sides of the directrix.

DEFINITIONS. Fig. 4, 5.

VIII. The tangents DLQ, DTq, which are drawn through the extremities of the latus rectum, are called focal tangents.

IX. The straight line AM, in the ellipse and hyperbola, is called the transverse axis, or the axis major.

X. If the transverse axis be bisected in C, the point C is called the centre of the ellipse or hyperbola.

XI. If a line BCb, which is bisected in C, be drawn perpendicular to the transverse axis, and CB, Cb, be each a mean proportional between SA, SM, the segments of the axis between the focus and the vertices, BCb is called the conjugate axis, or axis minor.

XII. A line PNp, drawn through any point N, in the axis parallel to the tangent KG, or perpendicular to the axis, and terminated by the curve at P and p, is called an ordinate to the axis.

XIII. And AN the segment of the axis, intercepted between the ordinate and the vertex, in all the sections, as also the other segment NM in the ellipse and hyperbola, is called an abscissa.

XIV. Any line passing through the centre of an ellipse or hyperbola, and terminated both ways by the curve in the former, but by the opposite curves in the latter, is called a diameter.

XV. A line drawn through any point in the parabola parallel to the axis, is called a diameter of the parabola.

XVI. Any point where the diameter meets the curve is called a vertex to that diameter.

PROP. III. Fig. 3, 4, 5.

The axis bisects all its ordinates, and divides the conic section into two equal and similar parts.

Let $P'Np$ be any ordinate, meeting the axis in N. Join SP, Sp . Because $SP = Sp$, Prop. I. and SN is common to the two right angled triangles SNP, SNp , therefore $Np = NP$. And because all the ordinates are bisected, if the curve ATp be turned round upon the axis AN , and placed upon ALP , all the points p will coincide with the points P , and the curve ATp with the curve ALP .

PROP. IV. Fig. 3.

The square of the semi-ordinate to the axis in the parabola, is equal to the rectangle under the latus rectum and the abscissa.

Because the line Qq is bisected in N, $QR \cdot Rq + RN^2 = QN^2 =$ (by Prop. I.) $PN^2 = PN^2 + NS^2 =$ (Cor. 1, Prop. II.) $PN^2 + NR^2$. Therefore $QR \cdot Rq = PN^2$. But $QR = SL$, and $Rq = RN + Nq =$ (Because $SN = NR$, and NDq is half a right angle) $SN + ND = 2NA$. Therefore $QR \cdot Rq = 2AN \cdot SL = AN \cdot LT$, and therefore $PN^2 = AN \cdot LT$.

COR. 1. The latus rectum being constant, the abscissa varies as the square of the ordinate.

COR. 2. The parabola recedes from the axis without limit. For the abscissa, and therefore the square of the semi-ordinate, increases without limit.

COR. 3. Any line which is drawn parallel to the axis of the parabola, can meet the curve in one point only. For, if it were supposed to meet the curve in more points than one, the semi-ordinates drawn through the points of intersection would be equal, when the abscissæ are unequal, which is impossible.

LEMMA I. Fig. 6.

If four straight lines be proportionals, and any other four proportionals, the rectangle under the first and fifth is, to the rectangle under the second and sixth, as the rectangle under the third and seventh to the rectangle under the fourth and eighth.

Let $AB : CD :: EF : GH$ and $BI : DK :: FL : HM$, and let AI, CK, EL, GM , be rectangles, then $AI : CK :: EL : GM$. For in DK, HM , produced if necessary, take DN, HO , such, that $AB : CD :: DN : BI$, and $EF : GH :: HO : FL$, and complete the rectangles CN, GO , then $CN = AI$ and $GO = EL$. But $AB : CD :: EF : GH :: DN : BI$, therefore $DN : BI :: EF : GH ::$

$HO : FL$. But $BI : DK :: FL : HM$; therefore $DN : DK :: HO : HM$. Because $CN : CK :: DN : DK$, and $GO : GM :: HO : HM$; therefore, $CN : CK :: GO : GM$, and therefore, $AI : CK :: EL : GM$.

COR. If A, B, C , and D , be four straight lines, and $A : B :: C : D$, then $A^2 : B^2 :: C^2 : D^2$.

PROP. V. Fig. 4, 5.

The square of the semi-ordinate to the axis in the ellipse and hyperbola is, to the rectangle under the abscissæ, as the square of the conjugate axis to the square of the transverse axis.

Through the point G , draw GVW in the ellipse, and $VGWV$ in the two hyperbolas parallel to AM . Then, because the lines KAG, QNg, gMk , are parallel.

$QR : KG :: gR : gG :: VW : GW :: NM : AM$, and $Rq : gk :: GR : Gg :: GV : GW :: AN : AM$; therefore, Lem. 1, $QR \cdot Rq : KG \cdot kq :: AN \cdot NM : AM^2$. But it may be proved, as in the last proposition, that $QR \cdot Rq = PN^2$, and because $GK = 2SA$, and $gk = 2SM$, therefore $KG \cdot kq = 4AS \cdot SM =$ (by Def. 11.) $4B^2C^2 = Bb^2$. Therefore, $PN^2 : Bb^2 :: AN \cdot NM : AM^2$, and alternately, $PN^2 : AN \cdot NM :: Bb^2 : AM^2$.

COR. 1. Because AM, Bb , are bisected in C , $PN^2 : AN \cdot NM :: BC^2 : AC^2$.

COR. 2. The square of the semi-ordinate varies as the rectangle under the abscissæ.

COR. 3. The conjugate axis in the ellipse is terminated by the curve; for, when the ordinate passes through the centre, the rectangle under the abscissæ is equal to the square of half the transverse axis, and therefore the square of the semi-ordinate is equal to the square of half the conjugate axis, and the ordinate is equal to the conjugate axis.

COR. 4. The two hyperbolas recede from the axis without limit; for the abscissæ, and therefore the square of the ordinate, increase without limit.

COR. 5. Those ordinates which are at equal distances from the centre of the ellipse, and the two hyperbolas are equal; and those which are nearer to the centre are greater in the ellipse, and less in the hyperbola, than those which are more remote.

COR. 6. Any line which is drawn parallel to the axis of the hyperbola will cut each of the opposite curves only in one point; for, if it be supposed to cut either of the curves in more points than one, the ordinates which are drawn through the points of intersection would be equal, when the distances from the centre are unequal.

PROP. VI. Fig. 4, 5.

The latus rectum of the ellipse and hyperbola is a third proportional to the transverse and conjugate axes.

For by Cor. 1, Prop. V. $AC^2 : BC^2 :: AS \cdot SM$, or $BC^2 : SL^2$; therefore $AC : BC :: BC : SL$ and $AM : Bb :: Bb : LT$.

COR. Hence $AN \cdot NM : PN^2 :: AM : LT$, for $AM : LT :: AM^2 : Ab^2 :: AN \cdot NM : PN^2$.

PROP. VII. Fig. 7, 8.

The square of half the conjugate axis, in the ellipse and hyperbola, is equal to the difference of the squares of half the transverse axis, and the distance of the focus from the centre.

Because AM is bisected in C, the difference of the squares of AC and SC is equal to the rectangle ASM, that is, (Def. 11.) to the square of BC.

Cor. 1. Fig. 7. If a line, SB, be drawn from the focus of the ellipse to the vertex of the conjugate axis, it will be equal to AC, half the transverse axis.

Cor. 2. Fig. 8. If a line, AB, be drawn joining the vertices of the axes of a hyperbola, it will be equal to CS, the distance of the focus from the centre.

PROP. VIII. Fig. 9, 10.

The conjugate axis bisects all lines drawn parallel to the transverse axis, which are terminated by the ellipse, and by the opposite hyperbolas. Those lines which are equally distant from the centre are equal; and those which are nearer to the centre are greater in the ellipse, and less in the hyperbola, than those which are more remote.

Take CN any distance from the centre, between C and A in the ellipse, and in CA produced in the hyperbola. Take CR = CN, and draw the ordinates PNp, QRq; join PQ, pq, meeting Bb in n and r. Because Pp and Qq are equal, Cor. 5, Prop. V., and they are bisected in N and R, the lines PQ, NR, pq, are equal and parallel, and because Pn pr are equal to NC, and Qn qr equal to RC, or NC, PQ, pq, are bisected in n and r, and they are at equal distances from the centre, because Cn Cr are equal to PN Np. Lastly, as Cn decreases PN decreases, and therefore CN, Cor. 5, Prop. V., increases in the ellipse, and decreases in the hyperbola; but Pn is equal to CN, Pn therefore increases in the former and decreases in the latter, as Cn, its distance from C, decreases.

Cor. 1. The conjugate axis divides the ellipse into two equal and similar parts; the two opposite hyperbolas are equal and similar: and the ellipse and hyperbola have each of them another focus and directrix, which have the same properties as the former. Take CH = CS, and Cd = C d; through d draw xdc perpendicular to Cd, meeting PQ, pq, in e and r, and join H Q. Then if the whole figure, n Q M q r, be turned round upon the axis Bb, and placed upon n P A p r, n Q r q will coincide with n P r p, and all the points Q q in the curve Q M q, with all the points P p in P A p. The straight line xdc will also coincide with X D E, the point H with S, and the lines H Q, Qe with the lines S P, P E: therefore H Q is always to Qe in the ratio of SP to P E.

Cor. 2. Suppose PQ, fig. 9, which is always parallel to AM, to move from the centre towards B, the points P, Q, will coincide at B, and the line EPQ will become a tangent to the ellipse; therefore the ordinates to the conjugate axis are parallel to the tangent at its vertex

PROP. IX. Fig. 9.

The square of the semi-ordinate to the conjugate axis, in the ellipse, is to the rectangle under the abscissæ as the square of the transverse axis to the square of the conjugate axis.

For PnQ, being parallel to AM, is perpendicular to Bb, and it is bisected in n; by the last Prop. it is therefore an ordinate to Bb, and by Prop. V. PN^2 , or $CN^2 : BC^2 :: AN \cdot NM : AC^2$, and by division $Bn \cdot nb : BC^2 :: CN^2$ or $PN^2 : AC^2$, and by alternation and inversion $Pn^2 : Bn \cdot nb :: AC^2 : BC^2 :: AM^2 : Bb^2$.

PROP. X. Fig. 9, 10.

The transverse axis, in the ellipse and hyperbola, is to the distances between the directrices in the determining ratio.

For SA : AD :: SM : MD, and alternately SA : SM :: AD : MD, therefore, by composition in the ellipse and division in the hyperbola,

AM : SA :: Dd : AD, and alternately, AM : Dd :: SA : AD, that is in the determining ratio.

Cor. 1 Hence AC is to CD in the determining ratio.

Cor. 2. The distance between the foci is to the transverse axis in the determining ratio.

For SM : MD :: SA : AD :: HM : AD, and alternately, SM : HM :: MD : AD, and by division in the ellipse and composition of the hyperbola, SH : HM :: AM : AD, and alternately, SH : AM :: HM : AD :: SA : AD.

Cor. 3. Hence CS, CA, and CD are continual proportionals.

PROP. XI. Fig. 7, 8.

All the diameters of an ellipse or hyperbola are bisected in the centre.

From any point, P, in the curve draw PC to the centre, and PN perpendicular to the axis. Take Cu = CN; and draw nG parallel to NP, but on the other side of the axis, let it meet the curve in G, and join CG. Then, because Cu = CN, the semi-ordinates Gn, PN, will be equal, Cor. 5, Prop. V., and the angles at N and n are right angles, therefore the triangles CNP, CnG, are equal, therefore CG = CP, and the angle nCG is equal to NCP, hence it follows that GCP is a straight line which is bisected at C.

PROP. XII. Fig. 17, 18, Plate XVII.

If, from any point in the ellipse or hyperbola, two straight lines be drawn to the foci, the sum of these lines in the ellipse, and their difference in the hyperbola, is equal to the transverse axis.

Let P be any point in the ellipse or hyperbola, and let S and H be the two foci. Join PS, PH, and through P draw PPe, parallel to the axis, meeting the directrices in E and e. Then SP will be to P E, and H P to P e, in the determining ratio, and alternately SP : HP :: P E : P e, therefore, in fig. 17, $SP + HP$, and $SP - HP$, in fig. 18, is to SP as Ee or Dd is to P E; and alternately, $SP \pm PH : Dd :: SP : P E :: AM : Dd$, Prop. X., therefore in the ellipse $SP + PH$, but in the hyperbola $SP - PH = AM$, the transverse axis.

DEF. XVII. Fig. 11, Plate II.

If from the centre C, at the distance CA, half the transverse axis, a circle be described, cutting the directrix of the hyperbola in the points H, h, and lines be drawn from the centre through the points of intersection, these lines are called the asymptotes.

PROP. XIII. Fig. 11.

If lines SH, Sh, drawn from the focus S to the points H, h, in which the asymptotes cut the directrix, they will be perpendicular to the asymptotes; and these lines, as also AG, Aa, the segments of the tangents at the vertex, which is intercepted between the asymptotes, are each equal to half the conjugate axis.

For, Cor. 3, Prop. X., $CS : CA :: CA : CD$, that is, $CS : CH :: CH : CD$; now the angle HCS is common to the two triangles CHD, CSII, therefore these triangles are similar and the angle CHS = CDH = a right angle. In the same way it may be proved that ChS is a right angle.

Again, $SII^2 = SC^2 - CH^2 = SC^2 - CA^2 = CB^2$ by Prop. VII; therefore $SII = CB$, in the same way it may be proved that $Sh = CB$; and because $CII = CA$, and CHS, CAa , are right angles, and the angle HCS is common to the triangles SII C, aAC, these triangles are equal, and $Aa = SII = BC$.

Cor. 1. Radius is to the sine of the angle contained by the asymptote and directrix in the determining ratio; for CA or CH is to CD in the same ratio, and $CII : CD :: \text{radius} : \text{sine } CHD$.

Cor. 2. If a line PG, fig. 12, be drawn from any point P in the hyperbola, or in the opposite curve, parallel to the asymptote, meeting the directrix in G, PG will be equal to PS. Draw PE perpendicular to the directrix; and because the angle PGE = CHD, PG is to PE in the determining ratio, or as SP to PE, therefore $PG = PS$.

PROP. XIV. Fig. 12.

The asymptotes never meet the curve, but any other line drawn parallel to an asymptote will meet one of the hyperbolas.

For if it be possible, let the asymptote meet the curve in the point R. Join RS, and draw RN perpendicular to the directrix. Then by Cor. 1, last Prop., HR is to RN in the determining ratio or as SR to RN, therefore $RS = RH$, and the angle RSH = RHS; which is impossible, for by last Prop. RHS is a right angle. In the same way it may be proved that it cannot meet the opposite curve. Let any other line GP be drawn parallel to the asymptote; and first let it be nearer to the focus. Join SG, and produce it to meet the asymptote CII in I; then the angle SGP = SIIH, which is less than SII R, a right angle; therefore, if GSP be made equal to SGP, SP GP will meet somewhere in P, which is a point in the curve. For draw PE perpendicular to the directrix, and the angle PGE being equal to CHD, PG is to PE in the determining ratio; therefore SP is to PE in the same ratio, and P is a point in the hyperbola.

Secondly, let gp be drawn parallel to the asymptote, at a greater distance from the focus. Join Sg, meeting HC in i; the angle Sgp = SiiH, which is less than a right angle; if therefore gSp be made equal to Sgp, the lines Sp, gp, will meet when produced in some point, p, which is in the opposite hyperbola; for the angle pge being equal to CHD, pg is to pe, or SP is to pe in the determining ratio, therefore p is a point in the curve.

Cor. Hence, if any line be drawn through the centre of an hyperbola within the angle contained by the asymptotes, it will meet both the curves.

DEFINITIONS. Fig. 11.

XVIII. If AM be the transverse axis and Bb the conjugate axis of two opposite hyperbolas, and other two hyperbolas be described, of which the transverse axis is Bb, and conjugate axis AM, these hyperbolas are said to be conjugate to the former.

XIX. When the two axes are equal, the hyperbolas are said to be equilateral.

PROP. XV. Fig. 11.

The asymptotes are diagonals of the rectangle, which is made by drawing tangents through the vertices of the four hyperbolas.

Let the tangents GA, IMI, which are drawn through the vertices of the transverse axis, meet the asymptotes in G, a, and I, i. Join IB, GB, as also ab, ib. The triangles MCI, ACA, are equal, for $AC = CM$, the angle MCI = ACA, and $CMI = CAa$, therefore $MI = Aa$, which is equal to CB, Prop. XIII. In like manner it may be proved that $Mi = Cb = CB$; therefore IB, BG, are equal and parallel to MC, CA, the angles IBC, GBC, are each a right angle, and IBG is one straight line, which is equal and parallel to MA. For the same reason iba is one straight line, which is equal and parallel to MA; and because the lines IBG, iba, are perpendicular to the axis BCb, they are tangents to the conjugate hyperbolas, and IG ai is a rectangle of which the asymptotes Ia, Gi, are the diagonals.

Cor. 1. The asymptotes GCi, ICA, are also asymptotes to the conjugate hyperbolas. For BI = BG = CA, which is the semi-conjugate axis to the hyperbolas LBR, lbr.

Cor. 2. If the hyperbolas be equilateral, the asymptotes will be perpendicular to each other.

PROP. XVI. Fig. 13, 14, 15.

If a straight line Pp, which cuts a conic section, or opposite sections, into two points P, p, meets the directrix in H, and a right line HST be drawn through the focus, and SP, Sp, be joined; the angle PSII will be equal to pST.

Draw pT parallel to PS, and let it meet HS in T; and draw PE, pe, perpendicular to the directrix. The triangles HPE, Hpe, are similar, as also HSP, HTp, and $SP : PE :: Sp : pe$; and alternately $SP : Sp :: PE : pe :: HP : Hp :: SP : pT$, therefore $Sp = Tp$, and the angle pST = pTS = PHH.

Cor. 1. When P and p coincide, fig. 13, 15, or when HP becomes a tangent to the conic section, SP will coincide with Sp, and the angles PSII, pST will be right angles.

COR. 2. Hence if a line SP be drawn from the focus to any point P in a conic section, fig. 16, and SH be drawn perpendicular to SP , meeting the directrix in H , and HP be joined, it will touch the conic section in P .

COR. 3. It is evident from this proposition, that a straight line cannot cut a conic section in more points than two.

PROP. XVII., Fig. 16.

If a tangent be drawn to any point in the parabola, it will bisect the angle contained by the two straight lines drawn from the point of contact, one to the focus, and the other to the directrix.

Let PH which touches the parabola at P meet the directrix in H . Join SP , SH , and draw PE perpendicular to the directrix. The angle SPE is bisected by PH . For $SP = PE$ and PH is common to the triangles PSH , EPH ; and PSH , PEH are right angles, therefore the triangles SPH , EPH , are similar, and the angles $SPH = EPH$.

COR. 1. Hence if a straight line PH bisects the angle SPE , it will be a tangent to the parabola at the point P .

COR. 2. Let PS meet the curve again in p , and let HI be drawn parallel to the axis, it will bisect Pp in I , and HI will be bisected by the curve in A . For angle $IHP = HPE = HPI$, therefore $IP = IH$, and if pH be joined, the line pH will be a tangent, and therefore for the same reason $Ip = IH$, therefore $IP = Ip$. Secondly, because $SA = AH$, the angle $ASH = AHS$, and the complements of these angles are equal, that is $ASI = AIS$, therefore $AI = AS = AH$.

PROP. XVIII., Fig. 17, 18.

If a tangent be drawn to any point in an ellipse or an hyperbola, and two lines be drawn from the point of contact to the foci, the angles contained by each of these lines and the tangent are equal. Let PT touch the ellipse or hyperbola at any point P , let it meet the directrices in T and t . Through P draw a line parallel to the axis AM meeting the directrices in E and e , draw PS , PH , to the foci, and join ST , Ht . Because the triangles TPE , tPe , are similar, $PE : PT :: Pe : Pt$, and by Sect. I, def. 1. $SP : PE :: HP : Pe$, therefore $SP : PT :: HP : Pt$, and the angles PST , PHT , are right angles, Cor. 1., Prop. XVI. therefore the triangles SPT , HPt , are similar, and the angle $SPT = HPt$.

PROP. XIX., Fig. 19, 20.

The tangents at any vertices of any diameter of an ellipse or an hyperbola are parallel.

Let PCG be any diameter of an ellipse, or hyperbola: draw the tangents PQ , GR , and join SP , PH , SG , GH . Because $SC = CH$, and $CP = CG$, and the angle $SCP = GCH$, the triangle $SCP = HCG$, and the angle $SPC = HGC$, also SP is equal and parallel to GH , therefore PH is equal and parallel to SG , and $SPHG$ is a parallelogram, therefore the angle $SPH = SGH$, and the halves of these angles, fig. 20, or the halves of their supplements, fig. 19, will be equal, that is the angle $SPQ =$

HGR , and if these be added to the equal angles SPC , CGH , in the ellipse, and subtracted from them in the hyperbola, $CPQ = CGR$, therefore PQ is parallel to GR .

DEFINITIONS. Fig. 17, 18.

XX. The straight line PR , which is drawn from the point of contact perpendicular to the tangent, intercepted between the tangent and the axis of a conic section, is called a normal.

XXI. The segment of the axis NR , which is intercepted between the ordinate and the normal, is called a subnormal.

XXII. If a straight line be drawn through any point in the diameter of a conic section, parallel to a tangent at the vertex, and terminated both ways by the curve, it is called an ordinate to the diameter.

XXIII. The segment of any diameter of a conic section, which is intercepted between an ordinate and the vertex, is called an abscissa.

XXIV. A diameter which is parallel to the tangent at the vertex of any diameter of the ellipse, or hyperbola, is called a conjugate diameter.

XXV. A line which is a third proportional to any diameter of the ellipse or hyperbola, and its conjugate, is called a parameter of that diameter.

XXVI. If a line be drawn through the focus of a parabola parallel to the ordinates of any diameter, terminated both ways by the curve, it is called a parameter to that diameter.

PROP. XX. Fig. 21, 22, 23. Plate III.

If two straight lines Pp , Qq , which meet each other in any part L , and are inclined to the directrix at any given angles LHX , LhX , cut a conic section, or opposite sections, in the points Pp and Qq ; the rectangles $LP \cdot Lp$ and $LQ \cdot Lq$ will be in a constant ratio to each other.

Let S be the nearest focus. Join HS , and produce it if necessary; also join SP , Sp , draw LX , PE , perpendicular to the directrix, and draw Lt , Lt , parallel to SP , Sp , meeting HS in T and t , because (prop. XVI.) the angle $PSH = pST$, fig. 21 and 23, and $= pSW$, fig. 22, the angle $LTt = LtT$ and $LT = Lt$. On L as a centre, at the distance LT or Lt , describe a circle cutting HPp in M and m . Join SL , and produce it to meet the circle in D and d ; and because the triangles HPE , $H LX$, are similar, as also HPS , HLT , $LT : SP :: LH : PH :: LX : PE$; and alternately $LT : LX :: SP : PE$, that is in the determining ratio, therefore the radius of the circle is given, when the distance of L from the directrix is given, whatever be the position of the line Pp . And because LT is parallel to PS , and Lt to pS ,

$$LP : TS :: LH : HT.$$

and $pL : St :: LH : tH$, therefore Lemma 1,

$$PL \cdot Lp : TS \cdot St :: LH^2 : HT \cdot tH.$$

But $TS \cdot St = DS \cdot Sd$, and $TH \cdot tH = MH \cdot Hm = LH^2 - LM^2$, fig. 21, 22, or $= LM^2 - LH^2$, fig. 23. Therefore $PL \cdot Lp : DS \cdot Sd :: LH^2 : LH^2 - LM^2$, or $LM^2 - LH^2$. But $LH^2 : LT^2$ or $LM^2 : PH^2$; PS^2 , and by division $LH : LH^2 - LM^2$, or $LM^2 - LH^2 :: PH^2 : PH^2 - PS^2$, or $PS^2 - PH^2$; which ratio depends only

upon the determining ratio and the angle LHX , SP being to PH in a ratio, which is compounded of the ratios of SP to PE , and PE to PH , or of the determining ratio, and of the sine of the angle LHX to radius. In the same manner it may be proved that the rectangle $QL \cdot Lq$ is to $DS \cdot Sd$ in a ratio depending only on the determining ratio and the angle LHX , therefore $PL \cdot Lp$ is to $QL \cdot Lq$ in a constant ratio, whatever be the distance of L from the directrix.

Cor. 1. If either of the lines Pp , Qq , or both of them become tangents to the conic section, or opposite sections, the squares of the tangents must be substituted for the rectangles $PL \cdot Lp$, $QL \cdot Lq$. For let LP touch the section in P , fig. 24, 25. Then QL being parallel to SP , by the preceding Prop. $LP : QS :: LH : HQ$; and $L P^2 : QS^2 :: LH^2 : HQ^2$; but $QS^2 = DS \cdot Sd$, and $QH^2 = MH \cdot Hm = LH^2 - LM^2$, therefore $L P^2 : DS \cdot Sd :: MH^2 : LH^2 - LM^2$, which was proved to be a constant ratio; therefore $L P^2$ is to $L p^2$ or $QL \cdot Lq$, fig. 22, in a constant ratio.

PROP. XXI. Fig. 27.

If two right lines QL , Pp , meeting each other at any point L , one of which is parallel to the axis, and the other is inclined to the directrix in a given angle, cut a parabola in the points Q , p , and P , the rectangle under QL , and the latus rectum will be to the rectangle $PL \cdot Lp$ in a constant ratio.

Draw LX perpendicular to the directrix; and from the centre L , at the distance LX , describe a circle, join QS , XS , let XS meet the circle in T , and join LT . Draw SO perpendicular to LX , take $OI = OX$, and join SI , then $SI = SX$, now $LT = LX$, and $QS = QX$, therefore LT is parallel to QS , and because the angle $QXS = SXQ = SIX$, the triangles QXS , SXI , are similar, and $XI : XS :: XS : XQ :: ST : QL$, therefore the rectangle $IX \cdot QL = XS \cdot ST = DS \cdot Sd$, which by the preceding proposition is to $PL \cdot Lp$ in a constant ratio, and because $IX = QOX$, the distance of the focus from the directrix, therefore $IX =$ latus rectum, therefore the rectangle under QL , and the latus rectum is to $PL \cdot Lp$ in a given ratio.

LEMMA II. Fig. 27.

If a straight line be divided in two points C and D , such, that the rectangle $CA \cdot AD = DB \cdot BC$, or $AC \cdot CB = BD \cdot DA$, the part AC will be equal to BD . First, let $CA \cdot AD = DB \cdot BC$. Bisect CD in E ; and $CA \cdot AD + EC^2 = AE^2$, also $DB \cdot BC + ED^2 = EB^2$, but $ED^2 = EC^2$, therefore $BE^2 = AE^2$, and $BE = AE$: and therefore $BD = AC$. Secondly, let $AC \cdot CB = BD \cdot A$, by bisecting AB in E , it may be shown as above, that $ED = EC$, and therefore $BD = AC$.

PROP. XXII. Fig. 28, 29.

All lines parallel to any diameter of the ellipse or hyperbola, which are terminated both ways by the ellipse, or opposite hyperbola, are bisected by the conjugate diameter.

Let ACB be any diameter of an ellipse, or hyperbola. Through the vertices A , B , draw the

tangents AL , BM ; and through the centre C draw the diameter DCK parallel to AL or BM , which will be the conjugate diameter. Through N , any point in DK , draw $LN M$ parallel to AB , meeting the ellipse or opposite hyperbolas in P and Q , and the tangents $A L$, $B M$, in L and M . Then AL being parallel to CN and BM , and $L N M$ parallel to ACB , $AL = BM$, and $LN = NM$; and Cor. 1, Prop. XX, $LA^2 : PL \cdot LQ :: BM^2 : QM \cdot MP$, therefore $PL \cdot LQ = QM \cdot MP$, therefore Lem. 2, $PL = QM$, and, because $LN = NM$, $PN = NQ$.

Cor. 1. If the diameter DK bisect all lines parallel to AB , it will be the conjugate diameter AB .

Cor. 2. Fig. 28. If a straight line RDT be drawn through D the vertex of the conjugate parallel to AB , it will touch the curve in the point D .

PROP. XXIII.

Every diameter of a conic section bisects all its ordinates.

1st. If the section be an ellipse, it is evident from the last proposition; for the ordinates of any diameter are parallel to the conjugate diameter.

2dly. If the section be an hyperbola, fig. 29, of which ACB is any diameter; in the tangent RAL take $AR = AL$, through L and R draw PLQ , FRG , parallel to AB , meeting the opposite hyperbolas in P , Q , and F , G , and the tangent at B in M , T . Join PF , cutting the diameter in V : then PF will be an ordinate which is bisected at V : for by last Prop. $PL = MQ$ and $FR = TG$; and Cor. 1, Prop. XX. $FR \cdot RG : RA^2 :: PL \cdot LQ : LA^2$, but $LA^2 = RA^2$, therefore $FR \cdot RG = PL \cdot LQ$, that is, $RF \cdot FT = LP \cdot PM$; therefore Lem. 2, $RF = PL$, and $PLR F$ is a parallelogram, and therefore PF is parallel to RAL , and $PV = VF$.

Lastly, let the section be a parabola, fig. 30, of which AN is any diameter, and PNQ an ordinate; through the vertex A draw the tangent LAM ; and draw PL , QM , parallel to NA , then $PL = QM$, but the rectangle under LP and the latus rectum is to LA^2 as the rectangle under MQ and the latus rectum to MA^2 , therefore $LA^2 = MA^2$, and $LA = MA$, and therefore $QN = PN$.

PROP. XXIV. Fig. 31. Plate IV.

If a straight line cutting the hyperbola, or opposite hyperbolas, meets the asymptotes in two points; the segments between the hyperbola or hyperbolas, and asymptotes will be equal.

Let PQ cut the hyperbola, or the opposite hyperbolas in P and Q , and meet the asymptotes in R , T ; the segments PR , QT , will be equal. For if PR be not equal to QT , let one of them as QT be the greater; take $QO = PR$, join CO , which, being produced, will meet the curve in some point q , Cor. Prop. XIV. Through q draw qpr parallel to QP meeting the curve in p and asymptote in r , bisect PQ in N , and draw the diameter CNn , and PQ , pq , will be ordinates to that diameter. Because $NQ = NP$ and $QO = PR$, therefore $NO = NR$ and $ON : qn :: CN : Cn :: NR : nr$, therefore $nq = nr$; but $nq = np$, therefore $np = nr$, which is absurd; therefore QT is not greater than PR .

COR. If the line TNR be supposed to move from N to A , the points PQ will coincide in A , and IA will be equal to AG ; therefore, when a line touches an hyperbola, the segments between the point of contact and the asymptotes are equal.

PROP. XXV. Fig. 32.

If from any point P in the hyperbola PQ two straight lines PL, PH , be drawn to the asymptotes, and from any other point Q , in the same or in the opposite curve, there be drawn other two straight lines QE, QF , parallel to the two former lines PL, PH . The rectangle $QE \cdot QF$ will be equal to the rectangle PL, PH .

Join PQ , and let it meet the asymptotes in R and T ; and because the triangles TQF, TPH , are similar, as also the triangles $RPL, RQE, QF : PH :: TQ : TP :: RP : RQ :: PL : QE$; therefore the rectangle $QF \cdot QE$ is equal to the rectangle $PH \cdot PL$.

COR. Hence if from any two points P, Q , in the same or in the opposite hyperbolas, two straight lines PL, QE , be drawn to the same or to different asymptotes parallel to the other asymptote; the rectangles $CL \cdot LP, CE \cdot EQ$, will be equal; also the parallelogram $CLPH$ will be equal to the parallelogram $CEQF$; and the triangle CLP to the triangle CEQ .

PROP. XXVI. Fig. 54.

If, from any point R in the asymptote of a hyperbola, there be drawn a straight line RT cutting the hyperbola, or opposite hyperbolas, in P or Q , and the other asymptote in T ; the rectangle PR, RQ , is equal to the square of the semidiameter which is parallel to RT .

Let AM, Bb be the two axes, join AB meeting the asymptote in N . Draw the tangent IAa meeting the asymptotes in I and a . Because Aa is equal and parallel to BC , Prop. XIII. AB is equal and parallel to aC , and $IA : aN :: AN : aC$, or AB ; now IA is half of Ia , therefore AN is half of AB and $AN = NB$.

Let CF be the semidiameter parallel to the line cutting the opposite hyperbolas, draw the tangent LFH meeting the asymptotes in L and H , draw FE parallel to CH , meeting the asymptote in E , and the conjugate hyperbola in D , and join CD . Because the rectangle $CN \cdot NA$ or $CN \cdot NB = CE \cdot EF$, Cor. Prop. XXV. and $CN \cdot NB = CE \cdot ED$, therefore $CE \cdot EF = CE \cdot ED$ and $EF = ED$, and FE is half of FD , but because LF is half of LH , Cor. Prop. XXIV. and FE is parallel to CH , FE is also half of CH , therefore $FD = CH$, and they are parallel, therefore CD is equal and parallel to FH , and CD is a conjugate diameter to CF . Let the line which cuts the hyperbola PFQ be parallel to CD or LH . Take any point t in the asymptote, and draw tr parallel to TR , cutting the curve or opposite curves in p and q , and the other asymptote in r . Draw PY, PZ, py, pz parallel to the asymptotes. Because the triangles PYR, pyr are equiangular,

$PR : PY :: pr : py$, and in like manner,

$PT : PZ :: pt : pz$, therefore Lem. 1.

$RP \cdot PT : YP \cdot PZ :: rpyt : yppz$; but $YP \cdot PZ = yppz$, Cor. Prop. XXV.; therefore $RP \cdot PT =$

$rpyt$; or since $RP = QT$, Prop. XXIV. $PR \cdot RQ = pr \cdot rq$; and when P is taken at F , the rectangle $PR \cdot RQ$ becomes FL^2 or FIP^2 which is equal to CD^2 ; and when P in the opposite hyperbola is at M , the rectangle $PR \cdot RQ$ becomes equal to GC^2 .

PROP. XXVII.

If two right lines, meeting each other, cut or touch a conic section, or opposite sections, the rectangles under the segments between the points of concurrence and the points of intersection, or the squares of the tangents, will be to each other as the squares of the semidiameters to which the lines are parallel.

If the lines are parallel to any of the diameters of the ellipse, or of the opposite hyperbolas, the proposition is evident from Prop. XX., because the lines which meet each other make the same angles with the directrix as those which pass through the centre, and the latter are bisected in the centre. But if either of the lines PLQ, LRT , or both the lines PLQ, NLM , be parallel to some of the conjugate diameters of the hyperbola, fig. 34, produce QLP till it meet the asymptote in G , and through G , draw $F GH$ parallel to LRT , meeting the opposite curves in F and H . Let CB, CD, CA , be the semidiameters which are parallel to QP, MN, RT . Then Prop. XX. $PL \cdot LQ : R \cdot L \cdot LT :: PG \cdot GQ : FG \cdot GH :: CB^2 : CA^2$, by Prop. XXVI. In the same manner it may be proved, that $R \cdot L \cdot LT : N \cdot L \cdot LM :: CA^2 : CD^2$; therefore $PL \cdot LQ : N \cdot L \cdot LM :: CB^2 : CD^2$.

If the lines touch the conic section, or opposite sections, the squares of the tangents will be to each other as the rectangles under the segments of any two lines drawn parallel to them, which meet each other, and cut the section or opposite sections; and therefore they are as the squares of the semidiameters to which they are parallel.

COR. fig. 33, 34. If two right lines IQ, IN , meeting each other in I , touch an ellipse or hyperbola in Q, N , and are parallel to two other lines VT, VN , which meet each other in V , and touch the ellipse or opposite hyperbola, or hyperbolas, in T, N ; $IQ : IN :: VT : VN$; for IQ^2, IN^2 , are to each other as the square of the semidiameters to which they are parallel, and VT^2, VN^2 , are in the same ratio.

PROP. XXVIII. Fig. 35, 36

If an ordinate be drawn to any diameter of an ellipse or an hyperbola, the rectangle under the abscissa will be to the square of the semi-ordinate as the square of the diameter is to the square of its conjugate.

Let ACM be any diameter of an ellipse or hyperbola, to which PNQ is an ordinate, and let DCK be the conjugate diameter, which is parallel to PNQ . Then by the preceding proposition $AN \cdot NM : PN \cdot NQ$ (or PN^2) :: $CA^2 : CD^2 :: AM^2 : DK^2$.

COR. 1. Because the parameter is a third proportional to the diameter and its conjugate, the rectangle under the abscissa is to the square of the semi-ordinate as the diameter is to the parameter.

COR. 2. The two conjugate diameters being constant, the rectangle under the abscissæ will vary as the square of the ordinate.

PROP. XXIX. Fig. 37.

If an ordinate be drawn to any diameter of a parabola, the square of the semi-ordinate is equal to the rectangle under the abscissæ and the parameter.

Let AN be any diameter of the parabola to which PNQ is an ordinate. Draw the parameter TSV , cutting the diameter in F ; join SA , and let the diameter meet the directrix in D . Because TF is half of TV , Prop. XXIII. and AF is half of DF or TF , Prop. XVII. Cor. 2, $AF:ET::FT:T'V$, and $AF \cdot TV = FT^2$; but $AF \cdot TV:AN \cdot TV::TF^2:PN^2$, Prop. XXI., therefore $AN \cdot TV = PN^2$.

COR. Because $TV = 2TF = 4SA$, $4SA \cdot AN = PN^2$.

PROP. XXX. Fig. 38.

If two tangents be drawn at the extremities of any right line which is terminated by a conic section, and which does not pass through the centre of an ellipse, they will meet each other in the diameter which bisects that right line.

Let PQ meet the curve in P and Q ; bisect PQ in N , and through N draw the diameter CNT . Through P draw the tangent PT , meeting the diameter in T , and join TQ which will touch the conic section in Q . For draw any other line DCB parallel to PNQ , meeting TP , TQ , in L and M . The triangles TNP , TCL , are similar, as also TNQ , TCM , therefore,

$NP:CL::TN:TC::QN:MC$, and alternately $NP:NQ::CL:CM$, therefore $CM = CL$, which is greater than CD or CB , therefore M is without the section, and the line TQ meets the curve only in one point Q .

COR. If two right lines which touch a conic section meet each other, a right line drawn through the point of concurrence, bisecting the line which joins the points of contact, will be a diameter of the section.

PROP. XXXI. Fig. 39.

If a tangent to any point in the parabola meet a diameter, and an ordinate be drawn to that diameter from the point of contact, the segment of the diameter between the vertex and the tangent will be equal to the abscissa.

Let TP , which touches the parabola in any point P , meet the diameter NA in T , and draw the ordinate PN . NA , will be equal to AT . Draw the tangent AI meeting PT in I ; join AP , and draw the diameter IG cutting AP in F and PN in G ; then $AF = FP$, Cor. Prop. XXIX. Therefore AI or $NG = PG$; and AI is half of NP ; but $AI:NP::TA:TN$, therefore TA is the half of TP .

PROP. XXXII. Fig. 40, 41.

If a tangent to any point in an ellipse, or an hyperbola, meet a diameter, and from the point of contact an ordinate be drawn to that diameter, the semidiameter will be a mean proportional between the segments of the diameter, which are intercepted between the centre and the ordinate, and between the centre and the tangent.

Let PT touch the ellipse or hyperbola in any

point P , and meet the diameter MA in T ; draw PNQ an ordinate to the diameter MA , $CN:CA::CA:CT$. Through the vertices A, M draw the tangents AI, ML , meeting PT in I and L , take $CO = CN$. Then Cor. Prop. XXVI. $IP:IA::LP:LM$, and alternately $IP::LP::IA::LM$, and because AI, NP, ML , are parallel, $AN:NM::TA:TM$, and by comp. fig. 41, or by div. fig. 40, $ON:AN::AM:TA$; and by taking the halves of the antecedents $CN:AN::CA:AT$, and by comp. fig. 40, or by div. fig. 41, $CA:CN::CT:CA$ and by inversion $CN:CA::CA:CT$.

SECT. II. OF THE DESCRIPTIONS OF THE CONIC SECTIONS; AND OF DRAWING TANGENTS TO THE CURVES.

PROP. XXXIII. PROBLEM. Fig. 3, 4, 5. Plate I.

The focus, directrix, and determining ratio being given, to find any number of points in the conic section.

Let DX be the directrix and S the focus, draw SD perpendicular to DX , which produce indefinitely. Draw LST perpendicular to DS ; and take SL and ST to SD in the determining ratio. Then LST , Cor. 3, def. is the latus rectum. Join DL, DT , and produce them indefinitely. Take $DX = DS$ and join XS meeting D, T in G , which Prop. II. will be parallel to DL in the parabola, it will meet it in some point g in the direction DL in the ellipse, and in the opposite direction in the hyperbola. Through G and g draw KAG, gMk , parallel to the directrix, meeting DL, DT , and the axis in K, G, A and g, k, M ; the points A, M , will therefore be the vertices of the axis. Through any point N , in the axis, between A and M in the ellipse, and anywhere on the same side of A with S in the parabola, and anywhere except between A and M in the hyperbola, draw QNq parallel to the directrix, and from the centre S , with a radius equal to QN , describe a circle cutting Qq in the points P, p ; and join SP, Sp , which are each equal to QN ; therefore P and p are points in the curve by the first proposition; and in this way may any number of points be found

PROP. XXXIV. PROBLEM. Fig. 42. Plate V.

Two unequal straight lines being given, which bisect each other at right angles, to describe an ellipse, of which the given lines shall be the axes.

Let AM, Bb , be the given lines of which AM is the greater. From the centre B , with a radius equal to AC , describe a circle meeting AM in S and H , which will be the foci, Prop. VII. Cor. 1. Take a string equal in length to AM , and fix the extremities of it at the points S and H , and by means of a pin let the string be stretched, and let the pin be carried round, till it return to the same point, the point M will describe an ellipse, of which AM, Bb , are the axes, as is evident from Prop. XII.

PROP. XXXV. PROBLEM. Fig. 43.

Two straight lines being given, which bisect each other at right angles, to describe an hyperbola, of which these lines shall be the axes.

Let AM, Bb , be the given lines, bisecting each other at right angles in C . Join AB , and take CS and CH , in AM produced both ways, equal to HB . At the point H let one end of a ruler be fixed, so that it may move round this point as a centre; and let a string be taken, the length of which exceeds that of the ruler by a line equal to AM ; let one end of the string be fixed at L , and the other at the point S ; apply the string by means of a pin at P , to the side of the ruler LH ; and let the ruler be moved about the centre H , while the string is constantly applied, and kept close to the ruler by the pin at P . Then the difference between the whole length of the string SPL and the ruler HL being equal to AM , the difference between HP and PS will be equal to AM ; and the point P will describe one of the opposite hyperbolas of which AM, Bb , are the axes, as is evident from Prop. XII.

PROP. XXXVI. PROBLEM. Fig. 44.

Two right lines being given, one of which is bisected by the other at right angles, to describe a parabola, in which the right line bisected shall be an ordinate, and the other line the axis.

Let AC, Bb , be the two given lines, one of which Bb , which is perpendicular to AC , is bisected in C . Find a third proportional to AC, CB ; and produce CA to D , so that AD may be a fourth part of that third proportional; take $AS = AD$, and draw DX perpendicular to DC . Let a ruler, the sides of which, HE, EL , are perpendicular to each other, be placed in the plane CDX , so that the side EL may be applied to DX ; and take a string equal in length to the side HE , one extremity of which must be fixed at H , and the other at S ; and let part of the string be applied, by means of the pin P , to the side of the ruler HE ; and whilst the side EL , moves along DX , let the string be stretched by the pin, and constantly applied to HE . Then, because the whole length of the string HPS is equal to HE , the part SP will always be equal to PE ; therefore the point P will describe a parabola, by the first definition, of which AC is the axis, S the focus, and DX the directrix; and BCb will be an ordinate, because it is perpendicular to the axis, and CB is a mean proportional between the abscissæ AC and $4AS$, or the latus rectum.

PROP. XXXVII. PROBLEM. Fig. 24, 25. Plate III.

To draw a tangent to a conic section from any given point without it, which is not the centre of the hyperbola.

If the given point H be in the directrix, draw HS to the focus which is nearest to the directrix; draw SP perpendicular to SH , meeting the curve in P , and join HP , which will touch the conic section in P , Cor. 1. Prop. XVI.

If the given point be in any other situation, as at L , join LS , and draw LX perpendicular to the directrix. Take LD to LX in the determining ratio, and from the centre L , at the distance LD , describe a circle DMq . From S draw SQ a tangent to the circle, meeting the directrix H . Join LQ , and draw SP parallel to it, or perpendicular to SH . Join HL and produce

it to meet SP in P , which is in the conic section, and the line HP touches the curve at P . For the triangles HQL, HSP , are similar, as also LHX, PHE , therefore $SP : PH :: QL : LH$ and $PH : PE :: LH : LX$; therefore, $SP : PE :: QL : LX$, that is in the determining ratio; therefore P is a point in the curve, and because PSH is a right angle, PH is a tangent, Cor. 1, Prop. XVI. Cor. Because two lines SQ, Sg , may be drawn from the point S to touch the circle; two tangents LP, Lp , may be drawn from L to the conic section.

SECT. III. OF THE CURVATURE OF THE CONIC SECTIONS.

DEFINITIONS.

XXVII. A circle is said to touch a conic section in any point, when the circle and conic section have a common tangent in that point.

XXVIII. If a circle touch a conic section in any point, so that no other circle can be drawn between the conic section and that circle, it is said to have the same curvature with the section in the point of contact, and it is called the circle of curvature.

PROP. XXXVIII.

If a circle touch a conic section, and cut off from the diameter, which passes through the point of contact, a segment equal to its parameter, the conic section is of the same curvature with the circle at the point of contact.

First, let a tangent DM be drawn to any point D in the parabola, fig. 45; draw also the diameter DF , and the perpendicular DL ; through any point Q in the curve, near to D , let the circle DQO be described to touch DM in D , and meet DF in P ; join PQ, DQ , and draw QN parallel to MD , meeting DF in N . Then because the angle $DPQ = MDQ = DQN$, the triangles DNQ, PDQ , having a common angle at D are equi-angular; hence, $PD : DQ :: DQ : DN$, and $PD \cdot DN = DQ^2$; also $PD^2 : PQ^2 :: DQ^2 : QN^2$, therefore $PD^2 : PQ^2 :: PD \cdot DN : P \cdot DN$, where $P =$ parameter of DF . Now, it is evident, that the nearer the point Q is to the point D , the nearer will the circumference of the circle be to a coincidence with the curve at that point; and, therefore, as no portion of these curves, however small, can be the same, the circumference of the circle will have approached the nearest possible to a coincidence with the curve at D , when the point Q falls upon it; in which case, the last analogy becomes $PD^2 : PD^2 :: PD : P$, therefore, $PD = P$, the parameter of DF ; therefore, the proposition in the case of the parabola is manifest.

Next let DM be a tangent at any point in the ellipse or hyperbola, fig. 46; DF, EG , conjugate diameters; and DHO a perpendicular to the two parallels DM, EG .

Through any point Q in the curve, near to the point D , let the circle DQO be described to touch DM in D , and meet DF in P . Let PQ, QD , be joined, and QN drawn parallel to DM , to meet DF in N . The triangles DNQ, PPD being similar, $DN : DQ :: DQ^2 : DP$ whence $DN : DP :: DQ^2 : DP^2$; but $DP : P$ (parameter) :

$FN \cdot ND : QN^2$; hence $DF \cdot DN : DP \cdot P :: FN \cdot N DD : Q^2 : DP^2 : QN^2$. Or $DF : P :: FN \cdot D Q^2 : DP \cdot QN^2$. But when Q and D coincide DQ and QN become equal, whence this analogy gives $DF : P :: DF : DP$, or $DP = P$ as before.

Cor. If, from any point D in an ellipse or hyperbola, a diameter DF be drawn, and a perpendicular DH to its conjugate EG , the radius of curvature at the point D is a third proportional to the perpendicular DH and the semi-conjugate diameter EC .

For since $DH : DC :: DP : DO$,
and $DC : EC :: EG : P$ or DP

therefore $DH : EC :: EG : DO :: EC : DR$, the radius of curvature.

SECT. IV. OF THE CONE AND ITS DIFFERENT SECTIONS.

DEFINITIONS. Fig. 47. Plate V.

XXIX. If any indefinite straight line passing through any fixed point A , without the plane of the circle CGB , or carried round the whole circumference of the circle, each of the surfaces generated by the motion is called a conical surface.

XXX. The solid contained by the conical surface and the circle CGB is called a cone.

XXXI. The point A is called the vertex of the cone.

XXXII. The circle CGB is called the base of the cone.

XXXIII. The right line AD passing through the vertex and the centre of the base is called the axis.

XXXIV. A right cone is that whose axis is perpendicular to the base.

XXXV. A scalene cone is that whose axis is inclined to the base.

PROP. XXXIX. Fig. 47.

If a cone be cut by a plane passing through the vertex, the section will be a triangle.

Let $ABGC$ be a cone of which AD is the axis; let GB be the common section of the base and cutting plane; join AB, AG . When the generating line comes to B and G , it will coincide with AB, AG ; they are, therefore, in the surface of the cone, and they are in the plane which passes through the points A, B, G ; therefore, the triangle ABG is the common section of the cone and the plane which passes through the vertex.

PROP. XL. Fig. 47.

If a cone be cut by a plane parallel to its base the section will be a circle, the centre of which is in the axis.

Let HFK be the section made by a plane parallel to the base of the cone, and let ACB, ADG , be the two sections of the cone, made by any two planes passing through the axis AD ; let KH, EF , be the common sections of the plane HFK and the triangles ACB, ADG . Then, because the planes HFK, BGC , are parallel, EII, EF will be parallel to DB, DG , and $EH : DB :: EA : AD : EF : DG$; but $DB = DG$, therefore, $EII = EF$; and for the

same reason $EF = EK$, therefore, HFK is a circle of which E is the centre.

PROP. XLI. Fig. 48.

If a scalene cone $ABDC$ be cut through the axis by a plane perpendicular to its base, making the triangle ABC , and from any point L in the straight line AC, LM , be drawn in the plane of the triangle, so that the angle $ALM = ABC$, and the cone be cut by another plane passing through LM , perpendicular to the triangle ABC ; the common section $LPMQ$ of this plane and the cone will be a circle.

Take any point N in the straight line LM ; draw FNG parallel to CB ; and let $FPGQ$ be a section parallel to the base, passing through FG ; then the two planes $FPGQ, LPMQ$, being perpendicular to the plane ABC , their common section PNQ is perpendicular to FNG ; therefore, $PN = NQ$ and $PN^2 = FN \cdot NG$, but the angle $ALM = ABC = AGF$, and the angles at N being vertical, the triangles FLN, MGN , are similar, and $MN : NG :: FN : NL$; therefore, the rectangle $MN \cdot NL = FN \cdot NG = PN^2$, therefore, the section $LPMQ$ is a circle, of which LM is a diameter. This section is called a subcontrary section.

PROP. XLII. Fig. 48, 49, 50.

If a cone be cut by a plane which does not pass through the vertex, and which is neither parallel to the base, nor to the plane of a subcontrary section; the common section of the plane and the surface of the cone will be an ellipse, a parabola, or an hyperbola, according as a plane passing through the vertex parallel to the cutting plane, falls without the cone, touches it, or falls within the cone.

Let $ABDC$ be any cone; and let STV be the common section of a plane passing through its vertex and the plane of the base, which will fall without the base, will touch it, or will fall within it; let PMQ be a section made by a plane parallel to ASV , through O the centre of the base OT draw perpendicular to SV , meeting the circumference of the base in B and C ; let a plane pass through A, B , and C , meeting the plane ASV in the line AT , the surface of the cone in AB, AC , and the plane of the section PMQ in LM ; then LM will meet the side AB in M , and it will meet the other side AC , fig. 48, in L , within the cone, it will be parallel to it, fig. 49, and it will meet it in fig. 50, produced beyond the vertex in K .

Take any point N in the line LM ; let $FPGQ$ be a plane passing through N parallel to the base; and let FNG, PNQ , be the common sections of this plane and the planes ABC, PMQ ; then PNQ will be the parallel to SV , and GF parallel to BT : and BT being perpendicular to SV, FNG is perpendicular to PNQ , therefore $PN = NQ$, and $PN^2 = EN \cdot NG$. First, if the line STV be without the base, fig. 48, through M and L draw $MHLK$ parallel to CB ; then because the triangles LNF, LMH , are similar, also MNG, MLK ,

$LN : FN :: LM : HM$, and
 $NM : NG :: LM : LK$; therefore
 $LN \cdot NM : FN \cdot NG$ or $PN^2 :: LM^2 :: HM \cdot LK$,
which ratio is the same wherever the point N is.

taken; the section LPMQ is therefore an ellipse of which LM is a diameter and PNQ an ordinate.

Secondly, if the line STV, fig. 49, touch the circumference of the base in C; let DLE be the common section of the base and the plane PMQ, which is parallel to PN, and perpendicular to BLC; and $BLLC = DL^2$, therefore $PN^2 : DL^2 :: FN \cdot NG : BL \cdot LC$ (or because $NG = LG$) : $FN : BL$; but the triangles MNF, MLE, being similar, $FN : BL :: MN : ML$, therefore $PN^2 : DL^2 :: MN : ML$; and the section DME is a parabola, of which ML is a diameter, and PNQ an ordinate.

Lastly, fig. 50, let the line STV fall within the base; through the vertex A draw AH parallel to GF; and because the triangles MNF, MHA, are similar, as also KNG, KHA,

$$MN : NF :: MH : HA \text{ and}$$

$$KN : NG :: KH : HA; \text{ therefore}$$

$MN \cdot NK : FN \cdot NG, \text{ or } NP^2 :: MH \cdot HK : HA^2$ that is in a constant ratio, therefore the section DME is a hyperbola, of which MK is a diameter and PNQ an ordinate.

SECT. V. OF THE AREAS OF THE CONIC SECTIONS.

PROP. XLIII. Fig. 51.

If any ordinate and abscissa of a parabola be completed into a parallelogram; the area of the parabola, included between the ordinate and the curve, is to the parallelogram as 2 to 3.

Let AN be the abscissa, and PQ the ordinate; let the parallelogram PQCB be completed; and let AN be divided i. to indefinitely small equal parts, of which ND is one; through D draw HI parallel to PQ, cutting the parabola in F and G, and through I draw KE parallel to NA; take $KR = KP$, and draw RL parallel to KE. By Prop. XXI. $HF \cdot HG : PN^2 :: HP : NA$, but because DN is indefinitely small, PQ or 2PN may be taken for HG; and $PK = HF$, also $NA = PB$, therefore $2PK \cdot PN : PN^2 :: HP : PB$; hence $2PK$, or $PR : PN :: HP : PB$, and as the parallelograms RB, PD, are also equiangular, they are equal, and the parallelogram PD : KB : 2 : 1, and the sum of all the parallelograms in APN is to the sum of all those in APB in the same ratio of 2 to 1; but the sum of all the parallelograms in APN approaches indefinitely near to the curvilinear area APPN, when their breadths are continually diminished; and in like manner the sum of all the parallelograms in APB approaches to the curvi-

linear area AFPB; therefore area AFPN : area AFPB : 2 : 1, and the area PAQ is to the parallelogram PBCQ as 2 to 3.

PROP. XLIV. Fig. 52, 53.

If two ellipses or two hyperbolas have a common axis, and an ordinate be drawn through the same point in the axis to each of the curves; the areas included between the common abscissa, the ordinates, and the two curves, also the whole areas of the ellipses will be to each other as the conjugate axes

Let AP, AQ, be two ellipses or two hyperbolas, take any abscissa AN, which is not greater than half the axis of the ellipse, and draw the ordinates NP, NQ. Let the abscissa AN be divided into any number of equal parts, AE, EF, FG, GN, &c.; draw the ordinates ERI, FSK, GTL, and complete the parallelograms AR, AI, ES, EK, &c.; also draw Ff, Kk, Ll , parallel to AN. Then it is evident that the difference between the circumscribed parallelograms AI, EK, FL, GQ, and the inscribed parallelograms Ei, Fk, Gl , is equal to GQ; and if parallelograms be inscribed in the same manner in the figure APN, the difference between these and the circumscribed parallelograms would be equal to GP, therefore the difference between each series of parallelograms, and the areas AQN, APN, will be less than the parallelograms GQ, GP, and because $GP : GQ :: NP : NQ$ and each parallelogram in the figure APN is to the corresponding parallelograms in the figure AQN in the same ratio, the sum of all those in APN is to the sum of all those in AQN as NP is to NQ, which is the same ratio with that of the conjugate axes. Conceive the breadths of the parallelograms to be now diminished, and their number increased, ad infinitum, and the parallelograms APN, AQN, will be ultimately equal to the areas APN, AQN, for the parallelograms GQ, GP, will now vanish, therefore the areas APN, AQN, are to each other as their conjugate axes; and if the sections be ellipses their whole areas are to each other in the same ratio.

COR. 1. If a circle be described about an ellipse, the area of the circle is to the area of the ellipse as the transverse axis is to the conjugate.

COR. 2. The area of an ellipse is equal to that of a circle whose diameter is a mean proportional between the two axes.

COR. 3. The areas of two ellipses are to each other as the rectangles under their axes.

INDEX TO THE DEFINITIONS IN THE PRECEDING TREATISE.

N. B. The figures refer to the corresponding numeral letters

ABSCISSA, 13, 23.

CONJECT, *v. n.*CONJECTURE, *v. a. & n. s.*CONJECTOR, *n. s.*CONJECTURABLE, *adj.*CONJECTURAL, *adj.*CONJECTURALITY, *n. s.*CONJECTURALLY, *adv.*CONJECTURER, *n. s.*Fr. *conjecturer* ;Ital. *conghietturare* ;Span. *conjeturar* ;Lat. *conjecturæ* ;

To conjecture is, to guess ;

to divine ; to form

a supposition. It

implies that evidence is either imperfect, or entirely wanting. To conject has the same meaning, and also that of to cast together. But this verb is of solete in both senses. Conjecture, as a noun, had formerly the additional meaning of idea ; notion ; conception. Conjector and conjecturer are synonymous, but the later of these words is that which is in general use.

The knight at his great boldnesse wondered ;

And though he scorn'd his yolle vanitee,

Yet mildly him to purpose answered,

For not to grow of nought he it *conjectured*.

Spenser. Faerie Queene.

Whatsoever may be at any time, out of Scripture, but probably and *conjecturally* surmised. *Hooker.*

I intreat you then,

From one that but imperfectly *conjects*,

Your wisdom would not build yourself a trouble.

Shakspeare.

Now entertain *conjecture* of a time,

When creeping murmur, and the poring dark,

Fills the wide vessel of the universe. *Id. Henry V.*

They'll sit by the fire, and presume to know

Who thrives and who declines, side factions, and give out

Conjectural marriages.

Id. Coriolanus.

It were a matter of great profit, save that I doubt it is too *conjectural* to venture upon, if one could discern what corn, herbs, or fruits, are likely to be in plenty or scarcity. *Bacon.*

If we should believe very grave *conjecturers*, carnivorous animals now were not flesh devourers then.

Browne.

They have not recurred unto chronology, or the records of time, but taken themselves unto probabilities, and the *conjecturality* of philosophy.

Id. Volgar Errors.

When we look upon such things as equally may or may not be, human reason can then, at the best, but *conjecture* what will be. *South.*

For so *conjectors* would obtrude,

And from thy painted skin conclude. *Swift.*

And darkness and doubt are now flying away,

No longer I roam in *conjecture* forlorn.

So breaks on the traveller, faint, and astray,

The bright and the balmy effulgence of morn.

Beattie.

How much that honourable gentleman was consulted in the original frame and fabric of the bill, commonly called Mr. Pitt's Indian bill, is matter only of *conjecture*, though by no means difficult to divine.

Burke.

The cause, though worth the search, may yet elude *Conjecture* and remark, however shrewd.

They take perhaps a well directed aim,

Who seek it in his climate and his frame. *Cowper.*

He, entering at the study door,

His ample area 'gan explore ;

And something in the wind

Conjectured, sniffing round and round,

Better than all the books he found,

Food chiefly for the mind. *Cowper.*

The land appeared a high and rocky coast,

And higher grew the mountains as they drew,

Set by a current towards it : they were lost

In various *conjectures*, for none knew

To what part of the earth they had been tost,

So changeable had been the winds that blew.

Byron. Don Juan.

CONJEE, or CANCHI, a district of the Carnatic, Hindostan, in the collectorship of Arcot. The face of the country is flat and sandy, but interspersed with fruitful spots and watered by the Palar. Towards the Ghauts it is thinly inhabited. The villages have, generally, the remains of a rampart and stone bastions around them ; which were, formerly, necessary to protect the inhabitants from the predatory troops of Tip-poo, and other tyrants, who devastated the country. This district has its chief supply of water from tanks and reservoirs, which are well managed here, and adapted to all the agricultural purposes of the inhabitants.

CONJEVERAM, or the Golden City, a considerable town in the Carnatic, is forty-six miles south-west from Madras. The streets are wide, and cross each other at right angles, with a range of cocoa-nut trees on each side ; but the houses are of mud. The tanks, however, are lined with stone, and generally in good order. Here is a famous pagoda dedicated to Mahadwa. The chief entrance is imposing : on the left, after passing through it, is a large edifice which, the

brahmins assert, contains 1000 carved pillars. Many of the groupes of deities are composed with great skill. The sides of the steps leading up to it are formed by two well carved elephants drawing a car. The inner court, being considered of great sanctity, is not suffered to be inspected by strangers. The country around is a barren sand.

To CONJOINBLE, *v. a.* From *con*, together, and *jobbernot*, the head. To concert; to settle; to discuss. A low cant word.

What would a body think of a minister that should *conjobble* matters of state with tumblers, and confer politicks with tinkers? *L'Estrange.*

CONJOIN, *v. a. & n.*

CONJOINING, *n.*

CONJOINT, *adj.*

CONJOINTLY, *adv.*

CONJUNCT, *adj.*

CONJUNCTION, *n. s.*

CONJUNCTIVE, *adj.*

CONJUNCTIVELY, *adv.*

CONJUNCTIVENESS, *n. s.*

CONJUNCTURE, *n. s.*

Fr. *conjoindre*; Ital. *congiungere*; Sp. *conjuntar*; Lat. *conjungere*. To yoke together is the idea here conveyed. Hence, to conjoin is, to unite; to form into one; to connect with; to link firmly together; to unite in marriage; to league with. Conjunction signifies union; association; the meeting of two planets in the same degree of the zodiac; a word that connects together the clauses of a period, and signifies the relation which they bear to each other. Conjunctive formerly meant closely united; but it now only means the mood of a verb which is used subsequently to a conjunction. Conjunction is, coincidence or co-operation of many circumstances or causes; a critical period; and, though seldom used in these senses, connexion; consistency.

And furthermore, no men shulde knowe his owen engendrure, ne who shuld have his heritage, and the woman shuld be the lesse beloved for the time that she were *conjunct* to many men. *Chaucer. Cant. Tales.*

They did their counsels nor in one compound, Where single forces faile, *conioynd* may gaine. *Spenser. Faerie Queene.*

He will unite the white rose and the red; Soile heaven upon his fair *conjunction*, That long hath frowned upon their enmity. *Shakspeare.*

She is so *conjunctive* to my life and soul, That, as the star moves not but in his sphere, I could not but by her. *Id.*

This part of his *Conjoins* with my disease, and helps to end me. *Id. Henry IV.*

If either of you know any inward impediment, Why you should not be *conjoined*, I charge You on your souls to utter it. *Id. Much Ado.*

It pleased the king, his master, to strike at me; When he, *conjunct*, and flattering his displeasure, Tript me behind. *Id. King Lear.*

God, neither by drawing waters from the deep, nor by any *conjunction* of the stars, should bury them under a second flood. *Raleigh.*

The treaty gave abroad a reputation of a strict *conjunction* and amity between them. *Bacon.*

I never met with a more unhappy *conjunction* of affairs than in the business of that earl. *King Charles.*

I was willing to grant to presbytery what with reason it can pretend to, in a *conjunction* with episcopacy. *Id.*

Such censures always attend such *conjunctions*; and find fault for what is not done, as with that which is done. *Clarendon.*

These are good mediums *conjunctively* taken, that is, not one without the other. *Brown.*

Common and universal spirits convey the action of the remedy into the part, and *conjoin* the virtue of bodies far disjoined. *Browne's Vulgar Errours.*

A gross and frequent error, commonly committed in the use of doubtful remedies, *conjunctly* with those that are of approved virtues. *Id.*

Men of differing interests can be reconciled in one communion; at least, the designs of all can be *conjoined* in ligatures of the same reverence, and piety, and devotion. *Taylor.*

Let that which he learns next be nearly *conjoined* with what he knows already. *Locke.*

Herein, I think, lies the chief, if not the only, reason, why the male and female in mankind are tied to a longer *conjunction* than other creatures, viz. because the female is capable of conceiving, and de facto is commonly with child again, and brings forth to a new birth, long before the former is out of a dependency for a support on his parents' help, and able to shift for himself, and has all the assistance that is due to him from his parents. *Id.*

Thou wrongest Pirithous, and not him alone; But, while I live, two friends *conjoined* in one. *Dryden.*

The parts of the body, separately, make known the passions of the soul, or else *conjunctly* one with the other. *Id.*

Man can effect no great matter by his personal strength, but as he acts in society and *conjunction* with others. *South.*

He is quick to perceive the motion of articulation, and *conjunctions* of letters in words. *Holder's Elements of Speech.*

Every virtue requires time and place, a proper object, and a fit *conjunction* of circumstances. *Addison's Spectator.*

Pompey and Caesar were two stars of such a magnitude, that their *conjunction* was as fatal as their opposition. *Swift.*

Silently as a dream the fabric rose;
No sound of hammer or of saw was there:
Ice upon ice, the well adjusted parts
Were soon *conjoined*, nor other cement asked
Than water interfused to make them one. *Cowper.*

Conjoined, like birds of the same feather,
Swear that you'll live and die together. *Huddesford.*

CONJOINT, or CONJUNCT, in heraldry, is used of charges when joined together; as *gules*, two lions rampant, conjoined under one head, *argent*, name Kellum. Or as, *argent*, seven masles, conjunct three, three and one.

CONJOINT TETRACHORDS, two tetrachords or fourths, where the same chord is the highest of one and the lowest of the other.

CONJOINED IN LURE, is two wings with the points downward and joined at the top, as in the diagram.

CONISSALÆ, in mineralogy, a class of fossils naturally and essentially compounded, not inflammable, nor soluble in water, found in detached masses, and formed of crystalline matter debased by earth. Of this class there are two orders, consisting of only one genus each. Those of the first are found in form of a naturally regular and uniform powder; all the genuine particles of which are nearly of one determinate shape, appearing regularly conereted, and not fragments of others once larger. Connissalæ of the second order are found in form of a rude, irregular, and shapeless powder, the particles of which are never of any determinate figure, but seem broken fragments of once larger masses. To the former genus belong the different species of sand; and to the latter the saburræ, or grits.

CONJUGATE, *v. a., n. s., adj.* } Lat. *con-*
CONJUGATION, *n. s.* } *jugere*, from
CO'NJUGAL, *adj.* } *con* and *ju-*
CONJUGALITY, *n. s.* } *gum*. These
CO'NJUGALLY, *adv.* } words are

closely allied with conjoin and its congeners; both classes having the sense of to yoke together. To conjugate is to join together; to unite in marriage; to live together: but the verb thus applied seems to be nearly disused. Its most common meaning is, to inflect verbs; to repeat all the various terminations of verbs. The noun, which signifies agreeing in derivation with another word, is also of rare occurrence. In geometry, the conjugate diameter is, a right line which bisects the transverse-diameter. Conjugal is that which relates to matrimony. Conjugation means a couple; the act of uniting things; union; and, more commonly, the form of inflecting verbs through their series of terminations. The quotation from Cowper will show, however, that there is modern authority for using this noun in the sense of an union.

The general and indefinite contemplations and notions of the elements, and their *conjugations*, are to be set aside, being but notional; and illimited and indefinite axioms are to be drawn out of measured instances. *Bacon.*

Those drawing as well marriage as wardship, gave him both power and occasion to *conjugate* at pleasure the Norman and the Saxon houses. *Wotton.*

The supper of the Lord is the most sacred, mysterious, and useful *conjugation* of secret and holy things and duties. *Taylor.*

The heart is so far from affording nerves unto other parts, that it receiveth very few itself from the sixth *conjugation* or pair of nerves. *Browne.*

His grammatical argument, grounded upon the derivation of spontaneous from sponte, weighs nothing; we have learned in logick, that *conjugates* are sometimes in name only, and not in deed.

Bramhall's Answer to Hobbes.

Have those who have writ so much about declensions and *conjugations*, about concords and syntaxes, lost their labour, and been learned to no purpose?

Locke.

The father, who is bound to take care for those he hath begot, is under an obligation to continue in *conjugal* society with the same woman longer than other creatures, whose young being able to subsist of themselves, before the time of procreation returns again, the *conjugal* bond dissolves of itself. *Id.*

Their *conjugal* affection still is tied,
 And still the mournful race is multiplied.
Dryden.

He marked the *conjugal* dispute,
 Nell roared incessant, Dick sat mute. *Swift.*
 All the various mixtures and *conjugations* of atoms
 do beget nothing. *Bentley.*

And seems it nothing in a father's eye,
 That unimproved those many moments fly?
 And is he well content his son should find
 No nourishment to feed his growing mind,
 But *conjugated* verbs and nouns declined?
Cowper.

Dick heard, and tweedling, ogling, bridling,
 Turning short round, strutting and sidling,
 Attested, glad, his approbation
 Of an immediate *conjugation*. *Id.*

Indignant she answered, 'No chin-scraping sot
 Shall be fastened to me by the *conjugal* knot:
 No—to Tyburn repair, if a noose you must tie,
 Other fish I have got, Mr. Tonsor, to fry.'
Huddesford.

CONJUGATE AXIS. See CONIC SECTIONS.

CONJUGATE HYPERBOLA. See CONIC SECTIONS.

CONJUGATION, in grammar. See GRAMMAR and LANGUAGE.

CONIUM, in botany, hemlock, a genus of the digynia order, and pentandria class of plants, natural order forty-fifth, umbellatæ. The partial involucre are halved, and mostly triphyllous; the fruit sub-globose and quinque-striated, the striæ crenated on each side. The three principal species are, 1. *C. Africanum*, with prickly seeds, a native of the Cape of Good Hope, and rarely growing above nine inches high. 2. *C. maculatum*, or the greater hemlock, grows naturally on the sides of banks and roads in many parts of Britain. It is a biennial plant which perishes after it has ripened its seeds. It flowers in June, and the seeds ripen in autumn. This species is sometimes applied externally, in the form of decoction, infusion, or poultice, as a discutient. 3. *C. tenuifolium*, with a striated seed, differs from the last in having taller stalks, which are not so much spotted. The leaves are much narrower, and of a paler green; and this difference is constant. It is a biennial plant, and grows naturally in Germany.

CONJURE, *v. a. & n.* } Fr. *conjur*; It.
CO'NJURE, *v. n.* } *congiurare*; Sp. *con-*
CO'NJURER, *n. s.* } *jurar*; Lat. *conjurare*.
CO'NJURING, *n. s.* } To swear in concert;
CONJURATION, *n. s.* } to conspire; to bind
CO'NJURATOR, *n. s.* } by an oath to some
CONJU'REMENT, *n. s.* } design common to

all the parties; to summon in a sacred name; to adjure solemnly; to evoke; to influence by enchantment; to practise charms or magical ceremonies. When the verb is used in the last two senses it has the accent on the first syllable. Conjunction is the form of solemnly summoning; an incantation; a conspiracy; but this last meaning is disused. A conjurer is one who uses enchantments; an imposter who pretends to be versed in magic. The word is also used ironically. Conjurement signifies a demand, or injunction, made with great earnestness.

Nece, I *conjure* and highly you defende,
 On his beholfe whiche that soul usall sende,

And in the vertue of coronis twaine,
Slea nat this man that hath for you this paine.

Chaucer. Troilus and Creide.

Let us go now to that horrible swearing of adjuration and *conjuracion*, as don those false enchantours and nigromancers in basins full of water, or in a bright swerde, in a cercke, or in a fire, or in a sholder bone of a shepe.

Id. Cant. Tales.

Ye wyndes I you *conjure* in chiefest of your rage,
That ye my lord safely send my sorrowes to asswage.

Earl of Surrey.

There was she faine

To call them all in order to her ayde,
And then *conjure*, upon eternall paine,
To counsel her, so carefully dismayed,
How she might heale her sonne, whose senses were decayed.

Spenser. Faerie Queene.

Your *conjuracion*, fair knight, is too strong for my
poor spirit to disobey.

Sidney.

What black magician *conjures* up this fiend,
To stop devoted charitable deeds?

Shakspeare. Richard III.

What is he, whose griefs

Bear such an emphasis? whose phrase of sorrow
Conjures the wandering stars, and makes them stand
Like wonder-wounded hearers?

Id. Hamlet.

What drugs, what charms,

What *conjuracion*, and what mighty magick,
or such proceeding I am charged withal,
I won his daughter with.

Id. Othello.

Good doctor Pinch, you are a *conjurer*;
Establish him in his true sense again.

Id. Comedy of Errors.

He in proud rebellious arms

Drew after him the third part of heaven's sons,
Conjured against the Highest.

Milton. Paradise Lost.

It should not be induced but by your earnest in-
treaties and serious *conjuraments*.

Milton.

I thought their own fears, whose black arts first
raised up those turbulent spirits, would force them to
conjure them down again.

King Charles.

He concluded with sighs and tears to *conjure* them,
that they would no more press him to consent to a
thing so contrary to his reason.

Clarendon.

I *conjure* you! Let him know,

Whate'er was done against him, Cato did it.

Addison's Cato.

You have *conjured* up persons that exist no where
else but on old coins, and have made our passions
and virtues visible.

Addison.

Our palaces are vast inhospitable halls. There the
bleak winds—there ' Boreas, and Eurus, and Caurus,
and Argestes loud; howling through the vacant lob-
bies, and clattering the doors of deserted guard-rooms,
appal the imagination, and *conjure* up the grim spec-
tres of departed tyrants—the Saxon, the Norman, and
the Dane, &c.

Burke.

Great skill have they in palmistry, and more
To *conjure* clean away the gold they touch,
Conveying worthless dross into its place;
Loud when they beg, dumb only when they steal.

Couper.

And now, quoth poor unthinking Ralph,
'Tis over, and the brood is safe
(For ravens, though as birds of omen
They teach both *conjurers* and old women,
To tell us what is to befall,
Can't prophesy themselves at all).

Id.

It is by the majesty, by the form of that justice,
that I do *conjure* and implore your lordships to give
your minds to this great business.

Sheridan.

CONJURATION properly implies magic words' characters, or ceremonies, whereby evil spirits, tempests, &c. are supposed to be raised, or driven away. The Romish priests formerly affirmed that they could expel devils, by preparing holy water in a particular manner, and sprinkling it over the possessed, with a number of conjurations and exorcisms. Some authors make the difference between *conjuracion* and witchcraft to consist in this, that the former effects its end by prayers and invocation of God's name, &c. to compel the evil spirit to do what is desired; whereas the latter attains its end by an immediate supplication to the devil himself. Both these, again, differ from enchantment and sorcery; in that these latter operate secretly and slowly by spells, charms, &c. without invoking infernal aid.

CONNARUS, Ceylon sumach, in botany, a genus of the decandria order, and monodelphia class of plants. The *STIG.* is simple: *CAPS.* bivalved, unilocular, and monospermous. The principal species is *C. monocarpus*, a native of India. It rises with a ligneous stalk eight or ten feet high, which is hard, rigid, and covered with a black bark, and divides upward into two or three branches with trifoliate leaves, having long foot-stalks placed alternate. It is propagated by cuttings, and is treated like other exotics.

CONNATE, *adj.* } Lat. *con* and *nascor*.

CONNA'SCENCE, *n. s.* } Brought into existence
along with another; being of the same birth.
Common birth; production at the same time;
being produced together with another being.

Christians have baptized these geminous births and double *connascencies*, as containing in them a distinction of soul.

Browne's Vulgar Errors.

Symphysis denotes a *connascence*, or growing to-
gether.

Wiseman.

Many, who deny all *connate* notions in the specula-
tive intellect, do yet admit them in this.

South.

Their dispositions to be reflected, some at a greater,
and others at a less thickness, of thin plates or bubbles,
are *connate* with the rays, and immutable.

Newton's Optics.

CONNATURALIZE, *v. a.* } Fr. *connatural*;

CONNATURAL, *adj.* } It. *connaturare*;

CONNATURALITY, *n. s.* } *connaturale*; Sp.

CONNATURALLY, *adv.* } *connaturalizarse*;

CONNATURALNESS, *n. s.* } *connatural*; Lat.

con and *nascor*. The verb signifies to render con-
sonant to; to unite by similarity of nature; to
make natural to. It is seldom used. *Connatural*
is, participating in the same nature; linked with
the being; united by nature; natural in common
to all.

First in man's mind we find an appetite

To learn and know the truth of every thing,

Which is *co-natural*, and born with it,

And from the essence of the soul doth spring.

Davies.

There is a *connaturality* and congruity between that
knowledge and those habits, and that future estate it
the soul.

Hale.

Some common notions seem *connaturally* engraven
in the soul, antecedently to discursive ratiocination.

Id.

Is there no way, besides
These painful passages, how we may come
To death, and mix with our *connatural* dust? *Milton.*

Whatever draws me on,
Or sympathy, or some *connatural* force,
Powerful at greatest distance to unite
With secret amity. *Id.*

Such is the *connaturalness* of our corruptions, except
we looked for an account hereafter.

Pearson on the Creed.

How often have you been forced to swallow sick-
ness, to drink dead palsies and foaming epilepsies, to
render your intemperances familiar to you,—before
ever you could *connaturalize* your midnight revels to
your temper. *Scott.*

These affections are *connatural* to us, and as we grow
up, so do they. *L'Estrange.*

CONNAUGHT, the most western of the four
provinces of Ireland, bounded on the east by
that of Leinster, on the west by the ocean, on
the north and north-west by part of the ocean
and province of Ulster, and on the south and
south-east by Munster. It is 130 miles long
and eighty-four broad; and was a distinct king-
dom till the reign of Henry II. It has no rivers
of note besides the Shannon, but possesses several
convenient bays and creeks; and the soil is fer-
tile in many places. It formerly contained many
dangerous bogs, overrun with wood, now in
some measure cleared; and produces abundance
of cattle, sheep, and deer: it is, however, still
the least cultivated of all the four provinces. It
contains six counties, one archbishopric, five
bishoprics, seven market-towns, ten boroughs,
and 330 villages. The distinction of Ireland
into provinces is said not to have been of late
regarded in any public documents.

CONNECT, v. a. & n.	} Ital. <i>connettere</i> ; Lat. <i>connectere</i> , from <i>con</i> and <i>nectere</i> . To link together; to knit together; to conjoin; to bring into union; to be coherent; to produce a consistent
CONNEX, v. a.	
CONNEXION, or	
CONNEXION, n. s.	
CONNECTIVE, or	
CONNEXIVE, n. s. & adj.	
CONNECTIVELY, adv.	

CONNEXING, n. s. }
whole from the parts. Connexion is the state
of being conjoined; the act of joining; just rela-
tion to something which precedes or follows; co-
herence of parts. Connective, as a noun, signi-
fies a conjunction. In common parlance, a
man's connexions mean his relations and friends;
and to form a connexion with, is, to become
very intimate with; to join in business or politics
with; to enter into an immoral alliance with a
female.

My heart, which by a secret harmony
Still moves with thine, joined in *connexion* sweet. *Milton.*

Contemplation of human nature doth, by a neces-
sary *connexion* and chain of causes, carry us up to the
Deity. *Hale.*

Those birds who are taught some words or sentences,
cannot *connex* their words or sentences in coherence
with the matter which they signify.

Id. *Origin of Mankind.*

The natural order of the *connecting* ideas must di-
sect the syllogisms; and a man must see *connexion* of

each intermediate idea with those that it *connects*, be-
fore he can use it in a syllogism. *Locke.*

We are all short-sighted, and very often see but
one side of the matter: our views are not extended to
all that has a *connexion* with it. From this defect I
think no man is free. *Id.*

The people's power is great and indisputable, when-
ever they can unite *connectively*, or by deputation, to
exert it. *Swift.*

They fly,
By chains *connexed*, and with destructive sweep
Behead whole troops at once. *Philips.*

There must be a future state, where the eternal and
inseparable *connexion* between virtue and happiness
shall be manifested. *Atterbury.*

The predicate and subject are joined in a form of
words by *connexive* particles. *Watts's Logic.*

The diversified but *connected* fabric of universal jus-
tice is well cramped and bolted together in all its parts;
and depend upon it, I never have employed, and I
never will employ, any engine of power which may
come into my hands to wrench it asunder. *Burke.*

Paul Benfield's associate and agent was held up to
the world as legislator of Indostan. But it was neces-
sary to authenticate the coalition between the men of
intrigue in India, and the minister of intrigue in Eng-
land, by a studied display of the power of this their
connecting link. Every trust, every honour, every
distinction, was to be heaped upon him. *Id.*

Some legislators went so far as to make neutrality
in party a crime against the state. I do not know
whether this might not have been rather to overstrain
the principle. Certain it is, the best patriots in the
greatest commonwealths have always commended and
promoted such *connexions*. *Id.*

It does not, however, appear that in things so inti-
mately *connected* with the happiness of life, as mar-
riage, and the choice of an employment, parents have
any right to force the inclinations of their children.
Beattie.

I formed several *connexions* with other youngers who
possessed superior advantages, the youngling actors,
who were busy in the rehearsal of parts in which they
were shortly to appear on the stage of life, where,
alas! I was destined to drudge behind the scenes.
Burns.

No friendship will abide the test,
That stands on sordid interest,
Or mean self love erected;
Nor such as may a while subsist
Between the sot and sensualist,
For vicious ends *connected*. *Cowper.*

With many a sob, amid a thousand fears,
The beauteous wanderer pours her gushing tears;
Each soft *connection* rends her troubled breast.
Darwin.

CONNECTICUT, or as it was called by the
ancient inhabitants, Quinnickticut, one of the
United States of North America, is situated be-
tween 40° 58' and 42° 2' N. lat., and 3° 16' and
5° 10' E. long. It is seventy-two miles broad
and 100 miles long; and bounded on the north
by Massachusetts, on the east by Rhode Island,
on the south by Long Island Sound, and on the
west by the state of New York; containing
about 4674 square miles, or a computed area of
2,991,360 acres. The following table contains
a list of its counties, population, and chief towns.

Counties.	Towns.	Pop. in 1810.	Pop. in 1820.	Chief Towns.
New London	15	34,707	35,943	New London.
Middlesex	7	20,723	22,405	Middleton.
Litchfield	22	41,375	41,267	Litchfield.
Tolland	10	13,779	14,330	Tolland.
Windham	15	23,611	31,684	Brooklyn
Fairfield	13	40,950	42,739	Fairfield
Hartford	18	44,733	47,264	Hartford
Newhaven	17	37,064	39,616	Newhaven
	122	261,942	275,248	

The population in 1790 was 237,946; in 1800 251,002; in 1810, 261,942; and in 1820, 275,248. With the exception of Massachusetts, Connecticut is the most populous state in the United States, having an average of fifty-nine persons to each square mile. Many thousands emigrate every year to the western country.

Connecticut contains five incorporated cities; namely, Hartford, Newhaven, Middletown, New London and Norwich. The capitals of the state are Hartford and Newhaven; the sessions of the legislature are held alternately at these places. The counties are divided and sub-divided into townships and parishes, and every township has a corporation invested with sufficient power for its own internal regulation.

This state, upon the whole, enjoys a favorable climate; although for a few weeks during the summer the weather is excessively hot, and the winters are very severe. The maximum of heat may be quoted, however, at 91°, and the greatest cold 10° below 0; but the heat seldom exceeds 85° and the cold is rarely below 0. The winter generally sets in in November and ends in April. The spring is backward, but the summer and autumn are exquisitely beautiful. Near the sea coast the inhabitants suffer much from variable weather; in advancing farther inland, however, the sea breezes have less influence on the air, and the weather is, consequently, more equable. The north-west winds, which prevail during the winter solstice, acquire a piercing keenness from their passage over dreary wastes of ice and snow; but, as a compensation, the sky presents one unclouded expanse of cerulean blue, and the winter is considered favorable to health and longevity.

The face of the country is much diversified, presenting to the traveller a continual succession of mountains, hills, and valleys, on the whole, fertile, yet interspersed with portions of thin and barren land. Much of the soil has been under cultivation for nearly a century, and still retains its original strength. Its principal productions are Indian corn, wheat, rye, oats, barley, buckwheat, flax in great quantity, hemp, potatoes of various kinds, &c. The Connecticut farmers reap great advantage also from their crops of pumpkins, onions, turnips, and beans. There is scarcely a farm in the country which has not one or more orchards attached to it, from the produce of which excellent cider is made in large quantities. The soil is in general very well calculated for the purpose of pasturage, which enables the farmers to feed great numbers of cat-

tle and horses; a considerable quantity of grass is also cultivated. Various kinds of ores and minerals are found in the different parts of the state, as iron, copper, silver, lead, and antimony; they have also coal, free-stone, serpentine marble, limestone, &c.

In Connecticut a larger proportion of the population is engaged in manufactures than in any other of the United States, Rhode Island alone excepted. The manufacture of tin into culinary vessels is carried on to a great extent. The ware thus made is sold by pedlars in all parts of the United States and Canada. Here are also manufactories of hemp and cotton, and, of late, improved machinery has been introduced. The manufacture of gin is carried to a very great extent in Hartford county. Litchfield county is celebrated for its iron works, in which goods sufficient for the supply of the whole state are manufactured. Large quantities of guns are made at Hamden and Newhaven. Glass-works and tanneries have been introduced in various parts, and paper, hats, candles, leather, boots and shoes, nails, wooden dishes, and various articles of turnery are also made in many of the towns. A sail-cloth manufactory and a powder-mill have likewise been established. An oil as mild as sweet oil, and equally agreeable with salads, or for medicinal purposes, and of great use in paints and varnishes, is extracted from the seeds of the sun flower: oil-mills of a peculiar construction are used to extract it, and it is estimated that every bushel of seed will produce a gallon of oil, so that the cultivation of the flowers yields, in many instances, a greater profit than that of any other produce. There are large orchards of mulberry trees; and silk-worms have of late been so successfully reared, that a promise is held out of their not only producing a sufficient supply for the purposes of the inhabitants, but also a surplus for exportation.

The foreign trade of Connecticut is principally carried on with the West Indies, but the coasting trade to the southern States is considered more valuable. The amount of shipping belonging to the State was, in 1815, 50,358 tons, and it has increased of late years. The value of the exports for the years ending September 30th, 1820, was 421,931 dollars. Their exports consist principally of horses, oxen, mules, oak-staves, pine-boards, oak planks, hoops, Indian corn, beans, beef, pork, fish, butter, cheese, cider, &c. A large number of coasting-vessels are employed for the conveyance of produce from this to the

neighbouring States. To Massachusetts, Rhode Island, and New Hampshire, they carry pork, corn, wheat and rye; to Georgia, North and South Carolina, butter, cheese, salted beef, potatoes, cider, apples, hay, &c., and receive in return, rice, indigo, and money. Considerable quantities of the produce of the eastern divisions of the State are sold at Providence, Norwich, and Boston. But as New York is nearer, and the state of the markets well known, this city has become the principal mart for the produce of Connecticut, especially the western parts of the State.

The value of land and houses in Connecticut, as established by the assessors' books, was in 1814, 86,550,933 dollars. There are ten banks established in the State, the aggregate amount of whose capital is upwards of three millions and a half of dollars.

The size of the farms in Connecticut is from fifty to 400 acres, held in fee-simple. The farmers and their families are mostly clothed in home-spun cloths. Their woollens and linens are also of domestic manufacture, and, although coarser, are generally of a stronger texture than the produce of the European loom. The annual value of the flaxen goods made in families, was, in 1810, estimated at 2,303,078, and of woollen at 1,098,241 dollars. Linen and woollen manufactories have now, however, been introduced, and they will probably every day become more common.

The principal towns and cities, besides what have already been mentioned, are Norwich, Middletown, Windsor, Weathersfield, Farmington, Milford, Stratford, Guildford, Stamford, Suffield, and Enfield. The houses in the smaller towns are generally constructed of wood, but the sides are neatly clap-boarded and painted white. They are seldom above two stories high. The roofs are slanting, covered with shingles, and painted of a slate color. Sash windows, with green Venetian blinds, are however, very common. The places of worship are built of similar materials as the houses; but generally surmounted by a spire, having one or two bells. The chief rivers are the Thames, the Connecticut, and the Housatonic, with their tributary streams. The whole range of the coast is indented with harbours, many of which are commodious and safe. The principal mountains are, the Lyme range; the Mount Tom range; the Green Mountain range, and the Tagheorac range, and these in most instances extend in a southerly direction the whole extent of the State. The inhabitants are almost entirely of English descent; the original stock from which they sprung consisted of 3000 souls, who settled in the towns of Hartford, Newhaven, &c., about the years 1635—1636. The inhabitants of Connecticut have long been celebrated for their industry, sobriety, and strict piety. It is said, that an instance of capital punishment does not occur above once in every nine or ten years. There is a law to prevent travelling on a Sunday; but strangers contravene it, although the elders go about to the different inn-keepers to forbid them to let out their horses. If a traveller arrive, he can generally find a saddled horse, and has only to mount and pursue for some short distance a

bye road. A great desire for improvement manifests itself in every town. Every district has its public school. The law requires, that a grammar-school be kept in every county town throughout the whole State. Yale College, which was founded in 1700, has been long celebrated as an eminent seat of learning. The library of this college contained, in 1820, 7000 volumes, and the students, amounting to 412, had libraries containing 2000 more. The consequence of this state of society is, a continued increase of population, so that although there have been more emigrated from this than from any other of the United States, it is at present full of inhabitants. Other causes concur doubtless in this effect: the greater proportion of the inhabitants are laborious husbandmen; their farms furnish them with all the necessaries, and many of the conveniences, but with few or none of the luxuries of life. They are temperate and industrious, and their subsistence does not depend on mere accidental circumstances. Here is no necessity for a long apprenticeship to fit them for a business, or a large stock of money required for them to commence with advantage, all which circumstances combined, operate as a never-failing inducement for early marriages. The people of Connecticut are remarkably well informed with respect to their rights; and, as is invariably the case in parallel circumstances, are tenacious to an excess of the least encroachment on them. This disposition frequently degenerates, in private life, into a litigious spirit, which unhappily affords ample employment to a numerous body of lawyers.

The Congregationalists are the most numerous religious denomination at present in Connecticut. Next to them are the Episcopalians and Baptists. There are very few of any other sect. In 1818 the former had 213 congregations, the Episcopalians sixty-nine, and the Baptists about seventy. Until the year 1818, Connecticut was governed by the charter of Charles II., granted in 1662, and which conveyed ample privileges to the people. The powers of the present government are vested in the three departments, the legislative, executive, and judicial. The first consists of a senate and house of representatives; the members of both of these bodies are elected annually, and meet once in each year, alternately at Newhaven and Hartford. The executive government consists of a governor and lieutenant-governor, who are elected by the people every year. All bills must be presented to the governor, but he has no vote upon legislative acts: if he disapprove of them, he returns them with his objections. The legislature may pass them, however, but in such cases the votes must be determined by the yeas and nays, and the names of the members entered on the Journals. The lieutenant-governor is the ex-officio speaker of the senate. The judicial power of Connecticut is vested in a supreme court of Errors, a superior court, and such inferior courts as the legislature may from time to time please to establish. The assembly appoint the judges and justices of the peace, and the judges hold their offices during good behaviour. Justices of the peace are elected annually. No judge or justice is allowed to re-

tain his office after he has arrived at seventy years of age. Every white male citizen of the United States, who has a settlement in the State, who is twenty-one years of age, of good moral character, and has paid a state tax within a year, is eligible as an elector. No person is bound to support or be a denizen of any particular religious sect. The governor and all the officers are liable to impeachment, which must be prosecuted by the house of representatives, and tried by the senate. No law can pass without the concurrence of both houses. Connecticut has ever been a republic, and may perhaps be cited as the most perfect and happy one that has ever existed in any time or in any country.

CONNECTICUT, a large river of North America, the most considerable one in the eastern part of the United States. It rises in the high lands, which separate the states of Vermont and New Hampshire from Lower Canada, and has been surveyed about thirty-five miles beyond the forty-fifth degree of latitude, to its northern head spring; from which, to its mouth, is upwards of 300 miles, through a thick settled country; having upon its banks a great number of the most flourishing and pleasant towns in the United States. It is from eighty to 100 rods wide, at a distance of 130 miles from its mouth. Its course between Vermont and New Hampshire, as well as through Massachusetts, and part of Connecticut, is generally S. S. W. until it reaches the city of Middleton; after which it runs a S. S. E. course to its mouth. The navigation of this beautiful river, which fertilises the land through which it runs, is much obstructed by falls. Two of these are between New Hampshire and Vermont; the first are called the Fifteen-miles falls. Here the river is rapid for twenty miles. The second remarkable fall is at Walpole, formerly called the Great Fall, but now named Bellows Falls. Above these, the breadth of the river is, in some places, twenty-two, in others not above sixteen, rods. The depth of the channel is about twenty-five feet, and commonly runs full of water. In September, 1792, however, owing to the severe drought, the water of the river, it is said, passed within the space of twelve feet wide and two and a half deep. A large rock divided the stream into two channels, each about ninety feet wide.

When the river is low, the eastern channel is dry, being crossed by a solid rock; and the whole stream falls into the western channels, where it is contracted to the breadth of sixteen feet, and flows with astonishing rapidity. There are several perpendicular falls one above another, within the length of half a mile, the largest of which is that where the rock divides the stream. Notwithstanding the velocity of the current at Bellows Falls, the salmon pass up the river, and are taken many miles above; but the shad proceed no farther. On the steep sides of the island rock, at the fall, hang several arm chairs, secured by a counterpoise; in these the fishermen sit to catch salmon with fishing nets. In the course of the river through Massachusetts are falls at South Hadley, around which locks and canals were completed in 1795, by an enterprising company, incorporated in 1792 by the legislature of

Massachusetts. In Connecticut the river is obstructed by falls at Enfield; to render which navigable in boats, a company has been incorporated, and a sum of money raised by lottery, but nothing effectual is yet done. The average descent of this river from Weathersfield in Vermont, 150 miles from its mouth, is two feet to a mile, according to the barometrical observations of J. Winthrop, Esq. made in 1786. The rivers and streams which fall into the Connecticut are numerous. At its mouth is a bar of sand, which considerably obstructs the navigation; it has ten feet water on it at full tides, and the same depth to Middleton, from which the bar is thirty-six miles distant. Above Middleton there are shoals which have only six feet water at a high tide; and here the tide ebbs and flows only about eight inches. Three miles above that city the river is contracted to about forty rods in breadth by two high mountains. On almost every other part the banks are low, and spread into fine extensive meadows. In the spring floods, which generally happen in May, these meadows are covered with water. At Hartford the water sometimes rises twenty feet above the common surface of the river, and, having no other outlet but the above-mentioned strait, it is sometimes two or three weeks before it returns to its usual bed. These floods add nothing to the depth of water on the bar at the mouth of the river, as it lies too far off in the sound to be affected by them. This river is navigable to Hartford city, upwards of fifty miles from its mouth; and the produce of the country, for 200 miles above it, is brought thither in boats. These boats are flat-bottomed, long, and narrow, and of so light a make as to be portable in carts. Before the construction of locks and canals on this river, they were taken out at three different carrying places, all of which made fifteen miles. Sturgeon, salmon, and shad, are caught in great plenty in their seasons, from the mouth of the river upwards; but the sturgeon cannot ascend the upper falls; besides a variety of small fish, such as pike, carp, perch, &c.

CONNICTATION, *n. s.* Lat. *conicito*. A winking.

CONNIVANCE, *v. n.* } Fr. *convincer*; Lat. *con-*
CONNIVENT, *n. s.* } *nivere*. To wink at a
CONNIVENT, *adj.* } fault, that is, to pretend
CONNIVER, *n. s.* } not to see it; to acqui-
CONNIVANCE, *n. s.* } esce in wrong doing, which it is our duty to prevent. This meaning runs through all the kindred words. Connivent, however, is applied by Milton in the sense of dormant; inattentive; and, as will be seen in the quotation, the Spectator gives to the verb its primary sense of to wink. But neither of these meanings is now in use.

It is better to mitigate usury by declaration, than to suffer it to rage by connivance. *Bacon.*

Disobedience, having gained one degree of liberty, will demand another: every vice interprets a connivance, an approbation. *South.*

The licentiousness of inferiours, and the remissness of superiours, the one violates, and the other connives. *Decay of Piety.*

This artist is to teach them how to nod judiciously, to connive with either eye. *Spectator.*

With whatever colours he persuades authority to *connive* at his own vices, he will desire its protection from the effects of other mens'. *Rogers.*

For the amusement of a few young soldiers, two or three thousand poor unarmed and innocent men may be murdered in one night, with the *connivance*, nay, and by the authority, of the law. *Beattie.*

Ye knew at least, by constant proofs addressed To ears and eyes, the vices of the rest.
But ye *connive* at what ye cannot cure,
And evils, not to be endured, endure,
Least power exerted, but without success,
Should make the little ye retain still less. *Cowper.*

It has been stated that the persons in the temporary possession of frames *connive* at their destruction; if this be proved upon inquiry, it were necessary that such material accessories to the crime should be principals in the punishment.

Byron. Speech on the Frame-breaking Bill.

CONNIVENTES VALVULÆ, CONNIVENT VALVES, in anatomy, wrinkles, cellules, and vasculæ, in the inside of the ilium and jejunum. See ANATOMY.

CONNOISSEUR, *n. s.* } French. A judge;
CONNOISSEURSHIP. } a critic. It is often used of a pretended critic.

Reason the *connoisseur*, and bright load star
In this world's sea to avoid the rock of chance. *Davies.*

Your lesson learnt, you'll be secure
To get the name of *connoisseur*. *Swift.*

SIR. BENJ. Nay now, Lady Smeerwell, you are severe upon the widow. Come, come, 'tis not that she paints so ill—but when she has finished her face, she joins it so badly to her neck, that she looks like a mended statue, in which the *connoisseur* sees at once that the head's modern, though the trunk's antique.

Sheridan. School for Scandal.

I leave to learned fingers, and wise hands,
The artist and his ape, to teach and tell
How well his *connoisseurship* understands
The graceful bend and the voluptuous swell:
Let these describe the undescribable.

Byron. Child Harold.

CONNOR, an ancient village of Antrim in Ireland, from which the bishopric of Down and Connor receives its latter name. On the bank of the Kells-water, are the ruins of a very ancient round tower, supposed to have been erected about the time of the Saxon invasion of England, and said to have been the residence of several kings. About 1200 silver pence of Edward I. were dug up here in 1820, which are supposed to have been brought over by some of the soldiers of that prince in 1318. It is eighty-nine miles from Dublin.

CONNOR (Bernard), M.D. and F.R.S. was born in Kerry, Ireland, about A.D. 1666. He studied physic in the university of Montpellier; and afterwards went to Paris. From thence he travelled to Venice, and through great part of Germany, to Warsaw, where he was made physician to king John Sobieski. In 1695 he came to England, read lectures in London, Oxford, and Cambridge, and became a member of the Royal Society and College of Physicians. He wrote a singular philosophical and medical treatise in Latin, entitled *Evangelium Medici*; tending to explain the miracles performed by Christ as natural events, upon the principles of natural philosophy. He wrote also a History of

Poland; Dissertations on Mount Vesuvius, &c. and died in 1698, aged thirty-two.

CONNOTATE, *v. a.* } *Sp. connotar*; Lat.
CONNÓTE, *v. a.* } *con* and *notare*. To

CONNOTATION, *n. s.* } connotate is to designate something besides itself; to imply; to infer. To connote signifies, to imply; to betoken; to include; and now, more frequently, to denote. Connotation is implication of something more than itself; inference; illation.

By reason of the co-existence of one thing with another, there ariseth a various relation or *connotation* between them. *Hale's Origin of Mankind.*

God's foreseeing doth not include or *connotate* pre-determining, any more than I decree with my intellect. *Hammond.*

Good, in the general notion of it, *connotes* also a certain suitableness of it to some other thing. *South.*

Plato by his ideas means only the divine essence with this *connotation*, as it is variously imitable or participable by created beings. *Norris.*

CONNU'BIAL, *adj.* Lat. *connubialis*. Matrimonial; nuptial; pertaining to marriage; conjugal.

Should second love a pleasing flame inspire,
And the chaste queen *connubial* rites require.

Pope's Odyssey.

So years successive, from perennial roots,
The wire or bulb with lessened vigor shoots,
Till curled leaves, or barren flowers, betray
A waning lineage, verging to decay;
Or till, amended by *connubial* powers,
Rise seedling progenies from sexual flowers. *Darwin.*

He left to his vizier all state affairs,

And showed but little royal curiosity:

I know not if he had domestic cares—

No process proved *connubial* animosity.

Byron. Don Juan.

CONNUMERATION, *n. s.* Lat. *con* and *numerare*. A reckoning together.

CONOCARPUS, in botany, the button tree, a genus of the monogynia order and pentandria class of plants, natural order forty-eighth, aggregatæ: cor. pentapetalous: the seeds naked, solitary, inferior; the flowers aggregate. There are three species, of which the best known are, *C. freca* and *C. procumbens*, both natives of the West Indies. They rise to about sixteen feet, but are of no beauty, nor is the wood of them used for any mechanical purpose in the countries where they grow naturally. They are, however, preserved in some botanic gardens in Britain for the sake of variety.

CONOID is a figure generated by the revolution of a conic section about its axis; there are, consequently, three kinds, answering to the three conic sections, viz. the elliptical conoid, or spheroid, the hyperbolic conoid, and the parabolic conoid. If a conoid be cut by a plane in any position, the section will be of the figure of some one of the conic sections; and all parallel sections of the same conoid are like and similar figures.

CONON, a renowned Athenian general and admiral, who flourished about A. A. C. 395. After his defeat by Lysander, (see ATTICA,) he fled to Evagoras king of Cyprus: after which he put himself under the protection of Artaxerxes king of Persia; with whose army he delivered Athens from its oppressors, and rebuilt

its walls. In the 360th year of Rome, he overcame the Lacedaemonians in a sea-fight near Cnidus upon the coast of Asia, depriving them of the sovereign rule they had on sea ever since the taking of Athens, but falling into the hands of Teribazus, a Persian, he was put to death.

CONOPS, in zoology, a genus of insects belonging to the order diptera. The characters are these: the rostrum is porrected, and jointed like a knee. The antennæ terminate by a flat and solid articulation, resembling the bowl of a spoon, with a lateral bristle, which, when closely examined, appears to be very hairy. Of this genus there are twelve or thirteen species; but our limits only allow us to notice, 1. *C. calcitrans* is to be found every where, especially in autumn, when it harasses the horses, and draws blood from them with its sting. 2. *C. macrocephala* might at first sight be mistaken for a species of wasp. It is smooth; the forepart of the head is lemon-color, as are the poisers; the feet are dun-colored. The thorax is variegated with black and reddish dun. The same takes place with respect to the segments of the abdomen; some of which are edged with lemon-color, chiefly the second, and part of the third, towards the sides. The wings are brown, watered, and clouded. This beautiful conops is found in meadows.

CONOVIVUM, in ancient geography, a town of the Ordovices, in Britain. From its ruins arose, at the distance of four miles, Aberconway, a town on the mouth of the Conway, in Caernarvonshire; and on the spot where Conovium stood is a hamlet, called Caerhean, the old town.

CONQUASSATE, *v. n.* } It. and Lat. *con-*
CONQUASSATION, *n. s.* } *quassare*. To shake;
to agitate violently; to dash to pieces. Agitation; concussion.

Vomits do violently *conquassate* the lungs.

Harvey.

CONQUER, <i>v. a. & n.</i>	} Fr. <i>conqueris</i> ; It. <i>conquistare</i> ; Sp. <i>conquistar</i> ; Lat. <i>conquiere</i> . To overcome; to bring under subjection; to surmount; to master; to win.
CONQUEROR, <i>n. s.</i>	
CONQUERESS, <i>n. s.</i>	
CONQUERABLE, <i>adj.</i>	
CONQUERMENT, <i>n. s.</i>	
CONQUEST, <i>n. s.</i>	

A conqueror is too frequently a sanguinary and unprincipled being, at once the scourge and the disgrace of mankind; though he has been dignified with the name of a hero by the folly of some, and the knavery of others. It is to be hoped that, in time, the human race will become enlightened enough to see the necessity of putting an early stop to the career of such pestilent ravagers.

And I saw, and beheld a white horse; and he that sat on him had a bow; and a crown was given unto him: and he went forth *conquering* and to *conquer*.

Rev. vi. 2.

There was a duk that highte Theseus;
Of Athenes he was lord and governour,
And in his time swiche a *conqueror*,
That greater was ther non under the sonne;
Ful many a rich contree had he wonne.
What with his wisdom and his chevalrie.
He *conquered* all the regne of Femieie.

Chaucer. Canterbury Tales.

Til on a time befel there such a caas,
That out of Rome was sent a senator
To *conquerin* relmis, and bring honour
Unto the toune of Rome. *Id.*

And eke Mercurius his message hath presented,
That nedis to the *conquest* of Itale
My destinie is sone for to saile. *Id.*

He lettes me to pursue a *conquest* welnere wonne,
To follow where my paynes were lost, ere that my
sute begunne. *Earl of Surrey.*

With conqueror's hands for bathde in their owne
blood,
And Cesar weeping over Pompeye's head. *Suckwille.*

Lo the infernall powres,
Covering your foe with cloud of deadly night,
Have borne him hence to Plutoc's balefull bowres:
The *conquest* your's, I yours's, the shield and glory
your's. *Spenser. Faerie Queene.*

So those which whilom wont with pollid cheeks,
The Roman triumph's glory to behold,
Now on these ashie tombs shew boldness vain,
And *conquerd* dare the *conqueror*'s disdain.

Id. The Ruins of Rome.

Bonduca! the victorious *conqueress*.

Id. The Ruins of Tine.

Put him to choler straight; he hath been used
Ever to *conquer* and to have his word of contradiction.
Shakespeare. Coriolanus.

Both tugging to be victors, breast to breast;
Yet neither *conqueror* nor *conquered*. *Id. Henry VI.*
I'll lead thy daughter to a *conqueror*'s bed;

To whom I will retail my *conquest* won,
And she shall be sole victress. *Id. Richard III.*

A perfect *conquest* of a country reduces all the
people to the condition of subjects. *Darvies on Ireland.*

Welcome, great Stagiritte, and teach me now

All I was born to know;

Thy scholar's victories thou dost undo;

He *conquered* the earth, the whole world you. *Cowley.*

The *conquered* also, and inslaved by war,
Shall, with their freedom lost, all virtue lose
And fear of God. *Milton.*

Deserving freedom more

Than those their *conquerors*, who leave behind
Nothing but ruin wheresoe'er they rove.

Id. Paradise Regained.

More willingly I mention air,

This our old *conquest*; than remember hell,
Our hated habitation. *Id.*

While the heap is small, and the particulars few,
he will find it easy and *conquerable*. *South.*

We *conquered* France, but felt our captive's charms;
Their arts victorious triumphed o'er our arms. *Pope.*

A critic that attacks authors in reputation, is as
the slave who called out to the *conqueror*, Remember,
Sir, that you are a man. *Addison's Guardian.*

The difference in favour of the first *conquerors* is
this; the Asiatic *conquerors* very soon abated of their
ferocity, because they made the *conquered* country
their own. They rose or fell with the rise or fall of
the territory they lived in. Fathers there deposited
the hopes of their posterity; and children there be-
held the monuments of their fathers. Here their lot
was finally cast, and it is the natural wish of all that
their lot should not be cast in a bad land. *Burke.*

Though *conquest* on my banner wait,

And triumph make my battles great,

Yet, 'tis not love of power or might

That arms me for the clashing fight,

But love of her, whose blessed smile

Approves my strength, o'erpayes my toil.

Leppley.

Her's are the willing chains o' love
By conquering beauty's sovereign law ;
And aye my Chloris' dearest charm,
She says she lo'es me best of a'.

Burns.

Give me the line that ploughs its stately course
Like a proud swan, conquering the stream by force ;
That, like some cottage beauty, strikes the heart,
Quite unindebted to the tricks of art.

Cowper.

Laurels may flourish round the conqueror's tomb,
But happiest they who win the world to come :
Believers have a silent field to fight,
And their exploits are veiled from human sight.

Id.

Of all the trophies gathered from the war,
What shall return ? The conqueror's broken car !
The conqueror's yet unbroken heart ! Again
The horn of Poland sounds, and not in vain.
Lutzen, where fell the Swede of victory,
Beholds him conquer, but, alas ! not die.

Byron. The Age of Bronze.

CONQUEST, in history, the name given to the invasion of England by William of Normandy ; who, overcoming Harold at the battle of Hastings, founded the Norman dynasty, and was hence called William the Conqueror. See ENGLAND, HISTORY OF.

CONRAD II. emperor of Germany, was elected in 1004. He was obliged to take the field against most of the German dukes who had revolted from him ; and put Ernest duke of Suabia under the ban of the empire, being one of the earliest instances of such a proscription. He died in 1039.

CONRAD III. emperor of Germany in 1138. The duke of Bavaria opposed his election, who being put under the ban of the empire, and deprived of his duchy, could not survive his disgrace. The margrave of Austria was ordered by the emperor to take possession of Bavaria ; but Welsti, uncle to the deceased duke, attacking him, was defeated near the castle of Winsburgh. The battle fought upon this occasion is famous in history, as having given rise to the party names of Guelphs and Gibbelines, afterwards assumed in Italy. The parole of the day with the Bavarians was Welsti, from the name of the general ; that of the Imperialists Werblingen, from a small village where Frederic duke of Suabia, their commander, had been nursed : by degrees these names served to distinguish these two parties ; and the Italians, who could not accustom themselves to such rough words, formed from them Guelphs and Gibbelines. Conrad died in 1152.

CONRAD JUNIOR, or CONRADIN, son of Conrad IV., was acknowledged emperor by the Gibbelines, who received him in triumph at Rome : but pope Alexander IV. had published a crusade against this orphan ; and Urban VII., his successor, gave the empire to Charles of Anjou, brother to Louis IX. king of France ; and the unfortunate youth, though powerfully supported even by the Turks, lost a battle, in which he was taken prisoner, and was publicly beheaded, by order of his base opponent, at Naples in 1229, in the eighteenth year of his age. In him ended the race of the dukes of Suabia, which had produced several kings and emperors.

CONSANGUINEOUS, *adj.* } Lat. *consan-*
CONSANGUINITY, *n. s.* } *guinitus, con-*

sanguinitas. Being near of kin ; of the same blood. Relationship by blood ; by common descent, and not merely by marriage.

Am I not *consanguineous* ? Am I not of her blood ?
Shakspeare. Twelfth Night.

I've forgot my father ;

I know no touch of *consanguinity*.

Id. Troilus and Cressida.

There is the supreme and indissoluble *consanguinity* and society between men in general ; of which the heathen poet, whom the apostle calls to witness, saith, We are all his generation. *Bacon's Holy War.*

The first original would subsist, though he outlived all terms of *consanguinity*, and became a stranger unto his progeny.

Browne's Vulgar Errors.

Christ has condescended to a cognation and *consanguinity* with us.

South.

It would (among public misfortunes) be an evil more natural and tolerable, that the house of commons should be infected with every epidemical phrensy of the people, as this would indicate some *consanguinity*, some sympathy of nature with their constituents, than that they should in all cases be wholly untouched by the opinions and feelings of the people out of doors. By this want of sympathy they would cease to be a house of commons.

Burke.

Let a man read Virgil with attention, and with taste, and then be a cruel parent, or an undutiful child, if he can. And let him ask his own heart this question, whether human nature would not be deprived of many of its best affections, and human society of its best comforts, if the ideas of those projectors were to be realised, who propose to improve the political art, by annihilating the attachments of *consanguinity*.

Beattie.

CONSANGUINITY, in English law, is kindred, either lineal or collateral, by blood or birth ; as affinity is kindred by marriage. In the descent of land it is important to ascertain who shall take it as next of blood, and who, in administration of other property, is next of kin.

Lineal consanguinity is that which subsists between persons of whom one is descended in a direct line from the other, as between a man and his father, grandfather, and great-grandfather, and so upwards, in the direct ascending line : or between a man and his son, grandson, great-grandson, and so downwards in the direct descending line. Every generation, in this lineal direct consanguinity, constitutes a different degree, reckoning either upwards or downwards : the father is related in the first degree ; and so likewise is the son, grandsire, and grandson, in the second ; great-grandsire and great-grandson in the third. This is the only natural way of reckoning the degrees in the direct line, and therefore universally obtains, as well in the civil and canon as in the common law.

Collateral kindred, or consanguinity, answers to the same description : collateral relations agreeing with the lineal in this, that they descend from the same stock or ancestor ; but differing in this that they do not descend one from the other. Collateral kinsmen are such then as lineally spring from one and the same ancestor, who is the stirps, or root, the stipes, trunk or common stock, from whence these relations are branched out. As if a man has two sons, who have each a numerous issue ; both these issues are lineally descended from him as their common ancestor ; and they are collateral kinsmen.

to each other, because they are all descended from this common ancestor, and all have a portion of his blood in their veins, which denominates them consanguineous.

The very being of collateral consanguinity consists in this descent from one and the same common ancestor. Thus Titus and his brother are related, because both are derived from one father. Titus and his first cousin are related, because both descend from the same grandfather; and his second cousin's claim to consanguinity is, that they are both derived from the same great-grandfather. In short, as many ancestors as a man has, so many common stocks he has from which collateral kinsmen may be derived. It appears that each person, at the twentieth degree, or the distance of twenty generations, has above a million of ancestors; and if a similar calculation be made of collateral kindred at the distance of twenty degrees forward, on the supposition that each couple of ancestors leave, one with the other, only two children, the number will be 274,877,906,944: as by the following tables:—

TABLE I.

Lineal Degrees.	Number of Ancestors.
1	2
2	4
3	8
4	16
5	32
6	64
7	128
8	256
9	512
10	1024
11	2048
12	4096
13	8192
14	16384
15	32768
16	65536
17	131072
18	262144
19	524288
20	1048576

It is evident that each person has two ancestors in the first degree, and that the number is doubled at every remove, because each of his ancestors has also two immediate ancestors of his own. In order to find the number of ancestors at any particular degree, we need only to find a power of 2, the index of which is the number of degrees; e. g. 2^7 , 2^{10} , 2^{15} , &c. will give the corresponding number respectively. Or the number of ancestors at any even degree may be had by squaring the number of ancestors at half that number of degrees: thus 16, the number of ancestors at four degrees, is the square of 4, the number of ancestors at two; 256 is the square of 16; 65536 of 256; and the number of ancestors at forty degrees would be the square of 1048576, or upwards of a million of millions. These powers are easily found by means of logarithms.

TABLE II.

Collateral Degrees.	Number of Kindred.
1	1
2	4
3	16
4	64
5	256
6	1024
7	4096
8	16384
9	65536
10	262144
11	1048576
12	4194304
13	16777216
14	67108864
15	268435456
16	1073741814
17	4294967296
18	17179869184
19	68719476736
20	274877906944

This calculation may also be made by squaring the couples, or half the number of ancestors, at any given degree; which will furnish us with the number of kindred we have in the same degree, at equal distance with ourselves from the common stock, besides those at unequal distances. Thus, in the tenth lineal degree, the number of ancestors is 1024; its half, or the couples, amounts to 512; the number of kindred in the tenth collateral degree amounts therefore to 262144, or the square of 512. And, if we will be at the trouble to recollect the state of the several families within our own knowledge, and observe how far they agree with this account; that is, whether, on an average, every man has not one brother or sister, four first-cousins, sixteen second cousins, and so on, we shall find, that the present calculation is very far from being overcharged.

CONSARCINATION, *n. s.* From Lat. *con-sarcino*. To piece. The act of patching together.

CO'NSCIENCE, *n. s.* Fr. *conscience*;
 CO'NSCIENCED, *adj.* Ital. *conscienza*;
 CO'NSCIENCELESS, *adj.* Sp. *consciencia*;
 CO'NSCIENT, *adj.* Lat. *conscientia*,
 CONSCIE'NTIOUS, *n. s.* from *con* and *scire*.
 CONSCIE'NTIOUSLY, *adv.* In its most obvi-
 CONSCIE'NTIOUSNESS, *n. s.* ous and extended
 CO'NSCIONABLE, *adj.* sense, conscience
 CO'NSCIONABLENESS, *n. s.* means that inter-
 CO'NSCIONABLY, *adv.* nal monitor which
 CO'NSCIONARY, *adj.* heaven has plac-
 CO'NSCIOUS, *adj.* ed in the human
 CO'NSCIOUSLY, *adv.* breast, to warn
 CO'NSCIOUSNESS, *n. s.* against the com-
 mission of crime, or to punish the criminal by
 the severity of its reproaches. In its secondary
 senses, all of which have more or less of refer-
 ence to the primary idea, it signifies equitable
 conduct; consciousness; the real sentiments;
 scruple; principle of action; and, in familiar
 and ludicrous style, reason; that which is rea-
 sonable. The conscientious man is he who acts
 strictly according to the dictates of a good con-
 science. Conscious denotes, having the power of
 thinking; being able to know one's own thoughts

and actions; being aware of a thing; being admitted to the knowledge of (in which case it has to be before the noun); bearing witness by the dictate of conscience to anything, because we know that we have been a participator in it. Conscience, Locke defines to be, the perception of what passes in a man's own mind; thence, its secondary application, to an internal sense of criminality or innocence. Bacon uses conscient in the sense of conscious. Conscionary, which is of scarce occurrence, indicates that which relates to conscience.

This is thank-worthy, if a man, for *conscience* toward God, endure grief. 1 Peter ii. 19.

But for to spoken of hire *conscience*,

She was so charitable and so pious

She wolde wepe if that she saw a mous

Caughte in a trappe if it were ded or blode.

Chaucer. Cant. Tales.

He that trosteth him so muckel in his good *conscience* that he despiseth and setteth at nought his good name or los, and recketh not though he kepe not his good name, n' is but a cruel cherl. *Id.*

When a people have no touch of *conscience*, no sense of their evil doings, it is bootless to think to restrain them. *Spenser.*

What hevens, what altars, what enraged hetes,

(Here heaped up with termes of love unkynd)

My *conscience* cleare with guilty bands would bind?

Id. Faerie Queene.

The reason why the simpler sort are moved with authority, is the *conscience* of their own ignorance.

Hooker.

A knave very voluble; no farther *conscionable* than in putting on the mere form of civil and humane seeming. *Shakspeare.*

Why dost thou weep? Can'st thou the *conscience* lack,

To think I shall lack friends! *Id. Timon.*

Dost thou in *conscience* think, tell me, *Æmilia*,

That there be women do abuse their husbands

In such gross kind? *Id. Othello.*

Now is Cupid a child of *conscience*; he makes res-titution. *Id. Merry Wives of Windsor.*

Yet though these men against their *conscience* strive,

There are some sparkles in their flinty breasts,

Which cannot be extinct, but still revive;

That, thou they would, they cannot quite be beasts. *Davies.*

We must make a *conscience* in keeping the just laws of superiours. *Taylor's Holy Living.*

A prince must be used *conscionably* as well as a common person. *Id.*

What you require cannot, in *conscience*, be deferred beyond this time. *Milton.*

Who against faith and conscience can be heard

Infalible? *Id. Paradise Lost.*

They did in their *consciences* know, that he was not able to send them any part of it. *Clarendon.*

The queen had been solicitous with the king on his behalf, being *conscions* to herself that he had been encouraged by her. *Id.*

Children are travellers newly arrived in a strange country; we should therefore make *conscience* not to mislead them. *Locke.*

It will be a wonderful *conscientiousness* in them, if they will content themselves with less profit than they can make. *Id.*

Since *conscientiousness* always accompanies thinking, and it is that which makes every one to be what he calls self, and thereby distinguishes himself from all other thinking things; in this alone consists personal identity, i. e. the sameness of a rational being. *Id.*

If these perceptions, with their *conscientiousness*, always remained in the mind, the same thinking thing would be always *consciously* present. *Id.*

Lead a life in so *conscientious* a probity, as in thought, word, and deed, to make good the character of an honest man. *L'Étrange.*

There is the erroneous as well as the rightly informed *conscience*; and, if the *conscience* happens to be deluded, sin does not therefore cease to be sin, because a man committed it *conscientiously*. *Smith.*

The rest stood trembling, struck with awe divine;

Æneas only, *conscious* to the sign,

Presaged the event. *Dryden's Æneid.*

Hector was in an absolute certainty of death, and depressed with the *conscience* of being in an ill cause. *Pope.*

An honest mind is not in the power of a dishonest: to break its peace, there must be some guilt or *conscientiousness*. *Id.*

Conscience signifies that knowledge which a man hath of his own thoughts and actions; and because, if a man judgeth fairly of his actions by comparing them with the law of God, his mind will approve or condemn him; this knowledge or *conscience* may be both an accuser and a judge. *Saift.*

Among substances, some are thinking or *conscions* beings, or have a power of thought. *Watts's Logick.*

If spirit be without thinking, I have no idea of any thing left; therefore *conscientiousness* must be its essential attribute. *Id.*

A *conscientious* person would rather doubt his own judgment, than condemn his species. He would say, I have observed without attention, or judged upon erroneous maxims; I trusted to profession, when I ought to have attended to conduct. *Burke.*

What is the moral law of nature is a question that has often been proposed. That (I would answer) is incumbent on us by the law of our nature, which, after candid inquiry, our reason and *conscience* declare to be right. *Beattie.*

How blest the youth in yonder valley laid!

Soft smiles in every *conscions* feature play,

While to the gale low-murmuring through the glade

He tempers sweet his sprightly-warbling lay. *Id.*

Guilt, still by sleepless *Conscience* bayed,

Feasts fearful on his ill-got spoils,

While Honesty incessant toils,

By Poverty way-laid. *Lefly.*

Curse on his pejured arts! dissembling smooth!

Are honour, virtue, *conscience*, all exiled?

Is there no pity, no relenting ruth,

Points to the parcats fondling o'er their child?

Then paints the ruined maid, and their distraction wild? *Burns.*

The cause is *Conscience*—*Conscience* oft

Her tale of guilt renews:

Her voice is terrible though soft,

And dread of death ensues. *Cowper.*

My mother! when I learned that thou wast dead,

Say, wast thou *conscions* of the tears I shed? *Id.*

Throned in the vaulted heart his dread resort,

Inexorable *Conscience* holds his court,

With still small voice the plots of Guilt alarms,

Bares his masked brow, his lifted hand disarms;

But, wrapped in night with terrors all his own,

He speaks in thunder, when the deed is done. *Darwin.*

Pale shoot the stars across the troubled night,

The timorous moon withholds her *conscions* light. *Id.*

Perhaps the recollection of the deed my *conscience* cannot justify, may haunt me in such gloomy and un-social fits, that I shall hate the tenderness that would

believe me, break from your arms, and quarrel with your fondness!

Her very smile was haughty, though so sweet;

Her very nod was not an inclination;

There was a self-will even in her small feet,
As though they were quite *conscious* of her station.

Byron. *Don Juan*.

CONSCIENCE, COURTS OF, are courts of recovery of small debts, constituted by act of parliament in London, Westminster, &c. and other populous and trading districts.

CONSCRIBE, *v. a.* } Lat. *conscribere*,
CO'NSCRIPT, *n. & adj.* } from *con* and *scribere*.

CONSCRIPTION, *n. s.* } To enroll; to call together for military service. The Roman senators were called conscript fathers, from their names being written on a register. Conscript has of late years been well known as the appellation of the French recruits; and conscription as that of the operation by which they have been obtained.

CONSECRATE, *v. a. & adj.* } Fr. *consacrer*;
CONSECRATION, *n. s.* } It. *consacrare*;
CONSECRATOR, *n. s.* } *consagrarre*;
CONSECRATORY, *adj.* } Sp. *consagrar*;

Lat. *consecrare*, from *con* and *sacrare*. To render sacred; to hallow; to set apart for religious uses; to devote to the service of; to canonise. Rendered sacred; devoted, dedicated to. The rite by which a person or thing is dedicated to the service of God, or devoted to any purpose; the act of canonising. The person who performs the rite.

He shall *consecrate* unto the Lord the days of his separation, and shall bring a lamb of the first year for a trespass offering.

Numbers vi. 12.

The *consecration* of his God is upon his head.

Id. vi. 7.

Enter into the holiest by the blood of Jesus, by a new and living way, which he hath *consecrated* for us.

Hebrews x. 20.

At the erection and *consecration*, as well of the tabernacle as of the temple, it pleased the Almighty to give a sign.

Hooker.

When thou reviewest this, th'ju dost review

The very part was *consecrate* to thee.

Shakspeare. *Sonnet lxxiv.*

His words of *consecration*, which you yourself in your letter do rightly term true *consecratory* words.

Bishop Morton.

Shall I abuse this *consecrated* gift

Of strength, again returning with my hair?

Milton.

The calendar swells with new *consecrations* of saints.

Hale.

We must know that *consecration* makes not a place sacred, but only solemnly declares it so, the gift of the owner to God makes it God's, and consequently sacred.

South.

Whether it be not against the notion of a sacrament, that the *consecrator* alone should partake of it.

Atterbury.

A bishop ought not to *consecrate* a church which the patron has built for filthy gain, and not for true devotion.

Ayliffe.

Those forms of bright perfection, which the bard, While boundless hopes and boundless views inflame, Enamoured *consecrates* to never-dying fame.

Beattie.

What says the prophet? Let that day be blessed

With holiness and *consecrated* rest.

Pastime and business, both it should exclude,

And bar the door the moment they intrude;

Nobly distinguished above all the six
By deeds in which the world must never mix.

Cowper.

The lover too shuns business and alarms,

Tender idolater of absent charms.

Saints offer nothing in their warmest prayers,

That he devotes not with a zeal like theirs:

'Tis *consecration* of his heart, soul, time;

And every thought that wanders is a crime. Id.

CONSECRATION is used for the benediction of the elements in the eucharist.

CONSECRATION, in Jewish antiquity, the Mosaic law ordained, that all the first born, both of man and beast, should be sanctified or consecrated to God. We find also, that Joshua consecrated the Gibeonites, as David and Solomon did the Nethinims, to the service of the temple; and that the Hebrews sometimes consecrated their fields and cattle to the Lord, after which they were no longer in their own power.

CONSECRATION, among antiquaries, is the representation on models of the apotheosis of an emperor, or his translation among the gods. On one side is the emperor's head, crowned with laurel, sometimes veiled; and the inscription gives him the title of *divus*: on the reverse is a temple, a bustum, an altar, or an eagle taking its flight towards heaven, either from off the altar, or from a cippus. Sometimes the emperor is seen in the air, borne up by the eagle; the inscription always *consecratio*. These are the usual symbols: yet on the reverse of that of Antonius is the Antonine column. In the apotheoses of empresses, instead of an eagle there is a peacock. As to the honors rendered these princes after death, they were explained by the words *consecratio pater, divus, ad deos*. Sometimes around the temple or altar are put *memoria felix, or memoria eterna*: for princesses *eternitas, and sideribus recepta*; on the side of the head, *dea* or *Θεα*.

CONSECRATION of churches, &c., among the ancient Christians, the consecration of churches was performed, it is said, with much solemnity. In what manner it took place for the first three ages, however, is uncertain; the authentic accounts reaching no higher than the fourth century. Some assert the consecration to have consisted in setting up the sign of the cross, or in placing a communion table in the church; others, that a panegyric sermon only, was preached in commemoration of the founder, and that they then proceeded to prayers; one of which was composed on purpose. The Roman Catholics bestow the ceremony of a formal consecration on almost every utensil, as well as building, used for sacred purposes, &c. In England, churches have been always consecrated with particular ceremonies, the form of which is left to the discretion of the bishop. That observed by Archbishop Laud, in the beginning of the seventeenth century, in consecrating St. Catherine Creed church, in London, gave great offence. The bishop came attended with several of the high commission, and some civilians. At his approach to the west door of the church, which was shut, and guarded by halberdiers, some that were appointed for that purpose, cried with a loud voice.—Open, open, ye everlasting doors, that the king of glory may come in! Presently the doors were opened, and

Laud, with some doctors and principal men, entered. As soon as they were within the place, his lordship fell down upon his knees; and, with eyes lifted up, and his arms spread abroad, said, This place is holy; the ground is holy: in the name of the Father, Son, and Holy Ghost, I pronounce it holy. Then, walking up the middle aisle towards the chancel, he took some of the dust, and threw it into the air several times. When he approached near the rail of the communion table, he bowed towards it five or six times; and, returning, went round the church, with his attendants in procession; saying first the hundredth and then the nineteenth Psalm, as prescribed in the Roman Pontifical. He then read several collects, in one of which he prays God to accept of that beautiful building, and concludes thus: We consecrate this church, and separate it unto thee as holy ground, not to be profaned any more to common use. In another he prays, That all who should hereafter be buried within the circuit of this holy and sacred place, may rest in their sepulchres in peace, till Christ's coming to judgment, and may then rise to eternal life and happiness. Then the bishop, sitting under a cloth of state, in the aisle of the chancel, near the communion table, took a written book in his hand, and pronounced curses upon those who should hereafter profane that holy place by musters of soldiers, or keeping profane law courts, carrying burdens through it: and at the end of every curse he bowed to the east, and said, Let all the people say, Amen. When the curses were ended, he pronounced a like number of blessings upon all that had any hand in framing and building that sacred and beautiful church; and on those that had given or should hereafter give, any chalices, plate, ornaments, or other utensils; and at the end of every blessing, he bowed to the east, and said, Let all the people say, Amen. After this came the sermon, then the sacrament, which the bishop consecrated and administered in the following manner: As he approached the altar, he made five or six low bows, and coming up to the side of it, where the bread and wine were covered, he bowed seven times. Then, after reading many prayers, he came near the bread, and, gently lifting up the corner of the napkin, he retreated hastily a step or two, and made three low obeisances; his lordship then advanced, and, having uncovered the bread, bowed three times as before. Then he laid his hand on the cup, which was full of wine, with a cover upon it; which, having let go, he stepped back, and bowed three times towards it; then he came near again, and lifting up the cover of the cup looked in it; and seeing the wine, let fall the cover again, retired back, and bowed as before. Then the elements were consecrated; and the bishop, having first received, gave it to some principal men in their surplices, hoods, and tippets; after which, many prayers being said, the solemnity of the consecration ended. The performance of this ceremonial was one of the crimes urged against Laud by the Commons.

CONSECTARY, *n. s.* & *adj.* Lat. *consecrarius*. A consequence deduced from premises; a corollary. Consequent; following as a natural consequence.

From the inconsistent and contrary determinations thereof, *consecratory* impieties and conclusions may arise.

Browne.

These propositions are *consecratories* drawn from the observations.

Woodward's Nat. Hist.

CONSECUTE, *v. n.* } Lat. *consequi*; *con-*
CONSECUTION, *n. s.* } *secutio*. The verb,
CONSECUTIVE, *adj.* } which signifies to fol-
CONSECUTIVELY, *adv.* } low close, to come up
 with, is not in use. Consecution is a chain of consequences; a series of deductions; a connected chain of propositions; succession; following in regular sequence. In the school of philosophy, consecutively is opposed to antecedently, and, in some instances, to effectually or causally.

The month of *consecution*, or, as some term it, of progression, is the space between one conjunction of the moon with the sun unto another.

Browne's Vulgar Errors.

Some *consecutions* are so intimately and evidently connexed to or found in the premises, that the conclusion is attained, and without any thing of ratiocinative progress.

Hale.

The moon makes four quarterly seasons within her little year, or month of *consecution*.

Holler.

In a quick *consecution* of colours, the impression of every colour remains in the sensorium.

Newton's Opticks.

That obligation upon the lands did not come into disuse but by fifty *consecutive* years of exemption.

Arbutnot on Chins.

CONSELVE, a considerable town and district of the Venetian territory, Italy, in the Paduan, containing forty-one villages, and 40,000 souls. The town has 5,700 inhabitants and a fine cathedral.

To CONSEMINATE, *v. a.* Lat. *consemينو*. To sow different seeds together.

CONSENSION, *n. s.* Lat. *concensio*. Agreement; accord.

A great number of such living and thinking particles could not possibly, by their mutual contact, and pressing and striking, compose one greater individual animal, with one mind and understanding, and a vital *consension* of the whole body.

Boutley.

CONSENT, *v. a.* & *n. s.* } Fr. *consenter*,
CONSENTER, *n. s.* } It. *consentire*; Sp.
CONSENTING, *n. s.* } *it. consentir*; Lat. *con-*
CONSENTA'NEOUS, *adj.* } *sentire*, from *con* and
CONSENTA'NEOUSLY, *adv.* } *sentire*. To agree
CONSENTA'NEOUSNESS, } to; to be of the
CONSENTIENT, *adj.* } same mind; to co-

operate; to allow that a thing shall be done. The act of yielding; of giving permission; unity of action or opinion; relation to; correspondance or coherence with; tendency to one end; joint acting together; one part of the body being sympathetically affected by action on some other part. Consentaneous signifies agreeable to; consistent with. Consentient is concurring in; being of one opinion.

In this we *consent unto* you, if ye will be as we be.

Genesis.

Ye han yoursclven shewed here to-day
 So high sentence, so holily, and well,
 That I *consent*, and confirme every del
 Your wordes all, and your opinion.

Chaucer. Cant. Tales.

Also a man shuld sorrow, for all that ever he hath desired ayenst the lawe of God, with *parfite consenting* of his reyn.

Then all that evening (welcomed with cold And cheareless hunger) they together spent; Yet found no fault, but that the hag did scold And rayle at them with grudgefull discontent, For lodging there without her own *consent*.

Spenser. Faerie Queene.

And all her sister nymphes with one *consent* Supplide her sobbing breaches with sad complement.

Id.

Ye comets scourge, the bad revolting stars That have *consented* unto Henry's death.

Shakspeare. Henry VI.

I am far from excusing or denying that compli-
ance; for plenary *consent* it was not.

King Charles.

The authority due to the *consentient* judgment and practice of the universal church.

Oxford Reasons against the Covenant.

It will cost no pains to bring you to the knowing, nor to the practice; it being very agreeable and *consentaneous* to every one's nature.

Hammond. Pract. Cat.

The fighting winds would stop there and admire,
Learning *consent* and concord from his lyre.

Coul. Davideis.

What in sleep thou didst abhor to dream,
Waking thou never wilt *consent* to do.

Milton.

Demons found
In fire, air, flood, or under ground,
Whose power hath a true *consent*
With planet or with element.

Id.

Paracelsus did not always write so *consentaneously* to himself, that his opinions were confidently to be collected from every place of his writings, where he seems to express it.

Boyle.

Nor can such an usurper, or any deriving from him, ever have a title, till the people are both at liberty to *consent*, and have actually *consented*, to allow and confirm him in the power he had till then usurped.

Locke.

Nobody doubts but an express *consent*, of any man entering into any society, makes him a perfect member of that society, a subject of that government.

Id.

When thou canst truly call these virtues thine,
Be wise and free by heaven's *consent* and mine.

Dryden's Pers.

Such is the world's great harmony, that springs
From union, order, full *consent* of things.

Pope.

Children are not *consenting* to their relation, but their relation, without their actual *consent*, binds them to its duties; or rather it implies their *consent*, because the presumed *consent* of every rational creature is in unison with the predisposed order of things.

Burke.

Thither with one *consent* they bend,
Their sorrows with their lives to end,
While each, in thought, already hears
The water hissing in his ears.

Beattie.

LIEUT. Upon my word the army is very much obliged to him. Well, then, I must marry the girl first, and ask his *consent* afterwards.

Sheridan. St. Patrick's Day.

CONSENTES, in Roman antiquity, the twelve superior gods, or Dii majorum gentium. The word signifies as much as consentientes; that is, who consented to the deliberations of Jupiter's council. Ennius has briefly expressed their names in these lines,

Juno, Vesta, Minerva, Ceres, Diana, Venus, Mars, Mercurius, Jovi, Neptunus, Vulcanus, Apollo.

CONSENZA, a town of Naples, in Calabria Citerior, anciently called Consentia, sixteen miles from the coast. It is an archbishop's see, with a considerable revenue.

CONSEQUENCE, n. s.	} Fr. <i>consequence</i> ; Ital. <i>conseguenza</i> ; Span. <i>consequencia</i> ; Lat. <i>consequentia</i> . That which follows in sequence; the result of a cause;
CO'NSEQUENT, n. s.	
CO'NSEQUENT, n. s. & adj.	
CO'NSEQUENTLY, adv.	
CONSEQUENTIAL, adj.	
CONSEQUENTIALLY, adv.	} which follows in sequence; the result of a cause;
CONSEQUENTIALNESS, n. s.	
CONSEQUENTNESS, n. s.	

a deduction from premises; the last member of a syllogism; consecution; that which can exercise an influence over; that which is of importance. Consequent, as a noun, is synonymous with consequence; as an adjective, it signifies regularly deduced; arising out of a cause. Consequential means necessarily springing from a certain cause; justly deduced from the premises. Of late years it has been perverted to the sense of conceited, pompous; but this use of it is at once an absurdity and a vulgarism. The ideas conveyed by consequentially, are, with correct inference; with a just connexion of thoughts; as a consequence of; eventually; in a regular series. Consequently denotes, in consequence of; necessarily; of course. Consequentness is regular connexion of propositions; coherence and just arrangement of discourse.

Doth it follow that they, being not the people of God, are in nothing to be followed? This *consequent* were good, if only the custom of the people of God is to be observed.

Hooker.

The instruments of darkness

Win us with honest trifles, to betray us

In deepest *consequence*.

Shakspeare. Macbeth.

Spirits that know

All mortal *consequences* have pronounced it.

Id.

But things of weight and *consequence* indeed

Himself doth in his chamber then debate;

Where all his counsellors he doth exceed,

As far in judgment, as he doth in state.

Davies.

They were ill paid; and they were ill governed, which is always a *consequent* of ill payment.

Id. on Ireland.

Let them examine the *consequentness* of the whole body of the doctrine I deliver.

Digby on the Soul, Dedication.

Asserted without any colour of scripture-proof, it is of very ill *consequence* to the superstructing of good life.

Hammond.

Though these kind of arguments may seem obscure; yet, upon a due consideration of them, they are highly *consequential* and concludent to my purpose.

Hale's Origin of Mankind.

Shun the bitter *consequence*; for know,

The day thou eatest thereof, thou shalt die.

Milton's Paradise Lost.

Sorrow being the natural and direct offer of sin, that which first brought sin into the world, must, by necessary *consequence*, bring in sorrow too.

South.

This satisfaction, or dissatisfaction, *consequent* upon a man's acting suitably or unsuitably to conscience, is a principle not easily to be worn out.

Id.

He could see *consequents* yet dormant in their principles, and effects yet unborn.

Id.

There is *consequently*, upon this distinguishing principle, an inward satisfaction or dissatisfaction in the heart of every man, after good or evil. *South.*

This relation is so necessary, that God himself cannot discharge a rational creature from it; although *consequently* indeed he may do so, by the annihilation of such creatures. *Id.*

The little, or almost insensible, impressions on our tender infancies have very important and lasting *consequences*: and there it is, as in the fountains of some rivers, where a gentle application of the hand turns the flexible waters into channels that make them take quite contrary courses. *Locke.*

It was not a power possible to be inherited, because the right was *consequent* to, and built on, an act perfectly personal. *Id.*

In the most perfect poem a perfect idea was required, and *consequently* all poets ought rather to imitate it. *Dryden.*

Can syllogism set things right?
No, majors soon with minors fight.
Or, both in friendly consort joined,
The *consequence* limps false behind. *Prior.*

We sometimes wrangle, when we should debate;
A *consequential* ill which freedom draws;
A bad effect, but from a noble cause. *Id.*

The anger of Achilles was of such *consequence*, that it embroiled the kings of Greece. *Addison's Spectator.*
Nobody writes a book without meaning something, though he may not have the faculty of writing *consequentially*, and expressing his meaning.

Id. Whig Examiner.

Their people are sunk in poverty, ignorance, and cowardice; and of as little *consequence* as women and children. *Swift.*

If such persons can answer the ends of relief and profit to themselves, they are apt to be careless enough about either the means or the *consequences.* *Burke.*

To enable men to act with the weight and character of a people, and to answer the ends for which they are incorporated into that capacity, we must suppose them (by means immediate or *consequential*) to be in that state of habitual social discipline, in which the wiser, the more expert, and the more opulent, conduct, and by conducting enlighten and protect the weaker, the less knowing, and the less provided with the goods of fortune. *Beattie.*

This once believed, 'twere logic misapplied,
To prove a *consequence* by none denied,
That we are bound to east the minds of youth
Betimes into the mould of heavenly truth. *Cowper.*

Beware of too sublime a sense
Of your own worth and *consequence.* *Id.*

Dangle, I have brought you two pieces, one of which you must exert yourself to make the managers accept, I tell you that: for 'tis written by a person of *consequence.* *Sheddan.*

When a proposal is made to emancipate or relieve, you hesitate, you deliberate for years, you temporise and tamper with the minds of men; but a death-bill must be passed off hand, without a thought of the *consequences.* *Byron. Speech on the Frame-breaking Bill.*

CONSERANS, a ci-devant territory of France, being the south-west division of the late province of Gascony. It was bounded on the east by Poix, on the south by Catalonia, and on the north-west by Comings. It is now included in the department of Gers.

CONSERVIGN, *n. s.* Lat. *consero.* Fit-ness; adaptation.

What order, beauty, motion, distance, size, *Conservation* of design, how exquisite! *Young.*

CONSERVE, *v. a. & n.* } Fr. *conserver* ;
CONSERVER, *n. s.* } Ital. *conservare* ;
CONSERVANT, *adj.* } Sp. *conservar* ; Lat.
CONSERVABLE, *adj.* } *conservare*, from
CONSERVANCY, *n. s.* } *con* and *servare.*
CONSERVATION, *n. s.* } To keep safe; to
CONSERVATIVE, *adj.* } protect; to candy
CONSERVATOR, *n. s.* } fruit. A conserve
CONSERVATORY, *n. s.* } is a sweetmeat

made of fruit; but this meaning is now principally used with reference to those preparations with which apothecaries make up their medicines into pills or boluses; a place in which anything is kept: this last meaning also is obsolete. Conserver and conservator is he who keeps; who preserves. Conservation is the act of preserving. 'A conservatory,' says Johnson, 'is a place where anything is kept in a manner proper to its peculiar nature, as fish in a pond, corn in a granary.' The word, however, except when used figuratively, is now rarely applied to anything but a building in which tender and exotic plants are protected from the inclemency of the weather. As an adjective, its application is obvious. Courts of conservancy are courts held by the lord mayor of London, for the preservation of the fishery, and the prevention of nuisances, on the river Thames; he being, *ex officio*, conservator of the river.

Geffray, thou wottist full wel this,
That every kindly thinge that is
Yhath a kyndely stede, there he
May best in it *conserved* be.

Chaucer. House of Fame.

And this place of whiche I the tel,
There as Fame doth ylyste to dwell,
Is sette amiddis of these thre,
Heven, and erthe, and eke the se,
As moste *conservatife* of soune. *Id.*

Conservature of kinges, dukes, and relmes. *Id.*
Will't please your honour to taste of these *con-serves*? *Shakspeare.*

They have in Turkey and the East certain confections, which they call *servets*, which are like to candid *conservees*, and are made of sugar rind lemons.

Bacon's Natural History.

It is an enquiry of excellent use, to enquire of the means of preventing or staying of putrefaction; for therein consisteth the means of *conservation* of bodies. *Id.*

A *conservatory* of snow and ice, such as they use for delicacy to cool wine in summer. *Id.*

For that you declare that you have many sick amongst you, he was warned by the *conservator* of the city, that he should keep at a distance.

Id. New Atlantis.

He hath been most industrious, both collector and *conserver* of choice pieces in that kind. *Hayward.*

The spherical figure, as to all heavenly bodies, so it agreeth to light, as the most perfect and *conservative* of all others. *Peacock.*

The lords of the secret council were likewise made *conservators* of the peace of the two kingdoms, during the intervals of parliament. *Clarendon.*

Nothing was lost out of these stores, since the art of *conserving* what others have gained in knowledge is easy. *Temple.*

¹¹ In the Eastern regions there seems to have been a general custom of the priests having been the perpetual *conservers* of knowledge and story. *Id.*

Tuberoses will not endure the wet of this season; therefore set the pots into your *conserve*, and keep them dry. *Evelyn's Kalendar.*

You may set your tender trees and plants, with the windows and doors of the greenhouses and *conservatories* open, for eight or ten days before April. *Id.*

Though there do indeed happen some alterations in the globe, yet they are such as tend rather to the benefit and *conservation* of the earth, and its productions, than to the disorder and destruction of both.

Woodward's Natural History.

The water dispensed to the air and atmosphere by the great abyss; that subterranean *conservatory*, is by that means restored back. *Id.*

They will be able to *conserve* their properties unchanged in passing through several mediums; which is another condition of the rays of light.

Newton's Opticks.

If wealth is the obedient and laborious slave of virtue and of public honour, then wealth is in its place, and has its use; but if this order is changed, and honour is to be sacrificed to the *conservation* of riches, riches which have neither eyes nor hands, nor anything truly vital in them, cannot long survive the being of their vivifying powers, their legitimate masters, and their potent protectors. *Burke.*

All your sophisters cannot produce any thing better adapted to preserve a rational and manly freedom than the course that we have pursued, who have chosen our nature rather than our speculations, our breasts rather than our inventions, for the great *conservatories* and magazines of our rights and privileges. *Id.*

We next inquire, but softly and by stealth, Like *conservators* of the public health, Of epidemic throats, if such there are, And coughs, and rheums, and phthisic, and catarrh, That theme exhausted, a wide chasm ensues, Filled up at last with interesting news, Who danced with whom, and who are like to wed, And who is hanged, and who is brought to bed. *Cowper.*

Then her skin, smooth and white as a gallipot; her mouth as round and not larger than the mouth of a penny pail; her lips *conserve* of roses; and then her teeth—none of your sturdy fixtures—ache as they would, it was but a small pull, and out they came, I believe I have drawn half-a-score of her poor dear pearls. *Sheridan.*

CONSERVATOR, an officer ordained for the preservation of the privileges of some cities and communities, having a commission to judge of, and determine, the differences among them. In most Catholic universities there are two conservators; the conservator of royal privileges, or those granted by kings; and the conservator of apostolical privileges, or those granted by the Pope. The first takes cognizance of personal and mixed causes between the regents, students, &c. and the latter of spiritual matters between ecclesiastics. Sometimes there were appointed, anciently, conservators of treaties of peace between princes; who were judges of the infractions made on the treaty, and charged with procuring satisfaction to be made.

CONSERVATOR OF THE PEACE, in the ancient English customs, was a person who had a special charge, by virtue of his office, to see the king's peace kept. Till the erection of justices of the peace by Edward III. there were several persons who by common law were interested in keeping the same; some having that charge as incident to

other offices; and others simply, or of itself, called custodes, or conservators of the peace. The chamberlain of Chester is still a conservator in that county; and petty constables are, by the common law, conservators, &c. in the first sense, within their own jurisdiction: so are also the coroner and the sheriff within their own county. The king is the principal conservator of the peace within all his dominions: the lord chancellor, lord treasurer, lord high steward, lord marshal, lord high constable, all the justices of the court of king's bench, by their office, and the master of the rolls, by prescription, are general conservators of the peace through the whole kingdom, and many commit breakers of the peace, and bind them in recognisances to keep it.

CONSERVATOR OF THE TRUCE, AND SAFE CONDUCTS, was an officer appointed in every seaport, under the king's letters patent. His charge was to enquire of all offences committed against the king's truce, and safe conducts upon the main sea, out of the franchises of the cinque ports, as the admirals were wont to do, and such other things as are declared, anno 3 Henry V. cap. 6.

CONSERVATORY, in gardening, is distinguished from the greenhouse by the circumstance of its affording protection only to the plants; while the greenhouse is used for the rearing of them. The conservatory is also often attached to the house as an apartment for the display of scarce and valuable plants during the time of their greatest beauty and perfection, which are removed from the greenhouse, stove, and hot-house, to the conservatory for such temporary exhibition.

CONSERVE, in pharmacy, a form of medicine contrived to preserve the flowers, herbs, roots or fruits of several simples, as near as possible to what they were when fresh gathered. See PHARMACY.

CONSESSION, *n. s.* } Lat. *concessio*. A
CONSESSOR, *n. s.* } sitting together. One that sits with others.

CONSIDER, *v. a. & n.* } Fr. *considerer*;
CONSIDERABLE, *adj.* } Ital. *considerare*;
CONSIDERABLENESS, *n. s.* } Span. *considerar*;
CONSIDERABLY, *adj.* } Lat. *considerare*.
CONSIDERANCE, *n. s.* } Etymologists are
CONSIDERATE, *adj.* } at variance with respect to the origin
CONSIDERATELY, *adv.* } of the rest of these
CONSIDERATENESS. } verbs. Some derive it from stargazing; others from sitting fixed in
CONSIDERATION, *n. s.* } thought, in contemplation. The
CONSIDERATIVE, *adj.* }
CONSIDERATOR, *n. s.* }
CONSIDERER, *n. s.* }
CONSIDERING, *n. s.* }
CONSIDERINGLY, *adv.* }

The latter seems to be the most natural. To consider is, to meditate seriously on; to weigh the reasons on each side; to examine carefully; to turn in the mind; to pay a proper degree of attention or respect to; to reward for service. That which is worthy of consideration, above mediocrity, important, is considerable. He who goes prudently to work; who makes a proper allowance for the failings of others, is considerate, acts considerately. Consideration signifies the act of considering; deliberate weighing of reasons;

prudence; worthiness of being regarded; an equivalent; a compensation; motive of action; the ground on which a conclusion is formed. Considering, as a noun, denotes hesitation; in its other sense, that of making allowance for; taking all things into consideration. Johnson classes it with the conjunctions.

None *considereth* in his heart, neither is there knowledge nor understanding. *Isaiah* xlv. 1

Let us *consider* one another to provoke unto love and to good works. *Hebrews* x. 24.

Consider all this, and red upon my voice,
As wisely as I shall evermore
Enmirth my might thy trewe servant to be.
Chaucer. Cant. Tales,

The Lord hath of his high discretion
Considered that it were destruction
To gentil blood to fighten in the gise
Of mortal bataille now in this surprise. *Id.*

Well seemd the ape to like the ordinance
Yet well *considering* the circumstance,
As pausing in greet doubt awhile he staid.
Spenser. Mother Hubberd's Tale.

The *consideration*, in regard whereof the law forbiddeth these things, was not because these nations did use them. *Hooker.*

Let us think with *consideration*, and *consider* with acknowledging, and acknowledge with admiration. *Sidney.*

Widow, we will *consider* of your suit;
And come some other time to know our mind.
Shakspeare. Henry VI

Take away with thee the very services thou hast done, which if I have not enough *considered*, to be more thankful to thee shall be my study.
Id. Winter's Tale.

At our more *considered* time we'll read,
Answer, and think upon this business.
Id. Hamlet.

Many mazed *considerings* did throng,
And pressed in with this caution. *Id. Henry VIII.*
After this cold *considerance*, sentence me;
And as you are a king, speak in your state
What I have done that misbecame my place.
Id. Henry IV.

I will converse with iron-witted fools,
And unrespective boys: none are for me,
That look into me with *considerate* eyes.
Id. Richard III.

The breath no sooner left his father's body,
But that his wildness mortified in him;
Consideration, like an angel, came,
And whist the offending Adam out of him,
Shakspeare. Henry V.

I'll not dissemble, sir; where'er I come,
I love to be *considerative*. *Ben Jonson.*

Circumstances are of such force, as they sway an ordinary judgment of a wise man, not fully and *considerately* pondering the matter.

Bacon's Colours of Good and Evil.
Consider,

Thy life hath yet been private, most part spent
At home. *Milton's Paradise Regained.*

He had been made general upon very partial, and not enough deliberated, *considerations*. *Clarendon.*

Many brought in very *considerable* sums of money. *Id.*

We must not always measure the *considerableness* of things by their most obvious and immediate usefulness, but by their fitness to make or contribute to the discovery of things highly useful. *Boyle.*

The *consideration* of human frailty ought to check this vanity: but since it does not, but that, with a sort of allowance, it shows itself in almost all religious societies, the playing the trick round sufficiently turns it into ridicule. *Locke.*

As to present happiness and misery, when that alone comes in *consideration*, and the consequences are removed, a man never chooses amiss. *Id.*

Foreigners can never take our bills for payment, though they might pass as valuable *considerations* among our own people. *Id.*

It is *considerable*, that some urns have had inscriptions on them, expressing that the lamps were burning. *Wilkins.*

A vain applause of wit for an impious jest, or of reason for a deep *considerer*.

Government of the Tongue.

He was oblig'd, antecedent to all other *considerations*, to search an asylum. *Dryden.*

In painting, not every action, nor every person, is *considerable* enough to enter into the cloth. *Dryden's Dufresnoy.*

'Twas grief no more, or grief and rage were one
Within her soul: at last 'twas rage alone;
Which burning upwards, in succession dries
The tears that stood *considering* in her eyes.
Id. Fables.

It seems necessary in the choice of persons for greater employments, to *consider* their bodies as well as their minds, and ages and health as well as their abilities. *Temple.*

Eternity is infinitely the most *considerable* duration. *Tillotson.*

I grant it to be in many cases certain, that it is such as a *considerate* man may prudently rely and proceed upon, and hath no just cause to doubt of. *Id.*

Lucan is the only author of *consideration* among the Latin poets, who was not explained for the use of the dauphin; because the whole Pharsalia would have been a satire upon the French form of government. *Addison's Frecholder.*

Many can make themselves masters of as *considerable* estates as those who have the greatest portions of land. *Addison.*

It is not possible to act otherwise, *considering* the weakness of our nature. *Spectator.*

I desire no sort of favour so much, as that of serving you more *considerably* than I have been yet able to do. *Pope.*

Such a treatise might be consulted by jurymen, before they *consider* of their verdict. *Swift.*

These speculations, however erroneous, were still useful; for though men err in assigning the causes of natural operations, the works of nature are by this means brought under their *consideration*; which cannot be done without enlarging the mind. *Barke.*

I do not say, sir, that all these establishments, whose principle is gone, have been systematically kept up for influence solely; neglect had its share. But this I am sure of, that a *consideration* of influence has hindered any one from attempting to pull them down. *Id.*

The direct power of the king of England is *considerable*. His indirect, and far more certain power, is great indeed. He stands in need of nothing towards dignity; of nothing towards splendour; of nothing towards authority; of nothing at all towards *consideration* abroad. *Id.*

The fabulist and the novel-writer deceive nobody; because, though they study to make their inventions probable, they do not even pretend that they are true; at least, what they may pretend in this way is con-

sidered only as words of course, to which nobody pays any regard.

Resigned

To sad necessity, the cock foregoes
His wonted strut; and, wading at their head
With well considered steps, seems to resent
His altered gait and stateliness retrenched.

Cowper.

Ans. Mild, gentle, *considerate* father—I kiss your hands! What a tender method of giving his opinion in these matters Sir Anthony has! I dare not trust him with the truth. I wonder what old wealthy hag it is that he wants to bestow on me! yet he married himself for love! and was in his youth a bold intriguer, and a gay companion!

Sheridan.

CONSIGN, *v. a. & n.* Fr. *consigner*; Lat. CONSIGNATIO, *n. s.* } *consignare*, from *con*
CONSIGNMENT, *n. s.* } and *signare*. To make
CONSIGNATURE, *n. s.* } a formal transfer of anything; to send; to entrust; to appropriate; to submit to the same terms with another; to consent to: the last two meanings are obsolete. Consignation is the act of consigning, and also of signing. A consignment is, the act of consigning; the thing consigned; the writing by which the thing is consigned. Consignature signifies, say 'Cotgrave and Sherwood,' a full stamping or absolute signature of.

Thou hast finished joy and moun;
All lovers young, all lovers must
Consign to thee, and come to dust.

Shakespeare. *Cymbeline.*

A maid yet rosed over with the virgin crimson of modesty: it were a hard condition for a maid to consign to.

Id

As the hope of salvation is a good disposition towards it, so is despair a certain *consignation* to eternal ruin.

Taylor.

If we find that we increase in duty, then we may look upon the tradition of the holy sacramental symbols as a direct *consignation* of pardon.

Taylor's *Worthy Communicant.*

The French commander *consigned* it to the use for which it was inteded by the donor.

Dryden's *Fables, Dedication.*

Men, by free gift, *consign* over a place to the Divine worship.

South.

Ask all the merchants who act upon *consignments*, where is the necessity (if they answer readily what their correspondents draw), of their being wealthy themselves.

Tatler.

At the day of general account, good men are then to be *consigned* over to another state, a state of everlasting love and charity.

Atterbury.

The four evangelists *consigned* to writing that history.

Addison.

Atrides, parting for the Trojan war,
Consigned the youthful consort to his care.

Pope's *Odyssey.*

A posterity, which, if this nefarious robbery under the fraudulent name and false colour of a government, should in full power be seated in the heart of Europe, must for ever be *consigned* to vice, impiety, barbarism, and the most ignominious slavery of body and mind.

Burke.

What lost a world, and had a hero fly?
The timid tear in Cleopatra's eye.

Yet be the soft triumvir's fault forgiven—
By this—how many lose not earth—but heaven!
Consign their souls to man's eternal foe,
And seal their own to spare some wanton's woe.

Byron. *The Corsair*

CONSIGNIFICATION, *n. s.* Similar signification.

CONSIGNMENT, in law, the depositing any sum of money, bills, papers, or commodities, in good hands; either by appointment of a court of justice, in order to be delivered to the persons to whom they are adjudged; or voluntarily, in order to their being remitted to the persons they belong to, or sent to the places they are designed for.

CONSIGNMENT OF GOODS, in commerce, is the delivering or making them over to another; thus, goods are said to be consigned to a factor, when they are sent to him to be sold, &c. or when a factor sends back goods to his principal, they are said to be consigned to him.

CONSILULAR, *adj.* Lat. *consimilis*. The
CONSILULARLY, *adj.* } adjectives are synony-
CONSILITUDE, *n. s.* } mous, and signify hav-
CONSILILITY, *n. s.* } ing one common re-
semblance; being alike. The nouns denote likeness, resemblance.

By which means, and their *consimilarity* of disposition, there was a very conjunct friendship between the two brothers and him

Aubrey.

CONSIST, *v. n.* Fr. *consister*; It. *con-*
CONSISTENCE, *n. s.* } *sistere*; Span. *consister*;
CONSISTENCY, *n. s.* } Lat. *consistere*, from *con*
CONSISTENT, *adj.* } and *sistere*. To exist in

CONSISTENTLY, *adv.* consequence of; to remain undissipated; to be comprised in; to be composed of; to co-exist; to agree with. Consistence and consistency signify state with relation to material existence; degree of density or rarity; substance; durable state; congruity with self or with something else; unchangeableness of principle or conduct. Consistent is, not contradictory to; acting uniformly; firm, as opposed to fluid.

He is before all things, and by him all things consist.

Colossians.

None alive may salve the sore
But only she that hurt me so,
In whom my lyfe doth now consist,
To save or slay me as she lyst.

Songes and Smettes.

Yet wisely moderated her owne smart,
Seeing his honor, which she tendred chiefe,
Consisted much in that adventure's priefe.

Spenser. *Faerie Queene.*

Flame doth not mingle with flame, as air doth with air, or water with water, but only remaineth contiguous; as it cometh to pass betwixt *consisting* bodies.

Bacon's *Natural History.*

There is the same necessity for the Divine influence and regimen, to order and govern, conserve and keep together, the universe in that *consistence* it hath received, as it was at first to give it, before it could receive it.

Hale's *Origin of Mankind.*

Meditation will confirm resolutions of good, and give them a durable *consistence* in the soul

Hammond.

Pestilential miasms insinuate into the humoral and *consistent* parts of the body.

Harvey on *Consumptions.*

Necessity and election cannot consist together in the same act.

Bramhall against *Hobbes.*

His majesty would be willing to consent to any thing that could *consist* with his conscience and honour.

Clarendon.

With reference to such a lord, to serve, and to be free, are terms not *consistent* only, but equivalent.

South

His friendship is of a noble make, and a lasting consistency. *Id.*

If in having our ideas in the memory ready at hand, *consists* quickness of parts; in this of having them unconfused, and being able nicely to distinguish one thing from another, where there is but the least difference, *consists*, in a great measure, the exactness of judgment, and clearness of reason, which is to be observed in one man above another. *Locke.*

Arbitrary absolute power, or governing without settled standing laws, can neither of them *consist* with the ends of society and government. *Id.*

If the holy Scriptures were but laid before the eyes of Christians, in their connexion and *consistency*, it would not then be so easy to snatch out a few words, as if they were separate from the rest, to serve a purpose, to which they do not at all belong, and with which they have nothing to do. *Id.*

Nothing but what may easily *consist* with your plenty, your prosperity, is requested of you.

Spratt's Sermons.

I pretend not to tie the hands of artists whose skill *consists* only in a certain manner which they have affected. *Dryden.*

You could not help bestowing more than is *consisting* with the fortune of a private man, or with the will of any but an Alexander.

Id. Fables, Dedication.

The land would *consist* of plains, and valleys, and mountains, according as the pieces of this ruin were disposed. *Burnet.*

I carried on my enquiries farther, to try whether this rising world, when formed and finished, would continue always the same, in the same form, structure, and *consistency*. *Id.*

A great part of their politicks others do not think *consistent* with honour to practise. *Addison on Italy.*

On their own axis as the planets run,
Yet make at once their circle round the sun;
So two *consistent* motions act the soul,
And one regards itself, and one the whole.

Pope's Essays.

It cannot *consist* with the Divine Attributes, that the impious man's joys should, upon the whole, exceed those of the upright. *Atterbury.*

Let the expressed juices be boiled into the *consistence* of a syrup. *Arbuthnot on Aliments.*

The sand, contained within the shell, becoming solid and *consistent*, at the same time that of the stratum without it did. *Woodward's Natural History.*

The only way of securing the constitution will be by lessening the power of domestic adversaries, as much as can *consist* with lenity. *Swift.*

One advantage is as little as possible sacrificed to another. We compensate, we reconcile, we balance. We are enabled to unite into a *consistent* whole the various anomalies and contending principles that are found in the minds and affairs of men. From hence arises, not an excellence in simplicity, but one far superior, an excellence in composition. *Burke.*

We see, then, that our liberty does not *consist* either in the power of doing what we please, or in being governed by laws made by ourselves. *Beattie.*

Time was, he closed as he began the day
With decent duty, not ashamed to pray;
The practice was a bond upon his heart,
A pledge he gave for a *consistent* part;
Nor could he dare presumptuously displease
A power, confessed so lately on his knees.

Courpcr.

Can glory's lust
Touch the freed spirit or the fettered dust?

Small care hath he of what his tomb *consists*—
Nought if he sleeps—nor more if he exists:
Alike the better-seeing shade will smile
On the rude cavern of the rocky isle,
As if his ashes found their latest home
In Rome's pantheon, or Gaul's mimic dome.

Byron. The Age of Bronze.

CONSISTENTS, in church history, a kind of penitents who were allowed to assist at prayers, but who could not be admitted to receive the sacrament.

CONSISTORY, *n. s.* } Fr. *consistoire*; It.
CONSISTORIAL, *adj.* } and Sp. *consistorio*;
CONSISTORIAN, *adj.* } Lat. *consistorium*. Po-
etically, *consistory* is applied to any solemn as-
semblage of persons. Shakspeare makes it also
signify a place of residence. In its restricted,
and more usual sense, it means the tribunal, or
place of justice, in the spiritual courts; the as-
sembly of cardinals; the assembly of the minis-
ters and elders of the reformed church, espe-
cially that of the French Protestants. Consistorial
is that which belongs to, or emanates from, a
consistory, as a consistorial decree. Dr. Grif-
fiths, in his sermon, which was animadverted
upon by Milton, denominates the Presbyterians
'consistorian schismatics.'

To speke thei shall not be so hold,
For sompning to the *consistory*,
And make hem saie with the mouthe I lie.

Chaucer. Canterbury Tales.

An offer was made, that, for every one minister,
there should be two of the people to sit and give
voice in the ecclesiastical *consistory*. *Hooker. Preface.*

How far I've proceeded,
Or how far further shall, is warranted
By a commission from the *consistory*,
Yea the whole *consistory* of Rome.

Shakspeare. Henry VIII.

My other self, my counsel's *consistory*, my oracle,
I, as a child, will go by thy direction.

Id. Richard III.

In mid air
To council summons all his mighty peers
Within thick clouds, and dark, tenfold involved,
A gloomy *consistory*. *Milton's Paradise Regain'd.*

Christ himself, in that great *consistory*, shall deign
to step down from his throne. *South.*

A late prelate, of remarkable zeal for the church,
were religions to be tried by lives, would have lived
down the pope and the whole *consistory*. *Atterbury.*

At Jove's assent, the deities around
In solemn state the *consistory* crowned.

Pope's Statius.

An official, or chancellor, has the name *consistorial*
audience with the bishop himself that deutes him.

Ayliffe's Parergon.

CONSISTORY is particularly used for the pope's
senate and council, before whom judiciary causes
are pleaded at Rome. This consistory, or college
of cardinals, never meets but when the pope
pleases to convoke it: he presides in person
mounted on a magnificent throne, and habited
in his pontificalia; on the right sit the cardinal
bishops and priests, and on the left the cardinal
deacons. The other prelates, protonotaries,
auditors of the rota, and other officers, are seated
on the steps of the throne: the courtiers on the
ground: ambassadors on the right, and consis-
torial and fiscal advocates behind the cardinals.

Besides the public consistory, there is also a private one, held in a retired chamber, called the chamber of papegay; the pope's throne being only raised two steps. Nobody is admitted but the cardinals, whose opinions are collected, and called sentences. Here are first proposed and passed all bulls for bishoprics, abbeys, &c. Hence bishoprics and abbeys are said to be consistorial benefices; as they must be proposed in the consistory, the annates be paid to the pope, and his bulls taken. Anciently they were elective; but by the concordate, which abolishes elections, they are appointed to be collated by the pope alone, on the nomination of the prince. Consistory was also used, among the reformed, for a council or assembly of ministers and elders, to regulate their affairs, discipline, &c.

CONSISTORY, or COURT CHRISTIAN, in the English laws, is a council of ecclesiastical persons, or the place of justice in an ecclesiastical or spiritual court. Every archbishop and bishop has a consistory court, held before his chancellor or commissary, either in his cathedral, in some chapel, aisle, or portico, or in some other convenient place of his diocese, for ecclesiastical causes. The spiritual court was anciently, in the time of the Saxons, joined with the county or hundred court; and the original of the consistory court, as divided from those courts, is found in a law of William I. quoted by Lord Coke. From this court there lies an appeal to the archbishop of each province.

CONSOCIATE, *v. a. v. n., & n. s.* } Lat. *con-*
CONSOCIATION, n. s. } *sociare*. To
 confederate with; to associate with; to join;
 to cement; to coalesce. A confederate; a partner.
 Alliance; fellowship; intimacy.

Partridge and Stanhope were condemned as *consociates* in the conspiracy of Somerset. *Hayward.*

There is such a *consociation* of offices between the prince and whom his favour breeds, that they may help to sustain his power, as he their knowledge.

Ben Jonson's Discoveries.

The ancient philosophers always brought in a supernatural principle to unite and *consociate* the parts of the chaos. *Burnet.*

By so long and so various *consociation* with a prince, he had now gotten, as it were, two lives in his own fortune and greatness. *Wotton.*

If they cohered, yet by the next conflict with other atoms they might be separated again, without ever *consociating* into the huge condense bodies of planets.

Bentley's Sermons.

CONSOL, *v. a.* } Fr. *consoler*;
 CONSOLATE, *v. a.* } It. *consolare*; Sp.
 CONSOLABLE, *adj.* } *consolar*; Lat.
 CONSOLATION, *n. s.* } *consolari*. To
 CONSOLATOR, *n. s.* } soothe; to cheer;
 CONSOLATORY, *n. s. & adj.* } to comfort; to alleviate mental anguish; to restore cheerfulness to the wretched. Consolatory, as a noun, signifies that which, either verbally or in writing, contains something capable of comforting. The meaning of the other derived words is sufficiently obvious.

I will begone,

That pitiful rumour may report my flight,
 To *consolate* thine ear.

Shakespeare. All's well that ends well.

We, that were in the jaws of death, were now brought into a place where we found nothing but *consolations*. *Bacon.*

What may some what *consolate* all men that honour virtue, we do not discover the latter scene of his misery in authors of antiquity.

Brown's Vulgar Errors.

Against such cruelties,
 With inward *consolations* recompensed;
 And oft supported so, as shall amaze
 Their proudest persecutors.

Milton's Paradise Lost.

Consolatories writ

With studied argument, and much persuasion sought,
 Lenient of grief and anxious thought. *Id. Agonists.*

Others the syren sisters compass round,
 And empty heads *console* with empty sound.

Pope's Dunciad.

Pride once more appears upon the stage, as the great *consoler* of the miseries of man.

Commentaries on Pope's Essay on Man.

Let the righteous persevere with patience, supported with this *consolation*, that their labour shall not be in vain.

Rogers.

They have a right to the acquisitions of their parents; to the nourishment and improvement of their offspring; to instruction in life, and to *consolation* in death.

Burke.

Our groves were planted to *console* at noon
 The pensive wanderer in their shades. At eve
 The moonbeam, sliding softly in between
 The sleeping leaves is all the light they wish,
 Birds warbling all the music. *Corper.*

Ah, where can sympathy reflecting find
 One bright idea to *console* the mind? *Darwin.*

And she would have *consolated*, but knew not how—

Having no equals, nothing which had e'e
 Infected her with sympathy till now.

Byron. Don Juan.

CONSOLLE, *n. s.* in architecture, is a part or member projecting in manner of a bracket, or shoulder-piece, serving to support a cornice, bust, vase, beam, and frequently used as keys of arches.

CONSOLIDATE, *v. a., v. n., & adj.* } Fr. *con-*
 CONSOLIDATION, *n. s.* } *consolidar*;
 CONSOLIDATIVE, *adj.* } It. *con-*
 CONSOLIDANT, *adj.* } *solidare*;

Sp. *consolidar*; Lat. *consolidare*. To compact into a solid body; to render hard; to make stable; to combine two parliamentary bills into one; to unite two benefices; to become hard; to acquire stability. Consolidation is the act of uniting into a solid mass; the act of giving confirmation to a thing. Consolidant and consolidative signify that which is capable of healing wounds; of effecting the union of severed parts.

In hurts and ulcers in the head, dryness maketh them more apt to *consolidate*.

Bacon's Natural History.

The word may be rendered, either he stretched, or he fixed and *consolidated*, the earth above the waters.

Burnet's Theory.

The effect of spirits in stopping hemorrhages, and *consolidating* the fibres, is well known to churgeons

Arbuthnot

The *consolidation* of the marble, and of the stone, did not fall out at random.

Woodward's Natural History.

The toiling steeds expand the nostril wide,
While every breath, by respiration strong
Forced downward, is *consolidated* soon
Upon their jutting chests. *Cowper.*

CONSOLIDATION, in law, is borrowed from the civil law; where it properly signifies an union of the possession, or occupation, with the property. Thus, if a man have by legacy usum fructum fundi, and afterwards buy the property, or fee-simple, of the heir; this is called a consolidation.

CONSOLIDATION, in medicine and surgery, the action of uniting broken bones, or the lips of wounds, by means of consolidating remedies, which, cleansing with a moderate heat and force, taking corruption out of the wounds, and preserving the temperature of the parts, cause the nourishment to be fitly applied to the part affected. Among the many instances of the consolidating power of blood and flesh, we have a very remarkable one in Bartholine's Medical Observations. A man being condemned to have his nose cut off by the hand of the common executioner, the friends, who were to be present, provided a new loaf of warm bread, which was cut in the middle, and the nose received in it as it fell from the face: the nose was after this nicely placed on the face again; and, being sewed on, the whole in time consolidated, and left no other marks of the ignominy than the scar round the whole nose, and the traces of the stitches.

CONSONANCE, *n. s.* } Fr. *consonance* ;
CONSONANCY, *n. s.* } Ital. *consonanza* ;
CONSONANT, *n. s. & adj.* } Sp. *consonancia* ;
CONSONANTLY, *adv.* } Lat. *consonans*. Ac-
CONSONANTNESS, *n. s.* } cordance of sound ;
CONSONOUS, *adj.* } consistency ; con-
gruity with ; concord ; friendship : the latter
sense is obsolete. Consonant signifies, agreeable
to ; conformable to ; according with. As a noun,
it means a letter which requires to be united with
a vowel before it can be sounded. Consonous
is, agreeing in sound ; symphonious.

Were it *consonant* unto reason to divorce these sentences,
the former of which doth shew how the latter
is restrained. *Hooker.*

This as *consonantly* it preacheth, teacheth, and delivereth,
as if but one tongue did speak for all. *Id.*

Let me conjure you by the rights of our fellowship,
by the *consonancy* of our youth. *Shakspeare. Hamlet.*

Such decisions held *consonancy* and congruity with
resolutions and decisions of former times.

Hale's Law of England.

Ourselves are formed according to that mind which
frames things *consonantly* to their respective natures.

Glawville's Scepis.

That where much is given there shall be much re-
quired, is a thing *consonant* with natural equity.

Decay of Piety.

Religion looks *consonant* to itself. *Id.*

Every one may observe a great many truths which
he receives at first from others, and readily assents
to, as *consonant* to reason, which he would have found
it hard, and perhaps beyond his strength, to have dis-
covered himself. Native and original truth is not so
easily wrought out of the mind as we, who have it
delivered and already dug and fashioned into our
hands, are apt to imagine. *Locke.*

In all vowels the passage of the mouth is open and
free, without any appulse or an organ of speech to
another : but in all *consonants* there is an appulse of
the organs, sometimes (if you abstract the *consonant*
from the vowels) wholly precluding all sound ; and,
in all of them, more or less checking and abating it.

Holder's Elements of Speech.

He discovers how *consonant* the account which
Moses hath left of the primitive earth, is to this from
nature. *Woodward.*

The two principal *consonances* that most ravish the
ear, are by the consent of all nature, the fifth and the
octave. *Wotton.*

He considered these as they had a greater mixture
of vowels or *consonants*, and accordingly employed
them as the verse requires a greater smoothness.

Pope's Essay on Homer.

And winds and waters flowed

n. consonance.

Thomson's Spring.

CONSOPIATE, *v. a.* } Lat. *conspire*. To

CONSOPIE, *v. a. & adj.* } lull to sleep. The

CONSOPIATION, *n. s.* } act of lulling to sleep.

The adjective signifies quieted ; calmed.

The masculine faculties of the soul were for a while
well slaked and *conspited*. *More.*

Its clamorous tongue thus being *conspite*. *Id.*

One of his maxims is, that a total abstinence from
intemperance is no more philosophy than a total *con-*
sopiation of the senses is repose. *Digby to Pope.*

CONSORT, *v. a. & n.* } Fr. *consorts* ; Ital.

CONSORT, *n. s.* } and Span. *consorte* ;

CONSORTABLE, *adj.* } Lat. *consors*. To as-

CONSORTION, *n. s.* } sociate with ; to join

CONSORTSHIP, *n. s.* } with ; to marry ; and,

in our old writers, to accompany. Consort is a
companion ; a wife or husband ; an assembly ;
a number of instruments playing together ; con-
junction with. It had formerly the accent on the
second syllable. Consortable is, comparable
to ; ranking with ; suitable. Consortion signifies
partnership ; fellowship ; society.

A *consort* of music in a banquet of wine, is as a
signet of carbuncle set in gold. *Eccles. xxxii. 5.*

But Coridon durst not with him *consort*,
Ne durst abide behind, for dread of worse effort.

Spenser. Faerie Queene.

Then all the people, as in solemn feast,
So him assembled with one full *consort*,
Rejoicing at the fall of that great beast. *Id.*

So forth they pas, a well-*consorted* payre,
Till that at length with Archimage they meet. *Id.*

To this sweet voice a dainty music fitted
Its well tuned strings, and to her notes *consorted*.

Id. Britain's Ida.

What will you do ? Let's not *consort* with them.

Shakspeare.

I'll meet with you upon the mart,
And afterward *consort* you till bed time. *Id.*

Fellowship,

Such as I seek, fit to participate
All rational delight ; wherein the brute
Cannot be human *consort*. *Milton.*

Male he created thee, but thy *consort*
Female for race ; then bless'd mankind, and said,
Be fruitful, multiply, and fill the earth.

Id. Paradise Lost.

He with his *consorted* Eve,

The story heard attentive. *Id.*

Thy Bellona, who thy *consort* came
Not only to thy bed, but to thy fame. *Denham.*

He begins to *consort* himself with men, and thinks himself one. *Locke on Education.*

Which of the Grecian chiefs *consorts* with thee? *Dryden.*

He single chose to live, and shunned to wed,
Well pleased to want a *consort* of his bed. *Id. Fables.*

He was *consortable* to Charles Brandon under Henry VIII. who was equal to him. *Wotton.*

His warlike amazon her host invades,
The' imperial *consort* of the crown of spades. *Pope.*

Take it singly, and it carries an air of levity; but, in *consort* with the rest, has a meaning quite different. *Atterbury.*

So thou, with sails how swift! hast reached the shore

' Where tempests never beat nor billows roar'
And thy loved *consort* on the dangerous tide
Of life, long since has anchored by thy side. *Cowper.*

Sweet fruits and kernels gathers from his hoard,
With milk and butter piles the plenteous board;
While on the heated earth his *consort* bakes
Fine flour, well kneaded, in unleavened cakes. *Darwin.*

Emperors are only husbands in wives' eyes,
And kings and *consorts* oft are mystified,
As we may ascertain with due precision,
Some by experience, others by tradition. *Byron. Don Juan.*

CONSPICUOUS, *adj.* } Lat. *conspicuo*.
CONSPICUOUSNESS, *n. s.* } That which may
CONSPICUITY, *n. s.* } easily be seen. A
seeing; beholding; sight; sense of seeing. *Conspicuity*, says Johnson, is, I believe, peculiar to Shakspeare, and perhaps corrupt.

What harm can your bisson *conspicuities* glean out of this character? *Shakspeare. Coriolanus.*

CONSPERSION, Lat. *conspersio*. A sprinkling about.

CONSPICUOUS, *adj.* } Ital. *conspicuo* ;
CONSPICUOUSLY, *adv.* } *conspicuo* ; Sp. *con-*
CONSPICUOUSNESS, *n. s.* } *spicuo* ; Lat. *con-*
CONSPICUITY, *n. s.* } *spicuo*. That which is obvious; capable of being seen from far; eminent for virtue, crime, talent, or rank; placed in a prominent situation. *Conspicuity* is brightness; favorableness to the sight.

Or come I less *conspicuous*? Or what change Absents thee? *Milton's Paradise Lost.*

Looked on with such a weak light they appear well proportioned fabricks; yet they appear so but in that twilight, which is requisite to their *conspicuousness*. *Boyle's Proem Essay.*

Such a patriot, formed in this happy way of improvement, cannot fail, as we see, to give notable decisions upon the bench of quarter-sessions, and eminent proofs of his skill in politics, when the strength of his purse and party have advanced him to a more *conspicuous* station. *Locke.*

If this definition be clearer than the thing defined, midnight may vie for *conspicuity* with noon. *Glanville's Scopsis.*

He attributed to each of them that virtue which he thought most *conspicuous* in them. *Dryden's Juvenal, Dedication.*

Thy father's merit points thee out to view,
And sets thee in the fairest point of light,
To make thy virtues or thy faults *conspicuous*. *Addison's Cato.*

The house of lords,
Conspicuous scene ' *Pope's Epist. of Horace.*

These methods may be preserved *conspicuously*, and entirely distinct. *Watts's Logic.*

I have a hundred times wished that one could resign life as an officer resigns a commission; for I would not take in any poor, ignorant wretch, by selling out. Lately I was a sixpenny private, and, God knows, a miserable soldier enough; now I march to the campaign, a starving cadet: a little more *conspicuously* wretched. *Burns.*

Inscribed above the portal, from afar
Conspicuous as the brightness of a star,
Legible only by the light they give,
Stand the soul-quickenng words—BELIEVE AND LIVE. *Cowper.*

CONSPIRE, *v. n.* } Fr. *conspirer* ; Ital.
CONSPIRER, *n. s.* } *conspirare* ; Sp. *con-*
CONSPIRACY, *n. s.* } *spirar* ; Lat. *conspirare*,
CONSPIRATOR, *n. s.* } from *con* and *spirare*.
CONSPIRANT, *n. s.* } Etymologists have labored very hard to
CONSPIRATION, *n. s.* } find some other root
CONSPIREMENT, *n. s.* } than the Latin *con*
and spirare; but their labors do not appear to have been very successful. To act together, as if all had but one breath, is the meaning indicated by the Latin, and it certainly appears to be that which is found in the derivatives. To conspire is, to league together closely for criminal purposes; to plot; to form base, felonious, or treasonable plans; in an innocent sense, it means to act in conjunction; to agree together. A conspiracy is a concert of persons to commit a crime; a concurrence of circumstances; a tendency of several causes to one event. The law always uses the word in an evil sense.

When shapen was all her *conspiracie*
From point to point. *Chaucer. Cant. Tales.*

The Temones shall backe returne in her founzaine,
And where he rose the sunn shall take his lodging,
Ere I in this finde peace or quietness,
Or that love, or my lady right wisly,
Leave to *conspire* against me wrongfully. *Wyat.*

As two broad beacons, sett in open fields,
Send forth the their flames far off to ever shyne,
And warning give, that enemies *conspyre*
With fire and sword the region to invade,
So flamed his eyne with rage and rancorous yre. *Spenscr. Faerie Queene.*

Where they in secret counsel close *conspired*
How to effect so hard an enterprize. *Id.*

Tell me what they deserve,
That do *conspire* my death with devilish plots
Of damned witchcraft. *Shakspeare Richard III.*

That moved pale Cassius to *conspire*?
Id. Antony and Cleopatra.

O *conspiracy*!
Shamest thou to show thy dangerous brow by night,
When evils are most free? *Id. Julius Cæsar.*

Take no care,
Who chase, who frets, and where *conspirers* are:
Macbeth shall never vanquished be. *Id. Macbeth.*

Stand back thou manifest *conspirator*,
Thou that contrivest to murder our dread lord. *Id. Henry VI.*

Thou art a traitor,
Conspirant 'gainst this high illustrious prince. *Id. King Lear.*

When the time now came that misery was ripe for him, there was a *conspiracy* in all heavenly and earthly things, to frame fit occasions to lead him unto it. *Sidney.*

Let the air be excluded; for that undermineth the body, and *conspireth* with the spirit of the body to dissolve it. *Bacon.*

There is in man a natural possibility to destroy the world; that is, to *conspire* to know no woman.

Broune's Vulgar Errours.

Either violently without mutual consent for urgent reasons, or *conspiringly* by plot of lust or cunning malice. *Milton.*

One put into his hand a note of the whole *conspiracy* against him, together with all the names of the conspirators. *South.*

When scarce he had escaped the blow

Of faction and *conspiracy*,
Death did his promised hopes destroy. *Dryden.*

One would wonder how, from so differing premises, they shou'd infer the same conclusion, were it not that the *conspiration* of interest were too potent for the diversity of judgment. *Decay of Piety.*

The press, the pulpit, and the stage,
Conspire to censure and expose our age.

Roscommon.

So moist and dry, when Phæbus shines,

Conspiring give the plant to grow. *Heigh.*

Vehement passion does not always indicate an infirm judgment. It often accompanies and actuates, and is even auxiliary to a powerful understanding; and when they both *conspire* and act harmoniously, their force is great to destroy disorder within, and to repel injury from without. *Burke.*

The very elements, though each be meant

The minister of man, to serve his wants,

Conspire against him. With his breath he draws

A plague into his blood; and cannot use

Life's necessary means, but he must die. *Cowper.*

In the vices, on the other hand, it is the discord that ensures the defeat—each clamours to be heard in its own barbarous language; each claims the exclusive cunning of the brain; each thwarts and reproaches the other; and even while their fell rage assails with common hate the peace and virtue of the world, the civil war among their own tumultuous legions defeats the purpose of the foul *conspiracy*. *Sheridan.*

CONSPIRACY, in English law, was once used almost exclusively, for an agreement of two or more persons falsely to indict one, or to procure him to be indicted of felony; who, after acquittal, shall have writ of conspiracy. Now, it is no less commonly used for the unlawful combination of journeymen to raise their wages, or to refuse working, except on certain stipulated conditions; an offence particularly provided for by stat. 2 & 3 E. VI. c. 15 (revised, continued, and confirmed by stat. 22 & 23. Car. II. c. 19, now expired): which enacts among other things, that 'if any artificers do conspire, they shall not do their works but at a certain price, or shall not take upon them to finish that another hath begun, or shall do but a certain work in a day, or shall not work but at certain times, every person so conspiring, shall forfeit for the first offence £10, or be imprisoned twenty days, for the second £20, or be pilloried, and for the third £40, or be pilloried, lose an ear, and become infamous.'—This stat. 2 & 3 E. VI. c. 15, appears to be yet in force, though not frequently resorted to for remedy in this case; the proceeding being usually by indictment for conspiracy. Journeymen confederating and refusing to work unless for certain wages, may be indicted for a conspiracy; notwithstanding the statutes which regulate their

work and wages do not direct this mode of prosecution; for this offence consists in the conspiring and not in the refusal, and all conspiracies are illegal, though the subject matter of them may be lawful. The fact of conspiring may be collected by the jury from collateral circumstances. Black. Rep. 392, Stra. 144. And if the parties concur in doing the act, although they were not previously acquainted with each other, it is conspiracy. Unlawful combinations of workmen were prohibited and punished by the act 39 G. III. c. 81, which was repealed, and more effectual provision enacted by 39 and 40 G. III. c. 106. By this latter act all contracts (except those between masters and men) for obtaining advance of wages, altering the usual time of working, decreasing the quantity of work, &c. are declared illegal.—Workmen making such illegal contracts are punishable by imprisonment: and the like punishment is inflicted on workmen entering into combinations to procure advance of wages, or preventing other workmen from hiring themselves, or procuring them to quit their employ, &c.—All meetings and combinations for effecting such illegal purposes are punishable in like manner: and offenders giving evidence against each other are indemnified. This act also provides for settling all disputes between masters and workmen by arbitration, with an appeal to the quarter sessions.

CONSPIRATORS are, by statute, defined to be such as bind themselves by oath, covenant, or other alliance, to assist one another falsely and maliciously to indict persons, or falsely to maintain pleas, or to any treason.

CONSPIRING POWERS, in mechanics, all such as act in a direction not opposite to one another.

CONSPISSATION, *n. s.* Thickness.

CONSPURCATE, *v. a.* Latin, *conspurco*.

CONSPURCATION, *n. s.* } To defile. Defilement; pollution.

} *comes stabuli*, as the

original of constable; Versteegan traces the word from Ang.-Sax. *cýgning*, abbreviated into king and stable, i. e. the prop or stay of the king. Johnson's derivation seems, however, to be the true one. Cowel and Chambers have well described the office of constable, and the change which time has effected in it. (See also the next article.)

The constable of the castle down is fare,

To seen this wrecke, and al the ship he sought,

And fond this very woman ful of care.

Chaucer. Cant. Tales.

Till Jesu hath converted thurgh his grace

Dame Hermegild, *constableness* of that place. *Id.*

Than Dredé had in her baillie

The keeping of the *constablerie*.

Id. Romaunt of the Rose.

When I came hither, I was lord high constable,

And duke of Buckingham; now peer Edward Bohun.

Shakspeare.

The knave constable had set me in the stocks, in the common stocks, for a witch.

Id. Merry Wives of Windsor.

This keepership is annexed to the *constablership* of the castle, and that granted out in lease.

Carew's Survey of Cornwall.

He cannot drink five bottles, bilk the score,
Then kill a *constable*, and drink five more;
But he can draw a pattern, make a tart,
And has the ladies' etiquette by heart. *Cooper.*

To *over-run* the **CONSTABLE**. Perhaps from Fr. *conte stable*, the settled, firm, and stated account. To spend more than what a man knows himself to be worth; a low phrase.

CONSTABLE is derived from comes stabuli, an officer generally well known in the empire; so called because, like the great constable of France (an office suppressed by Louis XIII.), as well as the lord high constable of England, was to regulate all matters of chivalry, tilts, tournaments, and feats of arms, which are performed on horseback.

CONSTABLE, LORD HIGH, OF ENGLAND, is the seventh great officer of the crown; and he, with the earl marshal of England, was formerly judge of the court of chivalry, called in king Henry IV's time *curia militaris*, and now the court of honor. It is the fountain of the martial law, and anciently was held in the king's hall. The power of the lord high constable was formerly so great, and of which so improper a use was made, that so early as the 13th of king Richard II. a statute passed for regulating and abridging it, together with that of the earl marshal of England; and, by this statute, no plea could be tried by them or their courts, that could be tried by the common law of the realm. The office of constable is said by some to have existed before the conquest. After the conquest, the office went with inheritance, and by the tenure of the manors of Harfield, Newham, and Whitenhurst, in Gloucestershire, by grand serjeanty, in the family of the Bohuns, earl of Hereford and Essex, and afterwards in line of Stafford as heirs general to them; but, in 1521, this great office became forfeited to the king in the person of Edward Stafford, duke of Buckingham, who was that year attainted for high treason; and in consideration of its extensive power, dignity, and large authority, both in war and peace, it has never been granted to any person, otherwise than *hac vice*, to attend at a coronation, or trial by combat.

CONSTABLE, LORD HIGH, OF SCOTLAND, is an officer of great antiquity and dignity. The first upon record is Hugo de Morvelle, in the reign of David I. He has two grand prerogatives, viz. 1. The keeping of the king's sword, which the king, at his promotion, when he swears fealty, delivers to him naked. Hence the badge of the constable is a naked sword. 2. The unlimited command of the king's armies in the field, in the absence of the king; but this command did not extend to castles and garrisons. He was likewise judge of all crimes committed within two leagues of the king's house, which precinct was called the chalmers of peace; though his jurisdiction came at last to be exercised only as to crimes during the time of parliament, which some extended likewise to all general conventions. This office was conferred heritably upon the noble family of Errol, by king Robert Bruce; and

with them it still remains, being expressly reserved by the treaty of union.

CONSTABLES, in the ordinary meaning of the word, are, 1. *The Constable of the Hundred*, or the High, Chief, or Head Constable (as he is otherwise called). By the statute of Winton or Winchester, 13 Ed. I. c. 6, it is ordered that in every hundred or franchise there shall be chosen two constables to make the view of armor, and to present the defaults of armor, and of the suits of towns and of highways, &c. Lombard, on Constables, p. 3, Coke 4 Inst. 267, and Hale 2 P. C. 96, all agree in declaring that constables of the hundred were first introduced by this statute.

2. *The Constable of the Vill*, or Petty Constable, as he is frequently called, to distinguish him from the officer last mentioned, is generally understood by the term constable, when mentioned without any peculiar addition. This constable has been repeatedly acknowledged by the law, to be 'one of the most ancient officers in the realm for the conservation of the peace,' Poph. 13. 4 Inst. 265. It must be confessed, however, that no mention of him by this identical name, is anywhere found to occur anterior to the reign of king Henry III. when it was provided that, in every village or township, there should be constituted a constable or two, according to the number of the inhabitants. But it is pretty certain that Lord Coke's idea is right, and that this officer is actually owing to the institution of the frankpledge, usually attributed to king Alfred, and was, in fact, originally the senior or chief pledge of the tithing, or decima. The powers and duties of this officer are very extensive, and are considered by Sir T. Tomline under the following heads. I. 1. His quality; and 2. qualifications. II. 1. His election; and 2. Who are exempted. III. His power and authority. IV. His duty. [These two are in many instances co-extensive, and are therefore carefully to be compared together]. V. His protection, indemnity, and allowances; and lastly, VI. His responsibility and punishment. We must refer to his elaborate Law Dictionary for the full exhibition of these topics; and are indebted to it for the following brief abstract of them.

1. The constable was ordained to repress felons and to keep the peace, of which he is a conservator by the common law. His office is, therefore, first, original or primitive as conservator of the peace; and secondly, ministerial and relative to justices of the peace, coroners, sheriffs, &c. whose precepts he is to execute. He is, however, an officer only for his own precinct, and cannot execute a warrant directed to the constable of the vill, or to all constables, generally, of that particular jurisdiction: for he is constable no where else; nor is he compellable to do it, though the warrant be directed to him by name; but he may, if he will, and so indeed may any other person.

2. The common law requires, that every constable should be idoneus homo, i. e. apt and fit to execute the said office; and he is said in law to be idoneus, who has these three things, honesty, knowledge, and ability.

3. He must be an inhabitant of the place for which he is chosen. But he ought not to be the

keeper of a public house. This is made an express disqualification in Westminster, by stat. 29 Geo. III. c. 25.

4. The objects of his power, authority, and duty, may be thus classed in alphabetical order; viz.

Affray	Malt
Ale-houses	Measures
Armed going	Militia
Bawdy-houses	Night Walkers
Bridges	Physicians, College of
Burglary	Plague
Customs	Poor's Rate
Distress, for rent	Postage
Drunkenness	Presentments
Escape	Riot
Felons	Robbery
Fires	Scavengers
Fishing, unlawful	Scolds
Forcible entry	Servants
Game acts	Soldiers
Gunpowder	Statutes
Hawkers and pedlars	Sunday
Highways	Swearing
Horses	Thieves, petty
Hue and Cry	Turnpikes
Husbandry	Vagrants
Innkeepers	Warrants of Justices
Juries	Watch
Laborers	Weavers, Kiddermins.
Land-tax acts	Weights
Lead. See THILVES.	Wreck.
Lottery Offices illegal	

CONSTABLE OF THE TOWER, a general officer who has the chief superintendance over the tower, and is lord lieutenant of the tower hamlets. He holds his appointment by letters patent from the king, and is not removable at pleasure. The tower, being a state prison, is also considered as a garrison, of which the constable is governor.

CONSTANCE, a city belonging to the grand duchy of Baden, situated on the Upper Lake of Constance. It is very ancient, and was erected into a bishopric in 750, the see being removed from Windish, a place in Switzerland, about six miles distant. It has a handsome bridge, and several fine structures. It formerly carried on a brisk trade in watches and printed linens, and was well fortified; but has much declined of late.

It is famous for the council held here from 1814 to 1818, when there were three popes; who were all deposed, and Martin V. was elected. This body of so named divines, caused John Huss and Jerome of Prague to be burnt, though the emperor Sigismund had given them a safe conduct, pursuant to the disgraceful maxim, 'that no faith is to be kept with heretics.' See HUSS. The dungeon of the convent where Huss was confined, which is only eight feet long, six broad, and seven high, and the stone to which he was chained, are still shown. His head carved in stone is erected upon the house where he was seized, and his statue serves for a pillar on which the pulpit of the cathedral stands. Constance was formerly in alliance with the cantons of Basil and Zurich, with whose assistance the inhabitants expelled the bishop, and embraced the doctrines of the reformation; but the Protestant

cantons being defeated in 1631, the emperor Charles V. compelled them to re-admit the bishop and the popish religion. The majority of the people, however, still continued Protestants; and Joseph II. in 1785, restored the free exercise of that religion with many other privileges, which in 1787 encouraged 350 emigrants from Geneva to settle in it. The population, however, is little more than 4000. At the congress held in 1802 for determining the indemnifications to those princes who had suffered by the cessions to France, this bishopric, with the exception of the convents and chapters, was transferred to Baden. It is thirty miles north-east of Zurich.

CONSTANCE, one of the largest lakes of Switzerland, which separates it from Germany. On its banks, between Aberlingen and Moerspomy, the French, under general Ferino, engaged the left wing of the Austrians, under the Archduke Charles, and completely routed them, 21st and 22nd of March, 1799. The extensive sheet of water consists properly of two lakes; viz. 1. Constance, Lower, or Zeller Zee, a lake between Germany and Switzerland, sixteen miles long and ten broad. 2. Constance, Upper, or Boden Zee, a large lake between Germany and Switzerland, thirty-five miles long, and twelve broad. The Rhine connects both lakes, and they are often treated as one. At the eastern extremity is a considerable island, on which stands the town of Lindau, once a free imperial city. It is said to be 350 fathoms deep near Mersbourg. Owing to the melting of the snow from the adjacent mountains, it is deeper in summer than in winter. There are several towns on its banks, which exhibit the most charming landscapes. It is famous for trout.

CONSTANT, *adj.* } Fr. *constant*; It. *cos-*
 CoNSTANTLY, *adv.* } *tante*; Sp. *constante*;
 CoNSTANCE, *n. s.* } Lat. *constans* Fixed;
 CoNSTANCY, *n. s.* } firm; unalterable; not
 CoNSTANCENESS, *n. s.* } to be shaken; resolute;
 consistent; steady; faithful in love and friendship. These meanings of the adjective are to be found in the adverb and the nouns. Shakspeare uses constancy in the sense of veracity; reality.

— He so often hadde hire don offence
 And she aye sade and *constant* as a wall
 Continuing ever hire innocence over all.

Chaucer. Cant. Tales.

Shamefast she was in maiden's shamefastnesse,
Constant in herte out of idel businesse
 To drive hire out of idel slogardie. *It.*

With fawning words he courted her awhile,
 And looking lovely, and oft sighing sore,
 Her *constant* hart did tempt with diverse guile.

Spenser. Faerie Queene.

The laws of God himself no man will ever deny to be of a different constitution from the former, in respect of the one's *constancy*, and the mutability of the other. *Hooker.*

Both loving one fair maid, they yet remained *constant* friends. *Sidney.*

Some shrewd contents
 Now steal the colour from Bassanio's cheek;
 Some dear friend dead; else nothing in the world
 Could turn so much the constitution
 Of any *constant* man.

Shakspeare. Merchant of Venice.

But all the story of the night told over,
More witnesseth than fancy's images,
And grows to something of great *constancy*,
But, however, strange and admirable. *Shakespeare.*

Rocks, pillars, and heaven's axle-tree,
Exemplify her *constancy* ;
Great changes never change her. *Davies.*

The world's a scene of changes, and to be
Constant, in nature were inconstancy. *Cowley.*

If you take highly rectified spirit of wine, and de-
phlegmed spirit of urine, and mix them, you may
turn these two fluid liquors into a *constant* body.

Boyle's History of Firmness.

Constancy is such a stability and firmness of
friendship, as overlooks and passes by lesser failures
of kindness, and yet still retains the same habitual
good-will to a friend. *South.*

This seems to me to be that beauty, which shines
through some men's actions, sets off all that they do,
and takes with all they come near; when by a *con-*
stant practice they have fashioned their carriage,
and made all those little expressions of civility and re-
spect, which nature or custom has established in con-
versation, so easy to themselves, as they seem not
artificial or studied, but naturally to follow from a
sweetness of mind and a well-turned disposition. *Locke.*

'Now through the land his care of souls he stretch'd,
And like a primitive apostle preached ;
Still cheerful, ever *constant* to his call ;
By many followed, loved b most, admired by all.

Dryden.

It is strange that the fathers should never appeal ;
nay, that they should not *constantly* do it. *Tillotson.*

In a small isle, amidst the widest seas,

Triumphant *constancy* has fix'd her seat ;

In vain the syrens sing, the tempests beat. *Prior.*

For the attainment of these ends, his policy con-
sisted in sincerity, fidelity, directness, and *constancy*.

Burke.

I'll pu' the budding rose, when P'æbus peeps in
view,

For it's like a baumy kiss o' her sweet bonnie mou ;
The hyacinth's for *constancy*, wi' its unchanging
blue,

And a' to be a posie to my ain dear May. *Burns.*

Thump after thump resounds the *constant* flail,
That seems to swing uncertain, and yet falls
Full on the destined ear. Wide flies the chaff,
The rustling straw sends up a frequent mist
Of atoms, sparkling in the noonday beam. *Couper.*

J. STRE. O, madam, punctuality is a species of
constancy, a very unfashionable quality in a lady.

Sheridan. School for Scandal.

His heart was one of those which most enamour us,

Wax to receive, and marble to retain.

He was a lover of the good old school,

Who still become more *constant* as they coo.

Byron. Beppo.

She was all which pure ignorance allows,

And flew to her young mate, like a young bird

And never having dreamt of falsehood, she

Had not one word to say of *constancy*.

Id. Don Juan.

CONSTANTIA, a district at the Cape of
Good Hope, consisting of two farms, which pro-
duced the well known wine once much prized
in Europe, by the name of Cape or Constantia
wine. See CAPE OF GOOD HOPE.

CONSTANTINA, or CONSTANTIA, a consi-
derable province of the territory of Algiers,

bounded on the north by the Mediterranean, on
the east by Tunis, on the south by the desert, and
on the west by Algiers Proper, or Titterie. It
is 230 miles in length, and 100 in breadth, being
the most fertile and best cultivated portion of the
Algerine states. Its principal internal produc-
tions are grain, hides, and wax ; but the coral
fishery on its shores has been the chief attraction
to European nations. It is governed by a bey,
half independent of the Algiers despot, who col-
lects his tribute from the southern districts every
two or three years, assisted by a chosen body of
troops.

CONSTANTINA, the capital of the above
territory, is the largest and strongest town in the
eastern part of Algiers, and is seated on the top
of an immense rock. It is only to be reached
by steps cut out of the rock ; and the usual way
of punishing criminals is to throw them down
this precipice. Here are many Roman anti-
quities, particularly a triumphal arch in fine pre-
servation. The neighbourhood is very fruitful
and watered by the Rummel, a river which flows
through the rock for upwards of a quarter of a
mile. It is seventy-five miles from the sea-coast,
and 210 east by south of Algiers.

The French formerly established the settlements
of Bona, La Callee, Cullu, and Tabarea, on this
coast, for which they agreed to pay a tribute of
£4000 a year to the bey ; but these places were
wrested from them by Great Britain in the late
war, and finally ceded to that power by the
treaty with Algiers in 1806 : we agreeing to pay
£11,000 annually to the bey.

CONSTANTINE I., surnamed the Great, the
first emperor of the Romans who embraced
Christianity. Dr. Anderson, in his Royal Ge-
nealogies, makes him not only a native of Bri-
tain, but the son of a British princess. It is
certain that his father, Constantius Chlorus, was
at York, when, upon the abdication of Diocle-
sian, he shared the Roman empire with Galerius
Maximinus in 305, and that he died in York in
306, having first caused his son, Constantine, to
be proclaimed emperor by his army, and by the
Britons. Galerius at first refused to admit
Constantine to his father's share in the imperial
throne ; but, after having lost several battles, he
consented in 308. Maxentius, who succeeded
Galerius, opposed him ; but, being defeated, he
drowned himself in the Tiber. The senate then
declared Constantine first Augustus, and Lici-
nius his associate in the empire in 313. These
princes published an edict, in their joint names,
in favor of the Christians ; but soon after, Lici-
nius, jealous of Constantine's renown, conceived
an implacable hatred against him, and renewed
the persecutions against the Christians. This
brought on a rupture between the emperors,
and a battle, in which Constantine was victo-
rious. A short peace ensued ; but Licinius
having shamefully violated the treaty, the war
was renewed ; when, Constantine totally defeat-
ing him, he fled to Nicomedia, where he was
taken prisoner, and strangled in 323. Const-
antine, now become sole master of the whole em-
pire, immediately formed the plan of establishing
Christianity as the religion of the state ; for which
purpose, he convoked several ecclesiastical coun-

cils; but, finding he was likely to meet with great opposition from the pagan interest at Rome, he conceived the design of founding a new city, to be the capital of his Christian empire. See CONSTANTINOPLE.

The glory Constantine had acquired, by establishing the Christian religion, was tarnished by the part he took in the persecutions carried on by the Arians, towards the close of his reign, against their Christian brethren who differed from them. Seduced by Eusebius, of Nicomedia, he banished several eminent prelates; soon after which he died, A. D. 337, in the sixty-sixth year of his age, and thirty-first of his reign. Constantine was chaste, pious, laborious, and indefatigable; a great general, successful in war, and deserving his success by his valor and genius; a protector of the arts, and an encourager of them by his beneficence. If we compare him with Augustus, we shall find that he ruined idolatry by the same address that the other used to destroy liberty. Like Augustus, he laid the foundation of a new empire; but less skilful, he could not give it the same stability; he weakened the body of the state by giving it a second head at Constantinople; and transporting the centre of motion and strength too near the eastern extremity, he left without heat, and almost without life, the western parts, which soon became a prey to the barbarians. The pagans were too much his enemies to do him justice. Eutropius says, that in the former part of his reign he was equal to the most accomplished princes, and in the latter to the meanest. The younger Victor, who makes him to have reigned more than thirty-one years, pretends, that in the first ten years he was a hero; in the twelve succeeding ones a robber; and in the ten last a spendthrift. It is easy to perceive, with respect to these two reproaches of Victor's, that the one relates to the riches which Constantine took from idolatry, and the other to those with which he loaded the church. A modern historian, of infidel principles, has followed this mode of depicting the character of Constantine very singularly. 'In the life of Augustus,' says Gibbon, 'we behold the tyrant of the republic, converted, almost by imperceptible degrees, into the father of his country and of human kind. In that of Constantine, we may contemplate a hero, who had so long inspired his subjects with love, and his enemies with terror, degenerating into a cruel and dissolute monarch, corrupted by his fortune, or raised by conquest above the necessity of dissimulation.'

The reality of the miracle by which Constantine is said to have been converted to Christianity, is the great 'historical doubt' of his life; and his domestic conduct, perhaps, his greatest reproach. At the instigation of his second wife, Fausta, he is said to have listened to the most improbable accusations against his eldest son, Crispus, a very amiable prince. Not only was he described as plotting secretly against his father's authority, but his mother-in-law is stated to have charged him with an attack upon her honor. On this he was suddenly apprehended, and put to death, without even the form of a trial, on the twentieth anniversary of the emperor's reign. His grandmother, Helena, convinced of his inno-

cence, resolved, it is added, to bring his accuser's motives to light, and found means of convicting her of an adulterous connexion with a slave of the palace, for which she was suffocated in the steam of a vapor-bath. The part which the emperor took in these proceedings is not exactly defined by historians; but, as he has not wanted eulogists, we may presume, that as it has never been offered, nothing like an honorable exculpation of him is to be found.

Eusebius's account of the miracle alluded to, is thus abridged by M. Milner:—While he was marching with his forces in the afternoon, previous to his great battle with Maxentius, A. D. 312, the trophy of the cross appeared very luminous in the heavens, higher than the sun, with this inscription, *τὸντο νικα*, 'conquer by this.' He and his soldiers were astonished at the sight; but he continued pondering on the event till night. And Christ appeared to him when asleep, with the same sign of the cross, and directed him to make use of the symbol as his military ensign. Constantine obeyed, and the cross was henceforward displayed in his armies.—History of the Church of Christ, vol. ii. p. 41. Eusebius adds, that Constantine communicated this wonderful circumstance to his friends in the morning, and sending for ingenious workmen, gave them a description of the sign, and saw them make one like it in gold and precious stones; which, says he, 'we have seen.'

This imitation of the visionary cross was afterwards the labarum of the army, and consisted of a cross, surmounted by the figure ☩ or ☩ , and encircled with a crown of gold; this being, according to the Greek orthography, the initial letters of the name of Christ. 'The victorious emperor himself having told it to us,' says Eusebius, who wrote this history a long time after, 'when we had the honor of his acquaintance and conversation. and having likewise confirmed it with an oath, who can refuse his assent to it, especially when following events have borne testimony to the truth of it?' To which, in effect, the judicious Lardner answers, 1. This relation is delivered by Eusebius upon the sole credit of Constantine; whereas a thing of so public a nature could not have rested upon his credit and authority only, if it had been true. Other witnesses might have been called to vouch for the truth of an event, so surprising and so recent, i. e. twenty years before Eusebius wrote the life of Constantine; and the historian, from dutiful affection for the emperor, and from a just concern for his own honor would not have failed to add something to this purpose. 2. The oath or oaths of Constantine upon this occasion, rather bring his relation into suspicion. 3. Eusebius renders this whole account suspicious, by not mentioning the *place* of this wonderful sight; and this defect renders it probable that Eusebius himself did not believe this story, nor intend to vouch for the truth of it. 4. There are other things concerning the standard, related by Eusebius, which he also had from Constantine, and which are very unlikely, if not altogether incredible. Wherever the standard was, says the historian, the enemies fled; and this is not improbable, because it might animate Constantine's soldiers,

and terrify the enemy. But it is added, that the salutary trophy was a safeguard to him who bore it, and there never was any one wounded in this service. This relation, for which Eusebius does not make himself answerable, surpasses all credible accounts of miracles; that when many darts were thrown, none should strike the bearer, nor yet light upon the upper part of the standard, where were the cross and the motto, but only, and always, upon the narrow circumference of the spear, or pole of the standard. 5. Lactantius, or the author of the book *Of the Deaths of Persecutors*, who wrote a few years after this appearance in the heavens is supposed to have happened, says nothing of it, but only mentions Constantine's dream or vision in his sleep.

Dr. Lardner's doubts on this subject are the more entitled to consideration, as he is far from forming an unfavorable opinion of Constantine's general character. 'We should be willing,' says he, 'to make allowances in favor of princes, and especially of long reigns. It is next to impossible for human wisdom and discretion, in the course of many years filled with action, not to be surprised into some injustice, through the bias of affection, or the specious suggestions of artful and designing people. Though, therefore, there may have been some transactions in this reign which cannot easily be justified, and others that must be condemned, yet we are not to consider Constantine as a cruel prince or a bad man.'

For ourselves, we apprehend, that neither the object nor the evidence of the miracle in question are worthy the Christian cause. How the emperor should identify the person of Christ, in the vision which is thought the more credible part of the narrative, seems difficult to conceive; and to us it is perfectly incomprehensible, that the Saviour should thus commission the symbol of his peaceful and holy religion to become, at once, that of the destruction of mankind.

CONSTANTINOPLE, the capital of the Turkish empire, called by the ancients Byzantium, and by the modern Turks Stampol or Istampol, is situated on the western shore of the Bosphorus. No situation can combine greater advantages: the Euxine Sea on the north, and the Mediterranean on the south, open to its commerce easy communications with the most fertile and important nations of the three continents; and nothing can be more superb than the view presented by the adjacent country, as the traveller approaches it. The city seems to rise from the bosom of the sea, like the vision of an enchanter's wand, the seven hills upon which it is built successively presenting themselves, crowned with glittering kiosks, gilded domes, and tapering minarets, intermixed with innumerable cypress trees, a green hill, beautifully sloping upwards from its walls, terminating the prospect. It is of a triangular form, its obtuse angle extending into the sea of Marmora, and the base facing the west, and has a wall from fourteen to twenty feet in height, running along the side towards the sea, surmounted at intervals with towers, and containing six gates. Its fortifications have suffered much from the effects of time, and many parts of them are in ruins. On the land side facing the west, is the celebrated wall built by Theodosius, ex-

tending five miles in length, and a fosse twenty-five feet wide. This wall, though it has stood the shock of so many attacks, is still in a state of amazing preservation: it is flanked with lofty towers, and has five gates, with stone bridges over the fosse. The *Porta Sancti Romani*, where the emperor Constantine Paleologus fell covered with glorious wounds, is associated with the most interesting recollections. The remaining wall of the triangle is formed of alternate courses of freestone and bricks, and has thirteen gates. All the angles were originally surmounted with towers, having conical roofs, but of these one was destroyed by an earthquake in 1763, and another is rapidly mouldering into decay. The whole area surrounded by these walls is 2000 acres, and their circumference about fourteen English miles.

The interior of Constantinople, however, presents a widely different appearance from the splendid coup d'œil, afforded by its exterior. Mr. Sandys remarks, 'I think there is not in the world any object that promiseth so much afar off, and entered, that so deceiveth the expectation.' It is indeed an assemblage of slanting, gloomy, and dirty streets, bearing no names, and so infested with filth and ordure, that one would suppose that the office of cleaning them is left entirely to the dogs and vultures which prowl about in great numbers, and the rain of heaven. The houses are very low (none of them being allowed to exceed twenty feet in height), and for the most part composed of wood or earth, and few of them boasting of the luxuries of glazed windows or chimneys. Owing to the combustible materials of which the houses are composed, and the proverbial improvidence of the Turks, fires are of very frequent occurrence; nay, it is said, that one would find it a matter of difficulty to point out the site of a single house in Constantinople where a fire has not been seen. Of the streets, the one leading from the seraglio to the *Atmejdán* is by far the most imposing; but if the Turks may, with any degree of justice, claim for their city the proud name of 'New Rome,' it must be attributable to the gloomy grandeur which is diffused over it, by its numerous palaces, mosques, bagnios, bazaars, and caravan-sarais.

The seraglio, however, is the most celebrated of all the buildings of Constantinople. It is situated on the eastern promontory, and, with its gardens, covers one of the seven hills. This palace was originally built by Mahomet II. but has been much enlarged and beautified by succeeding sultans, who have occupied it not merely for their women and their retinues, but with all the pomp and pageantry of the court, and a vast crowd of the officers attached to the government. It is supposed to contain upwards of 10,000 inhabitants. The grand entrance is on the west, through a marble portico, called, the *Baba-hoomajin*, or *Sublime Porte*; and from this entrance it is supposed the Ottoman Court took its title of *Porte* or *Sublime Porte*, affixed at present to all its public transactions and records. It is in this place that state delinquents are beheaded, and their heads are displayed for three days after their execution. The first court contains the mint, the principal

mosque (St. Sophia), and the officers of the vizier's divan. At the first two gates guards are always stationed. At about a thousand paces distance from the other gate, is situated the *Baba-Salem* (gate of health), which conducts to the second court. Through this gate none but the sultan can enter on horseback. The court contains the grand audience chamber, in which the sultan receives the ambassadors of foreign courts. The throne on which he reclines on these occasions, has been much admired for its great magnificence; it has the shape of a bed, and is covered with precious stones, and embroideries of pearls and jewels. The gate which leads to the third court is called *Baba-Saadi*, or the Gate of Happiness. Into this those only who compose the sultan's suite, being Mahomedans, are allowed to enter: ambassadors from foreign courts, and others who are favored with an audience, are conducted to the presence chamber by a covered passage. Beyond this court are situated the various apartments of the *Haram*, which generally contain about 500 unhappy females. From the elevated position of many of these abodes they may be seen from the city, but none of them can be visited, excepting those devoted to the summer residence of the females, during the time they are in their winter apartments. The furniture of the palace is said to be very magnificent. The audience chamber, in which the sultan and sultan-mother receive the visits of ceremony from the sultanas, is wainscotted with jasper, inlaid with ivory and mother of pearl, and has a kind of sofa which extends round the room; the walls are decorated with a profusion of mirrors, and the costly presents received from foreign powers; and the hangings are composed of cloth of gold, richly embroidered with fringes strung with pearls. The palace library contains several important Greek, Latin, and Oriental manuscripts; but as no Christian is permitted to enter this apartment, the exact number and value of its contents is entirely conjectural. According to Dr. Clarke, the gardens display nothing of refined taste in their arrangement, or of great curiosity in their contents, but the prospect from them is unrivalled.

Constantinople contains 130 public baths, and scarcely a street is to be found that has not its fountains. Many of these baths are very elegant structures, formed of hewn stone, and having the floors of their inner apartments paved with marble. The manner in which they are used by the Turks resembles the lustrations of the Greeks rather than our mode of bathing. The fountains are for the most part low square buildings, roofed with lead, and profusely decorated with gilding and paint, and inscribed with verses from the Koran, and favorite Mahomedan doctors. According to the most accredited statements the city altogether contains upwards of 300 mosques. The most celebrated, both for its antiquity and splendor of architecture, is, as we have already stated, *St. Sophia*. This magnificent building, said to be more extensive than *St. Peter's* at Rome, stands near the principal gate to the seraglio. It was originally built by *Constantine the Great*, but during a popular sedition, which took place in the reign of *Justinian*, it was burnt to the ground; in the same reign,

however, arose the present sumptuous edifice. It is built in the form of a Greek cross; the length from east to west being 270 feet, and the breadth from north to south 243. It is ornamented by a dome of so imperceptible a curve, that the perpendicular concavity is not more than one-sixth of the diameter. The principal vestibule is on the west side, and is twenty-eight feet wide, having nine doors of bronze, ornamented with a variety of subjects in alto relievo. The dome rests on pillars composed of the finest marble. *Andronicas* added two immense buttresses to it in 1317, and the Turkish emperor, *Selim II.*, four minarets, so that the exterior beauty of the building is greatly marred by the heterogeneous nature of its component parts. The interior of the church has been much defaced by the Turks. Its grand dome rests upon four arcades, which are connected with a like number of cupolas, and the whole blending together form an amazing expanse of roof. The spacious pavement is completely covered with the richest carpets. Nothing can exceed the splendor of the interior during the celebration of a Turkish festival; from the roof are suspended an innumerable quantity of lamps, composed of colored glass, globes of crystal, ostrich eggs, and ornaments of gold and silver, which reflect their radiance from the green jasper and porphyry pillars, with which the stupendous concave is thronged, 'and glitter,' as the Turkish writers say, 'like the stars in the firmament.' The whole interior of the dome was originally ornamented with rich Mosaic work upon a golden ground; but the Turks have obliterated all its beauty by covering it with white-wash. The revenues of *St. Sophia*, which amount to nearly £3000 per annum, principally arise from land held under a species of tenure, called *vacuf*, which is somewhat analogous to our church lands: they are expended in keeping the mosque in repair, and in paying the officiating imams. Of the mosques, several were originally Greek churches. The most celebrated, built by the Turkish sultans, are those of *Mahomet II.*, situated on one of the seven hills, and of the sultan *Achmet I.*, which has six minarets of amazing height and extraordinary beauty. There is also one, erected by *Bajazet*, in which are ten columns of verd antique, four of jasper, and six of Egyptian granite.

Most of these mosques are situated in squares or public places, and are generally surrounded by lofty colonnades of marble, having gates of brass. In the centre of the area is placed a fountain of polished marble. The remains of the founders of each mosque are deposited with such reliques as are supposed worthy of preservation, in a chapel attached to the principal building. The Greeks have twenty-three churches in Constantinople; there are also six Roman Catholic convents, several Jewish synagogues, and a Swedish church. The Christian churches have the appearance of private houses; no spires or bells being permitted to any religious edifice, excepting the mosques. The Protestant envoys, viz. the English, Swedish, and Dutch have chaplains attached to their respective suites.

Amongst the most curious and useful esta-

blishments of Constantinople may be mentioned the bazaars. They generally consist of immense square stone buildings, lighted by domes, and are admirably adapted to the exigencies of the climate. Almost every trade is carried on in its own particular quarter, and quite separated from all others. In one street nothing is to be purchased but arms and military accoutrements; another is devoted to the exclusive sale of jewels, diamonds, and precious stones; in a third you meet with nothing but silks, generally worn by the Turks, and in the manufacture of which the Armenians employ 10,000 looms. Whole streets are set apart for the sale of books, Arabic, Pèrsian, and Turkish MSS.; for pipe-makers, shoemakers, farriers, confectioners, &c. One of the most noted bazaars is appropriated to the sale of drugs, the spices of the east, and medicines, amongst which opium holds the foremost place. The bazaars are closed at an early hour every evening.

The numerous khans, situate in different parts of the city, afford ample accommodation for the merchants who frequent Constantinople from all quarters of the Turkish empire. The woman-market is held every Friday morning, in a large enclosed court, surrounded with numerous apartments. Hither the unhappy female-slaves are brought to be sold, some of them from an immense distance. The Egyptian and Abyssinian women are generally bought for domestic purposes, whilst the Georgians and Circassians are devoted to the harems of the wealthy, or the seraglio of the sultan. Some of these sell for several thousand piastres.

Constantinople is rich in antiquities. The most conspicuous is perhaps the Grecian Hippodromus, which is still in a state of excellent preservation. It is an enclosure, extending about 250 paces in length and 150 in breadth, and was used for the exhibition of public games, &c. During the time of the Greek empire the circus was ornamented with numerous statues, obelisks, &c. but few of these have escaped the successive ravages of the Turks, the French, and the Venetians. There are still remaining, however, many fragments of Greek and Roman sculpture, in different quarters of the city. The Atmedoa is to this day used by the Turkish noblesse as the place where they exercise themselves in their military game, called dijirit. This game consists in darting a white wand, of about four feet in length, at each other, whilst on horseback; in avoiding the darts of their antagonists; in stopping their horses when in full gallop, &c. The successful exercise of it requires great strength and agility.

Nothing can be more contradictory than the statements of different travellers, with respect to the population of Constantinople. Habesci says it amounts to 1,500,000, whilst on the other hand Eton reduces it to less than 300,000, and alleges, in proof of the correctness of his computation, that it does not occupy so large a site as the city of Paris, and that the buildings are smaller, and more open. It is impossible to ascertain precisely the number of inhabitants, as the Turks keep no registers: most modern travellers, however, concur in estimating the number at about

400,000. This population is of a very mixed character; scarcely one-half are Turks, the rest Greeks, Jews, Armenians, and Franks. These latter, when they appear in the streets and public places, present a singular contrast in their timid and circumspect behaviour, to the haughty, superb gait, and supercilious appearance of the Turks.

The walking costume of the females has in it something graceful; it consists of a mantle which covers the whole body, the eyes alone being visible, so that it is impossible to distinguish the age of the fair perambulator; and to address a lady in the streets is considered a great violation of good manners. What gives a very picturesque appearance to a Turkish crowd is the custom which prevails of every different trade and nation being habited in the costume of his respective country or profession. This produces an almost endless variety of color and pattern in their dress, and presents groupes and combinations of effect which painters in all countries have delighted to transfer to their canvas.

The Greek nobility, resident at Constantinople, principally occupy the Phonar, a northern district of the city. Their sole ambition appears to be directed to the obtaining some paltry place under the Turkish government, such, for instance, as that of interpreter, or provincial governor.

The most terrific enemy to the inhabitants of Constantinople is the plague. From the year 1783 to 1785, it is said, upwards of 100,000 children and young persons fell victims to this awful visitation. Most authors have concurred in attributing the great ravages committed by this evil, rather to the perverse carelessness and total inanity of the Turks, than to any peculiar disadvantage of the climate. This, however, is by no means healthy, being subject to continuous transitions from excessive heat to the piercing blasts of the north-east. Pooquerille estimates the average of the climate in ordinary years at sixty-six days of rain, four of snow, six of fog, twenty cloudy, forty variable, and fifteen thunder; thus, according to this calculation, 214 days of uniform serenity remain. This city is occasionally visited by tremendous thunder-storms, and earthquakes are not unfrequent. To these inconveniences may be added the scarcity of pure water in many parts, and the confined, crooked, and filthy state of the streets in every quarter.

The harbour of Constantinople in respect both to its security and the accommodation it is capable of affording to ships, is said to be one of the finest in the world. It separates the European quarters, Galata and Pera, from the north of the city, and is formed of a branch of the Bosphorus. It is about seven miles in length, and its breadth at the entrance is 500 yards. It is capable of containing 1200 ships. From its curved outline and the rich galleys which occasionally ride at anchor upon its waters, it, at an early period, obtained the appellation of the Golden Horn, which it still retains. Ships can approach close to the shore, and unload their cargoes with the utmost facility, owing to the steepness of the banks and the little influence

the tides have in these seas. The greatest inconvenience attending the harbour is said to be produced by a considerable current, which prevails along the south side, and which it requires some precaution to avoid in putting out to sea, lest the vessel be driven on the projecting point of the seraglio, where there is a tremendous torrent

The commerce of Constantinople is insignificant; Dr. Clarke says, 'The ships which crowd its ports have no connexion with its welfare; they are for the most part French, Venetian, Ragusan, Slavonian, and Grecian vessels, to and from the Mediterranean, exchanging the produce of their own countries for the rich harvests of Poland; the salt, honey and butter of Ukraine; the hides, tallow, hemp, furs and metals of Russia and Siberia; the whole of which exchange is transacted in other parts without any interference on the part of Turkey.' Thus with almost the finest situation, and some of the greatest facilities of any country in the world, Turkey is comparatively unknown as a commercial nation; and the manufactories do not, at the present day, produce a sufficient supply of goods for their own consumption. They generally pay their imports either in specie, or in gold and diamonds.

The intelligent traveller, just quoted, gives altogether a most gloomy picture of the trade and habits of this metropolis. 'We landed at Galata,' says he, 'in the midst of dunghills, on which a number of large, lean, and mangy dogs with their whelps, wallowing in mire, and all covered with filth and slime were sprawling or feeding. The appearance of a Frank (the name applied to every Christian in the Levant, of whatever nation,) instantly raises an alarm among the animals, who never bark at the Turks; and, as they were roused by our coming on shore, the noise became so great that we could not hear each other speak. To this clamour were added the brawlings of a dozen porters, vociferously proffering their services, and beginning to squabble with each other as fast as any of them obtained a burden. At length we were able to move on, but in such confined, stinking, and yet crowded lanes, that we almost despaired of being able to proceed. The swarm of dogs, howling and barking, continually accompanied us, and some of the largest attempted to bite. When we reached the little inn of Pera, where a few small rooms, like the divisions in a rabbit-hutch, had been prepared for our reception, we saw at least fifty of these mongrels collected round the door of the yard, like wolves disappointed of their prey. The late storms had unroofed several of the houses in Pera; that in which we lodged was among the number; one corner of it had been carried away with the wind, so that, without climbing to the top for a view of the city, we commanded a fine prospect of the Golden Horn, and part of Constantinople, through the walls of our bed-rooms, which were open to the air. Pera had recently suffered in consequence of a conflagration which had nearly consumed every house in the place. There was reason to believe some improvement would take place during its restoration; but we found it rising from its ashes like a new phoenix, without the slightest deviation from the form and appear-

ance of its parent. The exception only of one or two houses formerly of wood and rebuilt with stone might be noticed; but all the rest were as ugly, inconvenient, and liable to danger as before; and were it not for a few workmen, employed in fronting the houses of the merchants, no stranger could discover that any accident had taken place.

'Considering the surprising extent of the city and suburbs of Constantinople, the notions entertained of its commerce, and the figure it has long made in history; all the inconveniences if not the luxuries of life, might be there expected. Previous to an arrival, if any enquiry is made of merchants and other persons who have visited the place, as to the commodities of its markets, the answer is almost always characterised by exaggerations. They will affirm that everything a stranger can require may be purchased in Constantinople as in London, Paris, or Vienna; whereas, if truth be told, hardly any one article good in its kind can be procured. Let a foreigner visit the bazaars, properly so called, he will see nothing but slippers, clumsy boots of bad leather. coarse muslins, pipes, tobacco, coffee, cook-shops, drugs, flower-roots, second-hand pistols, poniards, and the worst manufactured wares in the world. In Pera, where Greeks and Italians are supposed to supply all the necessities of the Franks, a few pitiful stalls are seen, in which everything is dear and bad. Suppose a stranger to arrive from a long journey, in want of clothes for his body; furniture for his lodgings; books or maps for his instruction and amusement; paper, pens, ink, cutlery, shoes, hats; in short, those articles which are found in almost every city of the world; he will find few or none of them in Constantinople, except of a quality so inferior as to render them incapable of answering any purpose for which they were intended. The few commodities exposed for sale are either exports from England, unfit for any other market, or, which is worse, German and Dutch imitations of English manufacture. The woollen cloths are hardly suited to cover the floor of their own counting-houses; every article of cutlery and hardware is detestable; the leather used for shoes and boots is so bad that it can scarcely be wrought; hats, hosiery, linen, buttons, buckles, are all of the same character; of the worst quality, and yet of the highest price. But there are other articles of merchandise, to which we have been accustomed to annex the very name of Turkey, as if they were the peculiar produce of that country; and these at least a foreigner expects to find; but not one of them can be had. Ask for a Turkish carpet, you are told you must send for it to Smyrna; for Greek wines, to the Archipelago; for a Turkish sabre, to Damascus; for the sort of stone expressly denominated *turquoise*, they know not what you mean; for red leather, they import it themselves from Russia or from Africa; still you are said to be in the centre of the commerce of the world; and this may be true enough with reference to the freight of vessels passing the straits which is never landed. View the exterior of Constantinople, and it seems the most opulent and flourishing city of Europe; examine its interior, and its miseries and deficiencies are so

striking, that it must be considered the meanest and poorest metropolis of the world.

‘Never was there a people in possession of such advantages, who either knew or cared so little for their enjoyment. Under a wise government, the inhabitants of Constantinople might obtain the riches of all the empires of the earth. Situated as they are, it cannot be long before other nations, depriving them of such important sources of wealth, will convert to better purpose the advantages they have so long neglected.’

The police of Constantinople is perhaps unequalled by that of any other city in the world, and certainly exceeds the celebrated system adopted by Louis XIV. of France. By the Mahomedan law, theft is constituted a capital offence, yet the Government have found it expedient in some measure to connive at its commission: with this view they have a separate officer of police to superintend this particular class of criminals. He is styled *zyndan hassekisi* (keeper of the prison) and is in fact no other than the captain, or chief of thieves. He is, or was lately, selected from the servants of the Aga of the Janissaries, and his office is held so long as he is considered capable of discharging its duties; his incapacity being deduced from his inability to apprehend any particular thief, whose person is sought after. The moment an offender is caught, his whole interest is put in requisition, presents are sent, and the friends of the delinquent have immediate communication with the *zyndan hassekisi*, who on his part (should he espouse the culprit's cause) employs all his interest with the higher powers to save his life, and to get him transferred to the *Bagnio*, or great prison of the Arsenal, from whence after a few weeks incarceration he manages to procure his discharge. In the meantime the name of the new thief, every minutia characteristic of his person, and his most favorite modes of carrying on his profession, are noted down with the most punctilious accuracy in the books of the *zyndan*, and from this moment he becomes a member of the fraternity. A thief who has not thus propitiated the favor of this officer, is sure to be executed the first time he is convicted. The protegés of the *zyndan hassekisi*, are of both sexes, and of every age and country. Every disguise, from that of a man of rank to a mendicant, is assumed by them, and they exercise their professional talents with little or no hazard. Their gains, however, are taxed; for not only is he who has actually committed robbery obliged to give a portion of the effects stolen, but he against whom an information is laid, and who is apprehended on suspicion, cannot procure his release without handsomely paying for it. The *zyndan*, from the circumstance of his being selected from the corps of the *Mumgi*, is necessarily a person of some experience in the predatory profession; and every thief being known to excel in some particular branch of it, one for instance in forcing a door, another for his dexterity in picking locks, a third in inventing a feasible pretext for entering a house, &c. when any person lodges a complaint at the police office, he is minutely interrogated as to all the particulars of the case; the *zyndan hassekisi* summonses before him those who are known to pursue that particu-

lar line of the profession, and the guilty person is speedily detected. The stolen property is now soon recovered; notwithstanding which, if the owner of it do not handsomely fee the *zyndan*, it is divided amongst the thief and some few persons in office. The city guard is composed of a troop appointed to each gate; besides three or four men to most of the streets. These keep continually parading the city day and night. The gates are regularly closed one hour after sunset.

The suburbs of Constantinople are very thickly inhabited, and extend from the north of the city, near the harbour. The names of the principal of these, are Galata, Pera, and Scutari; Galata is chiefly peopled by the merchants and sea-faring men of all nations. Pera occupies a lofty hill immediately to the westward of Galata; and is built almost exclusively of wood and unburnt bricks. The streets are confined and badly paved, but the air and water are salubrious, and the prospects it affords from its elevated situation are exceedingly beautiful. Scutari lies on the Asiatic side of the Bosphorus, but is considered as belonging to the suburbs of Constantinople. It is built on the site of the ancient Chrysopolis and presents a remarkably picturesque appearance from the city. This suburb is the general rendezvous for the Asiatic caravans, and is principally remarkable as containing the finest cemeteries in the Ottoman Empire, some of them extending for many miles to the east and south of the town.

A belief entertained by the Turkish noblesse, that their capital will one day be re-taken by the Christians, has constituted this their most fashionable place of residence, as being farthest removed from the European side. To these may be added the suburb of St. Demetri, which is crowded with Greeks, and Tophana (the Iron foundry) situated on the north side of the harbour, and separated from Galata, by one of the cemeteries of which we have spoken above. There is also a village, in the immediate vicinity of the city, called Eyub from Eyub or Job, the name of one of Mahomet's standard-bearers; Mahomet II, having in a revelation discovered the burial place of this man (who was killed by the Saracens in their first siege of Constantinople) caused a splendid mausoleum and mosque to be raised over his ashes.

The environs of the capital exhibit but a melancholy appearance. A few Greeks did indeed cultivate a portion of the land, and are amply repaid for their toil by plentiful crops, but the Turks often devastate and pillage them, unchecked by the interference of the Government. Along the line of coast, however, numerous splendid palaces, with beautiful hanging gardens, are to be met with; and a few vineyards are scattered about the neighbourhood of Pera. Of the character of the inhabitants of this capital we shall speak more particularly under the head TURKEY. We may add, however, that the excessive indolence of the Turks, and the wretched policy of their Government, are seen nowhere beside in such striking colors. E. long. of the mosque of St. Sophia 23° 55' 15" N. lat. 41° 1' 27".

CONSTANTINOPLE, in law, a certificate which the

clerk of the pipe and auditors of the exchequer make at the request of any person who intends to plead or move in that court for the discharge of anything; and the effect of it is, the certifying what does constare upon record, touching the matter in question. A constat is held to be superior to a certificate; because this may err or fail in its contents; that cannot, as certifying nothing but what is evident upon record. The exemplification, under the great seal, of the enrolment of any letters patent, is also called a constat.

CONSTELLATE, *v. a. & n. ē* Fr. *constel-*
CONSTELLATION, *n. s.* } *lation*; Ital. *costellazione*; Sp. *constelacion*; Lat. *constellatus*. To shine with conjoint lustre; to unite the splendor of several lucent bodies. The accent was formerly on the first syllable. Constellation signifies several stars forming one cluster, and known by a particular name; also, figuratively, any assemblage of excellencies.

For the stars of heaven, and the *constellations* thereof, shall not give their light. *Isaiah xiii. 10.*

Fortune yeven hath this adversite:

Som wikke aspect or disposition
Of Saturne, by som *constellation*,

Hath yeven us this, although we had it sworn.

Chaucer. Cant. Tales.

The earth, the air, resounded;

The heavens and all the *constellations* rung.

Milton's Paradise Lost.

Great constitutions, and such as are *constellated* into knowledge, do nothing till they outdo all.

Broune's Vulgar Errors.

The condition is a *constellation* or conjuncture of all those gospel graces, faith, hope, charity, self-denial, repentance, and the rest.

Hammond's Pract. Catechism.

The several things which engage our affections do, in a transcendent manner, shine forth and *constellate* in God.

Boyle.

A *constellation* is but one;

Though 'tis a train of stars.

Dryden.

'T every polished gem we find,
Illuminating heart or mind,

Provoke to imitation;

No wonder Friendship does the same,

That jewel of the purest flame,

Or rather *constellation*.

Cowper.

CONSTELLATION, in astronomy, is a system of several stars near one another. Astronomers not only mark out the stars, but, to bring them into order, they distinguish them by their situations and positions in respect to each other; and distribute them into constellations, allowing several stars to make up one constellation. For the better distinguishing them, they reduce these constellations to the forms of animals, as men, bulls, bears, &c.; or to the images of some things known, as of a crown, a harp, a balance, &c.; or give them the names of those, whose memories they wish to transmit to future ages. The division of the stars by images and figures is of great antiquity, for, in the Book of Job, Orion, Arcturus, and the Pleiades are mentioned; and we meet with the names of many constellations in the writings of Homer and Hesiod. The ancients, in their division of the firmament, took in only so much as came under their notice,

distributing it into forty-eight constellations; but the modern astronomers comprehend the whole starry firmament, dividing it into three regions, viz. the zodiac, the region above, and that below it.

CONSTERNATION, *n. s.* Fr. *consternation*; Ital. *costernazione*; Span. *consternacion*; Lat. *consterno*. Excessive surprise; dismay; wonder; utter helplessness arising from fear.

They find the same holy *consternation* upon themselves that Jacob did at Bethel, which he called the gate of heaven.

South.

The natives, dubious whom

They must obey, in *consternation* wait

Till rigid conquest will pronounce their liege. *Philips.*

The nature of courage is, without a question, to be conversant with danger; but, in the palpable night of their errors, men under *consternation* suppose, not that it is the danger, which, by sure instinct, calls out the courage to resist it, but that it is the courage which produces the danger.

Burke.

CONSTIPATE, *v. a. 3* Fr. *constiper*; Ital.

CONSTIPATION, *n. s.* } *costipare*; Span. *constipar*; Lat. *constipare*. To render thick; to compress into little space. The act of compressing or condensing; stoppage from fulness; costiveness of the intestines. Both the verb and the noun are now chiefly used in the latter sense.

Of cold, the property is to condense and *constipate*.

Bacon.

This worketh by the detention of the spirits, and *constipation* of the tangible parts. *Id. Natural History.*

Omitting honey, which is laxative, and the powder of some loadstones in this, doth rather *constipate* and bind, than purge and loosen the belly.

Broune's Vulgar Errors.

It may, by amassing, cooling, and *constipating* of waters, turn them into rain.

Ray on the Creation.

The inactivity of the gall occasions a *constipation* of the belly.

Arbuthnot on Aliments.

There might arise some vertiginous motions or whirlpools in the matter of the chaos, whereby the atoms might be thrust and crowded to the middle of those whirlpools, and there *constipate* one another into great solid globes.

Bentley.

It requires either absolute fulness of matter, or a pretty close *constipation* and mutual contact of its particles.

Id.

CONSTITUTE, *v. a. & n. s.* }

CONSTITUTER, *n. s.* }

CONSTITUTION, *n. s.* }

CONSTITUTIONAL, *adj.* }

CONSTITUTIONALIST, *n. s.* }

CONSTITUTIONALLY, *adv.* }

CONSTITUTIONIST, *n. s.* }

CONSTITUTIVE, *adj.* }

CONSTITUENT, *n. s. & adj.* }

Fr. *consti-*

tuer; Ital. *costi-*

tituire; Span. *constituir*; Lat. *constituere*. To

constitute is;

to make to be;

to give regular

existence to;

to set up; to fix; to ordain; to depute; to appoint to office. The constituter is, the person who performs these acts; and the power by which he performs them is denominated constitutive. The noun, constitute, of old meant an established law. As an adjective, constituent signifies that which makes anything what it is; that which is an essential, integral part of. As a noun, it denotes the person or thing which performs the act of constituting; an indispensably necessary part of; he who deposes another to act for him. Constitution has several meanings.

The two prominent are, form of government; the state of the body with relation to strength and weakness, health and disease. It also denotes the act of constituting; mode of being; particular texture of parts; natural qualities; disposition with respect to temper; particular law; established usage. Constitutional, is that which is inherent in the corporeal constitution; in conformity with the civil constitution. Constitutionally means done legally; done according to the rules of the constitution. A constitutionist is one who is zealous for the constitution under which he lives; a constitutionalist, one who adheres to, or who has assisted in forming, a constitution. The last of these words is chiefly applied to those who formed, or defended, the French constitution of 1791.

We lawfully may observe the positive *constitutions* of our own churches. *Hooker.*

Dametas, according to the *constitution* of a dull head, thinks no better way to show himself wise than by suspecting every thing in his way. *Sidney.*

Some dear friend dead; else nothing in the world could turn so much the *constitution* Of any constant man.

Shakspeare. Merchant of Venice.

The Norman conquering all by might,
Mixing our customs, and the form of right,
With foreign *constitutions* he had brought. *Daniel.*

Although it be placed among the non-naturals, that is, such as, neither naturally *constitutive* nor merely destructive, do preserve or destroy.

Broune's Vulgar Errors.

We must obey laws appointed and *constituted* by lawful authority, not against the law of God.

Taylor's Holy Living.

Their first composure and origination requires a higher and nobler *constituent* than chance.

Hale's Origin of Mankind.

He defended himself with undaunted courage, and less passion than was expected from his *constitution*.

Clarendon.

The elements and *constitutive* parts of a schismatick, being the esteem of himself, and the contempt of others.

Decay of Piety.

The obstruction of the mesentery is a great impediment to nutrition: for the lymph in those glands is a necessary *constituent* of the aliment.

Arbuthnot on Aliment.

Amongst many bad effects of this oily *constitution*, there is one advantage; such who arrive to age, are not subject to stricture of fibres.

Id.

Nothing can be more reasonable than to admit the nominal division of *constitutionists*, and anti-constitutionists.

Bolingbroke.

It is impossible that the figures and sizes of its *constituent* particles should be so justly adapted, as to touch one another in every point. *Bentley's Sermons.*

This is more beneficial than any other *constitution*.

Id.

This light being trajected through the parallel prisms, if it suffered any change by the refraction of one, it lost that impression by the contrary refraction of the other: and so, being restored to its pristine *constitution*, became of the same condition as at first.

Newton's Opticks.

It is not probable any *constitutional* illness will be communicated with the small-pox by inoculation.

Sharp's Surgery.

Fierce licentiousness begets violent restraints. The military arm is the sole reliance; and then, call your *constitution* what you please, it is the sword that

governs. The civil power, like every other that calls in the aid of an ally stronger than itself, perishes by the assistance it receives. *Burke.*

A true natural aristocracy is not a separate interest in the state, or separable from it. It is an essential integrant part of any large body rightly *constituted*.

Id.

By a *constitutional* policy, working after the pattern of nature, we receive, we hold, we transmit our government and our privileges, in the same manner in which we enjoy and transmit our property and lives.

Id.

I could wish, undoubtedly, (if idle wishes were not the most idle of all things,) to make every part of my conduct agreeable to every one of my *constituents*. *Id.*

I have often observed, in the course of my experience of human life, that every man, even the worst, has something good about him; though very often nothing else than a happy temperament of *constitution* inclining him to this or that virtue. *Burns.*

But will sincerity suffice?

It is indeed above all price,

And must be made the basis;

But every virtue of the soul

Must *constitute* the charming whole,

All shining in their places. *Cowper.*

Patient of *constitutional* control,

He bears it with meek manliness of soul. *Id.*

There are valetudinarians in reputation as well as in *constitution*; who, being conscious of their weak part, avoid the least breath of air, and supply their want of stamina by care and circumspection.

Sheridan. School for Scandal.

CONSTITUTIONS, APOSTOLICAL, a collection of regulations attributed to the apostles, and supposed to have been collected by St. Clement, whose name they likewise bear. It is the general opinion, however, that they are spurious, and that St. Clement had no hand in them. They appeared first in the fourth century, but have been much changed and corrupted since. They are divided into eight books, consisting of a great number of rules and precepts, relating to the duties of Christians, and particularly the ceremonies and discipline of the church.

CONSTR'AIN, *v. a.* } Fr. *contraindre*;
CONSTR'AINABLE, *adj.* } Ital. *costringere*; Sp.
CONSTR'AINEDLY, *adv.* } *constrenir*; Lat. *con-*
CONSTR'AINER, *n. s.* } *stringere*, from *con-*
CONSTR'AIN'T, *n. s.* } and *stringere*. To
CONSTR'AIN'TIVE, *adj.* } compel; to prevent
by force; to violate; to embrace closely; to tie together; to constringe; to produce in opposition to nature; to withhold. Overpowering force; compulsion; act of restraining the desire; confinement.

But all for nought, the end is this, that he

Constrained was he nedes must her wed,

And taketh this olde wif, and goth to bed.

Chaucer. Canterbury Tales.

Save I, alas! whom care of force doth so *con-*
strayne,

To wale the day, and wale the night continually in
payne. *Earl of Surrey.*

Wherewith he gript her gorge with so great paine,
That soon to loose her wicked bonds did her *constraine*.

Spenser. Faerie Queene.

His limbs were waxen weak and raw,
Thro' long imprisonment, and hard *constraint*. *Id.*

Whereas men before stood bound in conscience to do as reason teacheth, they are now by virtue of human law *constrainable*; and, if they outwardly transgress, punishable. *Hooker.*

What occasion it had given them to think, to their greater obduration in evil, that through a froward and wanton desire of innovation we did *constrainedly* those things, for which conscience was pretended. *Id.*

Thy sight, which should
Make our eyes flow with joy,
Constrains them weep. *Shakspeare. Coriolanus*

I did suppose it should be on *constraint*;
But, heaven be thanked, it is but voluntary.
Id. King John.

Her spotless chastity,
Inhuman traitors! you *constrained* and forced.
Id. Titus Andronicus.

Not through any *constraining* necessity, or *constraining* vow. *Carew's Cornwall.*

The soft weapons of paternal persuasions, after mankind began to forget the original giver of life, became overweak to resist the first inclination of evil; or after, when it became habitual, to *constrain* it. *Raleigh.*

Love must freehearted be, and voluntary,
And not inlanted, or by fate *constrained.* *Davies.*
Bitter *constraint*, and sad occasion dear,
Compels me to disturb your season due. *Milton. Lycidas.*

In this northern tract our hoarser throats
Utter unripe and ill *constrained* notes. *Waller.*

My sire in caves *constrains* the winds,
Can with a breath their clam'rous rage appease;
They fear his whistle, and forsake the seas. *Dryden.*

Namur subdued, is England's palm alone;
The rest besieged, but we *constrained* the town. *Id.*

Constrained him in a bird, and made him fly
With party-colored plumes, a chatt'ring pye. *Id.*

Like you, a man; and hither led by fame,
Not by *constraint*, but by my choice, I came. *Id.*

The constant desire of happiness, and the *constraint*
it puts upon us to act for it, nobody, I think, accounts
an abridgment of liberty. *Locke.*

Every one's natural genius should be carried as far
as it could, but to attempt the putting another upon
him will be but labour in vain; and what is so plastered
on will at best sit but untowardly, and have always
hanging to it the ungracefulness of *constraint*
and affectation. *Id.*

When to his lust Ægyptus gave the rein,
Did fate or we the adult'rous act *constrain*? *Pope's Odyssey.*

How the strait stays the slender waist *constrain.* *Gay.*

Sweet bird, whom the winter *constrains*—
And seldom another it can—

To seek a retreat while he reigns,
In the well-sheltered dwellings of man. *Couper.*

CONSTRIC'T, v. a. } Fr. *contraction*; It.
CONSTRIC'TIVE, adj. } *costrizione*; Span. *con-*
CONSTRIC'TION, n. s. } *stricción*; Lat. *con-*
CONSTRIC'TOR, n. s. } *stringere, constrictum.*
To bind; to press tight together; to contract;
to cause to shrink. Contraction; shrinking together;
compression produced by some internal
quality. Having the power of causing to
contract; the agent in the act of so causing.

The air, which these receive into the lungs, may
serve to render their bodies equiponderant to the wa-
ter; and the *contriction* or dilatation of it may pro-
bably assist them to ascend or descend in the water.

Ray on the Creation.

Such things as *constrict* the fibres, and strengthen
the solid parts. *Arbuthnot on Diet.*

He supposed the *constrictors* of the eyelids must be
strengthened in the superciliaus.

Id. and Pope's Mart. Scrib.

CONSTRUNGE, v. a. } Fr. *constringent*; It.
CONSTRUNGE, adj. } *costringente*; Lat. *con-*
stringens, constringere. To compress, or bind
together, the particles of a substance; to force
anything to contract itself. Having a binding
quality. See **CONSTRAINT**, and **CONSTRUCT**.

The dreadful spout,
Which shipmen do the hurricano call,
Construng in mass by the almighty sun.
Shakspeare. Troilus and Cressida.

Try a deep well, or a conservatory of snow, where
the cold may be more *constringent*.
Bacon's Natural History.

Strong liquors, especially inflammatory spirits, in-
toxicate, *constringe*, harden the fibres, and coagulate
the fluids. *Arbuthnot.*

Winter binds

Our strengthened bodies in a cold embrace
Constringent. *Thomson's Winter.*

CONSTRUCT, v. a. } Fr. and Ital. *con-*
CONSTRUCTER, n. s. } *struire*; Span. *con-*
CONSTRUCTION, n. s. } *struir*; Lat. *con-*
CONSTRUCTIONAL, adj. } *struere.* To build;
CONSTRUCTIVE, adj. } to frame; to form;
CONSTRUCTIVELY, adv. } to put together. The
CONSTRUCTURE, n. s. } act of building; the

form of a building, construction: disposition of
parts; grammatical arrangement of words; in-
terpretation; meaning; mental representation;
manner of describing a geometrical figure or pro-
blem; manner of reducing a known equa-
tion into lines and figures. See the next arti-
cle. Constructive and constructively signify, by
construction.

In which sense although we judge the apostle's
words to have been uttered, yet hereunto we do not
require them to yield, that think any other *construc-*
tion more sound. *Hooker.*

There's no art

To show the mind's *construction* in the face
Shakspeare.

This label, whose containing
Is so from sense in hardness, that I can
Make no collection of it; let him shew
His skill in the *construction*.

Shakspeare. Cymbeline.

It cannot, therefore, unto reasonable *constructions*
seem strange, or savour of singularity, that we have
examined this point. *Browne's Vulgar Errors.*

Let there be an admiration of those divine attributes
and prerogatives, for whose manifesting he was pleased
to *construct* this vast fabrick.

Boyle's Usefulness of Natural Philosophy.

Some particles constantly, and others in certain
constructions, have the sense of a whole sentence con-
tained in them. *Locke.*

They shall the earth's *constructure* closely bind,
And to the centre keep the parts confined.

Blackmore.

The ways were made of several layers of flat
stones and flint: the *construction* was a little various,
according to the nature of the soil, or the materials
which they found. *Arbuthnot.*

Religion, in its own nature, produces good will
towards men, and puts the mildest *construction* upon
every accident that befalls them. *Spectator.*

He that would live at ease, should always put the best *construction* on business and conversation.

Collier on the Spleen.

They have a power given to them, like that of the evil critic, to subvert and destroy; but none to *construct*, except such machines as may be fitted for further subversion, and further destruction. *Burke.*

The precept given by a wise man, as well as a great critic, for the *construction* of poems, is equally true as to states:—Non satis est pulchra esse poemata, dulcia sunt. *Id.*

Such *constructive* whole, residing in a part only, is one of the most violent fictions of positive law, that ever has been or can be made on the principles of artificial incorporation. *Id.*

If shrewd, and of a well *constructed* brain,
Keen in pursuit and vigorous to retain,
Your son come forth a prodigy of skill;
As, whereso'er taught, so formed, he will;
The pedagogue, with self-complacent air,
Claims more than half the praise as his due share.

Cooper.

But man is a carnivorous production,

And must have meals, at least one meal a day!

He cannot live, like woodcocks, upon suction,

But, like the shark and tiger, must have prey:

Although his anatomical *construction*

Bears vegetables in a grumbling way.

Byron's Don Juan.

CONSTRUCTION, in algebra, a method of reducing a known equation into lines and figures. An equation may be formed, or the roots determined, by the intersections of a straight line with another line or curve, of equal dimensions with the equation to be constructed; for the roots of the equation are the ordinates of the curve at the points of intersection with the right line; and it is generally understood, that a curve may be cut by a right line in as many points as its dimensions amount to. In this manner, therefore, a simple equation will be constructed by the intersection of one right line with another; a quadratic equation, or an affected equation of the second rank, by the intersection of one right line with a circle, or any of the conic sections, which are all lines of the second order, and which may be cut by the right line in two points, and so produce the two roots of the quadratic equation. A cubic equation may be constructed by the intersection of the right line with a line of the third order, &c. &c. If, however, some other line of a higher order be made use of instead of the right line, then the second line, by whose intersections with the former the roots of the equation are to be determined, may be taken as many dimensions lower as the former is taken higher; and whatever be the height of an equation, it will generally be constructed by the intersections of two lines, whose dimensions, when multiplied together, make up the dimensions of the given equation. Thus, the intersections of a circle with the conic sections, or of these with each other, will construct the biquadratic equations, or those of the fourth power, because $2 \times 2 = 4$; and the intersections of the circle or conic sections with a line of the third order, will construct the equations of the fifth and sixth powers, &c. &c.

CONSTRUE, *v. a.* Fr. *construire*; Ital. *costruire*; Span. *construir*; Lat. *construere*. To show the signification of; to explain; to interpret.

If she give it me I force not,
And if she take it again she cares not
Construe what this is and tell not,

For I am faste sworne, I may not. *Wyat.*

That much she muzzd, yet could not *construe* it,
By any riddling skill or commune wit.

Spenser. Faerie Queene.

I must crave that I be not so understood or *construed*, as if any such thing, by virtue thereof, could be done without the aid and assistance of God's most blessed Spirit. *Hooker.*

Yet at my parting sweetly did she smile,

In scorn or friendship, nill I *construe* whether.
Shakspeare. The Passionate Pilgrim.

Construe the times to their necessities,
And you shall say, indeed, it is the time,
And not the king, that doth you injuries.

Id. Henry IV.

Virgil is so very figurative, that he requires (I may almost say) a grammar apart to *construe* him.

Dryden.

Thus we are put to *construe* and paraphrase our own words, to free ourselves either from the ignorance or malice of our adversaries. *Stillingfleet.*

When the word is *constructed* into its idea, the double-meaning vanishes. *Addison on Ancient Medals.*

CONSTUPRATE, *v. a.* Fr. *constuprer*; **CONSTUPRATION**, *n. s.* Span. *constuprar*; Lat. *constuprare*. To ravish; to debauch; to defile. Violation; defilement

Their wives and loveliest daughters *constuprated*.

Barton.

The very sight is a kind of *constupration*.

Bp. Hall.

CONSUBSIST, *v. n.* To exist at the same time with.

There are some who hold two *consubsisting* wills, an active and an elective, the latter continually directing the former. *Ab. Tucker.*

CONSUALIA, in antiquity, feasts held in honor of the god Consus, or Neptune. They were introduced with a magnificent cavalcade, because Neptune was reputed to have first taught men the use of horses. Evander is said to have first instituted this feast; it was re-established by Romulus, because some god, under the denomination of Consus, suggested to him the rape of the Sabines. To this feast all his neighbours were invited; and, to draw the greater concourse of people, he gave out that he had found an altar hid under the ground, which he intended to consecrate, with sacrifices to the god to whom it had been originally erected. Taking advantage of the confidence of the people who had assembled, and who were then engaged in the solemnities and sacrifices of the festival, he forcibly seized and carried away all their women. The consualia were of the number of sacred feasts. Originally, they were not distinguished from those of the circus; whence Valerius Maximus says, the rape of the Sabine women was effected at the games of the circus. Plutarch observes, that during this solemnity, horses and asses were exempted from all labor, and were led through the streets adorned with crowns and garlands, &c.

Festus says, the cavalcade was performed with mules; it being an opinion, that this was the first animal used to draw the car. Servius places the consualia on the 13th August; Plutarch on the 18th, and the old Roman calendar on the 21st of that month.

CONSUBSTANTIATE, *v. a., n. s.* } Fr. *con-*
 CONSUBSTANTIATION, *n. s.* [& *adj.*] } *substan-*
 CONSUBSTANTIAL, *adj.* } *tiel*; Sp.
 CONSUBSTANTIALITY, *n. s.* } *consub-*
 CONSUBSTANTIALIST, *n. s.* } *stantial*;

Lat. *consubstantialis*. To unite in one common substance or nature; to profess consubstantiation. Consubstantiate, as an adjective, means united. Consubstantial is, having the same essence; being of the same nature. Consubstantiality signifies, existence of more than one in the same subject; participation in the same nature. A Lutheran is a consubstantialist.

The Lord our God is but one God; in which indivisible unity, notwithstanding we adore the Father, as being altogether of himself, we glorify that *consubstantial* Word, which is the Son; we bless and magnify that co-essential Spirit, eternally proceeding from both, which is the Holy Ghost. *Hooker*.

It continueth a body *consubstantial* with our bodies; a body of the same, both nature and measure, which it had on earth. *Id.*

In their conceits the human nature of Christ was not *consubstantial* to ours, but of another kind. *Brerewood*.

He might almost *consubstantiate* and unite himself to his Saviour. *Hammond*.

The eternity of the Son's generation, and his co-eternity and *consubstantiality* with the Father, when he came down from heaven. *Id. on Fundamentals*.

Transubstantiation, *consubstantiation*, real presence, articles and distinctions set up by men without authority from Scripture, and other less differences, which good Christians may differ about without endangering their salvation. *Locke*.

The *consubstantiating* church and priest, Refuse communion to the Calvinist. *Dryden*.

In the point of *consubstantiation*, towards the latter end of his life, he changed his mind. *Atterbery*.

CONSUBSTANTIATION, *ομοσπουσις*, was a term first used by the fathers of the councils of Antioch and Nice, to express the orthodox doctrine of the Trinity the more precisely, and to serve as a barrier and precaution against the errors and subtleties of the Arians, who owned every thing except the consubstantiality. The Arians allowed that the word was God, as having been made God; but they denied that he was the same God, and of the same substance with the Father; accordingly, they exerted themselves to the utmost to abolish the use of the word. The emperor Constantine used all his authority with the bishops to have it expunged out of the symbols; but it was retained, and is still the distinguishing criterion between an Athanasian and an Arian. Curcellæus maintains, that it was an innovation in doctrine in the council of Nice, to admit an expression, the use of which had been abolished by the council of Antioch.

CONSUEITUDE, *n. s.* Lat. *consuetudo*. Custom or usage.

CONSUL, *n. s.* } Fr. Ital. Span. Lat.
 CONSULAR, *adj.* } *consul*. The chief magis-
 CONSULARY, *adj.* } trate of the Roman re-
 CONSULATE, *n. s.* } public, and, for a short
 CONSULSHIP, *n. s.* } period, of the French; an officer commissioned to reside in a foreign port, to protect the commerce of his nation. In Rome, consular man was one who had filled the office of consul. Consulate and consulship signify, the office of consul. See the next article.

Or never be so noble as a *consul*,
 Nor yoke with him for tribune.

Shakspeare. Coriolanus.
 Rose not the *consular* men, and left their places,
 So soon as thou sat'st down? *Ben Jonson's Catiline*.

The patricians should do very ill,
 To let the *consulship* be so defiled. *Id.*
Consuls of moderate power in calms were made;
 When the Gauls came, one sole dictator swayed.

Dryden.
 His name and *consulate* were effaced out of all public registers and inscriptions. *Addison on Italy*.

The *consular* power had only the ornaments, without the force, of the royal authority. *Spectator*.

CONSULS, in Roman history, were two magistrates invested with supreme authority for one year, and annually chosen in the Campus Martius. Brutus and Collatinus, the two first consuls, were elected A. U. C. 244. For 144 years afterwards the consuls were always chosen from patrician families, but the people, A. U. C. 388, obtained the privilege of electing one of the consuls from their own body, and sometimes both were plebeians. The first consul among the plebeians was L. Sextius. The *legitimum tempus*, the time fixed by law for the consulship, was forty-three years of age. The candidate was always to appear at the election as a private man, without a retinue, and it was requisite before he canvassed for the office, that he should have discharged the functions of a *quaestor*, *ædile*, and *prætor*. Sometimes these qualifications were disregarded. Valerius Corvinus was made a consul in his twenty-third year, and Scipio in his twenty-fourth. Young Marius, Pompey, and Augustus, were also under the proper age when they were invested with the office, and Augustus had never been *quaestor* or *prætor*.

The power of the consuls was unbounded, and they knew no superior but the gods and the laws; but, after the expiration of their office, their conduct was minutely scrutinised by the people, and their misbehaviour often punished. The badge of their office was the *prætecta*, a robe fringed with purple, afterwards changed for the *toğa picta* or *palmata*. They were preceded by twelve lictors, carrying the *fascès*, or bundle of rods, in the middle of which appeared an axe. The axe, as being the characteristic rather of tyranny than of freedom, was taken away from the *fascès* by Valerius Publicola, but it was restored by his successor. They took the *fascès* by turns monthly, preceded by the lictors, while at Rome, lest the appearance of two persons with the badges of authority, should raise apprehensions in the multitude. While one appeared publicly in state, only a crier walked before the other and the lictors followed behind without the *fascès*. Their authority was equal, yet the Va-

erian law gave the right or priority to the elder, and the Julian law to him who had most children; and he was generally called consul-major or prior. As their power was absolute, they presided over the senate, and could convene and dismiss it at pleasure. The senators were their counsellors; and among the Romans, the manner of reckoning their years was by the names of the consuls. By M. Tullio Cicerone et L. Antonio Consulibus, for instance, the year of Rome 689, was always understood. This custom lasted from A. U. C. 244, till A. U. C. 1294, or 541 of the Christian era. In public assemblies the consuls sat in ivory chairs, and held in their hand an ivory wand, called *Scipio eburneus*, which had an eagle on its top as a sign of dignity and power. When they had drawn by lot the provinces over which they were to preside during their consulship, they went to the capitol to offer their prayers to the gods, and to entreat them to protect the republic; after this, they departed from the city arrayed in their military dress and preceded by the lictors. Sometimes the provinces were assigned them by appointment of the senators. At their departure they were provided by the senate with whatever was requisite during their expedition. In their provinces, they were both attended by the twelve lictors, and equally invested with legal authority. They were not permitted to return to Rome without the special command of the senate; and they always remained in the province till the arrival of their successor. At their return they bargained the people, and solemnly protested that they had done nothing against the laws or interest of their country, but had faithfully and diligently endeavoured to promote the greatness and welfare of the state. No man could legally be consul two years successively, yet this institution was sometimes broken, and we find Marius re-elected consul after the expiration of his office during the Cimbric war. The office of consul, so dignified during the times of the commonwealth, became a mere title under the emperors, and retained nothing of its authority but the useless ensigns of original dignity. Even the duration of the office, which was originally annual, was reduced to two or three months by Julius Cæsar; but they who were admitted on the first of January, denominated the year, and were called *ordinarii*. Their successors during the year were distinguished by the name of *suffecti*. Tiberius and Claudius abridged the time of the consulship; and the emperor Commodus made no less than twenty-five consuls in one year. Constantine the Great renewed the original institution, and permitted them to be a whole year in office.

CONSULS, in trade, are officers appointed by the king at different foreign ports, to protect the commerce of our merchants. They are to keep up a correspondence with the British ministers residing in the courts whereon their consulate depends. They are to attend to the interests of the nation; to dispose of the sums given, and the presents made, to the lords and principals of places, to obtain their protection, and prevent insults of the natives on the merchants of the nation. It was stipulated by the treaty of Utrecht, between Great Britain and Spain, that

the consuls residing in the dominions of the king of Spain, should take inventories of the estates of the English dying intestate in Spain; and that such estates should be entrusted to two or three merchants, for the security and benefit of the heirs and creditors. And it is enacted, by the statute 9th George II., that it shall be lawful for persons appointed by the consuls at the ports of Cadiz and St. Mary's in Spain, with the majority of the British factors and merchants there, to receive from all English and Irish ships trading there, any sums of money not exceeding two rials plate per ducat on the freight of goods and merchandise there imported, and on all tonnage goods, not exceeding two rials plate per ton, and all their bills of lading shall specify to pay the same, under the denomination of contribution. And that all British and Irish commanders, trading to the said ports, and delivering there, shall, within ten days after their arrival, deliver a manifesto, upon oath, specifying the particulars of the cargo, and to whom consigned; which oath is to be administered by the consul, or by a person appointed by him; and the clearances shall be detained till payment of the money is made; and, should any depart without his clearances, the consul, on the return of any such master to any port in the king's dominions, may have an action at law against him for the said money. All monies raised to be applied to the relief of shipwrecked mariners, or other distressed persons, his majesty's subjects, and such other benevolent uses as the consul shall appoint.

CONSULT, *v. a., v. n. & n. s.* } Fr. *consultation*; Ital. *consultare*; Sp. *consultar*; Lat. *consultare*. To deliberate together; to ask advice of; to act with a reference to; to debate on; to contrive. Consult and consultation are synonymous; but the latter is most in use in prose, the former in poetry. They signify the act of consulting; a determination; an assembly of persons met to deliberate on something. Consultative is, having a power of consulting.

There shall not be found among you a charmer, or a *consulter* with familiar spirits, or a wizard.

Deut. xviii. 11.

Consult not with the slothful for any work.

Eccles. xxxvii.

Thou hast *consulted* shame to thy house, by cutting off many people.

Hab. ii. 10.

A senate-house, wherein three hundred and twenty men sat *consulting* always for the people.

1 Mac. viii. 15.

The chief priests held a *consultation* with the elders and scribes.

Mark xv. 1.

Every man,

After the hideous storm that followed, was
A thing inspired; and, not *consulting* broke
Into a general prophecy, that this tempest,
Dashing the garment of this peace, aboded
The sudden breach on't.

Shakspeare. Henry VIII.

Divers meetings and *consults* of our whole number, to consider of the former labors.

Bacon.

He sent for his bosom friends, with whom he most confidently *consulted*, and showed the paper to them, the contents whereof he could not conceive.

Clarendon.

We are, in the first place, to *consult* the necessities of life, rather than matters of ornament and delight.

L'Étrange.

A *consultation* was called, wherein he advised a salivation.

Wise man of Abscesses.

Yourself in person head one chosen half,

And march to oppress the faction in *consult*

With dying Dorax. *Dryden's Don Sebastian.*

He said, and rose the first; the council broke;

And all their grave *consults* dissolved in smoke.

Id. Fables.

The senate owes its gratitude to Cato,

Who with so great a soul *consults* its safety,

And guards our lives, while he neglects his own.

Addison.

A *consult* of coquets below

Was called, to rig him out a beau. *Swift.*

They (neutrals) are generally chosen, because they have no opinion of their own; and as far as they can be got in good earnest to embrace any opinion, it is that of whoever happens to employ them (neither longer or shorter, narrower or broader), with whom they have no discussion or *consultation*. The only thing which occurs to such a man when he has got a business for others into his hands, is how to make his own fortune out of it.

Burke.

Consult life's silent clock, thy bounding vein;

Seems it to say—Health here has long to reign?

Cowper.

CONSUME, *v. a. & n.* } Fr. *consummer*; Ital. *consummare*; *adj.* } *consumare*; Sp. *consumar*; Lat. *consumere*.
CONSUMABLE, *adj.* }
CONSUMER, *n. s.* }

To destroy by fire; to waste; to destroy; to waste away. Consumable is, that which is capable of being destroyed; that which may be worn out or spent. See CONSUMPTION.

Thou shalt carry much seed out into the field, and shalt gather but little in; for the locusts shall consume it.

Deut. xxviii.

Thou likenest it also to wilde fire,

The more it brenneth the more it hath desire

To consume every thing that brent would be.

Chaucer. Cant. Tales.

I dye though not incontinent,

By processe yet *consumingly*,

Is waste of fire which doth relent,

If you as wilfull will deny. *Wyat.*

His face was leane, and sundeaile pynd away,
And eke his hands *consumed* to the bone. *Sackville.*

For Heven itselfe shall their successe envy,

And them with plagues and murrins pestilent

Consume, till all their warlike puissance be spent.

Spenser. Faerie Queene.

His warlike shield all closely covered was,

Ne might of mortall eye be ever scene;

Not made of steele, nor of enduring bras,

(Such earthly metalls soon *consumed* beene),

But all of diamond perfect pure and cleene
It famed was. *Id.*

Where two raging fires meet together,

They do *consume* the thing that feeds their fury.

Shakespeare.

Fair flowers, that are not gathered in their prime,

Rot and *consume* themselves in little time.

Id. Venus and Adonis.

Our growing rich or poor depends only on, which is greater or less, our importation or exportation of *consumable* commodities.

Locke.

Money may be considered as in the hands of the *consumer*, or of the merchant who buys the commodity, when made to export.

Id.

Thus in soft anguish she *consumes* the day,
Nor quits her deep retirement. *Thomson's Spring.*

He sleeps in dust. Ah, how shall I pursue:

My theme! To heart-consuming grief resigned,

Here, on his recent grave I fix my view,

And pour my bitter tears. Ye flowery lays, adieu!

Beattie.

To joys forbidden man aspires,

Consumes his soul with vain desires;

Folly the spring of his pursuit,

And disappointment all the fruit. *Cowper.*

I have a silent sorrow here,

A grief I'll ne'er impart;

It breathes no sigh, it sheds no tear,

But it *consumes* my heart! *Sheridan.*

And, Oh! that pang where more than madness lies!

The worm that will not sleep—and never dies,

Thought of the gloomy day and ghastly night,

That dreads the darkness, and yet loaths the light,

That winds around, and tears the quivering heart!

Ah! wherefore not *consume* it—and depart!

Byron. The Bride of Abydos.

CONSUMMATE, *v. a. & adj.* } Fr. *con-*
CONSUMMATELY, *adv.* } *sommer*; It.

CONSUMMATION, *n. s.* } *consumare*;

Ital. *consumar*; Lat. *consummare*. To perfect;

to bring to a conclusion; to crown the whole.

Completion; accomplishment; the end of the

world; the end of life.

From the first beginning of the world unto the last *consummation* thereof, it neither hath been, nor can be, otherwise.

Hooker.

I do but stay till your marriage be *consummate*.

Shakespeare.

There shall we *consummate* our spousal rites.

Yourself, myself, and other lords, will pass

To *consummate* this business happily. *Id. King John.*

Ghost, unlaid, forbear thee!

Nothing ill come near thee!

Quiet *consummation* have,

Unremoved be thy grave. *Id. Cymbeline.*

The person was cunning enough to begin the deceit in the weaker, and the weaker sufficient to *consummate* the fraud in the stronger.

Broune's Vulgar Errors.

Earth, in her rich attire

Consummate, lovely smiled. *Milton's Paradise Lost.*

Last the bright *consummate* flower

Spirits odorous breathes. *Id.*

He had a mind to *consummate* the happiness of the day.

Tatler.

Gratian, among his maxims for raising a man to the most *consummate* greatness, advises to perform extraordinary actions, and to secure a good historian.

Addison's Freeholder.

That just and regular process, which it must be supposed to take from its original to its *consummation*.

Id. Spectator.

Under the conduct of Felix Ragusinus, a Dalmatian, *consummately* learned in the Greek, Chaldaick, and Arabic languages.

Warton. H. E. Poetry.

How'er ingenious on his darling theme

A sceptic in philosophy may seem,

Reduced to practice, his beloved rule

Would only prove him a *consummate* fool. *Cowper.*

There was the *consummation* and the crown,

The flower of Israel's infamy full blown;

Thence date their sad declension and their fall,

Their woes, not yet repealed, thence date them all.

Id.

CONSUMPTION, *n. s.* } Fr. *consomption* ;
 CONSUMPTIVE, *adj.* } Ital. *consumazione* ;
 CONSUMPTIVELY, *adv.* } Span. *consuncion*,
 CONSUMPTIVENESS, *n. s.* } *consumptio*. The act
 of wearing out, or applying to the purpose of
 subsistence ; waste ; the state of wasting away ; a
 disease of the lungs, accompanied by hectic fever,
 and gradual loss of flesh. Destructive ; exhaust-
 ing ; diseased by consumption. Consumptively,
 and consumptiveness, always refer to the disease,
 and signify tendency to it.

Consumption sow

In hollow bones of man. *Shakspeare. Timon.*

The stoppage of women's courses, if not looked to,
 sets them into a *consumption*, dropsy, or other disease.

Harvey.

Nothing taints sound lungs sooner than inspiring
 the breath of *consumptive* lungs. *Id.*

The lean, *consumptive* wench, with coughs decayed,
 Is called a pretty, tight, and slender maid. *Dryden.*

In commodities, the value rises as its quantity is
 less and vent greater ; which depends upon its being
 preferred in its *consumption*. *Locke.*

The essential end distinguishing character of a con-
 firmed *consumption*, is a wasting of the body by reason
 of an ulcerated state of the lungs, attended with a
 cough, a discharge of purulent matter, and a hectic
 fever. *Blackmore.*

Etna and Vesuvius have sent forth flames for this
 two or three thousand years, yet the mountains them-
 selves have not suffered any considerable diminution
 or *consumption* ; but are, at this day, the highest moun-
 tains in those countries. *Woodward.*

A long *consumptive* war is more likely to break this
 grand alliance than disable France.

Addison on the War.

By an exact regimen a *consumptive* person may hold
 out for years. *Arbutnot on Diet.*

Consumption near ; a joyless meagre wight,
 Panting for breath, and shrinking into shade,
 Eludes the grasp : thin as the' embodied air,
 Which erst deceived Ixion's void embrace,
 Ambitious of a goddess ! scarce her legs
 Feeble she drags, with wheezing labour on,
 And motion slow : a willow wand directs
 Her tottering steps, and marks her for the grave.

W. Thompson.

The balance between *consumption* and production
 makes price. The market settles, and alone can settle,
 that price. *Burke.*

A more uniform quantity of heat may be serviceable
 to *consumptive* patients than can be met with in this
 country, as the lungs cannot be clothed like the exter-
 nal skin, and are therefore subject to greater extremes
 of heat and cold in passing in winter from a warm
 room into the frosty air. *Darwin.*

A puny *consumptively* disposed mother. *Beddoes.*

CONSUMPTION, in medicine, is of very exten-
 sive signification, implying all disorders that
 bring any decay upon the constitution ; but is
 most commonly used for the phthisis pulmonalis.
 See MEDICINE.

CONSUMPTION, in farriery. See FARRIERY.

CONSUS, a name of Neptune, the pagan god
 of counsel. He had an altar under ground in
 the great circus at Rome, to show that counsel
 ought to be kept secret. See CONSUALIA.

CONSUTILE, *adj.* Lat. *consutilis*. That is
 sewed together.

CONTA'BULATE, *v. a.* } Lat. *contabulare*.
 CONTABULATION, *n. s.* } To floor with boards.
 Joining of boards together ; flooring. Both words
 are obsolete, and never were much in use.

CONTACT, *n. s.* } Fr. *contact* ; Ital. *con-*
 CONTACTION, *n. s.* } *tatto* ; Span. *contacto* ; Lat.
contactus. Touch ; close union ; juncture of two
 bodies. The act of touching.

The Platonists hold, that the spirit of the lover doth
 pass into the spirits of the person loved, which causeth
 the desire of return into the body ; whereupon fol-
 loweth that appetite of *contact* and conjunction.

Bacon's Natural History.

That deleterious it may be at some distance, and
 destructive without corporal *contaction*, there is no
 high improbability. *Browne's Vulgar Errors.*

When the light fell so obliquely on the air, which
 in other places was between them, as to be all re-
 flected, it seemed in that place of *contact* to be wholly
 transmitted. *Newton's Opticks.*

The air, by its immediate *contact*, may coagulate
 the blood which flows along the air-bladders.

Arbutnot on Diet.

The emphatic speaker dearly loves to' oppose,
 In *contact* inconvenient, nose to nose,
 As if the' gnomon on his neighbour's phiz,
 Touched with a magnet, had attracted his. *Cowper.*

The surface of the earth nearer the pole moves
 slower than it does in our latitude ; whence the re-
 gions of air brought from thence, move slower,
 when they arrive hither, than the earth's surface
 with which they now become in *contact* ; that is,
 they acquire an apparently easterly direction, as the
 earth moves from west to east faster than this new
 part of its atmosphere. *Darwin.*

CONTAGION, *n. s.* } Fr. *contagion* ;
 CONTAGIOUS, *adj.* } Ital. *contagio*, *conta-*
 CONTAGIOUSNESS, *n. s.* } *gione* ; Span. *con-*
tagio, *contagion* ; Lat. *contagio*. The effluvia
 by which diseases are propagated ; infection ;
 propagation of disease or mischief ; pestilential
 emanations ; plague. Infections caught by ap-
 proach or contact ; figuratively, caught by sym-
 pathy ; venomous ; pestilential. The quality of
 being contagious.

And of thy light my soule in prison light,
 That troubled is by the *contagion*
 Of my body, and also by the wight
 Of earthly lust and false affection.

Chaucer. Cant. Tales.

Or that the charme and veneme which they dronck,
 Their blood with secret filth infected hath,
 Being diffused through the senseless tronck,
 That through the great *contagion* direful deadly stonck.

Spenser. Faerie Queene.

But being grown strong, it forth doth bring
 Sorrow, an languish, and impatient paine
 In the inner parts, and lastly, scattering
Contagious poyson close through every vaine,
 It never rests till it have wrought his finall banck. *Id.*

If we two be one, and thou play false,
 I do digest the poison of thy flesh,
 Being strumpeted by thy *contagion*.

Shakspeare. Comedy of Errors.

Will he steal out of his wholesome bed,
 To dare the vile *contagion* of the night ?
Shakspeare. Julius Caesar.

The jades,
That drag the tragic melancholy night,
From their misty jaws
Breathe foul, *contagious* darkness in the air.
Shakspeare. Henry VI.

In infection and *contagion* from body to body, as the plague and the like, the infection is received many times by the body passive; but yet is, by the strength and good disposition thereof, repulsed. *Bacon.*

Nor will the goodness of intention excuse the scandal and *contagion* of example. *King Charles,*

Down fell they,

And the dire hiss renewed, and the dire form
Caught by *contagion*. *Milton. Paradise Lost.*

An excellent preservative against the *contagiousness* of sin. *Mountague.*

But when thou seest a single sheep remain
In shades aloof, or couched upon the plain;
Or listlessly to crop the tender grass;
Or late to lag behind, with truant pace;
Revenge the crime, and take the traitor's head,
Ere in the faultless flock the dire *contagion* spread.
Dryden. Georgic III.

We sicken soon from her *contagious* care,
Grieve for her sorrows, groan for her despair. *Prior.*

Wide o'er the human field, the body, spreads
Contagious war, and lays its beauties waste.
W. Thompson.

Frantic with fear, they sought by flight to shun
The fierce *contagion*. O'er the mournful land
The infected city poured her hurrying swarms.
Armstrong.

Men in this deplorable state of mind find a comfort
in spreading the *contagion* of their spleen. They find
an advance too; for it is a general popular error to
imagine the loudest complainers for the public to be
the most anxious for its welfare. *Burke.*

Long may the hardy sons of rustic toil
Be blest with health, and peace, and sweet content!
And, oh! may Heaven their simple lives prevent
From luxury's *contagion*, weak and vile. *Burns.*

Excess, the scrofulous and itchy plague,
That seizes first the opulent, descends
To the next rank *contagious*, and in time
Taints downward all the graduated scale
Of order, from the chariot to the plough.
Cowper.

You meet *contagion* issuing from afar,
And dash the baleful conqueror from his car;
When, guest of Death! from charnel vaults he steals,
And bathes in human gore his armed wheels.
Darwin.

CONTAGION, in some diseases, is only conveyed by immediate contact, as the venom of the pox; in others, by infected clothes, as the scabies; and in others it is transmitted through the air at a considerable distance, by effluvia arising from the sick, as in the plague and other pestilential disorders; in which case the air is said to be contagious, though this has been disputed. Although no attempt to investigate the nature of contagion, or to ascertain the properties of contagious matter, has hitherto proved successful, yet the means which have been effectually employed, either to abate its virulence or to destroy it entirely, afford a pretty fair inference that this matter is of a chemical nature. In 1773 the fumes of muriatic acid were successfully used by

Morveau in purifying the cathedral of Dijon; and it was doubtless from this that Dr. Carmichael Smyth was led to propose the fumes of nitric acid.

In November, 1795, this was tried on board several ships then lying at Sheerness; and, being found to answer the purpose of destroying the contagion which prevailed among the mer, government afterwards liberally rewarded Dr. Smyth for his discovery. The wards of the Union hospital ship were at this time very much crowded with patients; and of 200 sick persons on board, three-fourths were in different stages of a malignant contagious fever, which made a very rapid progress, and produced very fatal effects on the attendants and ship's company. Here the experiments were begun, conducted by Mr. Menzies, surgeon of the Discovery, and Mr. Bassan, surgeon of the Union. The following were the materials and apparatus employed in the process: A quantity of fine sand, twenty-four earthen pipkins, twenty-four common tea-cups, some long slips of glass for spatulas, a quantity of concentrated sulphuric acid, and a quantity of salt-petre (nitrate of potassa). Having then shut up all the ports and scuttles, the sand, previously heated in iron pots, was scooped out into the pipkins with an iron ladle, and in this heated sand, in each pipkin, a small tea-cup was immersed, containing about half an ounce of sulphuric acid, to which, after it had acquired a proper degree of heat, an equal quantity of nitrate of potassa in powder was gradually added, and the mixture stirred with a glass spatula till the vapor arose from it in considerable quantity. The pipkins were then carried through the wards by the nurses and convalescents, who kept walking about with them in their hands, occasionally putting them under the cradles of the sick, and in every corner where any foul air was suspected to lodge. They continued this fumigation till the whole space between decks, fore and aft, was filled with vapor, appearing like a thick haze. At first the vapor excited a tickling cough among the patients; but this generally ceased as the wards became more generally filled; and perhaps even this might be partly owing to the inattention of those who carried the pipkins, coming too close to the faces of the sick, and causing them to inhale the strong vapor arising from the cups. During the fumigation the bed-clothes and body-clothes of the sick were exposed as much as possible to the nitrous vapor; and all the foul linen removed from them was instantly immersed in a tub of cold water, afterwards carried on deck, rinsed out, and hung up till nearly dry, and then fumigated before it was taken to the washers: a precaution extremely necessary in every case of infectious disorder. Cleanliness and ventilation were likewise carefully attended to. This first experiment took up three hours; and about an hour after, the vapor having completely subsided, the ports and scuttles were opened to admit fresh air. After this first fumigation the air of the hospital was very sensibly sweetened; and the process was repeated next morning; when the people employed, being now more expert, finished the whole in about an

hour; and, the vapor subsiding in an hour, the fresh air was freely admitted. In the evening fumigations fewer pipkins were used, as the fresh air could not be afterwards so freely admitted as in the morning. The offensive and disagreeable smell arising from so many sick crowded together being by the fumigation perceptibly destroyed, even to the attendants, they were led to confide in its efficacy, to throw off the dread with which they had formerly approached the cradles of the diseased, and to perform the duties of the hospital with regularity and alacrity. Not one person in the ship was attacked with the fever, from the 26th of November, when the fumigation was first resorted to, till the 25th of December, though in the course of the three preceding months above one-third of all the people on board had been seized with the distemper, and it had proved fatal to more than one-fourth of these; and there was no probability but that sickness and mortality would have increased in proportion as the contagion spread, and as the despondency of the people, who considered themselves as so many devoted victims, increased.

'The principal diseases excited by poisonous miasmata,' says Dr. Hooper, 'are intermittent, remittent, and yellow fevers, dysentery, and typhus. The virus of the last is generated in the human body itself, and is sometimes called the typhoid fomes. The other miasmata are produced from most vegetable matter, in some unknown state of decomposition. The contagious virus of the plague, small-pox, measles, chincough, cynanche maligna, and scarlet fever, as well as of typhus and the jail fever, operates to a much more limited distance through the medium of the atmosphere, than the marsh miasmata. Contact of a diseased person is said to be necessary for the communication of plague; and approach within two or three yards of him, for that of typhus. The Walcheren miasmata extended their pestilential influence to vessels riding at anchor, fully a quarter of a mile from the shore.

'The chemical nature of all these poisonous effluvia is little understood, according to this writer. They undoubtedly consist, however, he adds, of hydrogen, united with sulphur, phosphorus, carbon, and azote, in unknown proportions, and unknown states of combination. The proper neutralisers or destroyers of these gasiform poisons, are nitric acid vapor, muriatic acid gas, and chlorine. The last two are the most efficacious; but require to be used in situations from which the patients can be removed at the time of the application. Nitric acid vapor, may, however, be diffused in the apartments of the sick, without much inconvenience. Bed-clothes, particularly blankets, can retain the contagious fomes in an active state, for almost any length of time. Hence, they ought to be fumigated with peculiar care. The vapor of burning sulphur or sulphureous acid is used in the East, against the plague. It is much inferior in power to the other antiloimic re-agents. There does not appear to be any distinction commonly made between contagious and infectious diseases.' See INFECTION and QUARANTINE.

CONTAIN, *v. a. & n.* } Fr. *contenir*; Ital. *contenere*; Span. *contener*; Lat. *continere*.
 CONTAINABLE, *adj.* }
 CONTAINER, *n. s.* }
 CONTENT, *n. s.* } To include within,

as a vessel; to comprehend in; to restrain; to keep within bounds; to live continently. The content, or contents, signify that which is contained in any thing. When the word is used with reference to that which is contained in a writing, the plural is always used. In other cases, authorities vary, some using the singular, and some the plural.

There are many other things which Jesus did, the which if they should be written every one, I suppose that even the world itself could not contain the books that should be written. *John* xxi. 25.

Wherefore also it is contained in the scripture. *1 Pet.* ii. 6.

But that if God him grauntin grace
 That he may, er he hennis pace,
 Contein undir obedience
 Through the vertue of pacience
Chaucer. Romaunt of the Rose.

How can they all in this so narrow verse
 Contayned be, and in small compasse held?
Spenser's Faerie Queene.

— Seven hundred princes, which maintaynd
 With mightie decedes their sondry governments,
 That were too long their infinite contents
 Here to record, ne much material. *Id.*

Their king's person contains the unruly people from
 evil occasions. *Id.*

I tell you, sirs,
 If you should smile, he grows impatient.——
 —Fear not, my lord, we can contain ourselves.
Shakspeare.

Though my heart's content firm love doth bear,
 Nothing of that shall from mine eyes appear. *Id.*

I have a letter from her,
 Of such contents as you will wonder at. *Id.*
 Some place it (the soul) in the root of life, the heart;
 Some in the river, fountain of the veins;
 Some say, she's all in all, and all in every part;
 Some say she's not contained, but all contains. *Davies.*

This island had then fifteen hundred strong ships
 of great content. *Bacon.*

Gently instructed I shall hence depart,
 Greatly in peace of thought, and have my fill
 Of knowledge what this vessel can contain. *Milton.*
 What seemed fair in all the world, seemed now
 Mean, or in her summed up, in her contained. *Id.*

The air, containible within the cavity of the col-
 pile, amounted to eleven grains. *Boyle.*

I shall prove these writings not counterfeit, but
 authentick; and the contents true, and worthy of a
 divine original. *Grew's Cosmologia.*

The contents of both books come before those of the
 first book, in the thread of the story. *Adáison's Spectator.*

Experiments are made on the blood of healthy ani-
 mals: in a weak habit serum might afford other con-
 tents. *Arbuthnot.*

I felt the ardour of my passion increase, till I could
 no longer contain. *Arbuthnot and Pope.*

At thy firmest age
 Thou hadst within thy bole solid contents,
 That might have ribbed the sides and planked the
 deck
 Of some flagged admiral. *Cowper.*

The morn is up again, the dewy morn,
 With breath all incense, and with cheek all bloom,
 Laughing the clouds away with playful scorn,
 And living as if earth contained no tomb,—
 And glowing into day. *Byron. Child Harold.*

CONTAMINATE, *v. a. & adj.* } Fr. *conta-*
CONTAMINATION, *n. s.* } *miner*; Ital.
contaminare; Sp. *contaminar*; Lat. *contaminare*.
 To pollute; to defile; to stain; to corrupt by
 base mixture; to render vile and degraded. Pol-
 lution; defilement.

Shall we now
 Contaminate our fingers with base bribes?
Shakespeare. Julius Cæsar.

A base pander holds the chamber door,
 Whilst by a slave, no gentler than a dog,
 His fairest daughter is contaminated
Id. Henry V.

Do it not with poison; strangle her in her bed,
 Even in the bed she hath contaminated. *Id. Othello.*

I quickly shed
 Some of his bastard blood, and in disgrace
 Bespoke him thus; contaminated, base
 And misbegotten blood I spill of thine.
Id. Henry VI.

The sons of idiots, of ignoble birth,
 Contaminate, and viler than the earth. *Sandys.*

Though it be necessitated, by its relation to flesh, to
 a territorial converse; yet 'tis, like the sun, without
 contaminating its beams. *Glanville's Apol.*

He that lies with another man's wife, propagates
 children in another's family for him to keep, and *contaminates*
 the honor thereof as much as in him lies.
Ayliffe's Parergon.

The only two openings by which I could enter the
 temple of Fortune, was the gate of niggardly economy,
 or the path of little chicaning bargain-making. The
 first is so contracted an aperture, I never could squeeze
 myself into it; the last I always hated—there was
contamination in the very entrance. *Burns.*

CONTECK, *n. s.* The derivation is uncer-
 tain. Tyrrwhit conceives the word to be from
 the Saxon; Skinner supposes it a corruption of
 contest; and Mr. Todd is disposed to think that
 we are indebted for it to the French, and points
 out attaquar as the parent. It means quarrel;
 contention; but has long been obsolete. Spenser
 seems to be the latest authority for the use of it

What now? seide Gamelyn; brother,
 Evil motè ye the;
 Wollè ye beginnin contek,
 And than so sonè fe? *Chaucer. Cant. Tales.*
 — Afterwards they gan with fowle reproch
 To stirre up strife, and troublous contecke broch.
Spenser. Faerie Queene.

CONTECTION. Lat. *contego, confectionum*.
 A covering.

CONTEMERATED, *adj.* Lat. *contemeratus*.
 Violated; defiled.

CONTEMN, *v. a.* } Ital. *contennere*; Lat.
CONTEMNER, *n. s.* } *contemnere*; Gr. *Τεμνω*.
CONTEMNING, *n. s.* } *Seco*, to cut off; whence
 temno, contemno To despise; to set at nought;
 to neglect; to defy.

So much the more was Calepine offended,
 That him to no revenge he forth could call,
 But both his challenge and himself contemned.
Spenser. Faerie Queene.

What am I that thou shouldst contemn me thus?
 Or what great danger dwells upon my suit?
Shakespeare. Venus and Adonis.

Yet better thus, and known to be contemned,
 Than still contemned and flattered. *Id. King Lear.*
 O ye sweet nymphs that beauty's loss do fear,
 Contemn the drugs that physic doth devise,
 And learn of love this dainty exercise (dancing).
Davies.

Eve, thy contempt of life and pleasure seems
 To argue in thee something more sublime
 And excellent than what thy mind contemns. *Milton.*

He counsels him to persecute innovators of wor-
 ship, not only as contemnors of the gods, but as dis-
 turbors of the state. *South.*

Pygmalion then the Tyrian sceptre swayed,
 One who contemned divine and human laws;
 Then strife ensued. *Dryden. Virgil's Æneid.*

Such worth the Laurel could alone repay,
 Profaned by Cibber, and contemned by Gray;
 Yet hence its wreath shall new distinction claim,
 And, though it gave not, take from Warton fame.
Huddesford.

There is many a pang to pursue me:
 They may crush, but they shall not contemn—
 They may torture, but shall not subdue me—
 'Tis of thee that I think—not of them. *Byron.*

CONTEMPER, *v. a.* } It. *contemperare*,
CONTEMPERATE, *v. a.* } *contemperare*; Span.
CONTEMPERAMENT, *n. s.* } *contemperar*; Lat.
CONTEMPERATION, *n. s.* } *contemperare*. To
CONTEMPERING, *n. s.* } temper; to mode-
 rate; to diminish the strength or virulence of,
 by admixture; the act of tempering or dimi-
 nishing any quality; a due mixture; proportion.
 Contemperament is the degree of any quality.
 Contemperring, as a noun, is mixing; blending
 with.

The mighty Nile and Niger do not only moisten
 and *contemperate* the air, but refresh and humectate
 the earth. *Browne.*

The use of air, without which there is no contin-
 uation in life, is not nutrition, but the *contemperation*
 of fervour in the heart. *Id. Vulgar Errors.*

There is not greater variety in men's faces, and in
 the *contemperations* of their natural humours, than
 there is in their fantasies. *Hale's Origin of Mankind.*

There is nearly an equal *contemperament* of the
 warmth of our bodies to that of the hottest part of the
 atmosphere. *Derham.*

The leaves qualify and *contemper* the heat, and hin-
 der the evaporation of moisture. *Ray on the Creation.*

If blood abound, let it out, regulating the patient's
 diet, and *contemperating* the humours.
Wise man's Surgery.

CONTEMPLATE, *v. a. & n.* } Fr. *contem-*
CONTEMPLATION, *n. s.* } *pler*; Ital. *con-*
CONTEMPLATIST, *n. s.* } *templare*; Sp.
CONTEMPLATIVE, *adj.* } *contemplar*;
CONTEMPLATIVELY, *adv.* } Lat. *contem-*
CONTEMPLATOR, *n. s.* } *plare*. The root
 of contemplate is referred, by Vossius and others,
 to *templum*, because temples were so situated as
 to be seen from all sides. The verb means, to
 think deeply and deliberately; to muse; to
 study; to meditate. Contemplation is studious
 thought; devout meditation; the faculty of
 study. The meaning of the kindred words is
 obvious.

Yet note their hungry vew he satisfide
But seeing, still the more desird to see,
And ever firmly fixed did abide
In *contemplation* of divinitee. *Spenser. Faerie Queene.*

How now? what serious *contemplation* are you in?
Shakspeare.

So many hours must I take my rest;
So many hours must I *contemplate*. *Id. Henry VI.*

I have breathed a secret vow
To live in prayer and *contemplation*,
Only attended by Nerissa here.

Id. Merchant of Venice.

In the Persian tongue the word *magus* imports as
much as a *contemplator* of divine and heavenly science.
Raleigh's History.

I am no courtier, nor versed in state affairs: my life
hath rather been *contemplative* than active. *Bacon.*

The Platonick *contemplators* reject both these de-
scriptions, founded upon parts and colours.

Broune's Vulgar Errors.

Sapor had an heaven of glass, which he trod upon,
contemplating over the same as if he had been Jupiter.

Peacham.

And these three powers three sorts of men do make;
For some, like plants, their veins do only fill;
And some, like beasts, their senses' pleasures take;
And some, like angels, do *contemplate* still. *Davies.*

Fixt and *contemplative* their looks,
Still turning over nature's books. *Denham.*

There are two functions, *contemplation* and practice,
according to that general division of objects; some of
which entertain our speculation, others employ our
actions. *South.*

The same idea, when it again recurs without the
operation of the like object on the external sensory, is
remembrance: if it be sought after by the mind, and
with pain and endeavour found, and brought again in
view, it is recollection: if it be held there long under
attentive consideration, it is *contemplation*. *Locke.*

We should make greater progress in the discovery
of rational and *contemplative* knowledge, if we sought
it in the fountain, in the consideration of things them-
selves; and made use rather of our own thoughts,
than other men's, to find it. *Locke.*

So many kinds of creatures might be to exercise the
contemplative faculty of man. *Ray on the Creation.*

How can I consider what belongs to myself, when
I have been so long *contemplating* on you.

Dryden's Jew. Preface.

There is not much difficulty in confining the mind
to *contemplate* what we have a great desire to know.

Watts.

He had from the beginning of his malady a distinct
view of his dissolution, which he *contemplated* with
that entire composure which nothing but the innocence,
integrity, and usefulness of his life, and an unaffected
submission to the will of Providence could bestow.

Burke.

They who consider with what infinite attention,
by what a disregard of every perishable object,
through what long habits of piety and *contemplation* it
is, any man is able to attain entire love and devotion
to the Deity, will easily perceive, that it is not the
first, the most natural, and the most striking effect,
which proceeds from that idea. *Id.*

If God vouchsafes to reveal himself to mankind,
can we suppose that he chooses to do so in such a
manner as that none but the learned and *contem-
plative* can understand him? *Id.*

See where he sits *contemplative* and fixed,
Pleasure and wonder in his features mixed;
His passions tamed, and all at his control,
How perfect the composure of his soul! *Cowper.*

If in the course of such a life as was
At once adventurous and *contemplative*,
Men who partake all passions as they pass,
Acquire the deep and bitter power to give
Their images again as in a glass,
And in such colors that they seem to live.—
Byron. Don Juan.

CONTEMPORISE, *v. a.* } Fr. *contem-*
CONTEMPORARY, *n. s. & adj.* } *porain*; It. &
CONTEMPORARINESS, *n. s.* } *Span. contem-*
CONTEMPORANEOUS, *adj.* } *poraneo*; Lat.
CONTEMPORANEITY, *n. s.* } *contemporalis*,
from *con* and *tempus*. To contemporise is used
by Sir Thomas Browne, in the sense of to render
contemporary. He seems to be the only person
who has employed it. Contemporary, as an ad-
jective, signifies existing at the same period;
brought into existence at the same time with;
of the same standing with; coeval. As a noun,
it means the person or thing to which the ad-
jective applies. It is sometimes, but incorrectly,
written cotemporary; a practice which is well
ridiculed by Bentley. See the quotation.

The indifferency of their existences, *contemporised*
into our actions, admits a farther consideration.

Broune's Vulgar Errors.

A grove born with himself he sees,
And loves his old *contemporary* trees. *Cowley.*

It is impossible to make the ideas of yesterday, to-
day, and to-morrow, to be the same; or bring ages
past and future together, and make them *contemporary*.
Locke.

As he has been favorable to me, he will hear of
his kindness from our *contemporaries*; for we are
fallen into an age illiterate, censorious, and detract-
ing. *Dryden's Jew. Preface.*

Albert Durer was *contemporary* to Lucas.
Id. Dufresnoy.

The active part of mankind, as they do most for
the good of their *contemporaries*, very deservedly
gain the greatest share in their applauses.

Addison's Freholder.

The Latins never use *co* for *con*, except before a
vowel, as co-equal, co-eternal; but, before a con-
sonant, they either retain the *n*, as *contemporary*, con-
sistation, or melt it into another letter, as collection,
comprehension; so that the word *cotemporary*, is a
word of his own composition, for which the learned
world will congratulate him. *Bentley.*

Contemporaries all surpassed, see one;
Short his career, indeed, but ably run;
Churchill, himself unconscious of his powers,
In penury consumed his idle hours;
And, like a scattered seed at random sown,
Was left to spring by vigour of his own. *Cowper.*

CONTEMPT, *n. s.* } Old Fr. *con-*
CONTEMPTIBLE, *adj.* } *tempt*; Lat. *con-*
CONTEMPTIBLENESS, *n. s.* } *temptus*. Scorn;
CONTEMPTIBLY, *adv.* } slighting; the
CONTEMPTUOUS, *adj.* } state of being
CONTEMPTUOUSLY, *adv.* } scorned; the
CONTEMPTUOUSNESS, *n. s.* } state of being
degraded; offence against the authority of courts
of law. For the latter sense, see the next article.
Contemptible is that which is worthy of being

despised; that which is despised; and formerly, but this meaning is become a vulgarism, apt to treat with contempt. In this latter sense, contemptuous is the proper word. See CONTEMN.

It was neither in contempt nor pride that I did not bow. *Esther,*

She lightly to him leapt, and in his necke
Her proude foote setting, at his head did levell,
Weening at once her wrath on him to wreak,
And his contempt, that did her judgment breake.

Spenser. Faerie Queene.

I throw my name against the bruising stone,
Trampling contemptuously on thy diadem. *Shakspeare.*

If she should make tender of her love, 'tis very possible he'll scorn it; for the man hath a contemptible spirit. *Id.*

To neglect God all our lives, and know that we neglect him; to offend God voluntarily, and know that we offend him, casting our hopes on the peace which we trust to make at parting, is no other than a rebellious presumption, and even a contemptuous laughing to scorn and deriding of God, his laws, and precepts. *Raleigh's Hist. of the World.*

Some much averse I found, and wond'rous harsh,
Contemptuous, proud, set on revenge and spite. *Milton's Agonistes.*

Knowest thou not
Their language, and their ways? They also know,
And reason not contemptibly. *Id. Paradise Lost.*

The shame of being miserable
Exposes men to scorn and base contempt,
Even from their nearest friends. *Denham.*

The apostles and most eminent Christians were poor, and used contemptuously. *Taylor's Holy Living.*

There is no action, in the behaviour of one man towards another, of which human nature is more impatient than of contempt; it being an undervaluing of a man, upon a belief of his utter uselessness and inability, and a spiteful endeavour to engage the rest of the world in the same slight esteem of him. *South.*

Nobody of any credit can bear the imputation of a lie; a mark that is judged the utmost disgrace, which debases a man to the lowest degree of a shameful meanness, and ranks him with the most contemptible part of mankind, and the abhorred rascality. *Locke,*

If he governs tyrannically in youth, he will be treated contemptuously in age; and the baser his enemies, the more intolerable the affront. *L'Estrange.*

His friend smiled scornful, and with proud contempt
Rejects as idle what his fellow dreamt. *Dryden's Fables.*

Who, by a steady practice of virtue, comes to discern the contemptibleness of baits wherewith he allures us. *Decay of Piety.*

Rome, the proudest part of the heathen world, entertained the most contemptuous opinion of the Jews. *Atterbury.*

Nothing, says Longinus, can be great, the contempt of which is great. *Addison.*

From no one vice exempt,
And most contemptible to shun contempt. *Pope's Ep.*

Thus to administer the opiate potion of amnesty, powdered with all the ingredients of scorn and contempt, is to hold to his lips, instead of 'the balm of hurt minds,' the cup of human misery full to the brim, and to force him to drink it to the dregs. *Burke.*

Yet life still lingers in thee, and puts forth
Proof not contemptible of what she can,
Even where death predominates. *Couper.*

You should never bestow pity on those who take pains for your contempt: pity those whom nature abuses, never those who abuse nature. *Sheridan.*

Lone, wild, and strange, he stood alike exempt
From all affection, and from all contempt:

His name could sadden, and his acts surprise;
But they that feared him dared not to despise.

Byron. The Corsair

CONTEMPT, in law, is a disobedience to the rules and orders of a court, which hath power to punish such offence; and as this is sometimes a greater, and sometimes a lesser offence, so it is punished with greater or less punishment, by fine or imprisonment.

CONTE'ND, v. a. & n.	Fr. <i>contendre</i> ; It. <i>contendere</i> ; Sp. <i>contender</i> ; Lat. <i>contendere</i> . <i>Terw.</i> .Eol.
CONTE'NDENT, n. s.	
CONTE'NDER, n. s.	{ <i>τενωω</i> , whence the ancient Latin, <i>tenno</i> .
CONTE'NDING, n. s.	
CONTE'NTION, n. s.	{ To stretch, to extend, CONTENTIOUSNESS, n. s. }
CONTE'NTIOUS, adj.	
CONTE'NTIOUSLY, adv.	

To contend is, then, to stretch the faculties, or the strength, in a struggle with any one; to strive against any person; to vie with; to act emulously; to dispute any thing; to have a struggle for; to insist positively. Contend takes *with*, and sometimes *against*, before the opponent; *for*, and sometimes *about*, before the cause of contention. Contentent, and contender, signify an antagonist; a champion: the first of these meanings is disused. Contention is, quarrel; emulation; ardor; strenuousness of endeavour. He who is contentious is of that troublesome and disagreeable class of persons who are prone to quarrel; fond of dispute; perverse

Distress not the Moabites, neither contend with them in battle; for I will not give thee of their land. *Deut. ii. 9.*

Avoid foolish questions and genealogies, and contentions and strivings. *Tit. iii. 9.*

Her lying tongue was in two parts divid'd,
And both the parts did speake, and both contended. *Spenser. Faerie Queene.*

Thereto the blatant beast, by them set on,
At him began aloud to baite and bay
With bitter rage, and fell contention. *Id.*

But being aged now, and weary too
Of warres delight and world's contentious toyle,
The name of knighthood he did disavow. *Id.*

Can we with manners ask what was the difference?
—Safely, I think; 'twas a contention in publik. *Shakspeare.*

His wonders and his praises do contend
Which should be thine or his *Id. Macbeth.*

Thus art with arms contending was victor of the day,
Which by a gift of learning did bear the maid away. *Id. The Passionate Pilgrim.*

Thou thinkest much that this contentious storm
Invades us to the skin. *Id. King Lear.*

None are so gross as to contend for this,
That souls from bodies may trauduced be;
Between whose natures no proportion is,
When root and branch in nature still agree. *Davies.*

We shall not contentiously rejoin, or only to justify our own, but to applaud and confirm his maturer assertions. *Browne.*

The question which our author would *contend* for, if he did not forget it, is, what persons have a right to be obeyed. *Locke.*

The *contenters* for it look upon it as undeniable. *Id.*

Your own earnestness and *contention* to effect what you are about, will continually suggest to you several artifices. *Holder.*

Their airy limbs in sports they exercise,
And on the green *contend* the wrestler's prize.

Dryden's Æneid.

In all notable changes and revolutions, the *contentents* have been still made a prey to the third party.

L' Etrange

Rest made them idle, idleness made them curious, and curiosity *contentions*. *Decay of Piety.*

The ancients made *contention* the principle that reigned in the chaos at first, and then love; the one to express the divisions, and the other the union of all parties in the middle and common bond.

Burnet's Theory of the Earth.

Do not *contentiousness*, and cruelty, and study of revenge, seldom fail of retaliation? *Bentley's Sermons.*

Those disputes often arise in good earnest, where the two *contenters* do really believe the different propositions which they support. *Watts on the Mind.*

Others corrupting religion, as these have perverted philosophy, *contend*, that Christians are redeemed into captivity; and the blood of the Saviour of mankind has been shed to make them the slaves of a few proud and insolent sinners. *Burke.*

Thrice happy they whom kindred souls unite,

By virtue chastened, yet alive to love;

Whose sole *contention* is to give delight,

Whose pleasures few can feel, but all approve.

Leftley.

Men deal with life, as children with their play,

Who first misuse, then cast their toys away;

Live to no sober purpose, and *contend*

That their Creator had no serious end. *Cowper.*

Then—with each feature working from the heart,
With feelings loosed to strengthen—not depart:
That rise—convulse—*contend*—that freeze, or glow,
Flush in the cheek, or damp upon the brow.

Byron. The Corsair.

CONTENT, *v. a., n. s. & adj.*

CONTENTATION, *n. s.*

CONTENTED, *part. adj.*

CONTENTEDLY, *adv.*

CONTENTEDNESS, *n. s.*

CONTENTFUL, *adj.*

CONTENTFULLY, *adv.*

CONTENTLESS, *adj.*

CONTENTLY, *adv.*

CONTENTMENT, *n. s.*

Content is moderate happiness; the temperate point of life; equally remote from elevation and depression; acquiescence in any thing. In parliamentary language the contents are those members who vote on the affirmative side of a question. Contentation, which signifies satisfaction, content; is out of use. Contentment signifies, being satisfied, but without feeling any lively pleasure; gratification.

For as we thought we had our travail spent

In sochie wise as we heldin us *content*;

Then eche of us toke our by the sleeve,

And forth withal as we shulde take our leve.

Chaucer.

Contented with thine owne estate,
Ne wish for death, ne feare his night.

Earl of Surrey.

Alas howe harde and steely hartes had they,
That not *contented* there to have thee dye,
With fettered gyves in prison where thou laye,
Increast so far in hateful crueltye,
That buryall to thy corps they eke denye. *Sackville.*

Among good things I prove and finde,
The quiet lyfe doth most abound,
And sure to the *contented* mynde
There is no riches may be founde.

Songes and Sonnetes.

That them repented much so foolishly
To come so far to seek for misery,
And leave the sweetness of *contented* home,
Though eating gyves, and drinking watry fume.

Spenser. Mother Hubbard's Tale.

The noblest mind the best *contentment* has.

Id. Fœrie Queene.

Content thyself with this much, and let this satisfy
hee, that I love thee. *Sidney.*

I seek no better warrant than my own conscience,
nor no greater pleasure than mine own *contentation*.

Id.

Submit you to the people's voices,

All your officers, and be *content*

To suffer lawful censure.

Shakspeare. Coriolanus.

Is the adder better than the eel.

Because his painted skin *contents* the eye? *Id.*

Best states, *contentless*,

Have a distracted and most wretched being,

Worse than the worst, *content*. *Id. Tinnon.*

If a man so temper his actions, as in some one of them he doth *content* every faction, the musick of praise will be fuller. *Bacon.*

She cannot in this world *contented* be,

For who did ever yet, in honor, wealth,

Or pleasure of the sense *contentment* find?

* * * * *

So when the soul finds here no true *content*,

And, like Noah's dove, can no sure footing take,

She doth return from whence she first was se. r.

Davies.

Dream not of other worlds,

Contented that thus far has been revealed,

Not of earth only, but of highest heaven.

Milton's Paradise Lost.

Angling was, after tedious study, a calmer of unquiet thoughts, a moderator of passions, a procurer of *contentedness*. *Walton's Angler.*

One thought *content* the good to be enjoyed;

This every little accident destroyed. *Dryden.*

Great minds do sometimes *content* themselves to threaten, when they could destroy. *Tillotson.*

Foe to loud praise, and friend to learned ease,

Content with science in the vale of peace.

Pope's Epistles.

Some place the bliss in action, some in ease;

Those call it pleasure, and *contentment* these.

Id. Essays.

The shield was not long after incrusted with a new rust, and is the same, a cut of which hath been engraved and exhibited, to the great *contentation* of the learned. *Arbuthnot and Pope.*

Having no spirit of order, he never looked forward; *content* by any temporary expedient to extricate himself from a present difficulty. *Burke.*

From labour health, from health *contentment* springs;

Contentment opens the source of every joy. *Beattie.*

He that holds fast the golden mean,

And lives *contentedly* between

The little and the great,
Feels not the wants that pinch the poor,
Nor plagues that haunt the rich man's door,
Inbittering all his state. *Cowper.*

CONTERMINABLE, *adj.* } Ital. *conter-*
CONTERMINATE, *adj.* } *minare*; *conter-*
CONTERMINOUS, *adj.* } *minale*; Span.

contermino; Lat. *conterminus*. Conterminable is, capable of the same bounds. Conterminate, that which has a common boundary with another. Conterminous, that which has the same bounds with; that which borders on.

Love and life are not *conterminable*.
Sir H. Wotton.

A strength of empire fixed
Conterminate with heaven. *B. Jonson.*

This conformed so many of them, as were *conterminous* to the colonies and garrisons, to the Roman laws. *Hale.*

CONTRERRANEAN, *adj.* } Ital. and Sp.
CONTRERRANEUS, *adj.* } *contrerraneo*; Lat.
contrerraneus. Of the same soil or country.

I hold that of the orator to be a wild extravagant speech, that if women were not *contrerranean* and mingled with men, angels would descend and dwell among us. *Howell.*

CONTESSERATION, *n. s.* Lat. *con* and *tesseratus*. An assemblage; a variety.

That person of his which afforded such a *contesseration* of elegancies. *Oley.*

CONTEST, *v. a. & n.* } Fr. *contester*; Ital.
CONTEST, *n. s.* } *contestare*; Sp. *con-*
CONTESTATION, *n. s.* } *testar*; Lat. *contesta-*
CONTESTABLE, *adj.* } *ri*. To dispute; to
CONTESTABLENESS, *n. s.* } strive against; to
CONTESTINGLY, *adv.* } strive with; to liti-
CONTESTLESS, *adj.* } gate; to emulate.

Contestation, which signifies debate, strife, Barrow uses in the sense of proof, testimony—"by a solemn contestation ratified on the part of God." Contestless means indisputable. Contestingly, in a disputing manner. But these words are not of frequent occurrence.

I do *contest*
As hotly and as nobly with thy love,
As ever in ambitious strength I did
Contend against thy labour.

Shakespeare. Coriolanus.

This of old no less *contests* did move,
Than when for Homer's birth seven cities strove.

Denham.

After years spent in domestick, unsociable *contestations*, she found means to withdraw. *Clarendon.*

'Tis evident upon what account none have presumed to *contest* the proportion of these ancient pieces.

Dryden's Dufresnoy.

These native propensities, these prevalencies of constitution, are not to be cured by rules, or a direct *contest*, especially those of them that are the humbler and meaner sort, which proceed from fear and lowness of spirit; though with art they may be much mended, and turned to good purpose. *Locke.*

The difficulty of an argument adds to the pleasure of *contesting* with it, when there are hopes of victory. *Burnet.*

Doors shut; visits forbidden, and, which was worse, divers *contestations* even with the queen herself.

Wotton.

Of man, who dares in pomp with *Jove contest*,
Unchanged, immortal, and supremely blest?
Popc's Odyssey.

Leave all noisy *contests*, all immodest clamours,
and brawling language. *Watts.*

Henry the Second, during his *contest* with the church, had the address to preserve the barons in his interests. Afterwards, when the barons had joined in the rebellion of his children, this wise prince found means to secure the bishops and ecclesiastics. *Burke.*

Between Nose and Eyes a strange *contest* arose,
The spectacles set them unhappily wrong;
The point in dispute was, as all the world knows,
To which the said spectacles ought to belong.

Cowper.

A bumper of good liquor
Will end a *contest* quicker
Than justice, judge, or vicar:
So fill a cheerful glass,
And let good humour pass. *Sheridan.*

CONTEX, *v. a.* } Fr. *contexre*; Ital.
CONTEXT, *v. a. & adj.* } *contesto*; Span. *con-*
CONTEXT, *n. s.* } *texto*; Lat. *conter-*
CONTEXTURAL, *adj.* } *tum*, past participle
CONTEXTURE, *n. s.* } of *conterere*. Cot-

grave, and after him Sherwood, defines the noun very satisfactorily: 'A context; a whole web, composition, worke; or, an interlacing, ioyning, or weaving together; also the forme or stile of a proces, booke, or discourse.' To which, however, may be added that, with references to a book, context means the general tenor of; the parts which come before and after any passage quoted; and that, as an adjective, it denotes firmly knit together; closely interwoven. As a verb it signifies, as does also context, to knit or weave together; to form a junction between the parts of. Both verbs are obsolete; though it is not easy to perceive why they have fallen into disuse. Contextural is that which has relation to the human frame. Contexture, Johnson fully and perspicuously describes to be the disposition of parts, one amongst others; the composition of any thing out of separate parts; the system; the constitution; the manner in which any thing is woven or formed.

That chapter is really a representation of one, which hath only the knowledge, not practice, of his duty, as is manifest from the *context*.

Hammond on Fundamentals.

Nature may *contex* a plant, though that be a perfectly mixt concrete, without having all the elements previously presented to her to compound it of. *Boyle.*

The fluid body of quicksilver is *contexed* with the salts it carries up in sublimation. *Id.*

If the quotation in the verse produced were considered as a part of a continued coherent discourse, and so its sense were limited by the tenour of the *context*, most of these forward and warra disputants would be quite stripped of those, which they doubt not now to call spiritual weapons; and they would often have nothing to say, that would not show their weakness, and manifestly fly in their faces. *Locke.*

Every species, afterwards expressed, was produced from that idea, forming that wonderful *contexture* of created beings. *Dryden's Dufresnoy.*

He was not of any delicate *contexture*; his limbs rather sturdy than dainty. *Wotton.*

Hollow and thin, for lightness; but withal *context* and firm, for strength. *Derham's Physico-Theology.*

Hence 'gan relax

the ground's *contexture*; hence Tartarian dregs,
Sulphur and nitrous spume, enkindling fierce,
Bellowed within their darksome caves. *Philips.*

CONTIGNATION, *n. s.* Lat. *contignatio*. A frame of beams joined together; a story. The act of framing or joining a fabric of wood; the act of laying rafters together.

We mean a porch, or cloister, or the like, of one *contignation*, and not in storied buildings.

Wotton's Architecture.

Where more of the orders than one shall be set in several stories or *contignations*, there must be an exquisite care to place the columns one over another.

Wotton.

They were easily led to consider the flames that were consuming France, not as a warning to protect their own buildings, (which were without any party-wall, and linked by a *contignation* into the edifice of France), as a happy occasion for pillaging the goods, and carrying off the materials of their neighbour's house.

Burke. Let. on Reg. Peace. Let. ii.

CONTIGUOUS, *adj.* } Fr. *contigu*; Ital.
CONTIGUOUSLY, *adv.* } and Span. *contiguo*;
CONTIGUOUSNESS, *n. s.* } Lat. *contiguus*, from
CONTIGUITY, *n. s.* } *contingere*. Meeting,
with actual contact; being nigh, without actual contact; being in the immediate vicinity of; bordering upon. Contiguous sometimes has *with* after it.

Some doth not mingle with flame as air doth with air, or water with water, but only remaineth *contiguous*; as it cometh to pass betwixt consisting bodies.

Bacon's Natural History.

Water, being *contiguous* with air, cooleth it, but moisteneth it not. *Id.*

The loud misrule

Of chaos far removed; lest fierce extremes,
Contiguous, might distemper the whole frame.

Milton.

He defined magnetical attraction to be a natural imitation and disposition conforming unto *contiguity*.

Brounec.

The immediate *contiguity* of that convex was a real space.

Hale's Origin of Mankind.

The East and West,

Upon the globe a mathematick point
Only divides: thus happiness and misery,
And all extremes, are still *contiguous*.

Denham's Sophy.

Distinguish them by the diminution of the lights and shadows, joining the *contiguous* objects by the participation of their colours. *Dryden's Dufresnoy.*

Thus disembroiled, they take their proper place,
The next of kin *contiguously* embrace,
And foes are sundered by a larger space.

Dryden's Ovid.

When I viewed it too near, the two halves of the paper did not appear fully divided from one another, but seemed *contiguous* at one of their angles.

Newton's Opticks.

Often, when we do not immediately call to mind what we wish to remember, we set ourselves, as it were, to search for it; we meditate on other things or persons, that seem to be like it, or contrary to it, or *contiguous*, or to bear any other relation to what we are in quest of; and thus, perhaps, we at last re-

member it. This continued effort of voluntary remembrance is called recollection. *Beattie.*

O for a lodge in some vast wilderness,
Some boundless *contiguity* of shade,
Where rumour of oppression and deceit,
Of unsuccessful or successful war,
Might never reach me more!

Cowper.

Called by thy voice, *contiguous* thoughts embrace
In endless streams, arranged by time or place;
The muse historic hence in every age
Gives to the world her interesting page. *Darwin.*

CONTINENT, *n. s. & adj.* } Fr. *continent*;
CONTINENTAL, *adj.* } It. and Sp. *contin-*
CONTINENTLY, *adv.* } *tinente*; Lat.
CONTINENCE, *n. s.* } *continentis*, past
CONTINENCY, *n. s.* } part. of *conti-*
nere. As an adjective, continent signifies hav-

ing the power of forbearing; the power of containing our own passions within due bounds. He is continent who, to use the words of Minsheu, 'contains or bridle himself from pleasures, either in covetousness, gluttony, or revelry.' The adjective has also, in some old writers, the meanings of continuous; opposing. The noun formerly meant not only a vast tract of continuous land, as Europe, but likewise that which contains anything. In the latter sense it is obsolete. Contenance, in the sense of continuity, is equally disused. It now means self-command; mastery over the passions

Virginitee is great perfection,
And *contenance* eke with devotion.

Chaucer. Cant. Tales.

Such power it had that to no woman's wast
By any skill or labour it would sit,
Unless that she were *continent* and chast
But it would lose or break, that many had disgrast.

Spenser. Faerie Queene.

A harder lesson to learn *contenance*
In ioyous pleasure than in grievous paine;
For sweetnesse doth allure the weaker sence
So strongly, that unweathes it can refraine
From that which feeble nature covets faine. *Id.*

Thou God of winds, that rainest in the seas,
Thou rainest also in the *continent*. *Id.*

Where is he?—

In her chamber, making a sermon on *continency* to her, and rails, and swears, and rates.

Shakspeare. Taming of the Shrew

Suffer not dishonour to approach
The' imperial seat; to virtue consecrate,
To justice, *contenance*, and nobility.

Id. Titus Andronicus.

Life

Hath been as *continent*, as chaste, as true
As I am now unhappy. *Id. Winter's Tale.*

I pray you, have a *continent* forbearance, till the speed of his rage goes slower. *Id. King Lear.*

My desire

All *continent* impediments would o'erbear,
That did oppose my will. *Id. Macbeth.*

O cleave, my sides!

Heart, once be stronger than thy *continent*;
Crack thy frail case. *Id. Antony and Cleopatra.*

The north-east part of Asia, if not *continent* with the west side of America, yet certainly is the least disjoined by sea of all that coast of Asia.

Brerewood on Languages.

Whether this portion of the world were rent
By the rude ocean from the *continent*,
Or thus created, it was sure designed
To be the sacred refuge of mankind. *Waller.*

Chastity is either abstinence or *continence*: abstinence is that of virgins or widows; *continence*, of married persons. *Taylor.*

Content without lawful vengery, is *continence*; without unlawful, chastity. *Grew's Cosmologia.*

He knew what to say; he knew also when to leave off, a *continence* which is practised by few writers. *Dryden's Fables. Preface.*

Answers ought to be made before the same judge, before whom the depositions were produced, lest the *continence* of the course should be divided; or, in other terms, lest there should be a discontinuance of the cause. *Ayliffe's Parergon.*

The declivity of rivers will be so much the less, and therefore the *continents* will be the less drained, and will gradually increase in humidity. *Bentley's Sermons.*

No *continental* power was willing to lose any of its *continental* objects for the increase of the naval power of Great Britain. *Burke.*

High towering palms, that part the southern flood,
With shadowy isles, and *continents* of wood. *Darwin.*

CONTINGENT, *v. n.* } Fr. *contingent*:
CONTINGENT, *n. s. & adj.* } Ital. and Span. *contingente*; Lat. *contingens*, pres. part.
CONTINGENTLY, *adv.* } *of contingere*. The
CONTINGENTNESS, *n. s.* } verb *contingere*, whi.
CONTINGENCE, *n. s.* }
CONTINGENCY, *n. s.* }

means to touch, to reach, to happen, is obsolete. Nor does it appear ever to have been in general use. That which is contingent, is that which occurs fortuitously; that which may happen, but cannot be reckoned upon as certain. A contingent is a thing under the dominion of chance, a proportion which each person is to furnish, in a certain case: thus, the quota of troops, or money, supplied by a German prince, in time of war, is denominated his contingent. Contingence, and contingency, signify the quality of being fortuitous; a circumstance that may happen. Contingently is, accidentally; not regularly.

Their credulities assent unto any prognosticks, which, considering the *contingency* in events, are only in the presence of God. *Broune's Vulgar Errors.*

Aristotle says, we are not to build certain rules upon the *contingency* of human actions. *South.*

Hazard naturally implies in it, first, something future; secondly, something *contingent*. *Id.*

His understanding could almost pierce into future *contingents*, his conjectures improving even to prophecy. *Id.*

For once, O heaven! unfold thy adamantine book
If not thy firm, immutable decree,

At least the second page of great *contingency*,
Such as consists with wills originally free. *Dryden.*

By *contingents* we are to understand those things which come to pass without any human forecast. *Grew's Cosmologia.*

I first informed myself in all material circumstances of it, in more places than one, that there might be nothing casual or *contingent* in any one of those circumstances. *Woodward.*

It is digged out of the earth *contingently*, and indifferently, as the pyritæ and agates. *Id. Natural History.*

No theatric audience in Athens would bear what has been borne, in the midst of the real tragedy of

this triumphal day; a principal actor weighing, as it were in scales hung in a shop of horrors,—so much actual crime against so much *contingent* advantage,—and, after putting in and out weights, declaring that the balance was on the side of the advantages. *Barke.*

Could chance
Find place in his dominion, or dispose
One lawless particle to thwart his plan;
Then God might be surpris'd, and unforeseen
Contingence might alarm him, and disturb
The smooth and equal course of his affairs. *Comper.*

CONTINUE, *v. a. & adj.* } Fr. *continuer*;
CONTINUE, *v. a. & n.* } Ital. *continuare*;
CONTINUER, *n. s.* } Span. *continuar*;
CONTINUATENESS, *n. s.* } Lat. *continuare*.
CONTINUATELY, *adv.* } Uninterrupted
CONTINUAL, *adj.* } action; unbroken
CONTINUALLY, *adv.* } succession of
CONTINUALNESS, *n. s.* } time, space, or
CONTINUANCE, *n. s.* } matter; unchang-
CONTINUATION, *n. s.* } ing, or unceas-
CONTINUATIVE, *n. s.* } ing existence;
CONTINUATOR, *n. s.* } are the primary
CONTINUEDLY, *adv.* } ideas of all the
CONTINUITY, *n. s.* } words under this
CONTINUOUS, *adj.* } head. To con-
CONTINUOUSLY, *adv.* } tinue is, to pro-
ceed incessantly; to have no stop or break; to remain in the same state, or place; to last; to protract; to persevere; to perpetuate. To continue is to connect closely together. Formerly, continuous and continual were used synonymously; but now, as Johnson observes, continual is used of time, and continuous of space. Continuative is an expression indicating permanence; a grammatical conjunction, under which head Harris classes, *if, because, therefore, &c*

Thy kingdom shall not *continue*.

1 Samuel xiii. 14.

O *continue* thy loving kindness unto them.

Psalms xxxvi. 10.

In thy book all my members were written, which in *continuance* were fashioned. *Id.* cxxxix. 16.

He that is of a merry heart hath a *continual* feast.

Proverbs xv. 15.

The multitude *continue* with me now three days, and have nothing to eat. *Matthew* xvi. 32.

If ye *continue* in my word, then are ye my disciples indeed. *John* viii. 31.

To them who, by patient *continuance* in well doing, seek for glory, and honour, and immortality, eternal life. *Romans* ii. 7.

For here we have no *continuing* city, but we seek one to come. *Hebrews* xiii. 14.

God give thee good chance,

And in vertue send thee *continuance*.

Chaucer's Canterbury Tales.

Lo see myne eyes flow with *continual* teares,
The body still away sleepless it weares. *Wyat.*

Styl to the death sortossed with the wawe
Of restless woe, in terror and dispeyre,
They lead a lyef *continually* in feare. *Suckville.*

All that same evening she in flying spent,
And all that night her course *continewel*.

Spenser's Faerie Queene.

There sate a man of ripe and perfect age,
Who did them meditate all his life long,
That through *continual* practise and usage
He now was grown right wise and wondrous sage. *Id.*

For who sees not, that Time on all doth prey?
But times do change and more *continually*,
So nothing here long standeth in one stay. *Id.*

——— through long *continuance* of his course,
Me seems the world is runne quite out of square
From the first point of his appointed sourse. *Id.*

We are of him and in him, even as though our
very flesh and bones should be made *continue* with
his. *Hooker.*

You either fear his humour, or my negligence, that
you call in question the *continuance* of his love.
Shakespeare, Twelfth Night.

Old woes, not infant sorrows, bear them mild;
Continuance tames the one. *Id. Rape of Lucrece.*

A most incomparable man, breathed, as it were,
To an untirable and *continue* goodness. *Id. Timon.*

I would my horse had the speed of your tongue,
and so good a *continuer*. *Id. Much ado about Nothing.*

The drawing of boughs into the inside of a room
where fire is *continually* kept, hath been tried with
grapes. *Bacon.*

Wool, tow, cotton, and raw silk, have, besides the
desire of *continuance* in regard of the tenuity of their
thread, a greediness of moisture. *Id.*

It is certain, that in all bodies there is an appetite
of union, and evitation of solution of *continuity*. *Id.*

They imagine that an animal of the longest dura-
tion should live in a continued motion, without that
rest whereby all others *continue*.
Browne's Vulgar Errors.

It seems injurious to Providence to ordain a way of
production which should destroy the producer, or con-
trive the continuation of the species by the destruction
of the *continuator*. *Id.*

The popular vote
Inclines here to *continue*, and build up here
A growing empire. *Milton.*

The dark abyss, whose boiling gulph
Tamely endured a bridge of wond'rous length,
From hell *continued*, reaching the utmost orb
Of this frail world. *Id.*

Other care perhaps
May have diverted from *continual* watch
Our great forbidder. *Id.*

The water ascends gently, and by intermissions;
but it falls *continuatly* and with force. *Wilkins.*

These Remish casuists speak peace to the consciences
of men, by suggesting something which shall
satisfy their minds, notwithstanding a known avowed
continuance in sins. *South.*

Here Priam's son, Deiphobus, he found,
Whose face and limbs were one *continued* wound;
Dishonest, with lopped arms, the youth appears,
Spoiled of his nose, and shortened of his ears.
Dryden's Æneid.

After the great lights there must be great shadows,
which we call reposes; because in reality the sight
would be tired, if it were attracted by a *continuity* of
glittering objects. *Dryden.*

Moderate punishments that are *continued*, that men
find no end of, know no way out of, sit heavy, and
become immoderately uneasy. *Loche.*

As the breadth of every ring is thus augmented, the
dark intervals must be diminished, until the neigh-
bouring rings become *continuous*, and are blended.
Newton's Opticks.

That pleasure is not of greater *continuance*, which
arises from the prejudice or malice of its hearers.
Addison's Frecholder.

You know how to make yourself happy, by only
continuing such a life as you have been long accus-
tomed to lead. *Pope.*

By perseverance, I do not understand a *continually*
uniform, equal course of obedience, and such as is not
interrupted with the least act of sin. *Norris.*

To these may be added *continutives*: as, Rome
remains to this day; which includes at least two
propositions, viz. Rome was, and Rome is.
Watts's Logick.

That texture, or cohesion of the parts of an animal
body, upon the destruction of which there is said to
be a solution of *continuity*. *Quincy.*

To whose dread expanse,
Continuous depth, and wond'rous length of course,
Our floods are rills. *Thomson's Summer.*

He (king John) was indolent, yet restless in his
disposition; fond of working by violent methods,
without any vigour; boastful, but *continually* betraying
his fears; showing, on all occasions, such a desire of
peace as hindered him from ever enjoying it. *Burke.*

Though civil society might be at first a voluntary
act (which in many cases it undoubtedly was), its
continuance is under a permanent standing covenant,
co-existing with the society; and it attaches upon
every individual of that society, without any formal
act of his own. *Id.*

All critics would agree that a *Fremshenius* would
have been thought to have managed the supplement-
ary business of a *continuator* most unskilfully, and to
have supplied the hiatus most improbably, if he had
not filled up the gaping space in a manner somewhat
similar, though better executed. *Id.*

All thou couldst have of mine, stern Death! thou
hast;
The parent, friend, and now the more than friend.
Ne'er yet for one thine arrows flew so fast;
And grief with grief *continuing* still to blend,
Hath snatched the little joy that life had yet to lend.
Byron. Child of Harold.

CONTINUED BASS, in music, thus called, says
Rousseau, because it is continued through the
whole piece. Its principal use, besides that of
regulating the harmony, is to support the voice
and preserve the tone.

CONTINUED PROPORTIONS, in arithmetical, is
that where the consequent of the first ratio is
the same with the antecedent of the second; as
4 : 8 :: 8 : 16; in contradistinction to discrete
proportion.

CONTINUITY is defined by some schoolmen
the immediate cohesion of parts in the same
quantum; by others, a mode of body whereby
its extremities become one; and by others, a
state of body resulting from the mutual impli-
cation of its parts. There are two kinds of con-
tinuity, mathematical and physical. The first is
merely imaginary, since it supposes real or phys-
ical parts where there are none. The other or
physical continuity, is that state of two or more
particles, in which their parts are so mutually
implicated as to constitute one uninterrupted
quantity.

CONTINUO, or BASSO CONTINUO, in music,
is the continual or thorough bass, which is some-
times marked in music books by the letters
B. C.

CONTOBADITES, a sect which appeared in
the sixth century. Their first leader was Severus
of Antioch; who was succeeded by John the
grammarian, surnamed Philoponus, and one
Theodosius, whose followers were also called
Theodosians. Part of them, who received a book
composed by Theodosius on the Trinity, formed

a separate body, and were called Contobaddites, from some place where they held their assemblies. The Contobaddites allowed of no bishops; which is the only peculiar circumstance recorded concerning them.

CONTORT, *v. a.* } Fr. *contorsion*; Ital. *con-*
CONTORTION, *n. s.* } *torsione*; Sp. *contorcion*;
Lat. *contortus*, from *contorque*. To twist; to
turn awry; to wring; to writhe. A bending;
twisting; distorting of; grimace.

The vertebral arteries are variously *contorted*. *Ray*.
Disruption they would be in danger of, upon a
great and sudden stretch or *contortion*. *Id.*

Air seems to consist of spires *contorted* into small
spires, through the interstices of which the particles
of light may freely pass. *Cheyne*.

How can she acquire those hundred graces and motions,
and airs, the *contortions* of every muscular motion
in the face? *Swift*.

Returning he proclaims by many a grace,
By shrugs and strange *contortions* of his face,
How much a dunce, that has been sent to roam,
Excels a dunce, that has been kept at home. *Cowper*.

CONTOUR, *n. s.* Fr. The outline; the
line by which any figure is defined or terminated.

CONTOURNE, in heraldry, is used when a
beast is represented standing or running with its
face to the sinister side of the escutcheon, they
being always supposed to look to the right, if not
otherwise expressed.

CONTOURNIATED, a term among antiquaries
applied to medals, the edges of which appear
as if turned in a lathe. This sort of work
seems to have had its origin in Greece; and to
have been designed to perpetuate the memories
of great men, particularly, those who had borne
away the prize at the solemn games. Such are
those remaining of Homer, Solon, Euclid, Pytha-
goras, Socrates, and several athletes.

CONTRA. A Latin preposition, used in com-
position, which signifies against.

CONTRABAND, *v. a.* } Fr. *contre-*
CONTRABANDIST, *n. s. & adj.* } *bande*; It. *con-*
trabbando; Sp. *contrabando*. That is, contrary
to proclamation. Contraband, as a verb, is not
in use, smuggle, which is synonymous with it,
being always employed. Prohibited goods;
goods which have not paid the custom-house
duty. Prohibited; illegal; unlawful. Contra-
bandist, is a smuggler.

If there happen to be found an irreverent expres-
sion, or a thought too wanton, in the cargo, let them
be staved or forfeited, like *contraband* goods.

Dryden's Fables. Pref.

Miraculous must be the activity of that *contraband*,
whose operations in America could, before the end of
that year, have re-acted upon England, and checked
the exportation from hence. *Burke*.

The *contraband* trade was at that time very success-
ful, and it sometimes happened to me to fall in with
those who carried it on. Scenes of swaggering riot
and roaring dissipation were till this time new to me;
but I was no enemy to social life. *Burns*.

Church quacks, with passions under no command,
Who fill the world with doctrines *contraband*,
Discoveries of they know not what, confined,
Within no bounds—the blind that lead the blind.

Cowper.

CONTRABAND GOODS, are articles of foreign
merchandise, the use of which is forbidden by
law; and a violation of which law exposes the
goods themselves to the liability of confiscation,
and places in the same liability to seizure all
other allowed merchandise found with them in
the same box, bale, or parcel, together with the
horses, waggons, &c. which conduct them. There
are some *contraband* goods, which, besides the
forfeiture, are attended with several penalties and
disabilities.

CONTRACT, *v. a., v. n. &* } Fr. *contracter*;
CONTRACT, *n. s.* } [adj.] Ital. *contrarre*;
CONTRACTATION, *n. s.* } *contracte*; Sp.
CONTRACTEDLY, *adv.* } *contratur*; Lat.
CONTRACTEDNESS, *n. s.* } *contractere*, from
CONTRACTIBILITY, *n. s.* } *con* and *trahere*.
CONTRACTIBLE, *adj.* } To contract is,
CONTRACTIBLENESS, *n. s.* } to reduce with-
CONTRACTILE, *adj.* } in smaller di-
CONTRACTILENESS, *n. s.* } mensions; to
CONTRACT, *v. n.* } lessen; to cor-
CONTRACTION, *n. s.* } rugate; to draw
CONTRACTOR, *n. s.* } together; to make a bargain; to
together; to make a bargain; to betroth; to ac-
quire; to incur; to shorten; to epitomise; to
shrink up; to bargain for. A contract signifies
an agreement between two parties; a compact;
the act which betroths a man and woman. Con-
traction is, the act of contracting; of shrinking;
state of being contracted; reduction of two
vowels or syllables into one; any thing in its
state of abbreviation. Contractor is, generally,
the party who contracts; in its restricted sense,
it means a person who undertakes to supply the
government with provisions, money, or other ar-
ticles of necessity. Thus applied, the word has
sometimes been synonymous with knave. Con-
tractile is, possessing the power of contracting,
of shrinking up. The meaning of the kindred
words is obvious.

When the soule is put in our bodies right anon is
contract original sinne. *Chaucer. Cant. Tales.*

Wedlocke *contract* in blood, and eke in blood
Accomplished, that many deare complaind.

Spenser. Faerie Queene.

First was he *contract* to Lady Lucy;
Your mother lives a witness to that vow

Shakspeare. Richard III.

Touched you the bastardy of Edward's children?—
—I did, with his *contract* with lady Lucy,
And his *contract* by deputy in France. *Id.*

The truth is, she and I, long since *contracted*,
Are now so sure that nothing can dissolve us.

Shakspeare.

Some things induce a *contraction* in the nerves,
placed in the mouth of the stomach, which is a great
cause of appetite. *Bacon.*

Yet if affliction once her wass began,
And threat the feebler sense with sword and fire,
The mind *contracts* herself and shrinketh in,
And to herself she gladly doth retire. *Davies.*

Why love among the virtues is not known;
It is, that love *contracts* them all in one. *Donne.*
Of enemies he could not but *contract* good store,
while moving in so high a sphere. *King Charles.*

To him the angel with *contracted* brow. *Milton.*

Let the measure of your affirmation or denial be
the understanding of your *contractor*; for he that de-
ceives the buyer or the seller by speaking what is

true, in a sense not understood by the other, is a thief.

Taylor's Rule of Living Holy.

Who, I beseech you, is it in this case, that makes the sect? Is it not those who contract the church of Christ within limits of their own contrivance? who, by articles and ceremonies of their own forming, separate from their communion all that have not persuasions which just jump with their model? *Locke.*

These established sects under the specious names of national churches, which, by their contracted and arbitrary limits of communion, justify against themselves the separation and like narrowness of others.

Id.

Justice, and keeping of contracts, is that which most men seem to agree in.

Id.

The agreement upon orders, by mutual contract, with the consent to execute them by common strength, they make the rise of all civil governments. *Temple.*

He that but conceives a crime in thought,

Contracts the danger of an actual fault.

Dryden's Juvenal.

On him thy grace did liberty bestow;

But first contracted, that, if ever found;

His head should pay the forfeit. *Id. Fables.*

Comparing the quantity of contraction and dilatation made by all the degrees of each colour, I found it greatest in the red. *Newton's Opticks.*

She was a lady of the highest condition in that country, and contracted to a man of merit and quality.

Tatler.

Oil of vitriol will throw the stomach into involuntary contractions. *Arbutnot on Aliments.*

Small air bladders, dilatable and contractible, are capable to be inflated by the admission of air, and to subside at the expulsion of it.

Id.

By this continual contractibility and dilatability by different degrees of heat the air is kept in a constant motion.

Id.

The arteries are elastick tubes, endued with a contractile force, by which they squeeze and drive the blood still forward.

Id.

Like friendly colours, found them both unite,
And each from each contract new strength and light.

Pope.

Shall Ward draw contracts with a statesman's skill?
Or Japhet pocket, like his grace, a will?

Id.

The main parts of the poem, such as the fable and sentiments, no translator can prejudice but by omissions or contractions. *Id. Essay on Homer.*

Neither he, nor any man, nor number of men, have a right (except what necessity, which is out of and above all rule, rather imposes than bestows) to free themselves from that primary engagement which every man born into a community as much contracts by his being born into it, as he contracts an obligation to certain parents by his having been derived from their bodies.

Burke.

As they who live retired are disconcerted at the sight of a stranger; as he whose body has never been made pliant by exercise cannot perform new motions either gracefully or easily; so the man, who has contracted a habit of ruminating upon a few things and overlooking others, is flustered, and at a loss, whenever he finds himself, as he often does, in unexpected circumstances.

Beattie.

An Italian writer asserts, that if the top of the floret be touched, all the filaments which support the cylindrical anther will contract themselves, and thus by raising or depressing the anther, the whole of the prolific dust is collected on the stigma. *Darwin.*

Contractile earths in sentient forms arrange,

And life triumphant stays their chemic change.

Straight all subscribed—Kings, Gods, Mutes,
Singer, Actor,—

A Flanders figure-dancer our contractor.

But here, I grieve to own, though it be to you,

He acted—even as most contractors do;

Sold what he never dealt in, and the amount

Being first discharged, submitted his account.

Sheridan.

CONTRACT, an agreement, written, or verbal, which serves as a proof of the consent granted, and the obligation passed between two parties. Among the ancient Romans contracts, and all voluntary acts, were written, either by the parties themselves, or by one of the witnesses, or by a domestic secretary of one of the parties, whom they called a notary, but who was no public person as among us. The contract, when finished, was carried to the magistrate, who gave it a public authority by receiving it inter acta, into the number of acts under his jurisdiction; giving each of the parties a copy thereof, transcribed by his clerks or domestic registers, and sealed with his seal. This practice passed into France, where it continued long. An express contract is where the terms of the agreement are openly uttered, as to pay a stated price for certain goods. An implied contract is such as reason and justice dictate, and which the law therefore supposes every man will perform: thus, if a man takes up wares from a tradesman, without any agreement of price, the law concludes that he contracted to pay their real value. In law these are good contracts, because there is one thing in consideration for another; but if a person promises to give or pay a certain sum, which afterwards, being demanded, he refuses to pay, no action lies to recover it; because such a promise does not amount to a contract, being only a simple promise, termed in law nudum pactum. But if any thing was given in consideration of such a promise, though only to the value of a penny, it is esteemed a good contract, and of course will be binding. Regard should be had to the time in, and from, which contracts are made; and there is a difference where a day of payment is fixed, and where there is not; for when a day is fixed, the contract is good immediately, and an action lies on it failing payment; but it is otherwise where the time of payment is not fixed.

CONTRACTS, NULL, are those prohibited by law: such are all contracts between persons incapable of contracting, as minors, religious, lunatics, wives without consent of their husbands, &c.

CONTRADICT, v. a.

CONTRADICTER, n. s.

CONTRADICTION, n. s.

CONTRADICTIONAL, adj.

CONTRADICTIONOUS, adj.

CONTRADICTIONOUSNESS, n. s.

CONTRADICTIVE, adj.

CONTRADICTORY, n. s. & adj.

CONTRADICTORIAL, adv.

CONTRADICTORINESS, n. s.

CONTRADICTORIOUS, adj.

CONTRADICTORIOUSLY, adv.

Fr. *contredire*; Ital. *contraddire*; Sp. *contradecir*; Lat. *contradicere*, from *contra* and *dicere*. To assert the contrary to what has been affirmed; to deny; to be in opposition to; to gainsay. Contradiction is denial of the truth of; attempt to refute; inconsistency; incongruity; contrariety, in thought or effect. Contradictory signifies in opposition to; not consistent with; in logic, that which is in

Id.

the fullest opposition, where both the terms of one proposition are opposite to those of another. Contradictory is, replete with contradictions; prone to cavil. The meaning of the other words of the same class is obvious.

But when the Jews saw the multitudes, they were filled with envy, and spake against those things which were spoken by Paul, *contradicting* and blaspheming. Acts xiii. 45.

And without all *contradiction* the less is blessed of the better. Hebrews vii. 7.

Laws human must be made without *contradiction* unto any positive law in scripture. Hooker.

All *contradictions* grow in those minds, which neither absolutely climb the rock of virtue, nor freely sink into the sea of vanity. Sidney.

I *contradict* your bans :
If you will marry, make your loves to me. Shakspeare. King Lear.

It is common with princes to will *contradictories*; for it is the solecism of power to think to command the end, and yet not to endure the means. Bacon.

That tongue,
Inspired with *contradiction*, durst oppose
A third part of the gods. Milton's Paradise Lost.

Can he make deathless death? That were
Strange *contradiction*, which to God himself
Impossible is held; an argument
Of weakness, not of power. Id.

Such as have discoursed hereon, have so diversely, contrarily, or *contradictorily* delivered themselves, that no affirmative from thence can be reasonably deduced. Browne.

To ascribe unto him a power of election, not to chuse this or that indifferently, is to make the same thing to be determined to one, and to be not determined to one, which are *contradictories*.
Bramhall's Answer to Hobbes.

When fashion hath once established what folly or craft began, custom makes it sacred, and it will be thought impudence, or madness, to *contradict* or question it. Locke.

It would be a direct *contradiction*, for any one to enter into society with others for the securing and regulating of property; and yet to suppose his land, whose property is to be regulated by the laws of the society, should be exempt from the jurisdiction of that government, to which he himself, the proprietor of the land, is a subject. Id.

It is not lawful to *contradict* a point of history which is known to all the world, as to make Hannibal and Scipio contemporaries with Alexander. Dryden.

The Jews hold, that in case two rabbies should happen to *contradict* one another, they were yet bound to believe the *contradictory* assertions of both. South's Sermons.

If truth be once perceived, we do thereby also perceive whatsoever is false in *contradiction* to it. Grew's Cosmologia.

This opinion was, for its absurdity and *contradictiousness*, unworthy of the refined spirit of Plato. Norris.

The rules of decency, of government, of justice itself, are so different in one place from what they are in another, so party-coloured and *contradictions*, that one would think the species of men altered according to their climates. Collier.

If a gentleman is a little sincere in his representations, he is sure to have a dozen *contradictories*. Swift's View of Ireland.

This objection, from the *contradictoriness* of our dreams, sounds big at first, and seems very unpromising to be accounted for. Baxter.

The best of men appear sometimes to be strange compounds of *contradictory* qualities: and, were the accidental oversights and folly of the wisest man,—the failings and imperfections of a religious man,—the hasty acts and passionate words of a meek man;—were they to rise up in judgment against them;—and an ill-natured judge be suffered to mark, in this manner, what has been done amiss,—what character so unexceptionable as to stand before him? Sterne.

Patient of *contradiction* as a child,
Affable, humble, diffident, and mild;

Such was Sir Isaac, and such Boyle and Locke :
Your blunderer is as sturdy as a rock. Cowper.

Nothing simple, nothing unmixed: all affected plainness, and actual dissimulation; a heterogeneous mass of *contradictory* qualities; with nothing great but his crimes, and even these contrasted by the littleness of his motives, which at once denote both his baseness and his meanness, and mark him for a traitor and a trickster. Sheridan.

CONTRADISTINGUISH, *v. a.* } Ital. *con-*
CONTRADISTINCT, *adj.* } *traddistin-*
CONTRADISTINCTION, *n. s.* } *guere*; Lt.
CONTRADISTINCTIVE, *adj.* } *contra* and
distinguerre. To distinguish on the other side; to distinguish not simply by differential, but by opposite qualities; to mark evidently the difference or opposition of qualities.

That there are such things as sins of infirmity, in *contradistinction* to those of presumption, is a truth not to be questioned. South.

The primary ideas we have peculiar to body, as *contradistinguished* to spirit, are the cohesion of solid, and consequently separable, parts, and a power of communicating motion by impulse. Locke.

We must trace the soul in the ways of intellectual actions, whereby we may come to the distinct knowledge of what is meant by imagination, in *contradistinction* to some other powers. Glanville's Scepsis.

This pleasure arising from the activity of the system, is supposed to constitute the happiness of existence, in *contradistinction* to the ennui, or tedium vitæ. Darwin.

CONTRAFISSURE, *n. s.* From *contra* and *fissure*.

Contusions, when great, do usually produce a fissure or crack of the skull, either in the same part where the blow was inflicted, and then it is called *fissure*; or in the contrary part, in which case it obtains the name of *contrafissure*. Wiseman.

CONTRAHENTS, *n. s.* Lat. *contrahens*. Contracting parties.

CONTRADICATE, *v. a.* } Lat. *contr-*
CONTRADICANT, *n. s.* } and *indicare*:
CONTRADICATION, *n. s.* } These word

in their primary English application, belong to medical science. See MEDICINE. To *contradicate* is to manifest symptoms, which show that a remedy commonly used in a disease was not, in this case, be resorted to. Bark and acids, for instance, are usually given in fevers; but if there be inflammation, or difficulty of breathing those symptoms are *contradictions*, which forbid the administration of acids and bark.

Vomits have their use in this malady; but the age and sex of the patient, or other urgent or *contraindicating* symptoms, must be observed.

Harvey on Consumptions.

I endeavour to give the most simple idea of the distemper, and the proper diet: abstracting from the complications of the first, or the *contraindications* to the second. *Arbuthnot on Aliments.*

Throughout it was full of *contraindicants*. *Burke.*

CONTRAMURE, *n. s.* Fr. *contremure*. In fortification, is an out-wall built about the main wall of a city.

CONTRANATURAL, *adj.* From *contra* and *natural*. Not accordant with nature; unnatural.

To be determined and tied up, either by itself, or from abroad, is violent and *contranatural*.

Bishop Rust.

CONTRANITENCY, *n. s.* From *Lat. contra* and *nitens*. Reaction; a resistency against pressure.

CONTRAPOSITION, *n. s.* From *contra* and *position*. A placing over against; placing in opposition to. In logic, 'a changing of the whole subject into the whole predicate, and the contrary; keeping both the same quantity and quality, but altering the terms from finite to infinite.'

CONTRAPUNTIST: *Ital. contrappunto*. One who has skill in counterpoint.

Counterpoint is certainly so much an art, that to be what they call, a learned *contrapuntist*, is with harmonists a title of no small excellence. *Mason.*

CONTRAREGULARITY, *n. s.* From *contra* and *regularity*. Contrariety to rule.

It is not only its not promoting, but its opposing, or at least its natural aptness to oppose, the greatest and best of ends; so that it is not so properly an irregularity as a *contraregularity*. *Norris.*

CONTRARIENTS. In the reign of king Edward II. Thomas earl of Lancaster, taking part with the barons against the king, it was not thought fit, in respect of their great power, to call them rebels or traitors, but *contrarients*; and hence we have a record of those times, called *Rotulum Contrarienticum*.

CONTRARY, *v. a. n. s. & adj.*

CONTRARIANT, *adj.*

CONTRARIES, *n. s.*

CONTRARIETY, *n. s.*

CONTRARILY, *adv.*

CONTRARINESS, *n. s.*

CONTRARIOUS, *adj.*

CONTRARIOUSLY, *adv.*

CONTRARIWISE, *adv.*

CONTRARY-MINDED, *adj.*

Fr. *contrarier*; *It. contrariare*; *Lat. contrarius*. To cross; to thwart; to contradict; to run counter to. *Con*trary, as a substantive, signifies that which is of opposite qualities; a proposition opposed to some other; a fact which is at variance with the allegation. Chaucer uses it in the sense of a rival; an opponent. Diametrically opposite to, of an entirely different nature, quite inconsistent with, are the meanings of the adjective. On the contrary, is on the other side. To the contrary, is to an opposite intent. In logic, contraries are, propositions which are inter-destructive, but the one of which being proved to be false, the truth of the other does not follow as a consequence. *Contrariant* means inconsistent; contradictory; repugnant to. *Contrariwise* is conversely; oppositely; on the contrary. The rest of the words of this class do not require explanation.

But the ship was now in the midst of the sea-tossed with waves: for the wind was *contrary*.

Matthew xiv. 24.

Then said Paul unto him, God shall smite thee, thou whited wall; for sittest thou to judge me after the law, and commandest me to be smitten *contrary* to the law?

Acts xxiii. 3.

So that *contrariwise* ye ought rather to forgive him, and comfort him, lest perhaps such a one should be swallowed up with overmuch sorrow.

2 Corinthians ii. 7.

In all the court he was ther wif ne maide,

Ne widowe, that *contraried* that he saide,

But said he was worthy to han his life.

Chaucer. Cant. Tales.

They live *contrary* to Christes life,

In hie prid against mekenesse,

Against suffraunce they usin strife,

And augre ayenst sobrenesse.

Id.

This is to sayn, that whether he or thou

May with his hundred, as I spake of now,

Sle his *contrary*, or out of listes drive,

Him shall I yeven Emelie to wive.

Id.

Others rejoyce to see the fire so bright,

And wene to play in it, as they pretend,

But fynd *contrary* of it, as they entende.

Wyat.

When I came to court, I was advised not to *contrary* the king.

Latimer.

He which will perfectly recover a sick, and restore a diseased, body under health, must not endeavour so much to bring it to a state of simple *contrariety*, as of fit proportion in *contrariety* unto those evils which are to be cured.

Hooker.

Finding in him the force of it, he would no further *contrary* it, but employ all his service to medicine it.

Sidney.

Made no resistance, nor could her *contraire*,

But ready passage to her pleasure did prepare.

Spenser. Faerie Queec.

That sayd, her rownd about she from her turnd,

She turnd her *contrary* to the sunne;

Thrise she her turnd *contrary* and returnd;

All *contrary*; for she the right did shunne.

Id.

But this coy dansell thought *contrariwise*,

That such proud looks would make her praised more.

Id.

No *contraries* hold more antipathy,

Than I and such a knave.

Shakespeare. King Lear.

He pleaded still not guilty:

The king's attorney, on the *contrary*,

Urged on examinations, proofs, confessions,

Of diverse witnesses.

Id. Henry VIII.

He will be here, and yet he is not here;

How can these *contrarieties* agree?

Id. Henry IV.

Many things, having full reference

To one consent, may work *contrariously*.

Id. Henry V.

But what can be *contrary* to the mind,

Which holds all *contraries* in concord still?

Davies.

God of our fathers, what is man!

That thou towards him, with hand so various,

Or might I say *contrarious*,

Temperest thy providence through his short course?

Milton.

The various and *contrary* choices that men make in the world, do not argue that they do not all pursue good; but that the same thing is not good to every man alike.

Locke.

God has stamped certain characters upon men's minds, which, like their shapes, may perhaps be a

juile mended, but can hardly be totally altered and transformed into the *contrary*. *Id.*

Though all men desire happiness, yet their wills carry them so *contrarily*, and consequently some of them to what is evil. *Id.*

There is a *contrariety* between those things that science inclines to, and those that entertain the senses. *South.*

He that believes it, and yet lives *contrary* to it, knows that he hath no reason for what he does. *Tillotson.*

They did it, not for want of instruction to the *contrary*. *Stillingfleet.*

If justice stood on the side of the single person, it ought to give good men pleasure to see that right should take place; but when, on the *contrary*, the commonweal of a whole nation is overborn by private interest, what good man but must lament? *Swift.*

Every thing that acts upon the fluids, must, at the same time, act upon the solids, and *contrariwise*. *Arbutnot on Aliments.*

If two universals differ in quality, they are *contraries*; as, every vine is a tree, no vine is a tree. These can never be both true together, but they may be both false. *Watts's Logic.*

The very depositions of witnesses themselves being false, various, *contrariant*, single, inconcludent. *Ayliffe's Pætergon.*

We know that over-labouring a point of this kind, has the direct *contrary* effect from what we wish. *Burke.*

Nor need we wonder, that each nation should be affected most agreeably with its own wit and humour. For, not to mention the prejudice that one naturally entertains in favour of what is one's own, a native must always understand, better than foreigners can, the relations, *contrarieties*, and allusions, implied in what is ludicrous in the speech and writings of his countrymen. *Beattie.*

Thy senate is a scene of civil jar,
Chaos of *contrarieties* at war;
Where sharp and solid, phlegmatic and light,
Discordant atoms meet, ferment, and fight. *Cowper.*

CONTRAST, *v. a. & n. s.* Fr. *contraster*; Ital. *contrastare*; Span. *contrastar*; Lat. *contra* and *stare*. To place in opposition to, for the purpose of making a comparison between, or heightening the effect of one of the things compared.

The figures of the groups must not be all on a side, that is, with their faces and bodies all turned the same way; but must *contrast* each other by their several positions. *Dryden.*

We ought to compare our subject with things of a *contrary* nature; for discoveries may be, and often are, made by the *contrast*, which would escape us on the single view. *Burke.*

He personates a sea-faring man, and with wonderful propriety supports the plainness and simplicity of the character: and this gives to the whole narrative an air of truth, which forms an entertaining *contrast*, when we compare it with the wildness of the fiction. *Beattie.*

Hard was the task, and painful to forbear,
When every social charm at once invited;
And sad the *contrast* of such social fare,
To sit alone in the mind's gloom benighted. *Leftley.*

Here also grateful mixture of well matched
And sorted hues (each giving each relief,
And by *contrasted* beauty shining more)
Is needful. *Cowper.*

Attend all ye who boast—or old or young—
The living libel of a slanderous tongue!
So shall my theme as far *contrasted* be,
As saints by fiends, or hymns by calumny. *Sheridan.*

Thick leaves shall form our coronal, like springs;
And round our necks shall glance the Hooni strings:
So shall their brighter hues *contrast* the glow
Of the dusk bosoms that beat high below. *Byron. The Island.*

CONTRAST, in painting and sculpture, expresses a difference of position, attitude, &c. of two or more figures; as where, in a groupe of three figures, one is shown before, another behind, and another sideways, they are said to be in contrast. The contrast is not only to be observed in the position of several figures, but also in that of several members of the same figure: thus, if the right arm advance furthest, the right leg is to be hindermost; if the eye be directed one way, the arm to go the contrary, &c. Contrast must be pursued even in the drapery.

CONTRATE/NOR. From *contra* and *tenor*. In music, the middle part; the counter tenor.

CONTRATE WHEEL, in watch-work, that next to the crown-wheel, the teeth and hoop of which lie contrary to those of the other wheels; whence its name.

CONTRAVALLATION, *n. s.* From Lat. *contra* and *valla*. The fortification thrown up by the besiegers, round the city, to hinder the sallies of the garrison. *Watts's Logic.*

When the late czar of Muscovy first acquainted himself with mathematical learning, he practised all the rules of circumvallation and *contravallation* at the siege of a town in Livonia.

CONTRAVALLATION, in military affairs, a line of fortifications formed to protect the besiegers of a place from any sallies of the garrison, as the line of circumvallation does from any outward attack. As the ancient garrisons included every man able to bear arms in a fortified town, these lines were more frequent than at present, and are to be found in every ancient work on fortification, since the time of Homer.

CONTRAVENE, *v. n.* } Fr. *contravénir*;
CONTRAVENIR, *n. s.* } Ital. *contraovertire*;
CONTRAVENTION, *n. s.* } Span. *contraovertir*;
Lat. *contra* and *venire*. To oppose; to hinder; to baffle; to disobey. Opposition; disobedience. *Johnson.*

It was observed by one of the chiefs of Sky, that fifty armed men might, without resistance, ravage the country. Laws that place the subjects in such a state, *contravene* the first principles of the compact of authority; they exact obedience, and yield no protection. *Swift.*

If Christianity did not lend its name to stand in the gap, and to employ or divert these humours, they must of necessity be spent in *contraventions* to the laws of the land. *Swift.*

CONTRAVERSION, *n. s.* Lat. *contra* and *vertere*. A turning the opposite way.

CONTRE, in heraldry, an appellation given to several bearings, on account of their cutting the shield contrary and opposite ways: thus we meet with contre-bend, contre-chevron, contre-pale, &c., when there are two ordinaries of the same nature opposite to each other, so as color may be opposed to metal, and metal to color.

CONTRACTATION, *n. s.* Lat. *contractatio*. Touching; handling; dalliance.

CONTRÉMBLING, *adj.* From *con* and *trembling*. Vibrating; shaking; quivering.

CONTRIBUTE, *v. a. & n.* } Fr. *contri-*
CONTRIBUTION, *n. s.* } *buir*; It. *con-*
CONTRIBUTIVE, *adj.* } *tribuire*; Span. *con-*
CONTRIBUTER, *n. s.* } *tribuir*; Lat. *con-*
CONTRIBUTOR, *n. s.* } *tribuire*. To
CONTRIBUTORY, *adj.* } give in conjunc-
CONTRIBUTARY, *n. s. & adj.* } tion with others;

to furnish a share to some common stock; to assist in furthering some end; to bear a part. He who does this is a contributor, or contributor, and the share which he supplies is his contribution, and is contributive, or contributory, to some purpose. Contribution, in a military sense, is the money paid for the support of an army lying in a country. Contributory is, paying tribute to the same sovereign; a fellow-tributary.

It hath pleased them of Macedonia to make a certain contribution for the poor saints. *Rom. xv. 26.*

The people 'twixt Philippi and this ground
Do stand but in a forced affection;
For they have grudged us contribution.

Shakespeare. Julius Cæsar.

I promised we would be contributors,
And hear his charge of wooing, whatsoever.

Shakespeare.

Thus we are engaged in the objects of geometry and arithmetick; yea, the whole mathematicks must be contributory, and to them all nature pays a subsidy.

Glanville's Scopsis.

Beggars are now maintained by voluntary contributions. *Graunt's Bills of Mortality.*

As the value of the premises renders them most proper incentives to virtue, so the manner of proposing we shall find also highly contributive to the same end.

Decay of Piety.

Art thou a true lover of thy country? zealous for its religious and civil liberties? and a cheerful contributor to all those public expences which have been thought necessary to secure them?

Atterbury.

Whatever praises may be given to works of judgment, there is not even a single beauty in them to which the invention must not contribute.

Pope's Essay on Homer

His master contributed a great sum of money to the Jesuits' church, which is not yet quite finished.

Addison on Italy.

This happy sensibility to the beauties of nature should be cherished in young persons. It engages them to contemplate the Creator in his wonderful works; it purifies and harmonizes the soul, and prepares it for moral and intellectual discipline; it supplies an endless source of amusement; it contributes even to bodily health.

Beattie.

He travels and expatiates; as the bee
From flower to flower, so he from land to land;
The manners, customs, policy, of all
Pay contribution to the store he glean; as
He sucks intelligence in every clime.

Cowper.

He need not remind us, that there is no great danger of our chancellor of the exchequer making any such experiment, any more than of the most zealous supporters of the war in this country, vying in their contributions with the abettors of republicanism in that.

Sheridan.

Although truth exacts
These amiable descriptions from the scribes,
As most essential to their hero's story,
They do not much contribute to his glory.

Byron. Don Juan.

CONTRISTATE, *v. a.* } Fr. *contrister*; It.
CONTRISTATION, *n. s.* } *contristare*; Sp. *con-*
tristar; Lat. *contristare*; to make sad; to inspire with sorrow. The act of making sad; dejection; gloominess; trouble; discontent; melancholy. Both words are out of use.

Blackness and darkness are but privatives, and therefore have little or no activity: somewhat they do *contristate*, but very little.

Bacon's Nat. Hist.

Incense and nidorous smells, such as were of sacrifices, were thought to intoxicate the brain, and to dispose men to devotion; which they may do by a kind of sadness and *contristation* of the spirits, and partly also by heating and exalting them.

Id.

CONTRITE, *adj.* } Fr. *contrit*; Ital. and
CONTRITENESS, *n. s.* } Sp. *contrito*; Lat. *con-*
CONTRITION, *n. s.* } *tritus*. Bruised; much worn; thence, worn with woe; harassed and humbled with the sense of guilt; repentant. In the books of divines, contrite is sorrowful for sin, from the love of God and desire of pleasing him; and attrite is sorrowful for sin, from the fear of punishment. The same distinction holds good in the nouns, contrition and attrition. Contrition also signifies the act of grinding; but this, as well as attrition in the sense of bruised, is obsolete.

If ther be a confessor to whom he may shrive him, and that he be first very *contrite* and repentant.

Chaucer. Cant. Tales.

Now shalt thou understand what is behoveful and necessary to every parfit penance; and this stont on three thinges, *contrition* of herte, confession of mouth, and satisfaction.

Id.

'Here in this bottle,' said the sory mayd,
I put the tears of my contrition,
Till to the brim I have it full defrayd.

Spenser's Faerie Queene.

Her *contrite* sighs unto the clouds bequeathed
Her winged spright. *Shakespeare. Rape of Lucrece.*
With tears

Watering the ground, and with our sighs the air
Frequenting, sent from hearts *contrite*, in sign
Of sorrow unfeigned, and humiliation meek.

Milton.

Fruits of more pleasing favour, from thy seed
Sown with *contrition* in his heart, than those
Which, his own hand manuring, all the trees
Of Paradise could have produced.

Id. Paradise Lost.

What is sorrow and *contrition* for sin? A being grieved with the conscience of sin, not only that we have thereby incurred such danger, but also that we have so unkindly grieved and provoked so good a God.

Hammond's Practical Catechism.

Your fasting, *contrition*, and mortification, when the church and state appoints, and that especially in times of greater riot and luxury.

Scratt's Sermons.

My future days shall be one whole *contrition*;
A chapel will I build with large endowment,
Where every day an hundred aged men
Shall all hold up their withered hands to heaven.

Dryden.

Some of those coloured powders, which painters use, may have their colours a little changed, by being very elaborately and finely ground; where I see not what can be justly pretended for those changes.

besides the breaking of their parts into less parts by that *contrition*. *Newton's Opticks.*

The *contrite* sinner is restored to pardon, and, through faith in Christ, our repentance is entitled to salvation. *Rogers.*

CONTRIVE, *v. a. & n.* } The derivation
CONTRIVER, *n. s.* } of contrive is thus
CONTRIVEMENT, *n. s.* } traced by Skinner
CONTRIVANCE, *n. s.* } ner: 'Teut. *tref-*
CONTRIVABLE, *adj.* } *fen, attingere;*
CONTRIVING, *n. s.* } *antreffen, offen-*
dere, invenire; to invent; find out; unde Gall. *contrower; excogitare; extunder.* To contrive is to imagine; to frame; to manage cleverly; to design; to plot; to wear away the time; but the last of these meanings is obsolete. Contrivance is the act of contriving; management; the thing contrived; plan; plot; artifice; disposition of parts or causes; making use of scanty materials to the best advantage. Contrivement is invention.

Three ages, such as mortal men *contrive*.

Faerie Queene.

Please ye, we may *contrive* this afternoon,
 And quaff carouses to our mistress's health. *Shakspeare.*

One that slept in the *contriving* lust, and waked to do it. *Id. King Lear.*

I, the mistress of your charms,
 The close *contriver* of all harms,
 Was never called to bear my part. *Id. Macbeth.*

It will hence appear how a perpetual motion may seem easily *contrivable*. *Wilkins's Daedalus.*

There is no work impossible to these *contrivances*, but there may be as much acted by this art as can be fancied by imagination. *Id. Mathematical Magic.*

What more likely to *contrive* this admirable frame of the universe than infinite wisdom? *Tillotson.*

Our poet has always some beautiful design, which he first establishes, and then *contrives* the means which will naturally conduct him to his end. *Dryden.*

Have I not managed my *contrivance* well,
 To try your love, and make you doubt of mine? *Id.*

Is it enough

That masking habits, and a borrowed name,
Contrive to hide my plenitude of shame? *Prior.*

Scenes of blood and desolation, I had painted as the common effects of those destructive machines; whereof, he said, some evil genius, enemy to mankind, must have been the first *contriver*.

Swift's Gulliver's Travels.

It would our ancestors at the revolution have deserved their fame for wisdom, if they had found no security for their freedom, but in rendering their government feeble in its operations, and precarious in its tenure; if they had been able to *contrive* no better remedy against arbitrary power than civil confusion. *Burke.*

When I hear the simplicity of *contrivance* aimed at and boasted of in any new political constitutions, I am at no loss to decide that the artificers are grossly ignorant of their trade, or totally negligent of their duty. The simple governments are fundamentally defective, to say no worse of them. *Id.*

Some, more acute, and more industrious still,
Contrive creation; travel Nature up
 To the sharp peak of her sublimest height,
 And tell us whence the stars; why some are fixed,
 And planetary some; what gave them first
 Rotation; from what fountain flowed their light.

Cowper.

To prove at last my main intent
 Needs no expense of argument,

Upon cutting and *contriving*—
 Seeking a real friend we seem
 To adopt the chymist's golden dream,
 With still less hope of thriving. *Id.*

They made a fire, but such a fire as they
 Upon the moment could *contrive* with such
 Materials as were cast up round the bay,
 Some broken planks, and oars, that to the touch
 Were nearly tender, since so long they lay
 A mast was almost crumbled to a crutch.

Byron. Don Juan.

CONTR'OL, *v. a. & n. s.* } Fr. *controler.*
CONTR'OLLABLE, *adj.* } Cotgrave and
CONTR'OLLER, *n. s.* } Sherwood refer
CONTR'OLLERSHIP, *n. s.* } the origin of con-
CONTR'OLLING, *n. s.* } trol to *con-*
CONTR'OLMENT, *n. s.* } *rolle*, 'a controle-

ment, or controlement; the copy of a roll (of account, &c.) To control, therefore, in its primitive sense, is to check by means of the roll. Skinner says, '*rola, rotula*, unde Fr. Gall. *contre-rolle, contra-dicere*, to contradict; gainsay; reprove; an inspector; ruler; director. The verb now bears the meaning of, to exercise authority over; to restrain; to oversee; to regulate; sometimes, though seldom, to overbear; to confute. The noun control, in addition to its obvious meanings, signifies a register, or account, kept by another officer, that each may be checked by the other. Controlment is, the act of superintending, or restraining; the state of being controlled; opposition; hostility.

Who shall *control* me for my works? *Ecc. v. 3.*

Authority to convent, to *control*, to punish, as far as with excommunication, whomsoever they think worthy. *Hooker.*

Were it reason that we should suffer the same to pass without *controlment*, in that current meaning, whereby every where it prevailieth. *Id.*

Give me a staff of honour for mine age;
 But not a sceptre to *control* the world.

Shakspeare. Titus Andronicus.

— Art made tongue-tyed by authority,
 And Folly (doctor-like) *controlling* skill.

Id. Sonnet lxi.

Here have we war for war, and blood for blood,
Controlment for *controlment*. *Id. King John.*

He does not calm his contumelious spirit,
 Nor cease to be an arrogant *controller*.

Id. Henry VI.

As for the time while he was in the Tower, and the manner of his brother's death, and his own escape, she knew they were things that a very few could *control*. *Bacon's Henry VII.*

They made war and peace with one another, without *controlment*. *Davies on Ireland.*

Let partial spirits still aloud complain,
 Think themselves injured that they cannot reign;
 And own no liberty, but where they may,
 Without *control*, upon their fellows prey. *Waller.*

Passion is the drunkenness of the mind, and therefore, in its present workings, not *controllable* by reason. *South.*

If the sinner shall win so complete a victory over his conscience, that all those considerations shall be able to strike no terror into his mind, lay no restraint upon his lusts, no *control* upon his appetites, he is certainly too strong for the means of grace. *Id. Sermons.*

The great *controller* of our fate
Deigned to be man, and lived in low estate.

Dryden.

I feel my virtue struggling in my soul :
But stronger passion does its power *control*.

Id. Aurengzebe.

No legislator, at any period of the world, has willingly placed the seat of active power in the hands of the multitude : because there it admits of no *control*, no regulation, no steady direction whatsoever. The people are the natural *control* on authority ; but to exercise and to *control* together is contradictory and impossible.

Burke.

If you set them to transact with such persons, they are instantly subdued. They dare not so much as look their antagonist in the face. They are made to be their subjects, not to be their arbiters or *controllers*.

Id.

Reader, attend—whether thy soul
Soars fancy's flights beyond the pole,
Or darkling grubs this earthly hole,
In low pursuit ;

Know, prudent, cautious, self-*control*,
Is wisdom's root.

Burns.

Roll on, thou deep and dark blue ocean—roll !

Ten thousand fleets sweep over thee in vain ;
Man marks the earth with ruin—his *control*
Stops with the shore.

Byron. Child Harold.

CONTROLLER, an officer appointed to control or oversee the accounts of other officers ; and, on occasion, to certify whether things have been controlled or examined. In Britain we have several officers under this title ; as controller of the navy, the customs, the mint, besides the following :—

CONTROLLER OF THE HANAPER, an officer who attends the lord chancellor daily, in term and in seal time, to take all things sealed in leather bags from the clerks of the hanaper, and to mark the number and effect thereof, and enter them in a book, with all the duties belonging to the king, and other officers for the same, and so charge the clerk of the hanaper with them.

CONTROLLER OF THE HOUSEHOLD, the second officer under the lord steward. His office is to control the accounts and reckonings of the Green Cloth, of which board he is always a member. He carries a white staff, and is always one of the privy council.

CONTROLLERS OF THE PELLs, two officers of the exchequer, who are the chamberlain's clerks, and keep a control of the pell of receipts, and going out.

CONTROLLER OF THE PIPE, an officer of the exchequer, that makes out a summons twice every year, to levy the farms and debts of the pipe. See **PIPE** and **EXCHEQUER**.

CON'TROVERSE, <i>v. a. & n. s.</i>	} Fr. <i>contro-</i> <i>verse</i> ; Ital. <i>controvertete</i> ; Sp. <i>contro-</i> <i>vertir</i> ; Lat. <i>contro-</i> <i>versus</i> , from <i>con</i> and <i>ver-</i> <i>tere</i> . Con- troverse is obsolete in both its forms : it is synonymous with <i>controvert</i> and <i>controvertis</i> .
CON'TROVE'RSAL, <i>adj.</i>	
CON'TROVE'RSIAL, <i>adj.</i>	
CON'TROVE'RSIALIST, <i>n. s.</i>	
CON'TROVE'RSION, <i>n. s.</i>	
CO'NTROVERSER, <i>n. s.</i>	
CO'NTROVERSOR, <i>n. s.</i>	
CO'NTROVERSY, <i>n. s.</i>	
CO'NTROVERSY-WRI'ETER, <i>n. s.</i>	
CO'NTROVERT, <i>v. a.</i>	
CON'TROVE'RTER, <i>n. s.</i>	
CON'TROVE'RTIBLE, <i>adj.</i>	
CON'TROVE'RTIST, <i>n. s.</i>	

To *controvert* is to debate ; to dispute ; to deny the truth of ; to call in question. *Controversy* is the written maintaining of conflicting opinions ; a lawsuit ; a quarrel ; opposition. The last two senses are unusual. *Controversialist* is a modern word for *controverser*, *controversor*, *controvertor*, *controvertist*, and *controversy-writer*. It is scarcely necessary to say that it signifies a disputant ; one who engages in controversy. Formerly, this kind of being was too apt to disregard decorum, and almost reduce literary and theological contests to a level with the contests of Billingsgate. In this instance, modern refinement has produced not merely a change, but an amendment.

If there be a *controversy* between men, and they come unto judgment, that the judges may judge them, then they shall justify the righteous, and condemn the wicked. *Deut. xxv. 1.*

The Lord hath a *controversy* with the nations.

Jer. xxv. 31.

Without *controversy* great is the mystery of godliness.

1 Timothy.

Persuasion ought to be fully settled in men's hearts, that, in litigations and *controverted* causes of such quality, the will of God is to have them to do whatsoever the sentence of judicial and final decision shall determine.

Hooker.

How cometh it to pass that we are so rent with mutual contentions, and that the church is so much troubled ? If men had been willing to learn, all these *controversies* might have died the very day they were first brought forth.

Id.

So fitly now here commeth next in place,
After the proofe of prowess ended well,
The *controverse* of beauties sovaine grace.

Spenser, Faerie Queene.

But this good Sir did follow the plain word,
Ne medled with their *controverties* vain.

Id. Mother Hubbard's Tale.

And *controvertis* hence a question takes,
Whether the horse by him became his deed,
Or he his manage by the well-doing steed.

Shakspeare. A Lover's Complaint.

The torrent roared, and we did buffet it,
With lusty sinews ; throwing it aside,
And stemming it with hearts of *controversy*.

Id. Julius Cæsar.

Discoursing of matters dubious, and many *controvertible* truths, we cannot without arrogance treat a credulity, or implore any farther assent than the probability of our reasons, and verity of our experiments.

Browne's Vulgar Errors.

This left no room for *controversy* about the title, nor for encroachment on the right of others.

Locke.

It happens in *controversial* discourses, as it does in the assailing of towns, where, if the ground be but firm wherein the batteries are erected, there is no farther enquiry whom it belongs to, so it affords but a fit rise for the present purpose.

Id.

Controversial writing is not wholly unprofitable ; and book-merchants of whatever kind or degree, undoubtedly receive no small advantage from a right improvement of a learned scuffle.

Shaftesbury.

Who can think himself so considerable as not to dread this mighty man of demonstration, this prince of *controvertists*, this great lord and possessor of first principles.

Tillotson.

If any person shall think fit to *controvert* them, he may do it very safely for me.

Cheyne's Philosophical Principles.

Railery and wit were never made to answer our inquiries after truth, and to determine a question of rational *controversy*. *Watts*.

They, strangers to the *controversial* field, Where deists, always foiled, yet scorn to yield, And never checked by what impedes the wise, Believe, rush forward, and possess the prize. *Couper*.

CONTRU'SION, *n. s.* Latin, *contrudere*. Thrusting against; pressing together.

CONTUMACY, *n. s.* } Fr. *contumace* ;
CONTUMACIOUS, *adj.* } It. Sp. and Lat.
CONTUMACIOUSLY, *adv.* } *contumacia*. The
CONTUMACIOUSNESS, *n. s.* } French have the
verb *contumacer*, which now signifies to cast for non-appearance; to non-suit; to out-law. Its meaning was formerly far more extensive. *Sherwood* defines it, 'to deal stubbornly, be perverse; follow his own will; disobey, or rebel against his superiors; to make a contempt; also to judge, or proceed against, as disobedient, obstinate, rebellious; to punish or censure, a contempt.' In the English words are retained those meanings which the French verb has lost. All of them convey the idea of obstinacy; perverseness; contempt of superior authority. In law, contumacy is a wilful disobedience to any lawful summons or judicial order.

Contumacie, presumption, irreverence, pertinacity, vain glorie, and many other twiggas that I cannot declare. *Chaucer. Cant. Tales*.

There is another very efficacious method for subduing of the most obstinate *contumacious* sinner, and bringing him into the obedience of the faith of Christ. *Hammond's Fundamentals*.

Such acts

Of *contumacy* will provoke the Highest
To make death in us live. *Milton. Par. Lost*.

From the description I have given of it, a judgment may be given of the difficulty and *contumaciousness* of cure. *Wiseman*.

These certificates do only, in the generality, mention the party's *contumacies* and disobedience. *Ayliffe's Parergon*.

He is in law said to be a *contumacious* person, who, on his appearance afterwards, departs the court without leave. *Id.*

CONTUMELY, *n. s.* } Fr. *contumelie* ;
CONTUMELIOUS, *adj.* } It. Sp. and Lat.
CONTUMELIOUSLY, *adv.* } *contumelia*. Rude-
CONTUMELIOUSNESS, *n. s.* } ness; contemptuousness; insolence or scurrillity of language; taunt; reproach. *Contumelious* is, arrogant; reproachful; inflicting ignominy; brutal.

Than stondesth the sinne of *contumelie*, or strif and cheste, and battereth and forgeth by villain's reprevings. *Chaucer. Cant. Tales*.

If the helm of chief government be in the hands of a few of the wealthiest, then laws, providing for continuance thereof, must make the punishment of *contumely* and wrong, offered unto any of the common sort, sharp and grievous, that so the evil may be prevented. *Hooker*.

The people are not wont to take so great offence, when they are excluded from honours and offices, as when their persons are *contumeliously* trodden upon. *Id.*

The oppressor's wrong, the proud man's *contumely*,
The pang of despised love, the law's delay.

Shakspeare's Hamlet.

With scoffs and scorns, and *contumelious* taunts,
In open market-place produced they me
To be a public spectacle. *Id. Henry VI.*

Fie, lords! that you, being supreme magistrates,
Thus *contumeliously* should break the peace. *Id.*

It was undervalued and depressed with some bitterness and *contumely*. *Clarendon*.

Why should any man be troubled at the *contumelies* of those, whose judgments deserve not to be valued? *Tillotson*.

As it is in the highest degree injurious to them, so it is *contumelious* to him. *Decay of Piety*.

Eternal *contumely* attend that guilty title, which claims exemption from thought, and arrogates to its wearers the prerogative of brutes. *Addison. Guardian*.

In all the quarrels and tumults at Rome, though the people frequently proceeded to rude *contumelious* language, yet no blood was ever drawn in any popular commotions, till the time of the Gracchi. *Swift*.

This business was not ended, because our dignity was wounded, or because our patience was worn out with *contumely* and scorn. We had not disgorged one particle of the nauseous doses with which we were so liberally crammed by the mountebanks of Paris, in order to drug and diet us into perfect tameness. *Burke*.

CONTUND, *v. a.* Fr. *contondant* ; It. & Sp. *contundente* ; Lat. *contundere*. To bruise; to beat violently; to pound.

CONTURBATION, *n. s.* Lat. *conturbatio*, from *con* and *turba* ; *τὸ βῆν*. Disturbance; confusion; disorder.

CONTU'SE, *v. a.* } Fr. *contus*, *contusion* ;
CONTU'SION, *n. s.* } Ital. *contuso*, *contusione* ;
Span. *contuso*, *contusion* ; from Lat. *contundere*. To beat together; to bruise without breaking the flesh. The act of bruising or pounding; the state of being bruised or pounded; a bruise.

That winter lion, who in rage forgets

Aged *contusions*, and all brute of time.

Shakspeare. Henry VI.

Of their roots, barks, and seeds, *contused* together, and mingled with other earth, and well watered with warm water, there came forth herbs much like the other. *Bacon*.

The bones, in sharp colds, wax brittle; and all *contusions*, in hard weather are more hard to cure. *Id.*

Take a piece of glass, and reduce it to powder, it acquiring by *contusion* a multitude of minute surfaces, from a diaphanous, degenerates into a white body.

Boyle on Colours.

The ligature *contuses* the lips in cutting them, so that they require to be digested before they can unite.

Wiseman.

Adjoining close to Kilwick's echoing wood,
Where oft the bitch fox hides her hapless brood,
Reserved to solace many a neighbouring squire,
That he may follow them through brake and brier,
Contusion hazarding of neck or spine,
Which rural gentlemen call sport divine. *Couper*.

CONVALESCENCE, *v. n.* } Lat. *convalescere*.

CONVALESCENCY, *n. s.* } The verb, which is

CONVALESCENCY, *n. s.* } now obsolete, signi-

CONVALESCENT, *adj.* } fies to be returning to health. *Convalescence* and *convalescency* mean restoration to health; recent recovery from disease. *Convalescent* is, being in a recovering state; free from disease, but not yet having recovered strength.

Being in a place out of the reach of any alarm she recovered her spirits to a reasonable *convalescence*.

Clarendon.

And every morn his colour freshlier came,

And every day helped on his *convallescence*;
 'Twas well, because health in the human frame
 Is pleasant, besides being true love's essence.

Byron. Don Juan.

CONVALLARIA, the lily of the valley, in botany, a genus of the monogynia order, and hexandria class of plants; *cor. sexfid*: BERRY spotted and trilobular. There are twelve species, of which three are natives of Britain, viz.:—*C. Majalis*, May lily. *C. multiflora*, Solomon's seal; and *C. polygonatum*, sweet-smelling Solomon's seal. They are all plants of considerable beauty, and may easily be propagated by their creeping roots.

CONVENÆ, an ancient people of Gallia Narbonensis, said by Pliny to have been originally robbers and slaves, whom Pompey compelled to settle at the foot of the Pyrenees, after the Seritorian war.

CONVENIENCE, *n. s.*

CONVENIENCY, *n. s.*

sense of convene, an instance of which we have given from Spenser. To convene is, to summon together; to convoke; to cite judicially; to come together; to assemble. Hence convent, conventicle, convention, mean aggregates of persons; persons collected together. Convent is the residence of a body of monks, or nuns. Conventicle is, in its general sense, an assembly; a meeting; but, in its customary sense, an assembly for religious worship, consisting of persons who do not belong to the church establishment; the bigotry of some of our ancestors induced them to attach to it a disgraceful idea, and to persecute those who composed it. See CONVENTICLE. Convention is the act of coming together; union; a contract; something settled by common consent; a provisional agreement; an assembly of persons. In this latter sense, the word has received a blot, from the conduct of the French legislature which bore the name of the convention. Conventional is, stipulated; agreed on by compact; settled by common consent, and not inhering in the nature of the thing. Convenience and conveniency denote, fitness; propriety; commodiousness; ease; accommodation; fitness of time and place;—that is, a concurrence, a coming together, of circumstances favorable to doing or enjoying something. Convenient, which is suitable, commodious, takes to or for before the following noun; and Johnson justly observes that 'perhaps it ought gen-

rally to have for before persons, and to before things.' Convenient is, consistent with; agreeable to. It is obsolete.

Give me neither poverty nor riches, feed me with food convenient for me. *Prov. xxx. 8.*

I have none Englishe convenient and digne,
 Myne herte's hele lady! the with to honour.

Chaucer.

Yet maugre love, and all his gods beside,
 I do possess the world's most regiment,
 As if ye please it into parts divide,
 And every part's inholders to convent,
 Shall to your eyes appear incontinent.

Spenser. Faerie Queene.

But what strange fortunes unto him befell,
 Ere he attained the point by him intended,
 Shall more conveniently in other place be ended. *Id.*

He is so meek, wise, and merciable,
 And with his word his work is convenient

Id. Pastorals.

It behoveth, that the place where God shall be served by the whole church be a publick place, for the avoiding of privy conventicles, which, covered with pretence of religion, may serve unto dangerous practices.

Hooker.

In things not commanded of God, yet lawful, because permitted, the question is, What light shall shew us the conveniency which one hath above another? *Id.*

He with his oath

By all probation will make up full clear,
 Whenever he's convented.

Shakspeare. Measure for Measure.

He came to Leicester;
 Lodged in the abbey, where the reverend abbot,
 With all his convent, honourably received him.

Id. Henry VIII.

Ay, all of you have laid your heads together
 (Myself had notice of your conventicles)
 And all to make away my guiltless life.

Id. Henry VI.

Use no farther means;

But, with all brief and plain conveniency,
 Let me have judgment.

Id. Merchant of Venice.

I this morning know

Where we shall find him most conveniently.

Id. Hamlet.

They sent forth their precepts to attach men, and convent them before themselves at private houses.

Bacon's Henry VII.

No man was better pleased with the convening of this parliament than myself.

King Charles.

Conventional services reserved by tenures upon grants, made out of the crown or knights service.

Hale's Common Law.

The ordinary covenants of most conventional tenants are, to pay due capon and due harvest journeys.

Carew's Surrey.

All the factious and schismatical people would frequently, as well in the night as the day, convene themselves by the sound of a bell.

Clarendon.

They are to be reckoned amongst the most general affections of the conventions, or associations, of several particles of matter into bodies of any certain denomination.

Boyle.

There are settled periods of their convening, or a liberty left to the prince for convoking the legislature.

Locke.

God, who hath given the world to men in common, hath also given them reason, to make use of it to the best advantage of life and convenience. *Id.*

As to his meals, I should think it best that, as much as it can be conveniently avoided, they should not be kept constantly to an hour. For when custom hath fixed his eating to certain stated periods, his stomach will expect victuals at the usual hour, and grow peevish if he passes it. *Locke.*

Every man must want something for the convenience of his life, for which he must be obliged to others.

Calamy's Sermons.

Who far from steeples and their sacred sound,
In fields their sullen conventicles found. *Dryden.*

Another crop is too like to follow; nay, I fear, it is unavoidable, if the conventicles be permitted still to scatter. *Id.*

In short-sighted men, whose eyes are too plump, the refraction being too great, the rays converge and convene in the eyes, before they come at the bottom.

Newton's Opticks.

I have read a sermon of a conventual, who laid it down that Adam could not laugh before the fall.

Addison's Spectator.

If he revoked this plea too, 'twas because he found the expected council was winding into a conventicle, a packed assembly of Italian bishops; not a free convention of fathers from all quarters. *Atterbury.*

Health itself is but a kind of temper, gotten and preserved by a convenient mixture of contraries.

Arbuthnot on Aliments.

Public conventions are liable to all the infirmities, follies, and vices of private men. *Swift.*

There was a pair of spectacles, a pocket perspective, and several other little conveniences, I did not think myself bound in honour to discover.

Swift's Gulliver's Travels.

And now the' almighty father of the gods
Convenes a council in the blest abodes. *Pope's Stat.*

They are commanded to abstain from all conventicles of men whatsoever; even, out of the church, to have nothing to do with publick business. *Id.*

Those are called conventual priors, that have the chief ruling power over a monastery. *Id.*

What organ it is that shall declare the corporate mind is so much a matter of positive arrangement, that several states, for the validity of several of their acts, have required a proportion of voices much greater than that of a mere majority. These proportions are so entirely governed by convention, that in some cases the minority decides. *Burke.*

Mild was the morn, the sky serene,
The jolly hunting band convene,
The beagle's breast with ardour burns,
The bounding steed the champaign spurns,
And Fancy oft the game describes,
Through the hound's nose, and huntsman's eyes. *Beattie.*

Thy parliaments adored on bended knees
The sovereignty they were convened to please;
Whate'er was asked, too timid to resist,
Complied with, and were graciously dismissed. *Cooper.*

I seek divine simplicity in him,
Who handles things divine; and all besides,
Though learned with labour, and though much admired

By curious eyes and judgments ill informed,
To me is odious as the nasal twang
Heard at conventicle, where worthy men,
Misled by custom, strain celestial themes
Through the pressed nostril, spectacle-bestrud. *Id.*

Then first necessity invented stools,
Convenience next suggested elbow chairs,
And Luxury the accomplished sofa last. *Id.*

And this example well may prove
That nought's so eloquent as love:
For oft had orators, whose style was
Mellifluent as the seeds of Pylos,
Convened, debated, and returned—
While still the rage of battle burned.
But Cupid's sweeter elocution
Brought matters quick to a conclusion. *Sheridan.*
The horrid crags, by topping convent crowned,
Byron's Child Harold.

Nothing but sound, as is manifest, can perfectly be represented by sound; and beyond this, the resemblance, between the flow of a verse and the idea excited by the words, must be wholly conventional, and not in any degree actual and self-existent.

Symmons. Pref. to the Æneis.

CONVENER, the title given to the præses of the fourteen deacons of the incorporations, or trades of Edinburgh, from his power of convening the deacons, or the whole incorporations, upon any emergency. He is elected by the fourteen deacons, and the two trades counsellors; wears a gold chain, and is a governor of the Trades Maiden Hospital; but is not ex-officio a member of the ordinary town council; though the magistrates generally appoint him one.

CONVENTICLE is a diminutive of convent; denoting, properly, a secret assembly of a part of the monks of a convent, to make a party in the election of an abbot. Hence the word stands for any seditious, or irregular assembly. F. Doucine observes, the occidentals always esteemed the fifth general council an unlawful conventicle. The term is said to have been first applied in England to the schools of Wickliffe, and has been since used to signify the religious assemblies of all who do not conform to the established doctrines and worship of the church of England. By 22 Car. II. cap. 1, it is enacted: that if any persons of the age of sixteen years, subjects of this kingdom, shall be present at any conventicle, where there are five or more assembled, they shall be fined 6s. for the first offence, and 10s. for the second: persons preaching incur a penalty of £20. Suffering a meeting to be held in a house, is liable to £20 penalty. Justices of the peace have power to enter such houses, and seize persons assembled, &c. And if they neglect their duty, they forfeit £100. And if any constable, &c. know of such meetings, and do not inform a justice of peace, or chief magistrate, he shall forfeit £5. But the 1st W. & M. cap. 18, ordains, that Protestant dissenters shall be exempted from penalties: though if they meet in a house with the doors locked, barred, or bolted, such dissenters shall have no benefit from that statute. Officers of the government, &c. present at any conventicle, at which there shall be ten persons, if the royal family be not prayed for in express words, shall forfeit £40, and be disabled. 10 Anne, cap. 2.

CONVENTION is also a name given to an extraordinary assembly of parliament, or the estates of the realm, held without the king's writ. Of this kind was the convention parliament which restored Charles II. This parliament met above a month before his return, and sat full seven months after his restoration, and enacted several laws still in force, which were confirmed by stat. 13,

Car. II. c. 7, and c. 14. Such also was the convention of estates in 1689, who, upon the retreat of king James II., came to a conclusion that he had abdicated the throne, and that the right of succession devolved to king William, and queen Mary; whereupon their assembly expired as a convention, and was converted into a parliament.

CONVENTION OF ESTATES, in Scotland, was partly of the nature of a parliament; but differing in this, that the former could only lay on taxes, while parliament could both impose taxes and make laws.

CONVENTION OF FRANCE, NATIONAL, the representatives of the French people, who met on the 20th of September, 1792, and among their first acts abolished monarchy in that kingdom. See FRANCE, HISTORY OF

CONVENTUS JURIDICI, in Roman antiquity, courts of justice established in the provinces; with jurisdictions circumscribed within certain limits, whither all who were within the limits of these courts were to repair for justice.

CONVERGE, *v. n.* Lat. *convergere*. To CONVERGENCY, *n. s.* } tend to one point; to
CONVERGENT, *adj.* } one common centre.
CONVERGING, *adj.* } Tendency to one point.
Tending to one point.

Where the rays from all the points of any object meet again, after they have been made to converge by reflexion or refraction, there they will make a picture of the object upon a white body. *Newton's Opticks.*

EnswEEPing first

The lower skies, they all at once converge
High to the crown of heaven. *Thomson's Autumn.*

Converge reflected light with nicer eye
The midnight owl, and microscopic fly. *Darwin.*

When a fly inserts its proboscis between these anthers (of the apocynum and rose-mifolium), to plunder the honey, they converge closer, and with such violence as to detain the fly, which thus generally perishes. *Id.*

CONVERSE, *v. n.* } Fr. *converser* ;
CONVERSE, *n. s.* } It. *conversare* ; Sp.
CONVERSIBLE, *adj.* } *conversar* ; Latin,
CONVERSABLY, *adv.* } *conversari*. To con-
CONVERSABLENESS, *n. s.* } verse is, to hold
CONVERSANT, *adj.* } intercourse with ;
CONVERSATION, *n. s.* } to be acquainted
CONVERSATIVE, *adj.* } with ; to talk with ;
to discourse familiarly, in which case it has
on before the thing ; to have commerce with
one of the opposite sex. Converse is, talk ;
acquaintance ; familiarity. Converse is a word
of a more poetical order than conversation, and
implies somewhat less of familiarity than the
latter. Easy talk, chit-chat, may be called con-
versation ; but can scarcely be dignified with the
name of converse. Conversation has the addi-
tional meanings of behaviour ; mode of living ;
knowledge by long acquaintance with. Con-
versant signifies, having a thorough knowledge of ;
having intercourse with, in which case it is fol-
lowed by *among* or *with* ; relating to, in which
sense it has *about*, and formerly had *in*, after it.
Conversable is, having talent for conversing ; be-
ing communicative. Conversative indicates, re-
lating to social commerce ; to public life ; not
contemplative.

All that Moses commanded, Joshua read before all the congregation of Israel, with the women, and the little ones, and the strangers that were conversant among them. *Jos. viii. 35.*

Having your conversation honest among the Gentiles, *1 Peter.*

She went to Pamela's chamber, meaning to joy her thoughts with the sweet conversation of her sister. *Sidney.*

Whiles thou now in Elysian fields so free,
With Orpheus, with Linus, and the choice
Of all that ever did in rimes rejoice,
Conversest, and doost hear their heavenly lays. *Spenser. The Ruines of Time.*

Let them make some towns near to the mountain's side, where they may dwell together with their neighbours, and be conversant in the view of the world. *Spenser's State of Ireland.*

The matters wherein church polity is conversant, are the publick religious duties of the church. *Hooker.*

I will converse with iron-witted fools,
And unrespective boys : none are for me,
That look into me with considerate eyes. *Shakspeare. Richard III.*

His apparent, open guilt ;
I mean his conversation with Shore's wife. *Id.*

Never to be infected with delight,
Nor conversant with ease and idleness *Id. King John.*

Old men who have loved young company, and been conversant continually with them, have been of long life. *Bacon.*

I set down, out of long experience in business, and much conversation in books, what I thought pertinent to this business. *Id.*

Go therefore half this day, as friend with friend,
Converse with Adam. *Milton's Paradise Lost.*

Gabriel, this day by proof thou shalt behold,
Thou, and all angels conversant on earth
With man, or men's affairs, how I begin
To verify that solemn message. *Id. Paradise Regain'd.*

Men then come to be furnished with fewer or more simple ideas from without, according as the objects they converse with afford greater or less variety. *Locke.*

It is easy to observe, that many young men continue longer in the thought and conversation of schoolboys than otherwise they would, because their parents kept them at that distance, and in that low rank, by all their carriage to them. *Id.*

To such a one, an ordinary coffee-house gleaner of the city is an arrant statesman, and as much superior too, as a man conversant about Whitehall and the court, is to an ordinary shopkeeper. *Id.*

We had conversed so often on that subject, and he had communicated his thoughts of it so fully to me, that I had not the least remaining difficulty. *Dryden.*

The knowledge of men and manners, the freedom of habitudes, and conversation with the best company. *Id.*

Those who are conversant in both the tongues, I leave to make their own judgment of it. *Id. Dufresnoy.*

Though it be necessitated, by its relation to flesh, to a terrestrial converse ; yet it is, like the sun, without contaminating its beams. *Glanville's Apol.*

Finding him little studious and contemplative, she chose to endure him with conversative qualities of youth. *Wotton.*

Being asked by some of her sex, in how long a time a woman might be allowed to pray to the gods, after

having *converse* with a man? If it were a husband, says she, the next day; if a stranger, never.

Guardian.

That fire and levity which makes the young scarce *conversible*, when tempered by years, makes a gay old age.

Addison.

By experience and *conversation* with these bodies, a man may be enabled to give a near conjecture at the metallic ingredients of any mass.

Woodward.

Formed by thy *converse* happily to steer
From grave to gay, from lively to severe.

Pope.

For him who lonely loves

To seek the distant hills, and there *converse*
With nature.

Thomson's Summer.

In a small degree, and *conversant* in little things, vanity is of little moment. When full grown, it is the worst of vices, and the occasional mimic of them all. It makes the whole man false. It leaves nothing sincere or trust-worthy about him. His best qualities are poisoned and perverted by it, and operate exactly as the worst.

Burke

Blest be the day I 'scaped the wrangling crew;
From Pyrrho's maze, and Epicurus' sty;
And held high *converse* with the godlike few,
Who to the enraptured heart, and ear, and eye,
Teach beauty, virtue, truth, and love, and melody.

Beattie.

In *conversation* too, let us always mind what is saying and doing around us, and never give the company ground to suspect, that our thoughts are elsewhere. Attention is a chief part of politeness.

Id

Words learned by rote, a parrot may rehearse,
But talking is not always to *converse*;
Not more distinct from harmony divine,
The constant creaking of a country sign.

Cooper.

MARIA. Oh, he has done nothing; but 'tis for what he has said—his *conversation* is a perpetual libel on all his acquaintance.

Sheridan.

To climb the trackless mountain all unseen,
With the wild flock that never needs a fold;
Alone o'er steep and foaming falls to lean;
This is not solitude; 'tis but to hold
Converse with Nature's charms, and view her stores
unrolled.

Byron. Childe Harold

Even at the holy altars as they stood,
His impious weapon shed Sichæus' blood.
Then, *conversant* with fraud, he tries his coils;
And long his sister's anxious love beguiles.

Symmons's Virgil.

CONVERSI, a title formerly given to Jews, who were converted to Christianity in England. Henry III. built them a house in London, and allowed them a competent subsistence for their lives.

CONVERSION, in war, a military motion, whereby the front of a battalion is turned where the flank was, in case the battalion is attacked in the flank.

CONVERT, *v. a. & n.* } Fr. *convertir*; It.
CO'NVERT, *n. s.* } *convertire*; Span.
CONVERTER, *n. s.* } *convertir*; Lat. *con-*
CONVERTIBLE, *adj.* } *vertere*, from *con*
CONVERTIBILITY, *adj.* } and *vertere*, to turn
CONVERTIBLY, *adv.* } accordingly; to turn
CO'NVERTITE, *n. s.* } to or from, to change,
CO'NVERSE, *n. s.* } is the primary idea
CONVERSELY, *adv.* } conveyed by all
CONVERSIBLE, *adj.* } these words. To
CONVERSION, *n. s.* } convert, is to turn

from infidelity or paganism, to the true faith; from vicious to virtuous courses; from one use,

state, or substance, to another; to change one proposition for another; to undergo a change. The agent in any of these acts is the converter; the patient is the convert or convertite; and the change which he has undergone is his conversion. In algebra, conversion of equations is the reducing of a fractional equation into an integral one. Convert and convertite are, however, applied only to persons. Convertible signifies, capable of being changed; transmutable; so much alike that one is used for the other. In geometry, a proposition is said to be the converse of another, when, after drawing a conclusion from something first proposed, we proceed to suppose what had been before concluded, and to draw from it what had been supposed. Thus, if two sides of a triangle be equal, the angles opposite to those sides are also equal; the converse of the proposition is, that if two angles of a triangle be equal, the sides opposite to those angles are also equal. Conversely means, with change of order; in a contrary order; reciprocally.

Then will I teach transgressors thy ways, and sinners shall be *converted* unto thee.

Psalm li. 13.

The abundance of the sea shall be *converted* unto thee, the forces of the Gentiles shall come unto thee.

Isa. lx. 5.

They passed through Phenice and Samaria, declaring the *conversion* of the Gentiles.

Acts xv. 4.

He which *converteth* the sinner from the error of his way, shall save a soul from death, and shall hide a multitude of sins.

James v. 20.

And so forforth she gan our lay declare,
That she the Constable, er that it was eve,
Converted, and on Crist made him beleve.

Chaucer. Cant. Tales.

What maketh this but Jupiter the king,
The which is prince and cause of alle thing,
Converting alle unto his proper wille,
From which it is derived soth to telle?

Id

For theft and riot they ben *convertible*,
Al can they play on giterne or ribible.

Id.

At last, when long she struggled had in vaine,
She gan to stoup, and her proud mind *convert*
To meeke obeysance of Love's mighty raine.

Spenser. Faerie Queene.

The love of wicked friends *converts* to fear:
That fear, to hate. *Shakspeare. Richard II.*
He thence departs a heavy *convertite*;
She there remains a hopeless cast-away.

Id. Rape of Lucrece.

Artificial *conversion* of water into ice, is the work of a few hours; and this of air may be tried by a month's space.

Bacon.

As fire *converts* to fire the things it burns;
As we our meats into our nature change.

Davies.

Nor would I be a *convertite* so cold,
As not to tell it.
They rub out of it a red dust which *converteth* into worms, which they kill with wine.

Donne.

Crystal will callify into electricity, and the needle freely placed.

Browne's Vulgar Errors.

Minerals are not *convertible* into another species, though of the same genus; nor reducible into another genus.

Harvey.

The papists cannot abide this proposition *converted*: all sin is a transgression of the law; but every transgression of the law is sin.

Hale.

When Platonism prevailed, the *converts* to Christianity of that school interpreted Holy Writ according to that philosophy.

Locke.

Though it be not the real essence of any substance, it is the specifick essence, to which our name belongs, and is *convertible* with it. *Id.*

There never was any person ungrateful, who was not also proud; nor, *convertibly*, any one proud, who was not equally ungrateful. *South's Sermons.*

If the whole atmosphere was *converted* into water, it would make no more than eleven yards water about the earth. *Burnet.*

The gall is not an alkali; but it is alkaliescent, conceivable and *convertible* into a corrosive alkali. *Arbutnot on Aliments.*

The *conversion* of the aliment into fat, is not proper nutrition. *Id.*

Many, that call themselves Protestants, look upon our worship to be idolatrous as well as that of the Papists; and put preclacy and popery together, as terms *convertible*. *Swift.*

Water *converted* into ice occupies a greater space than it did before, as appears by the bursting of bottles filled with water at the time of their freezing. *Darwin.*

Whimsical enough, faith! My father wants to force me to marry the very girl I am plotting to run away with!—He must not know of my connexion with her yet a while. He has to show summary a method of proceeding in these matters.—However, I'll read my incantation instantly.—My *conversion* is something sudden, indeed—but I can assure him it is very sincere. *Sheridan.*

CONVERT, in a monastic sense, a lay friar, or brother, admitted for the service of the house; without orders, and not allowed to sing in the choir. The word was anciently used for persons who embraced the monkish life at the age of discretion. But in the eleventh century, when they began to receive into monasteries illiterate persons, incapable of being clerks, and only destined for bodily labor, the signification of the word was necessarily changed.

CONVEX, *n. s.* & *adj.*

CONVEXED, *adj.*

CONVEXEDLY, *adv.*

CONVEXITY, *n. s.*

CONVEXLY, *adv.*

CONVEXNESS, *n. s.*

CONVEXO-CONCAVE, *adj.*

Fr. *convex*; It. and Sp. *convexo*; Lat. *convexus*. A convex is, a body which swells externally into a

spherical or elliptical form. Convex, as an adjective, means, the opposite of concave; swelling externally into a spherical or elliptical form. A convexo-concave body is, that of which the internal surface corresponds with the outward protuberance. The remaining words it is unnecessary to define.

Dolphins are straight; nor have they their spine *convexed*, or more considerably embowed than either sharks, porpoises, whales, or other cetaceous animals. *Broune's Vulgar Errors.*

They be drawn *convexedly* crooked in one piece; yet the dolphin, that carrieth Arion, is concavously inverted, and hath its spine depressed. *Id.*

In circuit to the uttermost *convex*

Of this great round.

Milton.

Almost all, both blunt and sharp, are *convexly* conical; they are all along *convex*, not only per ambitum, but between both ends. *Grew's Musaeum.*

It is the duty of a painter, even in this also, to imitate the *convex* mirrour, and to place nothing which glares at the border of his picture. *Dryden's Dufresnoy.*

These are the phenomena of thick *convexo-concave* plates of glass, which are every where of the same thickness. *Newton.*

Convex glasses supply the defect of plumpness in the eye, and, by increasing the refraction, make the rays converge sooner, so as to converge distinctly at the bottom of the eye if the glass have a due degree of *convexity*. *Id. Opticks.*

A comet draws a long-extended blaze; From east to west burns thro' the ethereal frame, And half heaven's *convex* glitters with the flame. *Tichel.*

If the eye were so piercing as to descry even opaque and little objects a hundred leagues off, it would do us little service; it would be terminated by neighbouring hills and woods; or, in the largest and evenest plain, by the very *convexity* of the earth. *Bentley.*

The stem of the bamboo is not hollow till it rises more than one foot from the earth; the divisions between the cavities are *convex* downwards. *Darwin.*

CONVEXITY is of particular import in catoptrics and dioptrics, where it is applied to mirrors and lenses. A convex mirror represents its images smaller than the objects; as a concave one represents them larger: a convex mirror reflects the rays from it, diverging; and therefore disperses and weakens their effect: as a concave one reflects them converging, so as they concur in a point, and have their effect increased: and by how much the mirror is a portion of a smaller sphere, by so much does it diminish the objects, and disperse the rays the more. A convex lens is either convex on both sides, called a convexo-convex; or it is plain on one side and convex on the other, called a plano-convex; or concave on one side, and convex on the other, called a convexo-concave, or concavo-convex, as the one or the other surface prevails, i. e. as this or that is a portion of a smaller sphere. All convex lenses deflect the rays of light in their passage, i. e. send them out from their convex surface converging, so as that they concur in a point or focus: hence burning lenses. Convex lenses magnify, i. e. represent their images larger than their objects; and this the more as they are portions of smaller spheres.

CONVEY, *v. a.*

CONVEYANCE, *n. s.*

CONVEYANCER, *n. s.*

CONVEYER, *n. s.*

Lat. *convhere*, from *con* and *vehere*. To remove from one place to another; to hand from one to another; to remove furtively; to transmit; to transfer; to impart; to manage with privacy. Conveyance is, the act of removing or carrying from one place to another; the road by which is conveyed; the means of removal; transmission from one to another; the method of secretly removing something from a place; the act of transferring property; the writing by which property is transferred; secret management; juggling artifice. A conveyancer is a lawyer, who draws up the conveyances, or deeds, by which property is transferred. A conveyer is, a person who conveys; but is never used in the sense of conveyancer, and vice versâ.

Let letters be given me to the governours beyond the river, that they may *convey* me over till I come into Judea. *Neh. ii. 7.*

I will *convey* them by sea, in floats, unto the place thou shalt appoint me. *1 Kings. v. 9.*

She hath the trashid without wene ;
The god of love had they nat sene,
Ne had Idilnesse the *coveide*
Within the verge where mirthe him pleide.
Chaucer. Romaunt of the Rose.

For by this wretch I being strait betrayed,
To one John Milton, sherife of Shropshire then,
All sodainly was taken, and *conveyed*
To Salis'bury, wyth rout of harness men. *Sackville.*

It cometh herein to pass with men, unadvisedly
fallen into error, as with them whose state hath no
ground to uphold it, but only the help which, by sub-
tile *conveyance*, they draw out of casual events, arising
from cay to day, till at length they be clean spent.
Hooker.

His blessed body, spoiled of lively breath
Was afterward, I know not how, *convoid*,
And fro me hid. *Spenser. Faerie Queene.*
The earl of Desmond, before his breaking forth into
rebellion, *conveyed* secretly all his lands to feoffees in
trust. *Id.*

Doth not the act of the parents, in any lawful grant
or *conveyance*, bind their heirs for ever thereunto? *Id.*
There was one *conveyed* out of my house yesterday
in this basket. *Shakspeare. Merry Wives of Windsor.*

I will *convey* the business as I shall find means, and
acquaint you withal. *Id. King Lear.*
We powt upon the morning, are unapt
To give or to forgive; but when we've stuffed
These pipes, and these *conveyances* of blood,
With wine and feeding, we have suppler souls.
Id. Coriolanus.

Tell her thou mad'st away her uncle Clarence,
Her uncle Rivers; ay, and for her sake,
Mad'st quick *conveyance* with her good aunt Ann.
Id. Richard III.

I am this day come to survey the Tower;
Since Henry's death, I fear, there is *conveyance*.
Id. Henry VI.

Nay, call the Cynic but a wittie foole,
Thence to abjure his handsome drinking bowl,
Because the thirstie swain with hollow hand
Convoid the stream to wet his drie weasand. *Hall.*
The *conveyers* of waters of these times content them-
selves with one inch of fall in six hundred feet.
Brewerwood on Languages.

This begot a suit in the Chancery before the lord
Coventry, who found the *conveyances* in law to be so
firm, that in justice he must decree the land to the
earl. *Clarendon.*

Can they not juggle, and with slight
Conveyance play with wrong and right?
Hudibras.

Some single imperceptible bodies must come from
them to the eyes, and thereby *convey* to the brain some
motion which produces those ideas. *Locke.*

A divine natural right could not be *conveyed down*,
without any plain, natural, or divine rule concerning
it. *Id.*

Our author has provided for the descending and
conveyance down of Adam's monarchical power, or
paternal dominion, to posterity. *Id.*

Iron works ought to be confined to places where
there is no *conveyance* for timber to places of vent, so
as to quit the cost of the carriage. *Temple.*

Those who stand before earthly princes, in the
nearest degree of approach, who are the dispensers
of their favours, and *conveyers* of their will, to others,
do, on that very account, challenge high honours to
themselves. *Atterbury.*

Verbal descriptions infusing sublime horror, are
such as *convey* lively ideas of the objects of supersti-
VOL. VI.

tion, as ghosts and enchantments; or of the thoughts
that haunt the imaginations of the guilty; or of those
external things which are pleasingly terrible, as storms,
conflagrations, and the like. *Beattie.*

I admire,
None more admires, the painter's magic skill,
Who shows me that, which I shall never see,
Conveys a distant country into mine,
And throws Italian light on English walls. *Copey.*

Ghostly counsel, if it either fall
Below the exigence, or be not backed
With show of love, at least with hopeful proof
Of some sincerity on the giver's part;
Or be dishonoured in the exterior form
And mode of its *conveyance* by such tricks
As move derision, or by foppish airs
And histrionic mummery, that let down
The pulpit to the level of the stage;
Drops from the lips a disregarded thing. *Id.*

A *conveyancer* he is—employ him who list:
Forbidding his aspect, and close is his list;
With more coin in his pocket than brains in his head,
Yet a book he has written that nobody read. *Huddesford.*

But taking him into her father's house
Was not exactly the best way to save,
But like *conveying* to the cat a mouse,
Or people in a trance into their grave.
Byron. Don Juan.

CONVEYANCE, in English law. The most com-
mon conveyances are deeds of gift; bargain and
sale; lease and release; fines and recoveries;
and settlements to uses. For the following out-
line of the common law, upon this curious sub-
ject, we are indebted to Tomlin's Dictionary.

Feoffments and grants were the two chief modes
used in the common law for transferring property.
The most comprehensive definition that can be
given of a feoffment seems to be, a conveyance
of corporeal hereditaments, by delivery of the
possession, upon, or within view of, the heredita-
ments conveyed. This delivery was thus made,
that the lord and the other tenants might be
witnesses to it. No charter of feoffment was
necessary; it only served as an authentication of
the transaction; and when it was used, the lands
were supposed to be transferred, not by the char-
ter, but by the livery which it authenticated.
Soon after the conquest, or perhaps towards the
end of the Saxon government, all estates were
called fees; the original and proper import of
the word feoffment is, the grant of a fee. It
came afterwards to signify a grant with livery of
seisin of a free inheritance to a man and his heirs;
more respect being had to the perpetuity, than
to the feudal tenure, of the estate granted. In
early times, after the conquest, charters of feoff-
ment were various in point of form. In the time
of Edward I. they began to be drawn up in a
more uniform style. The more ancient of them
generally run with the words *dedi, concessi, or*
denavi. It was not till a later period that feoff-
ments came into use. The more ancient feoffments
were also usually made in consideration of, or
for the homage and service of the feoffee, and to
hold of the feoffor and his heirs. But after the
stat. *quia emptores* (18 Edward I. stat. 1) feoff-
ments were always made to hold to the chief lords
of the fee, without the words *pro homagio et*
servitio. See 1 Inst. 6 a: 271 b.

The proper limitation of a feoffment is to a man and his heirs; but feoffments were often made of conditional fees (or estates tail as they are now called), and of life estates; to which may be added, feoffments of estates given in frank-marriage and frankalmoinage. To make the feoffment complete, the feoffor used to give the feoffee seisin of the lands; this is what the feudists call investiture. It was often made by symbolical tradition, but it was always made upon or within view of the lands. When the king made a feoffment he issued his writ to the sheriff, or some other person to deliver seisin: other great men did the same; and this gave rise to powers of attorney.

A *grant*, in the original signification of the word, is a conveyance or transfer of an incorporeal hereditament. As livery of seisin could not be had of these, the transfer of them was always made by writing, in order to produce that notoriety, which in the transfer of corporeal hereditaments was produced by delivery of the possession. But in other respects a feoffment and a grant did not materially differ. Such was the original distinction between a feoffment and a grant; but from this real difference in their subject matter only, a difference was supposed to exist in their operation. A feoffment visibly operated on the possession; a grant could only operate on the right of the party conveying. Now as possession and freehold were synonymous terms, no person being considered to have the possession of the lands but he who had at least an estate of freehold in them, a conveyance which was considered as transferring the possession, must necessarily be considered as transferring an estate of freehold; or, to speak more accurately, as transferring the whole fee. But this reasoning could not apply to grants; their essential quality being that of transferring things which did not lie in possession; they therefore could only transfer the right; that is, could only transfer that estate which the party had a right to convey. It is in this sense the expressions are to be understood, that a feoffment is a tortious and a grant a rightful conveyance. The introduction of uses produced a great revolution in this part of our laws. Uses at the common law, were, in most respects, what trusts are now. When a feoffment was made to uses, the legal estate was in the feoffee. He filled the possession, did the feudal duties, and was in the eye of the law the tenant of the fee. The person to whose use he was seized, called the cestuy que use, had the beneficial property of the lands; had a right to the profits; and a right to call upon the feoffee to convey the estate to him, and to defend it against strangers. This right at first depended on the conscience of the feoffee; if he withheld the profits from the cestuy que use, or refused to convey the estate as he directed, the feoffee was without remedy. To redress this grievance the writ of subpoena was devised, or rather adopted from the common law courts, by the court of chancery, to oblige the feoffee to attend in court and disclose the trust; and then the court compelled him to execute it. Thus uses were established: they were not considered as issuing out of, or annexed to the land, as a rent or condition, or a right of

common; but as a trust reposed in the feoffee, that he should dispose of the lands at the discretion of the cestuy que use, permit him to receive the rents, and in all other respects to have the beneficial property of the lands.

A conveyance cannot be fraudulent in part, and good as to the rest: for if it be fraudulent and void in part, it is void in all, and it cannot be divided. 1 Lib. Abr. 311. Fraudulent conveyances to deceive creditors, defraud purchasers, &c. are void, by stats. 13 Eliz. cap. 5, 27 Eliz. cap. 4. See FRAUD.

CONVICIATE, *v. a.* } Old Fr. *convicce*;
CONVICIOUS, *adj.* } Lat. *convicior*. To rail at; to clamor at; to raise an outcry. These words are both obsolete. So is the French noun, *convicce*, which Sherwood defines 'a reproach, railing word, biting tearme, spitefull scoff, despightful gird, or glaunce, malicious taunt.'

CONVICINITY, *n. s.* Lat. *con* and *vicinus*. Nearness; proximity.

CONVICIT, *v. a. & adj.* } Lat. *convincere*,
CONVICIT, *n. s.* } from *con* and *vin-*
CONVICTION, *n. s.* } *cere*. To prove the
CONVICITIVE, *adj.* } guilt of; to detect in
CONVICITIVELY, *adv.* } a criminal act; to confute; to show by proof; to destroy; but this last meaning is obsolete. The adjective means convicted; detected in the fact. A convict is one who has been convicted. Conviction is detection of guilt; the act of convicting; the act of convincing; full belief; assent of the mind to the truth of any thing; state of being convinced. Convictive signifies that which has the ability to convince.

And they which heard it, being *convicted* by their own conscience, went out one by one. *John* viii. 9.

If there be no such thing apparent upon record, they do as if one should demand a legacy by virtue of some written testament, wherein there being no such thing specified, he pleadeth that there it must needs be, and bringeth arguments from the love which always the testator bore him; imagining that these proofs will *convict* a testament to have that in it, which other men can no where by reading find. *Hooker*.

When therefore the apostle requireth ability to *convict* hereticks, can we think he judgeth it a thing unlawful, and not rather needful, to use the principal instrument of their *conviction*, the light of reason? *Id.*

Before I be *convict* by course of law,
To threaten me with death, is most unlawful.
Shakspeare. Richard III.

Things, that at the first shew seemed possible, by ripping up the performance of them, have been *convicted* of impossibility. *Bacon's Holy War.*

Although not only the reason of any head, but experience of every hand, may well *convict* it, yet will it not by divers be rejected. *Broune's Vulgar Errors.*

The third best absent is condemned,
Convict by flight, and rebel to all law;
Conviction to the serpent none belongs.
Milton's Paradise Lost.

We see generally that numbers of them exactly jump in a whole large collection of doctrines, consisting of abundance of particulars, as if their notes were, by one common stamp, printed on their minds, even to the least lineament. This is very hard, if not impossible, to be conceived of those who take up their opinions only from *conviction*. *Locke*

The manner of his conviction was designed, not as a peculiar privilege to him, but as a standing miracle, a lasting argument for the conviction of others, to the very end of the world. *Atterbury.*

Convict a papist he, and I a poet.

Pope's Epistle of Horace.

By the civil law, a person convict, or confessing his own crime, cannot appeal. *Ayliffe's Parergon.*

He that accuses all mankind of corruption, ought to remember that he is sure to convict only one. *Burke.*

Once on a time an emperor, a wise man,
No matter where, in China or Japan,
Decreed, that whosoever should offend
Against the well known duties of a friend,
Convicted once, should ever after wear,
But half a coat, and show his bosom bare. *Cowper.*

The police, however useless, were by no means idle: several notorious delinquents had been detected; men liable to conviction, on the clearest evidence, of the capital crime of poverty; men, who had been nefariously guilty of lawfully begetting several children, whom, thanks to the times!—they were unable to maintain. *Byron. Speech on the Frame-breaking Bill.*

CONVICTION, in law, is either where a man is outlawed, or appears and confesses, or else is found guilty by the inquest. *Crompton Inst. 9.* In the summary proceedings directed by acts of parliament for the conviction of offenders, and inflicting the penalties imposed by those acts, there is no intervention of a jury, but the person accused is acquitted or condemned by the suffrage of such person only as is appointed by the statute for his judge. It is implied in law that there must be a conviction before judgment, though not so mentioned in the statute; and where by any statute a second offence is made felony, or subjected to a heavier penalty than the first, it is always implied that such second offence should be committed after a conviction of the first. *1 How. 13-107.* Judgment amounts to a conviction, though it does not follow that all are adjudged who are convicted. *Horn. 14.* A conviction ought to be in the present tense, not in the time past. *Ld. Raym. 1376. Str. 608.* A conviction ought to be on an information or claim precedent. *Ld. Raym. 510.* When the conviction of offenders before justices of the peace, &c. is ordered by act of parliament, it must be intended after summons to bring them in, that they may have an opportunity of making their defence; and if it be otherwise the conviction shall be quashed. Of the summary convictions warranted by the law, are, 1. Those for offences and frauds against the laws of excise, and for the protection of other branches of the public revenue: which are to be enquired into and determined by the commissioners of the respective departments, or by justices of peace in the country. Some writers have the ultra-loyalty to plead for these as 'a species of mercy to the delinquents, who would be ruined by the expense and delay of frequent prosecutions by action or indictment.' 2. Those had before justices of the peace, in order to inflict divers petty pecuniary mulcts, and corporeal penalties, denounced by act of parliament, for various offences against the good order of society; such as common swearing, drunkenness, vagrancy, idleness, &c. See JUSTICE OF PEACE, and titles of various offences.

These used formerly to be punished by the verdict of a jury in the court leets, and sheriff's tourn, the king's ancient courts of law. These convictions proved very promptly: but the law requires a party to be summoned before the proceedings can commence: but if the summons be neglected, a magistrate may proceed by examining witnesses upon oath, and make his conviction of the offender in writing. He then usually issues his warrant, either to apprehend the offender, in case corporeal punishment is to be inflicted; or to levy the penalty incurred by distress and sale of his goods. Magistrates, it is said, ought to state in the conviction the whole of the evidence for and against the defendant. *8 T. R. 220.* But where power of conviction is by statute given to a magistrate, he is the sole judge of the weight of the evidence given before him, and the higher court will not examine whether or not he has drawn a right conclusion from the evidence.

CONVINCE, *v. a.* } Fr. convaincre; It.
CONVICEMENT, *n. s.* } convincere; Lat. convincere. To compel
CONVINCE, *n. s.* }
CONVINCEABLE, *adj.* } any one to assent to
CONVINCEINGLY, *adv.* } the truth of a dispu-
CONVINCEINGNESS, *n. s.* } ted proposition; to
prove the guilt of; to evince; to overpower; to surpass. The last meanings are obsolete. The other words, of the same stock, closely resemble the verb in the senses which they bear.

To convince all that are ungodly among them, of all their ungodly deeds. *Jude 15.*

It was a famous present for a prince,
And worthy work of infinite reward,
That treasons could bewray, and foes convince.
Spenser. Faerie Queene.

Your Italy contains none so accomplished a courtier, to convince the honor of my mistress.

Shakspeare. Cymbeline.

There are a crew of wretched souls
That stay his cure; their malady convinces
The great essay of art. *Id. Macbeth.*

When Duncan asleep, his two chamberlains
Will I with wine and wassel so convince,
That memory, the warden of the brain,
Shall be a fume. *Id.*

Knaves, be such abroad,
Who having, by their own importunate suit,
Or voluntary dotage of some mistress,
Convinced or supplied them, they cannot chuse
But they must blab. *Id. Othello.*

The discovery of a truth, formerly unknown, doth rather convince man of ignorance, than nature of error. *Ralceigh.*

Upon what uncertainties, and also convincible falfities, they often erected such emblems, we have delivered. *Brownie.*

This he did so particularly and convincingly, that those of the parliament were in great confusion. *Clarendon.*

Convince a man ever so much, that plenty has an advantage over poverty; make him see and own, that the handsome conveniences of life are better than nasty penury; yet as long as he is content with the latter, and finds no uneasiness in it, he moves not. *Locke.*

If that be not convincement enough, let him weigh the other also. *Decay of Piety. 2 E 2*

O seek not to *convince* me of a crime,
Which I can ne'er repent, nor can you pardon.
Dryden.

But, having shifted every form to 'scape,
Convinced of conquest, he resumed his shape.
Id. Virgil.

That which I have all this while been endeavouring to *convince* men of, and to persuade them to, is no other but what God himself doth particularly recommend to us, as proper for human consideration.

Tillotson.

The resurrection is so *convincingly* attested by such persons with such circumstances, that they who consider and weigh the testimony, at what distance soever they are placed, cannot entertain any more doubt of the resurrection than the crucifixion of Jesus.

Atterbury.

LADY T. Why, if my understanding were once *convinced*—

JOSEPH S. O, certainly, madam, your understanding should be *convinced*. Yes—yes—heaven forbid I should persuade you to do any thing you thought wrong. No, no, I have too much honour to desire it.
Sheridan.

Oh! too *convincing*,—dangerously dear
In woman's eye the unanswerable tear!
That weapon of her weakness she can wield,
To save subdue—at once her spear and shield.

Byron.

CONVIVE, *v. a.* } Lat. *convivere*. To
CONVIVAL, *adj.* } entertain; to feast; to
CONVIVIAL, *adj.* } feast together. The verb
CONVIVIALITY, *n. s.* } is obsolete, though the
act of which it is expressive was never more common. Convivial is relating to an entertainment; festal; jovial. Convivial men too often are men who, as Shakspeare says, 'put an enemy into their mouths, to steal away their brains,' and this folly is covered with the name of conviviality.

First, all you peers of Greece, go to my tent,
There in the full *convive* you,
Shakspeare. Troilus and Cressida.

I was the first who set up festivals;
Not with high tastes our appetites did force,
But filled with conversation and discourse
Which feasts, *convivial* meetings we did name.

Denham.

Your social and *convivial* spirit is such, that it is a happiness to live and converse with you.

Dr. Newton.

The plump *convivial* parson often bears
The magisterial sword in vain, and lays
His reverence and his worship both to rest
On the same cushion of habitual sloth.

Cowper.

As for vulgar fellowships and connexions, where a man is to act the pleasant fellow and set the table in a roar, if he has not the spirit and discretion to decline them, he will soon find his professional talents sacrificed to his *convivial* ones.
Cumberland.

CONVINDRUM, *n. s.* A low jest; a quibble; a mean conceit; a cant word.

Mean time he smokes, and laughs at merry tale,
Or pun ambiguous, or *convindrum* quaint.
Philips.

CONVOCATE, *v. a.* } Fr. *convoyer*; Ital.
CONVO'CE, *v. a.* } *convocare*; Span *con-*
CONVOCA'TION, *n. s.* } *vocar*; Lat. *convocare*.
To call together; to summon to an assembly; to convene. The verb *convoke* is the most in use. Convocation is, the act of summoning to

an assembly; an assembly; an assembly of the clergy for consultation upon matters ecclesiastical, in time of parliament: and, as the parliament consists of two distinct houses, so does this; the one called the upper house, where the archbishops and bishops sit severally by themselves; the other the lower house, where all the rest of the clergy are represented by their deputies. See the next article.

On the eighth day shall be an holy convocation unto you.
Lev. xxiii. 20.

This dolie dreme, this ugly visiou,
Brought till an ende, Creseide fro it awoke,
And all that court and *convocacion*
Vanished awaie.

Henderson. Testament of Creseide.

Diaphantus, making a general *convocation*, spake to them in this manner.
Sidney.

I have made an offer to his majesty,
Upon our spiritual *convocation*,
As touching France, to give a greater sum
Than ever at one time the clergy yet
Did to his predecessors part withal.

Shakspeare. Henry IV.

Assemblies exercise their legislature at the times that their constitution, or their own adjournment, appoints, if there be no other way prescribed to *convoke* them.
Locke.

This is the declaration of our church about it, made by those who met in *convocation*.
Stillington.

When next the morning warms the purple east,
Convoked the peacage.
Pope's Odyssey.

The senate originally consisted all of nobles, the people being only *convoked* upon such occasions as fell into their cognizance.
Swift.

Stamp with charmed foot, *convoked* the alarmed
Gnomes
From golden beds and adamantine domes.
Darwin.

CONVOCA'TION, an assembly of the clergy of England, by their representatives, to consult of ecclesiastical matters. It formerly sat for business during the session of parliament, and consists of an upper and a lower house. In the upper sit the bishops. In the lower the inferior clergy are represented by their proctors: it consists of all the deans and archdeacons, of one proctor for every chapter, and two for the clergy of every diocese. The lower house chooses its prolocutor, who is to take care that the members attend, to collect their debates and votes, and to carry their resolutions to the upper house. The convocation is summoned by the king's writ, directed to the archbishop of each province, requiring him to summon all bishops, deans, archdeacons, &c.

The power of the convocation is limited by a statute of Henry VIII. They are not to make any canons, or ecclesiastical laws, without the king's licence; nor, when permitted, can they put them in execution, but under several restrictions. They have the examining and censuring of all heretical and schismatical books and persons, &c. but there lies an appeal to the king in chancery, or to his delegates. The clergy in convocation, and their servants, have the same privileges as members of parliament. In 1665 the convocation of the clergy gave up the privilege of taxing themselves to the house of commons, in consideration of their being allowed to vote at elec-

tions of members for that house. Since that period they have seldom been allowed to do any business; and are generally prorogued from time to time till dissolved, a new convocation being called along with a new parliament.

CONVO'LTE, *v. a.* } Ital. *convolgere* ;
 Co'NVOLTED, *part. adj.* } Lat. *convolvere*. To
 CONVOLU'TION, *n. s.* } roll or enfold together; to roll one part upon another; to twist together in knots. Convolution is, the act of convolving; the state of being convolved. Convolutèd signifies, twisted together; rolled upon itself.

He writhed him to and fro *convolved*. *Milton.*

It is a wonderful artifice how newly hatched magots, not the parent animal, because she emits no web, nor hath any textrine art, can *convolve* the stubborn leaf, and bind it with the thread it weaves from its body. *Derham.*

Observe the *convolution* of the said fibres in all other glands, in the same or some other manner. *Grew's Cosmologia.*

A thousand secret, subtle pipes bestow,
 From which, by numerous *convolutions* wound,
 Wrapped with the attending nerve, and twisted round. *Blackmore.*

This differs from Muscovy-glass only in this, that the plates of that are flat and plain, whereas these are *convoluted* and inflected. *Woodward on Fossils.*

And tossed wide round,
 O'er the calm sea, in *convolution* swift
 The feathered eddy floats. *Thomson's Autumn.*

Used to milder scents, the tender race
 By thousands tumble from their honey'd domes
Convolved and agonizing in the dust. *Id.*

Where with vast *convolution* Draco holds
 The æliptic axis in his scaly folds,
 O'er half the skies his neck enormous rears,
 And with immense meanders parts the Bears. *Darwin.*

CONVOLUTION, in botany, a winding motion, proper to the trunks of some plants, as the convolvulus; the claspers of vines, bryony, &c.

CONVOLVULUS, in botany, bind-weed, a genus of the pentandria order, and the monogynia class of plants; natural order twenty-ninth, campanacæ: cor. campanulated and plaited; STIG. two; caps. bilocular, and the cells dispersuous. Of this genus there are 120 species. The most remarkable are the following:—1. *C. batatas*, or Spanish potato, has esculent roots, resembling the potato, which are annually imported from Spain and Portugal, where they are greatly cultivated for the table; but they are too tender to thrive in the open air in Britain. 2. *C. Canariensis*, with soft woolly leaves, is a native of the Canaries, but has long been preserved in the British gardens. It has a strong fibrous root, from whence arise several twining woody stalks, which, where they have support, will grow more than twenty feet high, garnished with oblong heart-shaped leaves, which are soft and hairy. The flowers are produced from the wings of the leaves, several standing upon one foot-stalk. They are for the most part of a pale blue; but there is a variety with white flowers. 3. *C. jalappa*, or jalap, used in medicine, is a native of Haleppo in Spanish America, situated between Vera Cruz and Mexico. It has a large root of an oval form,

which is full of a milky juice; from which come out many herbaceous twining stalks, eight or ten feet high, garnished with variable leaves; some of them being heart-shaped, others angular, and some oblong and pointed. They are smooth, and stand upon long foot-stalks: the flowers are shaped like those of the common greater bind-weed, each foot-stalk supporting only one flower. This species does not thrive in this country, unless constantly kept in a stove. The roots are purgative. See JALAP. 4. *C. nil*, or blue bind-weed, rises with a twining stalk eight or ten feet high, garnished with heart-shaped leaves, divided into three lobes, which end in sharp points. These are woolly, and stand upon long foot-stalks. The flowers also come out on long foot-stalks, each sustaining two flowers of a very deep blue color, whence their name of anil or indigo. This is one of the most beautiful plants of the genus: it flowers all the latter part of the summer, and in good seasons the seeds ripen very well in the open air. 5. *C. purpureus*, or major, is an annual plant growing naturally in Asia and America, but has long been cultivated in the British gardens. This species, properly supported, will rise ten or twelve feet high in warm summers. There are three or four lasting varieties: the most common has a purple flower; the others have a white, a red, or a whitish-blue flower, which last has white seeds. They flower in June, July, and August, and their seeds ripen in autumn. They are propagated by seeds sown on a hot-bed in spring, and towards the end of May they should be planted in warm borders, and supported by stakes. 6. *C. sepium*, or large white bind-weed. 7. *C. tricolor*, or minor, is a native of Portugal; but has been long cultivated in the gardens of this country. It is an annual plant, which has several thick herbaceous stalks growing about two feet high, which do not twine like the other sorts, but decline towards the ground, upon which many of the branches lie prostrate; they are garnished with spear-shaped leaves, which sit close to the branches: the foot-stalks of the flowers come out just above the leaves of the same joint, and at the same side of the stalks. They are about two inches long, each sustaining one large, open, bell-shaped flower, which in some is of a fine blue color with a white bottom; in others they are pure white, and some are beautifully variegated with both colors. The white flowers are succeeded by white seeds, and the blue by dark colored seeds; which difference is pretty constant.

CONVOY, *v. a.* } Fr. *convoyer*; Ital. *con-*
 Co'NVoy, *n. s.* } *vogliare*; Span. *convoyat*;
 Co'NVoyING, *n. s.* } low Lat. *conviare*. To act as a guide, a protection, an escort. A convoy is, that which escorts for the purpose of protecting; the thing protected; the act of attending as a protector; conveyance: but this last sense is obsolete. Both the verb and the noun are most commonly used with reference to protection afforded by sea.

Sister, as the winds give benefit,
 And *convoy* is assistant, do not sleep,
 But let me hear from you. *Shakspeare. Hamlet.*

Shakspeare. Hamlet.

Such fellows will learn you by rote where services were done; at such a breach, at such a *convoy*.

Shakspeare. Henry V.

Swift, as a sparkle of a glancing star,
I shoot from heaven to give him safe *convoy*.

Milton's Paradise Regained.

Had not God set peculiar value upon his temple, he would not have made himself his people's *convoy* to secure them in their passage to it. *South's Sermons.*

My soul grows hard, and cannot death endure;
Your *convoy* makes the dangerous way secure.

Dryden's Aurengzebe.

Convoy ships accompany their merchants, till they may prosecute the voyage without danger.

Dryden's Pref. Dufresnoy.

But hark! a rap comes gently to the door;
Jenny, who kens the meaning o' the same,
Tells how a neighbor lad eam o'er the moor,
To do some errands, and *convoy* her hame.

Burns.

Convoy, in military affairs, a detachment of men employed to guard any supply to a town or army, and prevent its falling into the hands of the enemy. As the conducting of a *convoy* is one of the most important and most difficult of all military operations, the officer who commands a *convoy* must take all possible precautions for its security, and endeavour, before its march, to get himself well informed concerning the out parties of the enemy. And as the commanding officer of the place from which the *convoy* is to march, and those of such other places as he is to pass by, are most likely to afford him proper assistance, he should take every measure in his power to secure a communication with them.

CONUS, a cone, in botany, a species of fruit, or scaly seed-vessel, so termed by Tournefort and other botanists. Linnaeus substituted strobilus in its place.

CONUSANCE, *n. s.* } Fr. *connoissance*. Cognizance; notice; knowledge of. *Conusable*, *adj.* }
CONUSABLE, *adj.* }
CONUSANT, *adj.* } liable to be tried. *Conusant* is, knowing; acquainted with. They are all law terms.

CONVULSIVE, *v. a.* } Fr. *convulsion*; Ital. *convulsione*; Span. *convulsar*; Lat. *convellere*, *convulsively*, *adv.* } *convulsum*. To give an irregular spasmodic motion to the muscles; to distort; to throw into disorder. In its medical sense, convulsion is a diseased action of muscular fibres, known by alternate relaxations, with violent and involuntary contractions of the muscular parts, without sleep. See MEDICINE. In its wider sense, it signifies motion that is irregular and violent; tumult; commotion; disturbance.

They are irregular and *convulsive* motions, or straggles of the spirits. *Hale's Origin of Mankind.*

If my hand be put into motion by a *convulsion*, the indifferency of that operative faculty is taken away. *Locke.*

All have been subject to some concussions, and fall under the same *convulsions* of state, by dissensions or invasions. *Temple.*

Her colour changed, her face was not the same,
And hollow groans from her deep spirit came;
Her hair stood up; *convulsive* rage possessed
Her trembling limbs, and heaved her lab'ring breast.

Dryden.

Follows the loosened, aggravated roar,
Enlarging, deepening, mingling peal on peal,
Crushed horrible, *convulsing* heaven and earth. *Thomson.*

No wizard mutters the tremendous spell,
Nor sinks *convulsive* in prophetic swoon;
Nor bids the noise of drums and trumpets swell,
To ease of fancied pangs the labouring Moon,
Or chase the shade that blots the blazing orb of noon. *Beattie.*

Earth yawns!—the crashing ruin sinks!—o'er all
Death with black hands extends his mighty pall;
Their mingling gore the fiends of Vengeance quaff,
And Hell receives them with *convulsive* laugh. *Darwin.*

Here roams the wolf, the eagle whets his beak,
Birds, beasts of prey, and wilder men appear,
And gathering storms around *convulse* the closing year. *Byron. Child Harold.*

Thus much she viewed an instant and no more—
Her struggles ceased with one *convulsive* groan;
On her sire's arm, which until now scarce held
Her writhing, fell she like a cedar felled. *Id. Don Juan.*

CONVULSION, a diseased action of muscular fibres, known by alternate relaxations, with violent and involuntary contractions of the muscular parts, without sleep. Cullen arranges convulsion in the class neuroses, and order spasmi. See MEDICINE.

CONWAY, a town of North Wales in Caernarvonshire, called also ABERCONWAY, which see.

CONWAY, a river of North Wales, which rises from a lake where the counties of Caernarvon, Denbigh, and Merioneth meet; and after flowing through the vale, along the east border of Caernarvonshire, which it separates from Denbighshire, falls into the Irish sea at Conway. This river, though its course from the lake to its mouth is only twelve miles, yet is so deep, in consequence of the many brooks it receives, that it is navigable by ships of good burden for eight miles. Small pearls are occasionally found in large black muscles taken in this river.

CONWAY, a valley of Caernarvonshire, equally beautiful and romantic. It is a long narrow tract, abounding in corn fields, pasture, and groves, and forming a fine contrast to the bleak mountain of Snowdon above it.

CONWAY, a township of Nova Scotia, in the province of New Brunswick, Sudbury county, on the western bank of St. John's River. It has the bay of Fundy on the south, and a pretty good harbour called Musquash Cove, at the west point.

CONWAY, a township of the United States, in the north-east corner of Stafford county, New Hampshire, on Saco river, incorporated in 1765. It contains 575 inhabitants, and was called Pigwacket by the Indians.

CONWAY, a thriving township in Hampshire county, Massachusetts, incorporated in 1767, and containing 2092 inhabitants. It lies thirteen miles north-west of Northampton, and 115 north-west by west of Boston.

CONY, *n. s.* } Fr. *connin*, *connil*;
CONY-BURROW, *n. s.* } Ital. *coniglio*; Span. *co-*
CONY-CATCH, *v. n.* } *nejo*; Dutch *konijn*;
CONY-CATCHER, *n. s.* } Ger. *kaninchen*; Sw. *kaning*; Lat. *cuniculus*. A rabbit; an animal

that lives in holes called cony-burrows; figuratively, a simpleton. To cony-catch is an old verb, now obsolete, signifying to trick; to cheat; to make a dupe of; and a cony-catcher is, of course, a swindler; a cheat; a trickster; a rascal.

Conies there were also playing,
That comin out of their clappers.

Chaucer. Cant. Tales.

For none I trow, that hath a witte so badde,
To set his hay for *conies* over rivers,
Nor yet set not a dragege nette for an hare. *Wyat.*

Sometime he runs among the flocks of sheep,
To make the cunning hounds mistake their smell;
And sometime, where earth-delving *conies* keep,
To stop the loud pursuers in their yell.

Shakspeare. Venus and Adonis.

I have matter in my head against you, and against
your *cony-catching* rascals.

Id. Merry Wives of Windsor.

With a short-legg'd hen,

Lemons and wine for sauce; to these a *cony*
Is not to be despair'd of, for our money.

Ben Jonson's Epigrams.

The husbandman suffers by hares and *conys*, which
eat the corn and trees. *Mortimer's Husband.*

CONY. See LEPUS.

CONY, AMERICAN. See CAVIA.

CONY, BRASILIAN. See CAVIA.

CONYBEARE (John Josias), a modern divine and geologist, was the son of Dr. William Conybeare, rector of St. Botolph, Bishopsgate, and grandson of Dr. Conybeare, bishop of Bristol. He was born in 1779, and educated at Westminster school; from whence, in 1797, he was elected to a studentship of Christ Church, Oxford. Here afterwards he gained, in two years, the undergraduate's prize for a Latin poem, entitled *Religio Brahmæ*. He took the degree of M.A. in 1804, and became usher of Westminster school; but in 1807 returned to college, and was elected to the Anglo-Saxon professorship of the university, a station for which his antiquarian taste and knowledge particularly qualified him. In 1812 he was chosen poetry professor, and preached in 1824 the Bampton Lecture. To the *Annals of Philosophy* he made some valuable communications on some scientific subjects, particularly on the mineralogy of Devon, Cornwall, and Wales. He has also some valuable papers in the *Archæologia*, on the Saxon poetry. He succeeded to the stall which his father had held in the cathedral of York; and in 1812 obtained the college living of Bathaston in Somersetshire. Mr. Conybeare died at Blackheath, in June 1824; having again preached the Bampton Lectures for the year, which he published.

CONYZA, fleabane, a genus of the polygama superflua order, and syngenesia class of plants; natural order forty-ninth, composite. Pappus simple: CAL. imbricated and roundish: cor. of the radius trifid. There are ninety-one species.

CONZ, or CONSARRBUCK, a town of Germany, in the ci-devant territory of the Electorate of Treves, now annexed to France. It is included in the department of the Sarre and Moselle, and seated at the confluence of these rivers.

CONZA, a town of Naples, in the province of Principato Ultra, of which it is considered the capital. It is situated at the foot of the Apennines, on the river Oanto; and is the see of an archbishop. Its principal commerce is in marble. It suffered greatly by an earthquake in 1694. Conza lies fifty-eight miles south-east of Naples. Long. 15° 39' E., lat. 40° 50' N.

COO, *v. a. & n. s.* } To make the same
COO'ING, *n. s.* } sound as a dove or pigeon. The word is imitative of the sound.
COO'ING is the note of the dove; invitation.

Let not the *cooings* of the world allure thee:
Which of her lovers ever found her true? *Young.*

The stock-dove only through the forest *cooes*
Mournfully hoarse. *Thomson's Summer.*

Those ears that are offended by the sweetly wild notes of the thrush, the blackbird, and the nightingale, the distant cawing of the rook, the tender *cooing* of the turtle, the soft sighing of reeds and osiers, the magic murmur of lapsing streams, will be regaled and ravished by the extravagant and alarming notes of a squeaking fiddle, extracted by a musician who has no other genius than that which lies in his fingers: they will even be entertained with the rattling of coaches, the rumbling of carts, and the delicate cry of cod and mackerel. *Smollet.*

The timorous hare,
Grown so familiar with her frequent guest,
Searce shuns me; and the stock dove unalarmed
Sits *cooing* in the pine-tree, nor suspends
His long love-ditty for my near approach. *Cooper.*

COOCH-BAILAR, or COOCH-BEHAR, a district of Hindostan, in the province of Bengal, lying between the twenty-sixth and twenty-seventh degrees of northern latitude. It is bounded on the north by Bootan, on the east by Rungamutty, on the south-west by Rungpore, and contains an area of 1300 square miles. It was formerly independent, and the rajah stamped coins called Naraing, in his own name, some of which are still current in Bootan. In 1772 the rajah, being invaded by the rajah of Bootan, applied for British assistance, and became in consequence our ally and tributary. The amount of his tribute annually is 72,000 rupees. Parts of the country still under his sway are very unproductive; but those annexed to Rungpore are as singularly fertile, producing great quantities of indigo and cotton. Cooch-bahar is in the collectorship of Rungpore. 'The lower ranks in the northern quarter,' says Mr. Hamilton, 'are so extremely indigent, that some years ago it was their custom to dispose of their children for slaves, without scruple, to any purchaser for a trifling consideration. It was quite common to see a mother dress up her child, with a view to enhance the price, and bring it to market. Although so little is necessary for the subsistence of a peasant, and food compared with other districts is cheap, yet their poverty and wretchedness are extreme.'

COOK, *v. a. & n. s.* } Old Fr. *keur*; Fr.
COOK'ERY, *n. s.* } *cuisinier*; It. *cuoco*;
COOK'LY, *adv.* } Span. *cocinero*; Ang-
COOK-MAID, *n. s.* } Sax. *coc*; Ger. *koch*;
COOK-ROOM, *n. s.* } Dut. *kok*; Swed. *kock*;
COOK-SHOP, *n. s.* } Lat. *coquus*. To dress
victuals; figuratively, to prepare for any purpose

One who dresses victuals. The art of dressing victuals.

And he will take your daughters to be confectionaries, and to be *cooks*, and to be bakers. 1 Sam. viii. 13.

Awake, thou *coke*, quod he; God geve the sorwe,
What ailthe thee to slegen by the morwe?

Chaucer. Cant. Tales.

One mistress Quickly is in the manner of his nurse, or his dry-nurse, or his *cook*, or his laundry, his washer, and his wringer.

Shakspear. Merry Wives of Windsor.

Hanging is the word, Sir; if you be ready for that, you are well *cookt*.

Shakspeare. Cymbeline.

Some man's wit

Found the art of *cook'ry* to delight his sense:

More bodies are consumed and killed with it,
Than with the sword, famine, or pestilence. *Davies.*

The commodity of this new *cook-room* the merchants having found to be so great, as that in all their ships the *cook-rooms* are built in their fore-castles, contrary to that which had been anciently used.

Raleigh's Essays.

The new-born babe by nurses overlaid,
And the *cook* caught within the raging fire he made.

Dryden.

Had either of the crimes been *cooked* to their palates, they might have changed messes.

Decay of Piety.

Their *cooks* could make artificial birds and fishes, in default of the real ones, and which exceeded them in the exquisiteness of the taste.

Arbutnot on Coins.

These are the ingredients of plants before they are prepared by *cookery*.

Id. on Aliments.

A friend was complaining to me, that his wife had turned off one of the best *cook-maids* in England.

Addison.

Not but that *cooks* and poets still were free
To use their power in nice variety;
Hence, mackerel seem delightful to the eyes,
Though dressed with inconsistent gooseberries;
Crabs, salmons, lobsters, are with fennel spread,
Who never touched that herb till they were dead;
Yet no man lards salt pork with orange peel,
Or garnishes his lamb with spitcheoked eel.

King. Art of Cookery.

My guts ne'er suffered from a college *cook*,
My name ne'er entered on a buttry book.

Bramston. The Man of Taste.

In general, mankind, since the improvement of *cookery*, eat about twice as much as nature requires. Suppers are not bad, if we have not dined; but restless nights naturally follow hearty suppers, after full dinners.

Franklin.

And, while the hallowed mixture thickens,
Signing death-warrants for the chickens;
Else greatly pensive poring o'er

Accounts her *cook* had thumbed before. *Sheridan.*

COOKERY, in its simple and ordinary modes, is an art sufficiently familiar to every house-keeper; and, in its luxurious refinements, too copiously detailed in directories published for the purpose, to require any enlargement here, were it even to merit consideration in a work of this nature.

COOK, or } To make the note of the
COOK, *v. n.* } cuckoo. The word is imitative of the sound produced by the bird. It is found in both old English and Scottish poetry, but is now obsolete.

COOK (James), the most celebrated of modern navigators, was the son of James Cook, a peasant

of Marton, in the North Riding of Yorkshire, where he was born October 27th, 1728. He was one of nine children, and was first sent to school by Mr. Skettow, his father's employer, where he was instructed in writing and the elements of arithmetic. Before the age of thirteen he was bound apprentice to a shopkeeper at Straith, ten miles from Whitby; but, some disagreement arising, the indentures were cancelled, and he bound himself apprentice to Messrs. Walkers of Whitby, who had several vessels in the coal trade. After serving them several years he entered, during the war of 1775, as a volunteer on board the *Eagle*, a king's ship of sixty guns, to which vessel Sir Hugh Palliser was soon after appointed. This officer perceived Cook to be an active and diligent seaman; and his promotion was forwarded by a letter of recommendation from Mr. Osbaldeston, M. P. for Scarborough. On the 15th of May, 1759, he was appointed master of the *Mercury*, which sailed to America, and joined the fleet under Sir Charles Saunders at the siege of Quebec. On this occasion he was recommended by captain Palliser to take the soundings of the St. Lawrence, between the island of Orleans and the north shore, which he performed in the most complete manner; and soon after to survey the most dangerous parts of the river below Quebec. These were his first efforts with the pencil. On the 22nd of September he was appointed master of the Northumberland, stationed at Halifax, where he first read Euclid, and studied astronomy and other branches of science. In 1762 he was with the Northumberland, assisting at the recapture of Newfoundland. The same year he returned to England, and married Miss Elizabeth Batts, of Barking in Essex. Early in 1763, when captain, afterwards admiral, Greaves was appointed governor of Newfoundland, Mr. Cook went out with him to survey the coasts of the island. In the beginning of 1764, Sir Hugh Palliser being appointed governor of Newfoundland and Labradore, Cook accompanied him as surveyor, and had the Grenville schooner to attend him; in which situation he continued till 1767. While thus occupied he gave a specimen of his progress in astronomy, in a short paper, printed in the 57th volume of the Philosophical Transactions, entitled Observation of an Eclips of the Sun at the island of Newfoundland, August the 5th, 1766, with the longitude of the place of observation deduced from it: this was one of the Burgeo Islands near Cape Ray, in N. lat. 27° 56' 19". In the mean time the spirit for geographical discovery, which had gradually declined since the beginning of the seventeenth century, began to revive. Two important voyages had been performed in the reign of George II. under captains Middleton, More, and Smyth, to discover a north-west passage through Hudson's Bay to the East Indies. Two others, under captains Byron, Wallis, and Carteret, had been undertaken by order of his late Majesty; and, before the return of these navigators, another voyage was resolved upon for astronomical purposes. Towards the end of the year 1767, the Royal Society desiring to send astronomers into the Pacific to observe the transit of Venus over the sun's disk, which it

was calculated would take place in 1769, a memorial was presented to his Majesty on the subject, and he directed a vessel to be fitted out for the purpose. Otaheite being fixed on for the place of observation, the command of the vessel, named the Endeavour, was given to Mr. Cook, now made a lieutenant, and he sailed from England in 1768.

After accomplishing the astronomical part of his instructions at Otaheite, lieutenant Cook traced the eastern coast of New Holland, which he named New South Wales, from the thirty-eighth degree of latitude to its northern extremity; and proved, if he did not first discover, that it was separated from New Guinea, by passing through the channel which he named after his ship, Endeavour Strait. In this voyage he also visited New Zealand, which Tasman had but barely discovered; and, by ascertaining its extent, and division by a strait, which bears his name, chased the advocates for the southern continent from one of their strong holds. Cook likewise added several new islands among the group, to which he gave the name of Society Islands.

Mr. Green, an assistant in the observatory at Greenwich, went out with Cook, as astronomer, and he was likewise accompanied by Mr. (afterwards sir Joseph) Banks, and the Swedish naturalist, Dr. Daniel Solander. To the report of the commander on his return to England, respecting New Holland, may be attributed the subsequent colonisation of Botany Bay. The conduct of this expedition, as well as its results, was so creditable to Mr. Cook, that on his return in July 1771, he was raised to the rank of master and commander in the navy. An account of the voyage, drawn up by Dr. Hawkesworth, was speedily published, and became very popular.

A second voyage was planned for him in the course of the following year; and his majesty's ship Resolution being appointed to the service, he sailed from the Thames accompanied by the Adventure, captain Furneaux, on the most enlarged plan of discovery ever attempted. He was directed to circumnavigate the globe in the high southern latitudes, and to make such traverses into every corner of the great Southern Ocean, as might finally and effectually resolve the grand question of a southern continent accessible to navigation; and this interesting point his researches decided in the negative, beyond the possibility of doubt. The other fruits of this voyage were the correct knowledge of the land discovered by La Roche, in 1675, to which Cook gave the name of New Georgia; the discovery of the eternally frozen Sandwich Land, the nearest known land to the south pole; the ascertaining the extent of the Archipelago of the New Hebrides, which Quiros discovered, and Bougainville looked at; the discovery of New Caledonia, and of many islands of the division which, in this voyage, he named Friendly Islands.

This expedition was important, not only for its various contributions to the sciences and to navigation, but as exhibiting a method of preserving the health of seamen, and especially of guarding against the attacks of that fatal enemy

to sailors, the scurvy. Captain Cook so successfully combated the causes and symptoms of this and other general disorders among seamen, that only one man was cut off by it during the expedition. Having communicated his plans in this respect to the Royal Society, and the success which had attended them, he was chosen a fellow of that body, and his experiments were thought worthy of being rewarded by the Copleian gold medal. Government also recognised the value of his services by promoting him to the rank of post-captain in the navy, and a captainship in Greenwich Hospital.

Cook drew up his own narrative of the second voyage, but Dr. Douglas, afterwards bishop of Salisbury, superintended its passage through the press.

In 1776 this great navigator sailed on his third and last voyage, in the Resolution, accompanied by the Discovery, captain Clerk. In this voyage captain Cook was directed to examine the land in the southern ocean recently discovered by Kerguelen, and then to proceed through the Pacific to the coast of New Albion, from whence he was to proceed to the north along the coast of America to the latitude 65°, where he was to commence his search for a passage into the Atlantic, and particularly to examine all rivers or inlets pointing towards Hudson's and Baffin's Bays. In the event of not finding such passage, he was directed to seek one through the Frozen Ocean, either round Asia or America. As an encouragement to his crews, the reward of £20,000 for the discovery of a northern passage, which by the letter of the act of parliament was confined to the ships of his majesty's subjects, was now extended to those of his majesty, and £5000 were at the same time voted to any vessel that should first approach the pole within one degree.

Though the main object of this voyage was unsuccessful, that is, the discovery of a northern passage, it produced a vast addition to maritime geography. Kerguelen's Land was examined and its extent determined, several new islands were discovered in the South Pacific, former discoveries revisited, and many new lights thrown on the manners of the natives. The group of the Sandwich Islands in the North Pacific were likewise discovered, and a considerable portion of the western coast of North America.

The principal interest of this voyage, however, arises from the disastrous event that terminated the life of this great commander. He returned from the North Western coast of America to pass the winter of 1778 at Owhyhee, one of his recent discoveries. During his continuance here the crews of the ships were treated with the utmost hospitality and kindness by the natives, and their wants being liberally supplied, the natives were well remunerated. Early in February captain Cook sailed for Kamschatka, but was compelled by an accident to revisit his winter quarters. And a boat having been at this time stolen by one of the islanders, the captain went on shore to seize the person of the king, as a hostage till it was restored. The whole affair seems to have been ill managed on the part of the British commander and his officers.

He penetrated the country with an insufficient force, and the officer commanding his boat pushed off suddenly, when the life of captain Cook was dependent upon his being able to reach it. He was compelled to fire more than once on the natives, who struck him to the ground with a club, and despatched him afterwards with their spears.

His death took place February 14th, 1779; and his remains were recovered without difficulty. On the tidings of his fate reaching Europe, the highest public honors were paid to his memory not only at home, but by foreigners. A medal commemorative of his discoveries was struck by the Royal Society; his eulogy was pronounced in the Florentine Academy, and was made a prize subject by one of the French scientific societies: and the government bestowed pensions on his widow and three sons. Many designs were proposed to the Royal Society on this occasion; but the following was preferred and struck. On one side was the head of captain Cook in profile, with this inscription round it, *JAC. COOK OCEANI INVESTIGATOR ACERRIMUS*; and on the exergue, *REG. SOC. LOND. SOCIO SUO*. On the reverse is a representation of Britannia holding a globe, with this inscription round her, *NIL INTENTATUM NOSTRI LIQUERE*; and on the exergue, *AUSPICIIS GEORGI III.*

Captain Cook may be ranked among the few popular men who have not been over-rated by an admiring country. Neither in his attachment to his profession, nor his nautical skill, has any British commander ever exceeded him. His personal intrepidity, his perseverance, his promptitude, and his humanity and equanimity of temper, were also remarkable: while in addition to these important qualities he possessed a respectable fund of general scientific knowledge, was unassuming but frank in his manners, and of a most excellent private character. The more detailed results of his voyages have become, of course, matter of history, and will be found in our descriptions of the various portions of the globe which he visited.

COOKA, DAR, a country of central Africa, supposed to be the same described by the Arabian geographers under the name of Cauga, and situated on or near the banks of the Bahr el Fittre.

COOKE (George Frederick), a popular theatrical performer, was born in Westminster, April 17th, 1756. His father was an officer in the army, who, dying young, left his wife in difficulties. Removing to Berwick-upon-Tweed, she apprenticed her son to a printer; but his genius spurned the trammels of business, and he was perpetually engaging his companions to assist in theatrical performances. His indentures in consequence of this were soon cancelled; and he was now tried in the navy; but from this he also broke away to join an itinerant company of actors. He became the hero of the scene at York, Newcastle, Chester, Manchester, and Liverpool, successively; acquired so much notice, that in 1794 he was engaged by the manager of the Dublin theatre, with which he continued connected until October 1800, when

he first appeared in London at Covent Garden theatre, in the character of Richard III. His reputation was at once established, and after several times repeating the part of Richard III. he acted Iago, Macbeth, Shylock, Sir Giles Overreach, Sir Pertinax Macsycophant, Kitey, &c., with at least equal applause. Intemperance, however, ultimately destroyed his popularity. He became the plague and terror of English managers, and removed to the United States, where he displayed the same powerful abilities, and the same vicious weakness, until death, accelerated by intemperance, put an end to his career, March 25th, 1812. He married Miss Daniels, a singer of considerable talents, whom he is said to have treated with great cruelty, and from whom he was separated in July 1801, by the ecclesiastical court.

COOK'S BAY, a bay on the west coast of Easter Island, in the Pacific Ocean. Long. 109° 35' W., lat. 27° 11' S.

COOKS' COMPANY, one of the companies of the city London, incorporated in 1481. Their coat of arms is emblazoned *argent*, a chevron engrailed, *sable*, between three columbines.

COOK'S RIVER, now Cook's Inlet, an extensive arm of the sea, which penetrates into the north-west coast of North America, between Cape Elizabeth and Point Banks, that is, between long. 207° 9', and 207° 45' E. of Greenwich, lat. 58° 42', and 59° 10' N. Captain Cook sailed up this inlet seventy leagues without finding any termination, (see **COOK**), which induced him to think it was a river; and it was long described as such by geographers. But the error was ascertained by the expedition of captain Vancouver in 1794, who explored it to its extremity, which he found to be in long. 148° 43' W., lat. 61° 29' N. The shores on both sides of this bay are regular and unbroken, and near the coast is a border of low land, covered with wood, which continues to grow some distance up the mountains of the interior, which are wrapt in perpetual snow. West of the inlet, about seventy miles from its entrance, is a volcano, observed by Vancouver to emit large columns of pale smoke. As he advanced into this inlet his progress, in the month of May, was much impeded by ice. The inhabitants were similar in their manners and general appearance to those of Prince William's Sound.

COOK'S STRAIT, the strait which divides the two islands of New Zealand in the South Pacific Ocean.

COOL, *v. a. v. n., n. s. & adj.* } Anglo-Saxon, *celan*; Germ. *kulen*; Dutch, *koelen*; Swed. *kyta*. To cool is, to reduce the quantity of heat in any substance. Thence, metaphorically, to appease passion; to moderate zeal; to become less pleased with; less anxious to obtain or accomplish some object. When used with reference

to the diminution of temperature, cool implies, the presence of a small remaining portion of warmth; that the substance approaches to coldness, but is not positively cold. Figuratively, it signifies, luke-warm; wanting in zeal; having entire self-possession. Cooler is, that which can reduce the heat of the body; a vessel in which any thing is cooled, particularly a vessel in which wort is cooled by the brewer. Coolness is, moderate cold; incipient rupture of friendship. Coolly is, without passion or violent emotion. The vulgar phrase of to cool the heels, means, to keep waiting.

And they heard the voice of the Lord God walking in the garden in the *cool* of the day. *Genesis* iii. 8.

And he cried and said, Father Abraham, have mercy on me, and send Lazarus, that he may dip the tip of his finger in water, and *cool* my tongue; for I am tormented in this flame. *Luke* xvi. 24.

Sittith thou there, my brother John,

Tho seide Gamèlyn,

Fo to *colin* thy hotte bodie,

As I did *colè* myn. *Chaucer. Cant. Tales.*

Why takest not of that same fruit of gold ?

Ne sittest downe on that same silver stoole

To rest thy weary person in the shadow *coole* ?

Spenser. Faerie Queene.

My lord Northumberland will soon be *cooled*.

Shakspeare. Henry IV.

My humour shall not *cool*; I will incense Ford to deal with poison; I will possess him with yellowness.

Shakspeare. Merry Wives of Windsor.

This difference consisteth not in the heat or *coolness* of spirits; for cloves and other spices, naphtha, and petroleum, have exceeding hot spirits, hotter a great deal than oil, wax, or tallow, but not inflamed.

Bacon's Natural History.

The toad loveth shade and *coolness*. *Id.*

In dogs or cats there appeared the same necessity for a *cooler* as in man. *Harvey on Consumptions.*

They parted with such *coolness* towards each other, as if they scarce hoped to meet again. *Clarendon.*

Yonder the harvest of cold months laid up, Gives a fresh *coolness* to the royal cup;

There ice, like crystal, firm and never lost, Tempers hot July with December's frost. *Waller.*

You never *cool* while you read Homer. *Dryden.*

The sheep enjoy the *coolness* of the shade.

Id. Virgil.

He set his leg in a pail-full as hot as he could well endure it, renewing it as it grew *cool*. *Temple.*

Snow they use in Naples instead of ice, because, as they say, it *cools* or congeals any liquor sooner.

Addison on Italy.

He will keep his jealousy to himself, and repine in private, because he will be apt to fear some ill effect it may produce in *cooling* your love to him.

Id. Spectator.

Philander was enjoying the *cool* of the morning, among the dews that lay on every thing about him, and that gave the air a freshness.

Id. on Med.

Jelly of currants, or the jelly of any ripe subacid fruit, is *cooling*, and very agreeable to the stomach.

Arbuthnot on Dict.

Acid things were used only as *coolers*.

Id. on Aliments.

Motives that address themselves *coolly* to our reason, are fittest to be employed upon reasonable creatures.

Atterbury.

I'm impatient till it be done; I will not give myself liberty to think, lest I should *cool*.

Congreve's Old Bachelor.

Had they thought they had been fighting only other people's quarrels, perhaps it might have *cooled* their zeal. *Swift.*

Your first wort being thus boiled, lade off into one or more *coolers*, or cool-backs, in which leave the surlage behind, and let it run off fine.

Mortimer's Husbandry.

Coolers are of two sorts; first, those which produce an immediate sense of cold, which are such as have their parts in less motion than those of the organs of feeling; and secondly, such as, by particular viscosity, or grossness of parts, give a greater consistence to the animal fluids than they had before, whereby they cannot move so fast, and therefore will have less of that intestine force on which their heat depends. The former are fruits, all acid liquors, and common water; and the latter are such as cucumbers, and all substances producing viscosity. *Quincy.*

She in the gelid caverns, woodbine wrought,
And fresh bedewed with ever-spouting streams,
Sits *coolly* calm. *Thomson's Summer.*

These are the sober, in whose *cooler* brains

Some thought of immortality remains;

The rest too busy or too gay to wait

On the sad theme, their everlasting state,

Sport for a day, and perish in a night,

The foam upon the waters not so light. *Cowper.*

Green balks and furrowed lands, the stream that spreads

Its *cooling* vapour o'er the dewy meads,
Downs that almost escape the 'inquiring eye,

That melt and fade into the distant sky, *Id.*

COOM, *n. s.* Fr. *coûme*. Soot that gathers over an oven's mouth; that matter that works out of the wheels of carriages; it is used in Scotland for the useless dust which falls from large coals.

COOMB, or COMB, *n. s.* Fr. *combe*; Lat. *cumulus*. A heap; a measure of corn containing four bushels.

COOMB, *n. s.* Ang.-Sax. *comb*. A narrow valley enclosed on either side with hills.

COOMBE (William), a miscellaneous author of respectable powers, was born at Bristol in 1741. His father was a considerable merchant, and in 1777 stood candidate for the city, but died during the canvas. Mr. Coombe was educated at Eton and Oxford; after which he is said to have dissipated a handsome fortune in fashionable pursuits. His first publication was a satire entitled the Diaboliad; but he did not affix his name to this performance; nor indeed to any of his numerous publications. His next and most voluminous work was The Devil upon Two Sticks in England, 4 vols. 12mo., published in 1790, and reprinted 1810. In 1810 also appeared Dr. Syntax's Tour in Search of the Picturesque. It was inserted in the Poetical Magazine, then in course of publication at Mr. Ackermann's; and written, as the writer of this paper has heard the ingenious author declare, according as the fancy of the artist (Rowlandson), who supplied the decorations, suggested topics to his mind. Mr. Coombe regularly pinned up the sketch against a screen of his apartment in the king's bench, and wrote off his verses as the painter wanted them. The second part of the Diaboliad now made its appearance, and two further expeditions of Dr. Syntax; but they were the efforts of a jaded muse. In 1812 Mr. Ackermann published a history of Westminster Abbey, in

2 vols. 4to, by Mr. Coombe, who also was a principal contributor of essays, short pieces, illustrative of engravings, &c. to many of his miscellanies. He also claimed the authorship of the Letters that pass under the name of Lord Littleton. His last poem was the History of Johnny Quæ Genus. Mr. Coombe, as we have noticed, was fashionable and dissipated in youth; and became an inmate, in consequence, of the king's bench prison and its rules for upwards of twenty years, we believe. He stated indeed that a portion of this restraint was voluntary, and with a view to secure some property to a younger branch of his family. But he was always cheerful, gentlemanly, and interesting in his conversation. During the last years of his life, literature was his principal support. His death took place in his eighth-second year, at his lodgings in Lambeth-road, June 18th, 1823.

COOP, *v. a. & n. s.* } Icel. *kuppa*; Swed.
 COOPER, *n. s.* } *kopp*; Dutch *kuppe*;
 COOPERAGE, *n. s.* } Angl.-Sax. *cyf*. That which keeps or holds: a barrel; a cage; a pen for animals. To coop, therefore, is to pen up; to circumscribe; to enclose. It is mostly used with the intensive particle *up*, and generally implies somewhat of close restraint. A cooper is a man who makes that sort of coops called barrels, casks, &c.; and a cooperage is a place in which he carries on his trade; also the price paid for his work.

That pale, that white-faced shore,
 Whose foot spurns back the ocean's roaring tides,
 And coops from other lands her islanders.

Shakspeare. King John.

The Englishmen did *coop up* the lord Ravenstein, that he stirr'd not; and likewise held in strait siege the town.

Bacon.

Græchus was slain the day the chickens refused to eat out of the *coop*; and Claudius Pulcher underwent the like success when he contemned the tripodary augurations.

Brown.

The contempt of all other knowledge, as if it were nothing in comparison of law or physick, of astrology or chymistry, *coops* the understanding *up* within narrow bounds, and hinders it from looking abroad into other provinces of the intellectual world.

Locke.

They are *cooped in* close by the laws of their countries, and the strict guards of those whose interest it is to keep them ignorant.

Id.

There were a great many crammed capons together in a *coop*.

L'Estrange.

In the taking of a town the poor escape better than the rich; for the one is let go, and the other is plundered and *cooped up*.

Id.

Twice conquered cowards, now your shame is shown,

Cooped up a second time within your town!

Who dare not issue forth in open field.

Dryden's Æncid.

The Trojans *cooped* within their walls so long,
 Unbar their gates, and issue in a throng.

Id.

What! *coop* whole armies in our walls again?

Pope.

Societies of artificers and tradesmen, belonging to some towns corporate, such as weavers and *coopers*, by virtue of their charters, pretend to privilege and jurisdiction.

Child.

'Tis the cruel gripe,

That lean, hard-handed Poverty inflicts,

The hope of better things, the chance to win,
 The wish to shine, the thirst to be amused,
 That at the sound of winter's hoary wing
 Unpeople all our counties of such herds
 Of fluttering, loitering, cringing, begging, loose
 And wanton vagrants, as make London, vast
 And boundless as it is, a crowded *coop*. *Cooper.*

COOPEE, *n. s.* Fr. *coupé*. A motion in dancing.

COOPER (Anthony-Ashley), first earl of Shaftesbury. See SHAFTESBURY.

COOPER (John Gilbert), a celebrated author of the last century, was born in 1723; and descended from an ancient family in Nottinghamshire. He resided at Thurgarton priory, which was granted by king Henry VIII. to William Cooper, one of his ancestors. After studying under Dr. John Nicoll, at Westminster school, he became in 1743, a Fellow Commoner of Trinity College Cambridge; but quitted the university on his marriage with Susanna the daughter of William Wright, Esq., recorder of Leicester. In 1745 he published the Power of Harmony, a poem in 4to; and in 1746, and 1747, several essays and poems, signed Philæthes, in Dodsley's *musæum*. With the assistance of the Rev. John Jackson of Leicester, he published with his name, The Life of Socrates, collected from the Memorabilia of Xenophon and the Dialogue of Plato, and illustrated by Aristotle, Diodorus Siculus, Cicero, &c. 1749, 8vo. In 1754 appeared his Letters on Taste, 8vo; an elegant volume, on which no small share of his reputation is founded; and in 1755, The Tomb of Shakspeare, a Vision, 4to. In 1756 he assisted Moore in the publication of The World; and attempted to rouse the indignation of his countrymen against the Hessians, then brought over to defend the nation, in a poem called the Genius of Britain, addressed to Mr. Pitt. In 1758 he published Epistles to the Great, from Aristippus in Retirement, 4to.; and The Call of Aristippus, Epistle IV., to Mark Akenside, M.D. Also, A Father's Advice to his Son, in 4to. In 1759 followed Ver Vert; or, the Numery Parrot; an Heroic Poem, in four cantos, inscribed to the abess of D***, 4to; and, in 1764, Poems on Several Subjects, by the author of the Life of Socrates; with a prefatory Advertisement by Mr. Dodsley. He died at his father's house in May-fair, after a long and excruciating illness arising from the stone, April 14th, 1769.

COOPER (Samuel and Alexander), two eminent English miniature painters. Samuel was born in 1600, and bred under his uncle John Hoskins. He derived, however, his principal excellence from studying the works of Vandyke. His pencil was chiefly confined to the head, in which, with all its dependences, especially the hair, he was inimitable. He died in 1672; and his pieces are universally admired all over Europe, selling for incredible prices. His brother, Alexander, became limner to Christina queen of Sweden.

COOPER, in geography, a large navigable river of the United States, which joins the Ashley, below Charleston city in south Carolina. These form a spacious and convenient harbour,

which communicates with the ocean, just below Sullivan's Island, which it leaves on the north seven miles south-east of the city. In these rivers the tide rises six feet and a half. The Cooper is a mile wide at the ferry, nine miles above Charleston.

COOPER, KING's, an officer in every custom-house and excise office.

COOPER, COMPANY OF THE MYSTERY OF, was incorporated in 1530. Their coat of arms is emblazoned; party per pale *gules* and or a chevron between three hoops in a chief *azure*.

COOPERATE, *v. a.* } Fr. *cooperer*; Ital. }
 COOPERATION, *n. s.* } *cooperare*; Sp. *cooper-* }
 COOPERATIVE, *adj.* } *rar*; Lat. *cooperare.* }
 COOPERATOR, *n. s.* } To labor in conjunc- }
 COOPERANT, *adj.* } tion with to the same }
 end; to concur with another person or thing in producing the same effect. It has *with* before the agent, and *to* before the end. Conjoint labor employed to one purpose.

It puzzleth and perplexeth the conceits of many, that perhaps would otherwise *cooperate with* him, and makes a man walk almost alone to his own ends.

Bacon.

We might work any effect without and against matter; and this not holpen by the *cooperation* of angels or spirits, but only by the unity and harmony of nature.

Id. Natural History.

For age with virtue is *cooperative.* *Davies.*

His mercy will not forgive offenders, or his benignity *cooperate* to their conversions.

Broune's Vulgar Errors.

By giving man a free will, he allows man that highest satisfaction and privilege of *cooperating* to his own felicity.

Boyle.

All these causes *cooperating*, must, at last, weaken their motion.

Cheyne's Philosophical Principles.

The special acts and impressions by which the Divine Spirit introduces this charge, and how far human liberty *cooperates with* it, are subjects beyond our comprehension.

Rogers.

Vanity often *cooperates* with curiosity, for he that is an hearer in one place, wishes to qualify himself to be a principal speaker in some inferior company, and therefore more attention is given to narrations than any thing else in conversation.

Johnson.

If I might venture to appeal to what is so much out of fashion in Paris, I mean to experience, I should tell you, that in my course I have known, and, according to my measure, have *cooperated* with great men; and I have never yet seen any plan which has not been mended by the observations of those who were much inferior in understanding to the person who took the lead in the business.

Burke.

I scorn to take advantage of the eagerness of your zeal, and to prove that I think the sincerity of your zeal and attachment needs no such test, I will make your interest *cooperate* with your principle; I will quarter many of you on the public supply, instead of calling on you to contribute to it.

Sheridan.

COOPERING, is the art of manufacturing and keeping in repair casks and other vessels used for manufacturing, containing, and transporting various kinds of liquids. It must have been a trade almost coeval with the dawn of history, it being of the very first necessity; for, humble as it seems,

the art of coopering has enabled man to possess and retain the richest viands of foreign climes: it promotes and facilitates the export and import of the produce of distant countries: it has, therefore, enriched the merchant, supplied the wants and luxuries of the people, augmented the public revenue of all civilised countries, and given spirit to navigation. It is impossible, in reflecting on the utility of this trade, not to feel that it contributes a much greater quota of the necessaries and comforts of life, than it at first appears to do.

The trade in London is divided into several ramifications, and the persons carrying it on, as well as the journeymen, are confined to their respective departments. 1. The butt-cooper is engaged in manufacturing all kinds of casks for breweries, &c. also puncheons and hogsheds for distilleries. His working tools are but few in number; the first, an adze, similar to the same tool made use of by carpenters, except that the handle is shorter, being only about ten inches long: he has also an axe, and, with this and the adze, he reduces the staves to the form he wishes. He has also a bench, consisting of a piece of simple plank, and generally four or five feet long, and one foot wide, standing on four feet, raised to about two feet high at one end, and eighteen inches at the other, forming an inclined plane on its top. There are a stop and two upright keeps at each end of the top of the bench, which serve the purpose of keeping the stave firmly on it, in the operation of jointing. Their planes consist of two or three only, called jointers, similar to the same kind of tool used by joiners. The butt-cooper's is from three to four feet long, with which he makes all his joints; it requires to be kept in good order, and to be exactly true on its face, the mouth of the plane small, and the iron thin and sharp.

The shave, a machine similar to a tool called a spoke-shave, is of rather larger dimensions than the common one used by carpenters. But coopers use them of various sizes. It is a sharpened piece of hardened metal, with two legs let into a small block of beech wood, rounded on the face, and shaped at the ends so as to be held in the hand by the workman; the iron is sharpened as planes are, and it is fixed in the stock by two small wedges. With this tool the cooper smooths and finishes the inside and outside of all his casks, rounds and shapes their edges, and, in fine, finishes his work for use. The tool called a tooth, commonly, the old woman's tooth, is made not unlike the shave, except the iron which is in fact the tooth. It is very narrow and sharp, approaching an aris, and is used for making grooves round the top and bottom of the staves, to receive the ends of the cask. They use also a series of bits, called centre and dowering bits; the former for making perforations to insert cocks and other conveniences for filling or emptying casks; the latter for boring the edges of two opposite joints, in the tops and bottoms of vessels requiring to be doweled together.

Doweling is no more than fixing oaken pins in the joints; and is made use of only in large vessels, to prevent the joints from swagging from their places; it is of the greatest utility, and a

good cooper never neglects it; it is confined to the tops and bottoms only. A hoop, technically, is to the cooper a model, into which he fits all his staves; this model or hoop is of ascertained dimensions, and is as various as the numerous different vessels made use of: for instance, they have a hoop for butts, hogsheads, puncheons, barrels, and all other casks required for the different quantities of liquids to be vended at a butt-coopery, on a large scale. These are laid down, and the work is divided among the most expert in their several ways.

Some men are employed in hewing the staves, and reducing them to their lengths; others in joining and fitting them into the hoop; and some in preparing the tops and bottoms; while others are cleaning and smoothing the staves to receive the ends and final hooping. The staves made use of by the butt-cooper, are invariably of oak, and until very lately were wholly imported from the Baltic, and sold in the market by a merchant, called the stave merchant. The staves are imported in the several lengths required, and sold by the thousand, under the following designations, viz. pipe staves about five feet six inches long, two inches thick, and six inches wide; hogshead staves four feet long; barrel staves three feet six inches long. There are also to be met with, long and short headings; the former run about thirty inches in length, and the latter from twenty to twenty-four inches; these various staves are found to meet most of the required purposes of coopery. The retail dealer sorts and divides them for the consumer into the best pipe staves, seconds, &c. and the same to the hogshead, and barrel staves. The headings are sold generally as imported; Dantzic and Hamburg staves are considered the best; although great quantities are imported from Riga, Memel, and Konigsberg. When all communication with the Baltic was stopped in the late war, staves rose as high as £500 per thousand, and the smaller in proportion. This gave rise to the introduction of staves from Canada, which soon superseded the necessity of the importation from the Baltic; and there is now in the market, from our own possessions in America, abundance of all descriptions, sold at two-thirds the price of those from the Baltic: they are, however, not found to be so durable, but they work better, and make a neater article.

Iron, the cooper is not in need of, because its place can be supplied with other materials, except for his working tools. But England abounding in iron, it is found economical to make our hooping of that metal. Iron hoops are obviously the best for the butt-cooper, whose staves are usually of good substance; but in cases in which the staves are thin, iron hoops should be avoided, or at least but partially employed. The oxide of iron, of which these hoops supply abundance, commonly known as rust, eats away and destroys the wood with which it comes in contact, as well as the hooping itself. Foreign casks are seldom bound by iron; not always from the want of the metal, but from fancying that it may be injurious to their contents; it is particularly avoided in France, and indeed, in all wine countries: in France the best coopery is practised. The hooping is sold,

as most iron work usually is, by the hundred, in various lengths, previously wrought in a mill at the furnaces, of great variety of thickness. It is cut by the cooper to the length he requires to hoop his butts, or other vessels, punched at the lap, and cold rivetted. Previously to putting on the hooping, the staves are dried, either by being exposed to an open fire, or in kilns; the latter is now the most approved in large manufactories.

2. The rundlet-cooper carries on a second branch of this trade; he makes use of all the tools used by the butt-cooper, except that his collection may be on a smaller scale. This manufacturer makes the bottles of various small contents for the use of the distiller, who sends out his spirits in them, consisting of bottles, from one gallon and upwards to twenty gallons; he uses the long and short headings, which he rends into two or more in thickness, according to the substance required in his bottles. This is an extensive branch of business.

3. The dry-cooper finds his employment in manufacturing hogsheads, and casks for containing every kind of dry produce: the leading feature of the employment in his line, is the making of hogsheads for sugar. His tools are of the same description as before named, but he works the staves out of all kinds of wood, and is not obliged to be so neat in his fittings, as the butt rundlet coopers. It is an extensive line of business at all sea-ports, in which great exports are constantly making: he supplies casks to pack the supplies in, of all dry articles, for both army and navy, as clothing and hats; besides military stores, which are, for convenience, usually packed in casks. His business is also extensive in supplying suitable and secure vessels for the apothecary general to the army, whose medicines are forwarded in a dry state, securely enclosed in casks, prepared by the dry-cooper.

4. The white-cooper manufactures all such domestic utensils as are used in private brewing, washing and dairies; such as churns, pails, and every convenience required for the multiplied purposes of our domestic economy. At the white-coopers is to be found the most extensive employment of the staves called long and short headings. He proceeds in the manufacturing of his goods in a similar way to the butt-cooper; but rends his staves into several thicknesses, in order to make his articles lighter, and better adapted to their required purposes. He makes use of many different kinds of hoops; buying the iron hoops by weight, ready milled and fit for use; he having only to fit and cold rivet them on all his vessels bound by iron hooping. Many of the articles manufactured by this tradesman, are secured by wooden hoops; for instance, all tubs used in laundries and dairies; these, known to the trade by the name of white hoops, are generally rended out of ash wood. The white-cooper, to accommodate the housekeeper, usually keeps a shop, at which may be found exposed for sale, various articles required in domestic concerns. In London, to this branch of coopery, is sometimes added turnery, which, in a retail shop, supplies all kinds of brushes and baskets, with many other articles both convenient and useful.

5. The wine-cooper is a person employed in

drawing off, bottling, and packing wine, spirits, or malt liquor. In London, many persons follow this business only, and keep in their employ several assistants. It is common for persons of the first consequence to employ the wine-cooper to take charge of their wines. He has stipulated prices for all he does, charging his bottling off by the pipe, half-pipe, or as it may happen; he keeps a working butt-cooper in his employ to repair and job in the upholding, and supporting, the several casks in which wine and spirits are contained.

Under the trade of the Cooper, may also be included the manufacture of canteens, or those small vessels of wood in which soldiers, when on their march, or in the field, carry their liquor. These were formerly made of tin, but the use of wooden canteens has for some time been general in the British armies. They are made, in shape, very like barrels, cylindrical, seven inches and a half in diameter, and four inches long on the outside, holding three pints. These vessels have for several years been manufactured on a large scale at the Ordnance Wharf, Westminster Bridge. The wood made use of is the best foreign oak, and Mr. Smart, of the above wharf, has obtained his majesty's letters patent, for an improved method of preparing timber, so as to prevent its shrinking.

The manufacturing of backs and vats for brewers and distillers does not necessarily belong to coopering, it being a distinct branch of trade, and performed by persons called back and vat-makers: they work in English oak commonly, and take care to select that which is soundest and freest from knots, and saw it out into two inch, two and a half, and three inch planks, which are laid by for seasoning. We add a few particulars of this art as having grown out of that of which we have just treated. Carpenters work at this business, as the machines are of all shapes; for instance, the coolers for breweries are commonly oblong squares, and are made by this tradesman. The only particulars required in making good coolers, is that the sides be adequately strong, the joints well fitted, and the whole not too deep. The sides of a cooler of ordinary dimensions, should be at least two inches and a half thick; the joints should be well ploughed and tongued; the bottoms should be jointed in a similar way, and these will require doweling; the ends are grooved into the sides; and the whole is spilled together with iron pins. These vessels are sometimes scorched or charred in their insides, for the double purpose of preventing their decay, and also the too rapid acidity of the liquor exposed to cool in them. Mash-tuns, the under and jack backs, working tuns, and store vats, for the still and brewhouse, are best manufactured at the back-makers, as every thing he does is on a large scale. He keeps materials better adapted to the purpose than can be found at the butt-coopers. The above vessels are usually made round; and they are prepared in a similar manner to those of the butt-maker, except that their staves are generally of English oak. Some of these vats are immense, particularly those called store vats, containing from twenty to thirty butts and upwards; the hoops are necessarily of iron, very

strong, and frequently joined by a nut and screw rivet, which allows of removal in case of repair and accident.

COOPER'S ISLAND, one of the lesser Virgin Isles, in the West Indies, situated south-west of Ginger Island, and uninhabited. It is five miles long and one broad. Lat. 18° 5' N., long. 63° 57' W.

COOPER'S TOWN, a post-town of New York, in Otsego County, and the chief town of the country round Otsego. It is pleasantly situated at the south-west end of the lake, twelve miles north-west of Cherry Valley, and seventy-three west of Albany. It is built on a plan regularly laid out in squares.

COOPER'S TOWN, a town of Pennsylvania, situated on the Susquehanna. Water is brought here from West Mountains, by a conduit of 470 pipes.

COOPTATE, *v. a.* } Fr. *coop*ter; Lat. *coop*-
COOPTATION, *n. s.* } *tare.* To choose; adoption; assumption.

Dubitation is the beginning of all knowledge: I confess this is true in the first election and *cooptation* of a friend, to come into the true knowledge of him by queries and doubts. *Hewel.*

COORDAIN, *v. a.* } Lat. *con* and *ordi*-
COORDINATE, *adj.* } *nare.* To keep within
COORDINATELY, *n. s.* } the same limits, class,
COORDINATENESS, *n. s.* } rank, or station. Co-
COORDINATION, *n. s.* } ordinate is holding
the same rank; not being subordinate. Thus, shell-fish may be divided into two coordinate kinds, crustaceous and testaceous; each of which is again divided into many species, subordinate to the kind, but coordinate to each other. The meaning of the kindred words is obvious.

In this high court of parliament there is a rare *coordination* of power, a wholesome mixture betwixt monarchy, optimacy, and democracy.

Hewel's Pre-eminence of Parliament.

When these petty intrigues of a play are so ill ordered, that they have no coherence with the other, I must grant that Lysidius has reason to tax that want of due connexion; for *coordination* in a play is as dangerous and unnatural as in a state.

Dryden on Dramatic Poesy.

The word Analysis signifies the general and particular heads of a discourse, with their mutual connections, both *coordinate* and subordinate, drawn out into one or more tables. *Watts.*

COORG, a district of Southern India, in the Western Ghauts, situated between the province of Mysore and Malabar. Its chief produce is spices, sandal-wood, teak-timber, and rice. The woods abound with elephants and wild beasts. Considerable importations of rice have lately been made from this district into the Mysore. Here the river Cauvery has its source, but Coorg contains scarcely any towns. The rajah and his family reside in the fortress of Mercara. The rajahs are mentioned as independent princes by Ferishta in 1583, and the present family have reigned since the year 1632. They are of the Nair caste, and the sovereign is termed the Vir Rajah. One of the rajahs formerly made a hedge and ditch along his whole eastern boundary; and they retained their independence till the year 1773, when Hyder Ali subjugated them.

Tippoo ordered the royal family to be removed from Bednore to the fort of Periapatam; whence the rajah escaped in the year 1788, and, by the assistance of a few brave subjects, expelled the armies of Tippoo from Coorg. Oppotunely for this prince the British, in the year 1791, declared war against Tippoo, and, as he enabled general Abercrombie's army to reach Mysore, lord Cornwallis insisted, as one of the articles of peace with Tippoo, that he should relinquish all sovereignty over Coorg, and include it in the ceded territories. The rajah of Coorg afterwards cooperated with the British army under general Staart; and, on the downfall of Tippoo, was guaranteed the free and uncontrolled management of his territory.

COOT, *n. s.* Fr. *cotéc*; Dut. *macr-koet*. A small black water-fowl, seen often in fens and marshes.

A lake, the haunt
Of coots, and of the fishing cormorant.

Dryden's Fables.

COOTE (Sir Eyre), an eminent British general, was born in 1726. In 1745 he served in Britain against the rebels; and, in 1756, went out to the East Indies, where he distinguished himself in many important actions, particularly at the siege of Pondicherry, for which he was presented with a diamond-hilted sword by the directors of the East India Company. In 1769 he was made commander-in-chief of the Company's forces; but about the end of the following year he quitted Madras, and returned to England, where he was appointed governor of Fort St. George, and made knight of the Bath. In 1781 he went again to India, as commander-in-chief, and, in the following year, with 10,000 men, defeated Hyder Ali at the head of 150,000. Sir Eyre Cooté died at Madras in 1783, and his body was brought to England, and interred at Rockwood, in Hampshire. The East India Company erected a fine monument to his memory in Westminster Abbey.

COOTS, or COOTSTOWN, a town of Pennsylvania, in Berks county, situated on a branch of Sauhoca Creek, seventeen miles N.N.E. of Reading, and north-west by north of Philadelphia.

COP, *n. s.* Ang-Sax. *cop*; Dut. *kop*; Ger. *kopf*; Wel. *coppa*; Ital. *copo*; Lat. *caput*. The head; the top of any thing; any thing rising to a head; as a cop, vulgarly cock, of hay; a cob-castle, properly cop-castle, a small castle, or house on a hill; a cob of cherry-stones, for cop, a pile of stones one laid upon another; a tuft on the head of birds.

The gan I on this hill to gone,
And found upon the coppe a wone.

Chaucer. The House of Fame.

His berd as any sowe or fox was rede,
And thereto brode as though it were a spade,
Upon the cop right of his nose he hade
A wert, and thereon stode a tufte of heres
Rede as the bristles of a sowes eres.

Id. Prol. to Cant. Tales.

COPAIBA, or balsam of copaiba, a liquid resinous juice, flowing from incisions made in the trunk of the *copaifera balsamum*. It is

transparent, of a whitish or pale-yellowish color, an agreeable smell, and a bitterish pungent taste. It is usually about the consistence of oil, or a little thicker: when long kept, it becomes nearly as thick as honey, retaining its clearness; but does not grow dry or solid, as most other resinous juices do. There is, indeed, a thick sort of balsam of copaiba, which is not transparent, and generally has a portion of turbid water liquor at the bottom. This sort is probably either adulterated by the mixture of other substances, or has been extracted by coction from the bark and branches of the tree: its smell and taste are much less pleasant than those of the genuine balsam. Pure balsam of copaiba dissolves entirely in rectified spirit, especially if the menstruum be previously alkalisèd: the solution has a very fragrant smell. Distilled with water, it yields a large quantity of a limpid essential oil; and in a strong heat, without addition, a blue oil. The balsam of copaiba is a useful corroborating detergent medicine, accompanied with a degree of irritation. It strengthens the nervous system; in large doses proves purgative, promotes urine, and cleanses and heals exulcerations in the urinary passages. Fuller observes, that it gives the urine an intensely bitter taste, but not a violent smell as the turpentes do. This balsam has been principally celebrated in gleans and the fluor albus, and externally as a vulnerary. The dose rarely exceeds twenty or thirty drops, though some direct sixty or more. It may be taken in the form of an elæo-saccharum, or in that of an emulsion, into which it may be reduced by triturating it with almonds, or rather with a thick mucilage of gum arabic, till they are well incorporated, and then gradually adding a proper quantity of water.

COPAIFERA, in botany, a genus of the monogynia order, and decandria class of plants. There is no calyx; there are four petals; the legumen ovate; one seed with an arillus. We know but of one species, viz. *C. balsamum*. This tree grows near a village called Ayapel, in the province of Antiochi, in the Spanish West Indies, about ten days journey from Carthagea. Great numbers of these trees grow to the height of fifty or sixty feet. Some of them do not yield any balsam; those which do, are distinguished by a ridge which runs along the trunks. They are wounded in the centre, and calabash shells, or other vessels, are placed at the wounded parts to receive the balsam, which flows wholly out in a short time. One of these trees will yield five or six gallons of balsam: but though they will thrive well after being tapped, yet they never afford any more balsam.

COPAL, gum copal, is a gum of the resinous kind, brought from New Spain, being the concrete juice of the *rhus copallinum*, which grows in these parts. See RHUS. It comes to us in irregular masses, some of which are transparent, and of different shades, from a light yellow to a deep brown. Some pieces are whitish and semi-transparent. To the smell it is more agreeable than frankincense; but has neither the solubility in water common to gums, nor in spirit of wine common to resins. By these properties it resembles amber; which has induced some to

think it a mineral bitumen resembling that substance. In distillation it yields an oil, which is indissoluble in spirit of wine. Copal itself is soluble in the essential oils, particularly in that of lavender, but not easily in the expressed ones. It may, however, be dissolved in linseed-oil by digestion, with a heat very little less than is sufficient to boil or decompose the oil. This solution, diluted with spirit of turpentine, forms a beautiful transparent varnish, which, when properly applied, and slowly dried, is very hard and durable. This varnish is applied to snuff-boxes, tea-boards, and other articles. It preserves and gives lustre to paintings, and greatly restores the decayed colors of old pictures, by filling up the cracks, and rendering the surfaces capable of reflecting light more uniformly.

COPARCENER, n. s. Lat. *con* and *par-*
COPARCENERY, n. s. } *ticps*. Coparcener
COPARCENY, n. s. } is defined in the
COPARTNER, n. s. } quotation from Cow-
COPARTNERSHIP, n. s. } ell. Coparcenery is
 joint succession. Coparceny, an equal share of coparceners. A copartner is a joint partner; one who is in partnership with others.

Coparceners are otherwise called *parceners*; and, in common law, are such as have equal portion in the inheritance of the ancestor. *Cowell.*

This great lordship was broken and divided, and partition made between the five daughters: in every of these portions, the *coparceners* severally exercised the same jurisdiction royal, which the earl marshal and his sons had used in the whole province. *Davies on Ireland.*

In descent to all the daughters in *coparcenery*, for want of sons, the chief house is allotted to the eldest daughter. *Hale's History of Common Law.*

In case the father left only daughters, the daughters equally succeeded to their father, as in *copartnership*. *Id.*

So should I have *copartners* in my pain;
 And fellowship in woe doth woe assuage. *Shakspeare. Rape of Lucrece.*

Our faithful friends,
 Th' associates and *copartners* of our loss. *Milton's Paradise Lost.*

Shall I to him make known
 As yet my change, and give him to partake
 Full happiness with me? Or rather not;
 But keep the odds of knowledge in my power,
 Without *copartner*? *Id.*

Rather by them
 I gained what I have gained, and with them dwell
Copartner in these regions of the world. *Id. Paradise Regained.*

COPATAIN, adj. From *cop*. High raised; pointed.

Oh, fine villain! a silken doublet, a velvet hose, a scarlet cloke, and a *copatain* hat. *Shakspeare. Taming of the Shrew.*

COPE, v. a., v. n. & n. s. } Ang.-Sax. *cœppe*.
CO'PING, n. s. } Cope, as a noun,
 means any covering for the head, but this sense is obsolete; and a sacerdotal cloak; any thing which is expanded over the head; as the concave of the skies. The verb, in the sense of to contend, to struggle, to strive, says Johnson, 'is a word of doubtful etymology. The conjecture of Junius

derives it from *koop*, to buy, or some other word of the same import: so that to cope with, signifies to interchange blows, or any thing else with another.' It has also been derived from *κοπρω*; *cædo*, percutio. Mr. Todd, however, observes, that 'it may, with as much propriety, be referred to *cop*, the head; and so imply, to make head against; like the French expression, *faire tête à quelqu'un*.' Cope has, besides, the various meanings, to cover, as with a cope; to reward; to interchange kindness with; to embrace. In the last three senses it is disused. Coping is the upper tier of masonry which covers the wall; that is, the cop, or head of the wall. See *Cop*.

All these were of costly stones, even from the foundation unto the *copying*. *1 Kings vii. 9.*

For there was he nat like a cloisterere,
 With threadbare cope, as is a poure scolare,
 But he was like a maister or a pope. *Chaucer. Prol. to Cant. Tales.*

All these things that are contained
 Within this goodly cope, both most and least,
 Their being have, and daily are increase. *Spenser.*

Know my name is lost,
 By treason's tooth bare gnawn, and canker-bit;
 Yet am I noble as the adversary
 I come to cope. *Shakspeare. King Lear.*

I and my friend
 Have, by your wisdom, been this day acquitted
 Of grievous penalties; in lieu whereof,
 Three thousand ducats due unto the Jew,
 We freely cope your courteous pains withal. *Id. Merchant of Venice.*

Let our trains
 March by us, that we may peruse the men
 We should have *coped* withal. *Id. Henry IV.*

It is likely thou wilt undertake
 A thing, like death, to chide away this shame,
 That *copies* with death itself, to 'scape from it. *Id. Romeo and Juliet.*

Thou fresh piece
 Of excellent witchcraft, who of force must know
 The royal fool thou *copest* with. *Id. Winter's Tale*

Thou art e'en as just a man,
 As e'er my conversation *coped* withal. *Id. Hamlet.*

I will make him tell the tale anew;
 Where, how, how oft, how long ago, and when,
 He hath, and is again to cope your wife. *Id. Othello.*

But Eve was Eve;
 This far his over-match, who, self-deceived,
 And rash, beforehand had no better weighed
 The strength he was to cope with, or his own. *Milton's Paradise Lost.*

Over head the dismal hiss
 Of fiery darts in flaming volleys flew,
 And flying vaulted either host with fire;
 So, under fiery cope, together rushed
 Both battles main. *Id.*

The scholar believes there is no man under the cope of heaven, who is so knowing as his master. *Dryden.*

They perfectly understood both the hares and the enemy they were to cope withal. *L'Estrange.*

A very large bridge, that is a' made of wood, and *coped* over head, *Addison on Italy.*

Their generals have not been able to cope with the troops of Athens, which I have conducted. *Id. Whig Examiner.*

The *copying*, the modillions, or dentils, make a noble show by their graceful projections.

Id. Frecholder.

Host *coped* with host, dire was the din of war.

Phillips.

If the mind apply itself first to easier subjects, and things near a-kin to what is already known; and then advance to the more remote and knotty parts of knowledge by slow degrees, it will be able, in this manner, to *cope* with great difficulties, and prevail over them with amazing and happy success. *Watts on the Mind.*

Such here the rage of Mars; as, danger proof,
The Greeks rushed on beneath their tortoise roof
To gain the wall: while some their ladders plant,
Fenced by their lifted shields; and climb, and pant,
And grasp the battlements: the Trojans there
Fight with the soul and weapons of despair.
Beneath the *cope* of death, their hands employ
Whatever chance affords them to destroy.

Symmons' Æneis.

COPEMAN, *n. s.* } Ang.-Sax. ceapman;
COPEMATE, *n. s.* } Dutch koopman. Cope-
man is a chapman. Cope-mate is a companion;
a friend: 'perhaps,' says Dr. Johnson, 'for cups-
mate a companion in drinking, or one that dwells
under the same cope, for house.' Mr. Todd
suggests that it is rather from cope in the sense of
exchange: one who interchanges kindness with
another.

Ne ever staid in place, ne spake to wight,
Till that the fox his *opesmate* he had found.

Hubberd's Tale.

For ceapman we now say chapman, which is as
much as to say, a merchant or *copeman*. *Verstegan.*

COPENHAGEN, formerly Kiobmandshavn, the merchant's harbour. The principal city in the Danish monarchy, is situated on the east coast of the isle of Zealand, in lat. 55° 41' 4" N., and long. 12° 34' 15" E. It is one of the best built cities in the world, and decidedly the handsomest in the north of Europe; being about five miles in circumference, and fortified towards the land with regular ramparts and bastions. A broad, deep fosse surrounds the city, and on the sea-side it is defended by the Crown Battery. The citadel is situated on the north-east extremity, and completes the fortifications of the town.

The first mention of Copenhagen in history occurs about the year 1048. At that time it was an insignificant place, principally occupied by fishermen. In 1168 the king of Denmark presented this town to the celebrated bishop Absalon or Axel, who fortified the harbour, and built the castle of Axelhuus, to defend the coast against the bands of pirates who at that time infested the Baltic. On account of the protection which was thus afforded to the inhabitants, and the great convenience of its harbour, many other Zealanders were induced soon after to make it the place of their residence. It thus gradually increased, and in 1254 the city records represent it as surrounded by ditches, and well fortified. In 1284 it received new privileges; and, in 1443, was fixed upon as the place of residence by the Danish court. Like many other towns situate in a vicinity where timber is abundant, it was for many ages of its history constructed entirely of wood. In consequence of this, de-

structive fires were of very frequent occurrence; in 1728, and 1794, 2000 private houses, besides churches, public buildings, &c. were consumed to ashes by dreadful conflagrations. From this latter period the erection of wooden houses was prohibited, and the great regularity of the city is chiefly attributable to this circumstance. Since the attack of the British in 1807 the fortifications have been greatly improved.

Copenhagen consists of the Old Town, the New Town, and Christian's Haven. Some of the streets are broad and well paved, whilst others are narrow and very inconvenient. The buildings are chiefly composed of brick, or white calcareous stone, but the public edifices of freestone or Norwegian marble. The city is in many parts intersected by canals which afford great facilities for the conveyance of goods. The division called the Old Town, which is in fact the most modern, having been built since the disastrous fires mentioned above, occupies the western division of the city, north of the harbour. It contains the ruins of the magnificent palace of Christiansburg, built by Christian VI., and is said to have cost him 6,000,000 of dollars. This superb structure was nearly destroyed in the fire of 1794, but enough of it remains to convey an idea of its stupendous extent, and great magnificence. One of the wings remains entire, and is appropriated to the purposes of a national museum. It contains many very curious and interesting collections of animals, shells, minerals, paintings, antiquities, medals, dresses, and walkie and husbandry implements used by the Laplanders: it is well worthy the attention of the traveller. Nearly in the centre of the old town is situated the kongens nye tom, or king's new market: it is an irregular enclosure of great extent. A fine equestrian statue of Christian V. in bronze, decorates the centre of the area, and on one of its sides is the castle of Charlottenberg, formerly the residence of the queen, but now appropriated to the academy of the fine arts. This quarter contains also the observatory erected by Frederick V. for one of the disciples of Tycho Brahe. This building is particularly worthy of observation: it is constructed in a cylindrical form, and has a spiral carriage road, made of brick, to within twenty or twenty-five feet of the summit. The view of the city from one of the rooms, where the astronomical apparatus is kept, is said to be remarkably fine. Here also are the dock, the exchange, the theatres, the university, the artillery house, besides many other stately buildings, and churches; but the most interesting object is, perhaps, the pillar erected in honor of the late king, and of his having granted freedom to the peasants on the crown lands. The pillar is made of Norwegian granite, having the four corners of its base ornamented with four figures, representing peace, plenty, content, and industry.

The New Town, at least that part of it called Amalienburg, was built by Frederick V. It consists chiefly of an octagon, known by the name of Frederick's Square, opening into four rectangular streets, which have a very imposing effect. The grand entrance to this square is through a gate composed of double rows of Corinthian pillars. The enclosure is adorned by

four elegant palaces; one occupied by the king, another by the crown prince, a third by the king's brother, and the fourth is appropriated to the Marine Academy. An equestrian statue of Frederick V. occupies the centre of the square: it is said to have cost the Danish East Company, at whose expense it was erected, £80,000. One of the streets leading from this square conducts to the harbour, and another to Frederick's church, the monument of Danish pride and poverty. This building was begun many years ago, but, for want of funds to carry on the design, at present remains in an unfinished state. It was originally intended to have been the greatest ornament to Copenhagen, as indeed it would be were it finished.

The palace of Rosenberg, a small Gothic edifice, said to have been built by Inigo Jones, stands near the rampart; it contains the state apartment in which the king holds his annual bed of justice. The gardens attached to this palace are very extensive, and are the favorite promenade of the fashionable inhabitants.

Christian's Haven is situated on the small island of Amack, and is connected with the old town by two bridges. This quarter supplies Copenhagen, almost exclusively, with butter, cheese, fruit, and all kinds of vegetables. See AMACK.

Mr. M'Donald, in speaking of the general mode of building in Copenhagen, says, 'Instead of the usual right angles formed by the corners of the houses, at the extremities or divisions of the streets, the builders of Copenhagen have squared them off in a semi-octangular form, and thereby secured various advantages. Carriages and horses cannot so frequently run foul of each other, or run down persons on foot at the turnings of the streets; the space gained gives a free circulation to the air, and the look of as many handsome squares as there are street divisions in the city.' The houses of Copenhagen are for the most part spacious, consisting of four stories, and cellars sunk under ground; those of the nobility are particularly splendid, the light and elegant architecture of the modern Italians being most used. The tradesmen of this capital appear to have but little idea of setting off their commodities to the best advantage; their shops, as usual, are confined to the ground floor, and they make but little display in their windows.

Copenhagen contains twenty churches, and several synagogues, exclusive of its cathedral, which was destroyed during the late disastrous siege. The bishop of Zealand resides principally in this capital, where he has a splendid palace. The city also contains twenty-two hospitals, of which the most interesting, both as it regards its utility and regulations, is the lying-in-hospital; a school of midwifery, and a foundling are attached to this establishment. The University was founded in 1479. Divinity, law, medicine, and philosophy, are here taught by able masters; the average number of students is about 700, 168 of whom are maintained from the public funds. The library contains a considerable number of books, but few of them are of recent date; it also possesses a collection of Icelandic MSS. The Royal Library is a superb collection of up-

wards of 250,000 volumes; a few years ago it was enriched by the Arabic MSS. of Niebuhr.

The harbour of Copenhagen is formed by the straits of Kellebae, which separate Amack from Zealand, and though the entrance is so narrow that only one ship can pass at a time, the depth is sufficient to admit vessels of the largest size. Upwards of 500 ships can anchor at a time in this harbour; and the canals are so formed that merchantmen can come close to the warehouses that line the quays, to load and unload their cargoes. Every ship of war has its particular station, and is separated from the merchantmen by a kind of gallery. When the Danish navy was in its prosperity, this harbour presented a beautiful spectacle.

The trade of Copenhagen was very considerable at the commencement of the last century; it gradually increased until the war of the French revolution, which involving Holland and other maritime countries, a large transfer of business was made to the Danish capital, not only for the navigation of the European seas, but for remote voyages to India, &c. This branch of commerce carried on under the Danish name, but principally on the account of Great Britain, was mutually advantageous to both parties. Not a vestige of it, however, now remains; it received its death-blow at the bombardment of the English in 1807. The principal trade of Copenhagen is at present with Norway, Iceland, and the Faroe Isles. From Norway it receives all its cannon, shot, anchors, and iron work. Russia supplies it with flax, masts, sail-cloth, hemp, and cordage; Sweden with pitch and tar; and Germany with oak. The shipping belonging to this port may be averaged at 400 vessels, manned by 6000 seamen. The chief manufactures are woollen stuffs, sail-cloth, cotton stuffs, leather, spirituous liquors, and porcelain. There are also anchor foundries, roperies, and extensive dock-yards.

The bank of Copenhagen was established in 1736, by Christian VI. Accounts are kept in rix-dollars, marks, and schillings. The population of Copenhagen in 1769 amounted to 71,000, in 1801 to 90,000, and at present it is computed at 105,000. It is 170 miles north-east of Hamburgh, 315 south-west of Stockholm, and 600 north-east of London.

COPERNICUS, or KOPERNIK (Nicholas), an eminent astronomer, who led the way to the modern establishment of the new system of the universe, was born at Thorn, now subject to Prussia, then a town of Poland, according to some accounts, in January, but more correctly, we believe, according to others, February 19th, 1473. Frederick the Great boasts, in his (*Euvres Posthumes*, rather prematurely, that he could reckon Copernicus amongst the great names of his country. Thorn was not seized by Prussia until 1793, and did not become a settled part of her dominions until 1814.

Such was the singular state of astronomical science, prior to the appearance of this great man, that the limits of vision are truly said to have been taken for the boundaries of the universe. As far back as the middle of the second century, Ptolemy had digested all the elements of ancient astronomy into his system, adding to

them his own observations. This was so far fortunate for the science, as the burning of the Alexandrian library annihilated almost all the labors of antiquity, and would doubtless have retarded the progress of astronomy in Europe for ages, had not the works of Ptolemy escaped that destruction. This is not the place to enter into any details of his system. Taking the heavens for a real sphere, and the stars for so many bodies attached to its vault, he believed that a uniform and circular motion tended to the perfection of nature's works, and thought that the earth was the centre of that motion; that the entire starry heavens, therefore, turned round it in twenty-four hours, from east to west. Besides this general and daily revolution, he made the sun and planets move round the earth, in their periodical courses; and, fixing the order of the respective position of these stars, he placed Mercury immediately after the moon—still further Venus, and after that the sun. He laid it down in his works, as a first principle of astronomy, that the earth could not have any motion.

Long-established observations, as well as his own, led him to perceive a particular movement of the sun and planets, sometimes direct and accelerated, and sometimes retarded. In order to account for these inequalities upon one uniform principle, and to explain all these changes of direction, Ptolemy conceived, with Apollonius, that circles more or less great and numerous were so disposed, that the centres of the one revolved on the circumference of the other: he furnished the orbits of the planets with these circles; and changing them at pleasure, on encountering new difficulties and embarrassments, he thus vainly hoped to account for the irregularities and phenomena of the movements of the sun and planets. This led Alphonso of Castile, eleven centuries afterwards, to exclaim: 'Had I been consulted at the creation, the universe would have been arranged in a more simple and rational manner.' He had no other meaning, probably, than that Ptolemy's world could not be the creation of eternal wisdom.

It was when these fanciful dreams had obtained universal credence, and no other mode of accounting for the phenomena of the universe was current, that Copernicus was born to arouse the human mind from their influence. His parents were Nicholas Copernicus, and Barbe of Wetzehrod, sister of the bishop of Warmie. Being sent to the university of Cracow to pursue his studies, he was in the list of pupils in 1492. He applied himself to the culture of Grecian and Latin literature, and particularly of mathematics. The school of Cracow, then the only one in Poland, was become very celebrated and flourishing in these three departments of learning. Jacob of Kobylin, Nicholas Szadek, Martin of Olkusz, afterwards eminent professors of mathematics, were school-fellows of Copernicus—the four were scholars of Albert Brudzewski, in astronomy and mathematics. When Brudzewski went into Lithuania to fill the post of secretary to the grand duke Alexander, afterwards king of Poland, Copernicus quitted his country for Bologna, where he pursued astronomical observations, not as a pupil, but according to the

testimony of Rheticus, as assisting and confirming the labors of Dominick Marie of Ferrara. He had been already instructed in astronomy and mathematics on leaving Poland. He acquired such a name for knowledge in Italy, that being called to Rome at twenty-seven years of age to profess the mathematics, his public lectures drew from all sides a numerous concourse of scholars. All his activity was not, however, absorbed by his public teaching; for, continuing his astronomical pursuits, he observed the eclipse of the moon in 1500. At his return to Poland, he passed through Padua, where he sustained a public examination in anatomy, and was deemed worthy of being received as doctor in medicine. In 1504 he was inscribed as member of the university of Cracow; and it appears that his design was to establish himself there, had not his uncle recalled him to Warmie, by making him a prebendary in his cathedral.

As soon as he was settled at Frauenburg, he devoted himself entirely to the observation of the heavens, and to perfecting the means and obtaining the assistance necessary to this object; applying particularly (as he declares in his epistle to Paul III. the sovereign pontiff), to the rigorous and profound examination of all the principles and hypotheses—in a word, to the entire doctrine of the astronomy of his own time. 'Let us figure to ourselves,' says Copernicus in this epistle, 'an assemblage of detached members of the human body, belonging to individuals of different heights and conformations. If one thought, out of these, to form one perfect, the disposition of the parts, and their different configurations, would present, in a discordant connexion, the hideous appearance of a monster, rather than of the regular human form. This is,' continues Copernicus, 'the aspect that the edifice of ancient astronomy offers to my view. The explanation of the celestial movements presents quicksands to me, on which opinions generally received are wrecked. Suppositions favorable in certain cases, and not capable of application in others—sometimes adopted, sometimes forcibly interpreted, sometimes abandoned, far from illuminating the progress of reasoning, produce as much confusion as obscurity.'

Copernicus, in fact, carried into the examination of astronomy, that profound and concentrated attention, that severe and scrupulous exactitude, which, while he compared, connected, or discussed previous notions, allowed him to take nothing for granted, and soon elicited those great outlines of his system: that the sun is a fixed star, surrounded by planets that revolve round him, and of which he is the centre and the great luminary; that, besides the principal planets, there are others of a secondary order that circulate as satellites round their principals, and, with these, round the sun; that the earth is a principal planet, subject to a triple movement; that all the phenomena of daily and annual movement, the periodical return of the seasons, all the vicissitudes of light, and temperature of the atmosphere which accompany them, are the results of the rotation of the earth round its axis, and of its periodical movement round the sun; that the apparent course of the stars is but an optical il-

lusion, produced by the real motion of the earth, and the oscillations of its axis—that, in fine, the movements of all the planets give place to a double order of phenomena, which it is essential to distinguish, and of which the one is derived from the earth's motion, and the other from the motions of these planets round the sun. Such are the eternal and immutable truths of the science of the stars, that Copernicus revealed and announced in his immortal work, *Revolutions of the Celestial Orbs*. 'In reading this master-piece,' says an able modern essay on the labors of this great man, 'to the perfection of which, the writings of the ancients was no assistance, and to which modern knowledge has added nothing, it would seem as if nature had unveiled to him the wonders of her simplicity. The principles of mechanism, or of the science of motion, were yet to be brought forth. They were waiting for Galileo, Kepler, Huygens, and Newton, to be conceived and revealed. They were waiting for Euler, Clairaut, d'Alembert, Lagrange, and Laplace, to be applied, developed, and understood. Why, then, does Bailly seek to reproach Copernicus with being ignorant of the parallel movement of the earth's axis, not being a third movement, distinct and separate, but only the result of the first two, considered under certain conditions? We know that this knowledge is the fruit of the century that has just closed. Copernicus, without knowing the laws of motion, discovered the result of general principles; and by the force of his genius he triumphed over those beautiful and profound combinations from which it is derived. Two centuries of intellectual exertions, were necessary to create a new science, which confirmed this original and happy conception.' The tenth chapter of his first book, contains an exposition of the arrangement of the celestial bodies. There Copernicus, in a manner, sketches out the general plan of the creation; assigns their classes to the celestial bodies, and ranges the planets in their movements round the sun. He asserts boldly in this connexion, that the distance of the fixed stars was almost infinite; inasmuch, that all the distance between the earth and the sun, would appear to the eye, placed at the distance of those stars, as an insensible point. This assertion, since confirmed by the most delicate observations, demonstrates his extended views of the universe; and removing to a greater distance the boundaries of space, has finally indicated, in the immensity of the heavens, where the earth is lost, innumerable groups of suns and worlds, similar to our solar system. Bailly had therefore good reason for affirming, that the mathematics owe to Copernicus the first notion of infinity, which has since become the source of new sciences, and of the most astonishing discoveries. The principles of geometry being of essential use in astronomy, Copernicus, in following Ptolemy's work, gives the explanation of the right lines in a circle, and the method of estimating, by their means, the arcs and angles. A complete treatise of Trigonometry, particularly spherical, is placed at the end of the book. This was published separately, it seems some years before, and offers some very important problems in geometry, re-

solved by Copernicus, of which the history of mathematics has not, even to this day, rendered him the honor, in the erroneous supposition that he had drawn them from the work of Muller of Franconia, surnamed Regiomontanus, printed in 1533.

'The third book,' says the ingenious essayist we have adverted to, 'is a repository of the finest discoveries of which the sagacity of man can boast.' Copernicus 'satisfied himself that the fixed stars, preserving the same distance from the ecliptic, vary in their longitudes, or their distance from the equinoctial points; and as those stars never change position among themselves, he thence concluded, that their change in longitude was not the effect of their own movement, but that of the retrograding from east to west of the equinoctial points, known in astronomy under the name of precession of equinoxes. Combining afterwards the observations of Aristarchus of Samos, and those of Ptolemy and of the Arabians on the inclination of the ecliptic to the equator, with those which he had followed himself during thirty years, he deduced therefrom a change in this inclination. He confirmed two important phenomena; the one, which was first remarked by Hipparchus, and since known by all subsequent astronomers, that the equinoctial points had a retrograde movement; the other, the discovery of which is solely his own, that the movement was unequal, and that the obliquity of the ecliptic was subject to variations.' In this book he lays down in principle, that the axis of the earth, however it may be regarded as parallel to itself for explaining the seasons, is also found subjected to two movements of an extreme slowness: that, in the first place, the extremity of this axis, or the earth's pole, turns insensibly round that of the ecliptic, from east to west, in a period of about 26,000 years; and, as the movement of the axis necessarily affects that of the equator, the equinoctial points, gliding on the ecliptic, retrograde annually an arc of about fifty seconds: that, in the second place, this axis balances itself, like a lever that oscillates in its infinitely slow movement, sometimes elevating, sometimes lowering itself towards the ecliptic; and, as the inclination of these axes regulates that of their circles and of their planes, it follows that the balancing of the earth's axis brings a necessary alteration into the inclination of the equator from the ecliptic: from which it results, that the retrogradation of the equinoctial points, and all the changes in the position of the stars, are derived from two movements, to which the axis of our globe is, as will be presently shown, subjected in the annual revolution; that those two movements are so dependent one upon the other, that they are mutually influential on their respective accelerations and retardations; that, in fine, the trifling inequalities that affect them, are periodical—having a limit marked which they could not pass, and where they renew themselves, in order to accomplish the same revolution in a certain number of years or of ages.

Copernicus first asserted in this work the important theory of attraction. 'Gravity,' says he, 'is a tendency, that the author of nature has imprinted on all parts of matter, for uniting and

forming them into a mass. This property is not peculiar to the earth only; it belongs equally to the sun, to the moon, and to all the planets. It is thereby that the molecules of matter that compose those bodies, are united and rounded into globes, and preserve their spherical form. All the substances, placed at the surface of the celestial bodies, press equally towards the centres of those bodies; and this, without hindering those bodies from circulating in their orbits. Why should this constancy be any obstacle to the movement of the earth? Or, if we suppose that the centre of gravity ought, necessarily, to be that of all the movements, why place this centre in the earth, whilst the sun and all the planets have also their centres of gravity, and whilst the sun, by reason of its infinitely preponderating mass, would merit this preference? This choice is the more reasonable, inasmuch as all the phenomena, and all the appearances in the movements of the stars and planets, are deduced from it, in a manner at once simple and easy.

Science is in no small degree indebted to cardinal Schonberg, and Tydeman Gisius, bishop of Culm, whose pressing solicitations forced the work, *On the Revolutions of the Celestial Orbs*, into publication. Gassendi says, it was not finished before 1530; and several years more elapsed before the author could summon resolution to commit it to the press. He in fact but just lived to see a complete copy of it a few hours before his death, which took place at Frauenberg, in consequence of the rupture of a blood-vessel, and palsy, May 24, 1543. The account of his having been imprisoned for his discoveries, which we often see in print, is wholly without foundation. He was evidently too cautious and too orthodox to expose himself to that danger. In his epistle to the pope, alluded to in the beginning of this article, he says, 'If there be some who, though ignorant of mathematics, presume to judge concerning them, and dare to condemn this treatise, because they fancy it is inconsistent with some passages of scripture, the sense of which they have miserably perverted, I regard them not, and even despise their rash censure. It is notorious that Lactantius, a celebrated author, but an indifferent mathematician, only shows his own ignorance and folly when he derides those who hold that the earth has the form of a globe; and it ought not to give offence if we laugh in our turn. Mathematics are designed for mathematicians; who will, if I am not mistaken, consider our labors of some service to the ecclesiastical republic. For not long since, when in the Lateran council, under Leo X. the question about the emendation of the calendar was debated, it remained undetermined, because the lengths of the years and months, and the motions of the sun and moon, were not accurately measured. What I have done in this matter I submit principally to your holiness, and then to the judgment of all learned mathematicians.'

Copernicus appears to have occasionally acted in the direction of the civil affairs of his chapter and of the neighbourhood. He was administrator of the possessions of the prince in Allenstein; superintended some exertions of the government to establish a uniform coinage; and is said to

have left a MS. work on the management of the mint. He was often entrusted, in the absence of his diocesan, with the administration of the bishopric of Emerland, and nominated as a candidate for the see, in 1537, by king Sigismund. The election, however, was in favor of one of his competitors.

He seems also to have amused himself occasionally as an engineer, and constructed, half a mile up the river, an oblique dam fifteen ells and a half long, and a mill on the top of it by which water was raised for the supply of the town of Frauenburg. It was conveyed by a wheel from the top of a tower, from which it was carried by pipes to the house of each canon. This is said to have been the model of the great hydraulic machine at Marly, and the tower formerly bore the following inscription:—

Hic patitur aque sursum proferare coactæ,
Ne careat sitiens Incola mentis ope,
Quod natura negat tribuit Copernicus arte,
Unum pro cunctis Fama loquatur opus

Some travellers in the district that gave birth to this illustrious philosopher, arrived 'at Frauenberg, 12th August, 1802, and entered the church, where the ashes of Copernicus reposed. Near the altar, belonging to the prebend of Copernicus, was a sepulchral stone, partly enclosed by a marble balustrade, that was carried round the great altar. Spheres, rudely graven, and the letters Nicol, pointed out the place where the remains of this illustrious man were deposited. The worthy chapter, who attach as much veneration to the memory of Copernicus, as zeal for whatever interests the common glory of a nation, gave the most obliging assistance. On washing the stone, one could distinguish the letters Nicol....Cop....us; and in the second line, Obiit AN. M..... The rest of the letters were effaced. Having raised the stone, we caused the opening to be digged, because, before the eighteenth century, the prebendaries of Varnie had no particular tombs. We were present at the work. Only a few half decayed bones were discovered. The chapter retained a sixth part of those mortal remains of Copernicus, and we brought away the rest,' they say, 'with a regular certificate, signed by the first prelates of the chapter. We sent to the church of Pulawy, one third of these precious relics, and kept the other two for the Society.' These gentlemen were members of the Literary Society of Warsaw, and communicated the above interesting facts to M. Sniadecki, to whose essay we have been much indebted for this paper.

COPERNICUS, the name of an astronomical instrument invented by Mr. Whiston, to exhibit the motions and phenomena of all the planets, according to the Copernican system.

COPIAPO, a district of South America, in the north of Chili, which abounds in minerals of all kinds, and particularly load-stone, lapis lazuli, saltpetre, sal gem, and pure sulphur. Gold also has been found here; and some silver mines have been recently worked. The province is bounded on the north by the Peruvian deserts; on the east by the Andes; south by Coquimbo; and west by the Pacific Ocean; being about 100

leagues in length from north to south, and forty-four broad from east to west. Its rivers are the Copiapo, Salado, Castagno, Totorel, Quebradaponda, Guaseo, and Chollai. The grain and fruits are excellent, but the pasturage poor for want of rain. The temperature is mild, but the country thinly peopled; not containing, altogether, above 5000 inhabitants.

COPIAPO, a town of Chili, and one of its most important sea-ports, is situated immediately at the mouth of the river of the same name, in lat. 27° 15' S. The harbour affords good anchorage, is easy of access for vessels of any size, and, as it opens towards the west, is protected from the northerly and southerly winds.

COPIATA; from κοπῶω, to cut; a grave digger. In the first ages of the church clerks were destined for this employment. A. D. 357 Constantine made a law in favor of the priests copiatæ, i. e. of those who had the care of interments; whereby he exempted them from the lustral contribution. Before that time they were called decani and lecticarii, because they were divided by decads, each of which had a bier for the carriage of the dead bodies. They had precedence of the chantors.

COPINSHA and **CORNHOLM** are two of the Orkney Islands, united by a reef, dry at half-tide. They are together not more than two miles in length, and two miles south-east of Mairland. The rocks are covered with sea-fowl.

COPIOUS, *adj.* } Fr. *copieux*; It. Sp. }
COPIOUSLY, *adv.* } and Lat. *copia*. Lavishly }
COPIOUSNESS, *n. s.* } bestowed; abundant; }
 exuberantly plentiful; flowing freely; abounding in words or images. Copiously signifies abundantly; diffusely; at large. Copiousness is, abundance; exuberance of style,

Rose, as in dance, the stately trees, and spread their branches hung with *copious* fruit. *Milton.*

Full measure only bounds excess, before the all-bounteous king, who showered with *copious* hand, rejoicing in their joy. *Id.*

Hail, Son of God, Saviour of men! thy name shall be the *copious* matter of my song henceforth, and never shall my harp thy praise forget, nor from thy Father's praise disjoin. *Id.*

The Roman orator endeavoured to imitate the *copiousness* of Homer, and the Latin poet made it his business to reach the conciseness of Demosthenes. *Dryden.*

These several remains have been so *copiously* described by abundance of travellers, and other writers, that it is very difficult to make any new discoveries on so beaten a subject. *Addison.*

This alkaline acrimony indicates the *copious* use of vinegar and acid fruits. *Arbuthnot on Aliments.*

The tender heart is peace, and kindly pours its *copious* treasures forth in various converse. *Thomson's Spring.*

Paul Benfield made (reckoning himself) no fewer than eight members in the last parliament. What *copious* streams of pure blood must he not have transfused into the veins of the present? *Burke.*

This pleasure (of existence) is increased when the system is stimulated into stronger action than usual, as, after a *copious* dinner, and at the beginning of intoxication. *Darwin.*

But chiefly Juno, that imperial power who holds her influence o'er the nuptial power, their vows address: to her, the beautiful queen, with lifted eyes and supplicating mien, as her fair hands the sacred goblet hold, on the white heifer's forehead drains the gold. Before the gods with *copious* slaughter fed, and the crowned shrines, she walks with solemn tread. *Symonds's Æneis.*

We admit that, by some powerful hands, our unrhymed verse has been so constructed as to be *copiously* harmonious; and we are, of course, sensible that, in any language, rhyme is only one of the charms of verse, which cannot be availing when unaccompanied with the other requisites of poetic diction. *Id. Pref. to Æneis.*

COP'PLAND, *n. s.* A piece of ground in which the land terminates with an acute angle.

COP'PLANT, *v. a.* From *con* and *plant*. To plant together.

COP'PORTION, *n. s.*, From *con* and *portion*. Equal share.

COPPA, in law, a cop or cock of grass, hay, or corn, divided into titheable portions, as the tenth cock, &c. This word denotes laying up the corn in cops or heaps, not bound up, that it may be the more fairly tithed; and in Kent they still retain the word, a cop or cap of hay, straw, &c.

COP'PPED, *adj.* From *cop*. Rising to a top or head.

It was broad in its basis, and rose *copped* like a sugar-loaf. *Wiseman's Surgery.*

A galeated eschinus being *copped* and somewhat conic. *Woodward.*

COP'PEL, *n. s.* } This word is variously }
COP'PLE-DUST, *n. s.* } spelt; as *copel*, *cupel*, }
cuple, and *cupple*; but I cannot find its etymology, says Dr. Johnson. It may, however, be traced to the Italian *copella*, or the Teutonic, *kopel*. See **CUPEL**.

COP'PPER, *v. a., n. s. & adj.* } Fr. *cuivre* }
COP'PPER-COLORED, *adj.* } Ital. *cupro*; Sp. }
COP'PPER-MINE, *n. s.* } *cobre*; Dutch, }
COP'PPER-NOSE, *n. s.* } *koper*; Germ. }
COP'PPER-PLATE, *n. s.* } *kopper*; Latin, }
COP'PPER-WIRE, *n. s.* } *cuprum*; from }
COP'PPER-WORK, *n. s.* } *εὐπρος*, Cyp- }
COP'PPERAS, *n. s.* } rus. Pliny calls }
COP'PPER-DUST-WORK, *n. s.* } it. as *Cyprum*. }
COP'PPERSMITH, *n. s.* } A well-known }
COP'PPER-WORM, *n. s.* } metal; a large }
COP'PPERISH, *adj.* } vessel to boil }
COP'PPERY, *adj.* } in, made of cop- }
 per, and of greater magnitude than a boiling pot. The verb signifies, to cover with thin plates of copper. The compounds require no explanation; except, perhaps, copper-nose, which means a red, carbuncled nose; copper-work, which is a place where copper is manufactured; and copper-worm, which denotes a little worm in ships; a worm that gnaws garments; and a worm that breeds in the hand. Copperas is a name given, in common parlance, to the sulphates of copper, iron, and zinc. See **CHEMISTRY**.

Two vessels of fine *copper*, precious as gold.

Ezra viii. 27

Alexander the *coppersmith* did me much evil: the Lord reward him according to his works.

2 *Timothy* iv. 14.

He went his way, and with the *coper* he came,
And this chanon it in his hondes name.

Chaucer. Cant. Tales.

And more for rank despight, than for great paine,
Shakt his long locks, colourd like *copper-wyre*.

Spenser. Faerie Queene.

He having colour enough, and the other higher, is
too flaming a praise for a good complexion: I had as
lieve Helen's golden tongue had commended Troilus
for a *copper-nose*.

Shakspeare.

They boiled it in a *copper* to the half; then they
poured it into earthen vessels.

Bacon's Natural History.

It may be questioned, whether, in this operation,
the iron or *copperas* be transmuted, from the cognation
of *copperas* with *copper*, and the iron remaining after
conversion.

Browne.

Gutta rosacea ariseth in little hard tubercles, affect-
ing the face all over with great itching, which being
scratched, looks red, and rises in great welks, render-
ing the visage fiery, and makes *copper-noses*, as we
generally express them.

Wiseman.

Salmones, as the Grecian tale is,

Was a mad *coppersmith* of Elis;

Up at his forge by morning peep.

Swift.

This is like those wrought at *copper-works*.

Woodward.

Some springs of Hungary, highly impregnated with
vitriolick salts, dissolve the body of iron put into the
spring, and deposit, in lieu of the irony particles car-
ried off, *coppery* particles brought with the water out
of the neighbouring *copper-mines*.

Id. On Fossils.

Copper is heavier than iron or tin; but lighter than
silver, lead, and gold.

Hill on Fossils.

Copper is the most ductile and malleable metal,
after gold and silver. Of a mixture of *copper* and
lapis calaminaris is formed brass; a composition of
copper and tin makes bell-metal; and *copper* and
brass, melted in equal quantities, produces what the
French call bronze, used for figures and statues.

Chambers.

Hence glow, refulgent tin, thy crystal grains,
And tawny *copper* shoots her azure veins.

Darwin.

COPPER, one of the six primitive metals, so
called because the island of Cyprus formerly
furnished great quantities of this metal, which,
in the days of Homer, was the one principally
used. The discovery and use of copper preceded
that of iron. Yet it is probable that iron was
known in the days of Homer's heroes; for in
speaking of polished iron and copper, he calls
the first white and the other red. Some authors
attribute the discovery of copper to Cadmus;
but, according to Strabo, it was first found at
Chalcis, a city in Eubœa, now called Negro-
pont, whence its Greek name. Other authors
say it was first dug in the island of Cyprus, and
thence obtained its Latin appellation. The color
of this metal when pure is pale red, its spec-
ific gravity from 8.7 to 9.3, which depends not
only on its degree of purity, but also on its con-
densation by hammering. The specific gravity
of Japan copper is to water as 9000 to 1000;
but that of the Swedish kinds only as 8784 or
8843. The color, when clean, is very brilliant,
but it is extremely liable to tarnish. Its elasti-
city is superior to that of any other metal except
steel. From this last quality masses of the metal
emit a loud and lasting sound when struck; es-
pecially when cast into such a form as may

make the metal vibrate in the most simple man-
ner possible. Thus, if cast into the hollow form
of a bell, without any cracks or imperfections, a
uniform tone will be produced by it; or at least
the tones produced by the stroke will consist of
a single predominant one, and of others that
have an agreement with it. When broken, by
often bending backward, it appears internally of
a dull red color, without any brightness, and of
a fine granulated texture, resembling some kinds
of earthenware. It continues malleable in a
red heat, and in this state extends much more
easily than when cold. In a heat far below igni-
tion, the surface of a piece of polished copper
becomes covered with various ranges of pris-
matic colors; the red of each order being nearest
to the end which has been most heated. Copper
rusts in the air; but the corroded part is very
thin, and preserves the metal beneath from fur-
ther corrosion. It is remarkably impatient of
moisture when in a state of fusion; and the
contact even of a very small quantity of water
will cause a vast mass of melted metal to be
thrown about with incredible violence, to the im-
minent danger not only of the bystanders, but
even of the strongest furnaces and buildings.
Effects of this kind are said to have been pro-
duced by so slight a cause as the workmen spit-
ting in a furnace full of melted copper. For an
account of the combinations of this metal with
salts, earths, and other metals, see CHEMISTRY.

Brunswick or Friesland green is prepared by
pouring a saturated solution of muriate of am-
monia over copper filings or shreds in a close
vessel, keeping the mixture in a warm place,
and adding more of the solution from time to
time, till three parts of muriate and two of cop-
per have been used. After standing a few weeks,
the pigment is to be separated from the unoxi-
dised copper, by washing through a sieve; and
then it is to be well washed and dried slowly in
the shade. This green is almost always ad-
terated with ceruse.

Verdigris, and other preparations of copper,
act as virulent poisons, when introduced in very
small quantities into the stomachs of animals. A
few grains are sufficient for this effect. Death is
commonly preceded by very decided nervous
disorders, such as convulsive movements, tetanus,
general insensibility, or a palsy of the lower ex-
tremities. This event happens frequently so
soon, that it could not be occasioned by inflam-
mation or erosion of the primæ viæ; and, in-
deed, where these parts are apparently sound,
It is probable that the poison is absorbed, and,
through the circulation, acts on the brain and
nerves.

The only chemical antidote to cupreous solu-
tions, whose operation is well understood, is
water strongly impregnated with sulphureted hy-
drogen. The alkaline hydrosulphurets are acrid,
and ought not to be prescribed.

But we possess, in sugar, an antidote to this
poison, of undoubted efficacy, though its mode
of action be obscure. M. Duval introduced into
the stomach of a dog, by means of a caoutchouc
tube, a solution in acetic acid, of four French
drachms of oxide of copper. Some minutes af-
terwards he injected into it four ounces of strong

syrup. He repeated this injection every half hour, and employed altogether twelve ounces of syrup. The animal experienced some tremblings and convulsive movements. But the last injection was followed by a perfect calm. The animal fell asleep, and awoke free from any ailment.

If we boil for half an hour, in a flask, an ounce of white sugar, an ounce of water, and ten grains of verdigris, we obtain a green liquid, which is not affected by the best tests of copper, such as ferropurssiate of potash, ammonia, and the hydrosulphurets. An insoluble green carbonate of copper remains at the bottom of the flask.

We extract the following abridged view of the ores of copper from Dr. Ure's excellent Chemical Dictionary:—

1. *Octohedral or native copper.* Color copper-red, frequently incrusting with green. Massive, imitative, and crystallised; in the perfect cube; the cube truncated, on the angles, on the edges, and on the edges and angles; the garnet dodecahedron; perfect octohedron; and rectangular four-sided prism. Lustre glimmering, metallic. Fracture hackly. Streak splendid. Completely malleable. Flexible, but not elastic. Difficultly frangible. Specific gravity 8.4 to 8.7. It consists of 99.8 of copper, with a trace of gold and iron. It occurs in veins, in granite, gneiss, &c., and is found chiefly in Cornwall.

2. *Octohedral red copper ore.*

a. *Foliated red copper ore.* Color dark cochineal-red. Massive, and crystallised, in the perfect octohedron, which is the primitive form; in the octohedron, truncated on the angles; on the edges, with each angle acuminated with four planes; bevelled on the edges, and each angle acuminated with eight planes. Lustre adamantine, inclining to semi-metallic. Cleavage four-fold. Translucent on the edges, or translucent. Streak muddy, tile red. Hardness between calcareous and fluor-spar. Brittle. Specific gravity 5.6 to 6.0.

b. *Compact red copper ore.* Color between lead-gray and cochineal-red. Massive and reniform. Lustre semi-metallic. Fracture even. Opaque. Streak tile red. Brittle.

c. *Capillary red copper ore.* Color carmine-red. In small capillary crystals. Lustre adamantine. Translucent.

The whole of these red ores are deutoxides of copper, and are easily reduced to the metallic state before the blow-pipe. They dissolve with effervescence when thrown in powder into nitric acid; and a green nitrate results. In muriatic acid no effervescence takes place. They occur principally in veins that traverse primitive and transition rocks; abundantly in the granite of Cornwall. The earthy red copper ore, which is rare, is a sub-species of the preceding.

d. *Tile ore.* The earthy tile ore has a hyacinth red color. It occurs massive and incrusting copper pyrites. It is composed of dull dusty particles. It soils slightly, and feels meagre. It occurs in veins, as at Lauterberg in the Hartz. The indurated tile ore has an imperfect flat conchoidal fracture; a streak feebly shining; and is intermediate between semi-hard and soft. It is an intimate combination of red

copper ore and brown iron ochre, containing from 10 to 50 per cent. of copper.

3. *Black copper, or black oxide of copper.* Color between bluish and brownish-black. It occurs massive, and thinly coating copper pyrites. It is composed of dull pasty particles, which scarcely soil. Streak slightly shining. Before the blow-pipe it emits a sulphureous odor, melts into a slag, and communicates a green color to borax. It is said to be an oxide of copper with oxide of iron. It occurs at Carharrac and Tincroft mines, in Cornwall.

4. *Emerald copper or diopbase.* Color emerald green. It occurs only crystallised. The primitive form is a rhomboid of $123^{\circ} 58'$. The only secondary form at present known, is the equiangular six-sided prism. Lustre shining pearly. Cleavage three-fold. Fracture small conchoidal. Translucent. As hard as apatite. Brittle. Specific gravity 3.3. It becomes a chestnut-brown before the blow-pipe, and tinges the flame green, but is infusible; with borax it gives a bead of copper. Its constituents are, oxide of copper 28.57, carbonate of lime 42.83, silica 28.57.—*Vauquelin.* By Lowitz, it consists of 55 oxide of copper, 33 silica, and 12 water, in 100. It is found in the land of Kirguise, 125 leagues from the Russian frontier, where it is associated with malachite and limestone.

5. *Blue copper, or prismatic malachite,* of which there are two kinds,—the radiated and earthy.

The radiated has an azure-blue color. Massive, imitative, and crystallised. Its primitive form is an oblique prism. The secondary forms are, an oblique four-sided prism, variously bevelled, and a rectangular four-sided prism, or eight-sided prism, acuminated with four planes. Lustre vitreous. Cleavage threefold. Fracture imperfect conchoidal. Translucent. Color of the streak, lighter. Harder than calcareous spar. Brittle. Specific gravity 3.65. It is soluble with effervescence in nitric acid. With borax it yields a metallic globule, and colors the flux green. Its constituents are, copper 56, carbonic acid 25, oxygen 12.5 water, 6.5.—*Vauquelin.* It is found at Leal-hills, in Dumfriesshire, and Wanlockhead in Lanarkshire, and at Huel Virgin and Carharrac, in Cornwall, and in many places on the continent.

b. *Earthy blue copper.* Color smalt-blue. Massive. Friable. Specific gravity 3.354. It is found in Norway, &c.

The velvet-blue copper belongs to the same species. Lustre glistening and pearly. It has been found only at Oravicza, in the Bannat, along with malachite and the brown iron stone.

6. *Malachite;* of which there are, the fibrous and compact.

a. *Fibrous malachite.* Color perfect emerald-green. Imitative, and crystallised, in oblique four-sided prisms, variously bevelled or truncated; and in an acute-angular three-sided prism. Crystals short, capillary, and acicular. Lustre pearly or silky. Translucent, or opaque. Softer than blue copper. Streak pale green. Brittle. Specific gravity 3.66. Before the blow-pipe it decrepitates, and becomes black. Its constituents are, copper 58, carbonic acid 18, oxygen 12.5 water 11.5.—*Klaproth.* It occurs principally in

veins. It is found at Sandlodge in Mainland, one of the Shetlands; at Landidno in Caernarvonshire; and in the mines of Arendal in Norway.

b. Compact malachite. Color emerald-green. Massive, imitative, and in four-sided prisms. Glimmering and silky. Fracture small grained uneven. Opaque. Streak pale green. Specific gravity 3.65. In veins, which traverse different rocks in Cornwall, Norway, &c. Brown copper, from Hindostan, is placed after this mineral by professor Jameson. Its color is dark blackish-brown. Massive. Soft. Specific gravity 2.62. It effervesces in acids, letting fall a red powder. Its constituents are, carbonic acid 16.7, deutoxide of copper 60.75, deutoxide of iron 19.5, silica 2.1.—*Dr. Thomson.*

7. Copper-green.

Common copper-green, or chrysocholla, contains three sub-species.

a. Conchoidal copper-green. Color verdigris-green. Massive, imitative, and incrusting. Glistening. Fracture conchoidal. Translucent. Harder than gypsum. Easily frangible. Specific gravity 2.0 to 2.2. It becomes black and then brown before the blow-pipe, but does not fuse. It melts and yields a metallic globule with borax. Its constituents are, copper 40, oxygen 10, carbonic acid 7, water 17, silica 26. It accompanies malachite. It is found in Cornwall, &c.

Silicious copper, or kieselkupfer, is a variety of the above. Color asparagus-green. In crusts. Glistening. Fracture even or earthy. Opaque. Soft. Its constituents are, copper 37.8, oxygen 8, water 21.8, silica 29, sulphate of iron 3.

b. Earthy iron-shot copper-green. Color olive-green. Massive, and in crusts. Friable. Opaque. Sectile.

c. Slaggy iron-shot copper-green. Color blackish-green. Massive. Glistening. Fracture conchoidal. Opaque. Soft. Easily frangible. It is probably a compound of conchoidal copper-green and oxide of iron. Both occur together, and pass into each other. It occurs in Cornwall, along with olivenite.

8. *Prismatic vitriol, blue vitriol, or sulphate of copper.* Color dark sky-blue. Massive, imitative, and crystallised. The primitive figure is an oblique four-sided prism, in which the lateral edges are $124^{\circ} 2'$, and $55^{\circ} 58'$; with edges and angles often truncated. Shining. Cleavage double. Fracture conchoidal. Translucent. Harder than gypsum. Specific gravity 2.1 to 2.2. Taste nauseous, bitter, and metallic. Its solution coats iron with metallic copper. Its constituents are, oxide of copper 32.13, sulphuric acid 31.57, water 36.3.—*Berzelius.* It occurs along with copper pyrites, in Parys-mine in Anglesea, and in Wicklow.

9. *Prismatic olivenite, or phosphate of copper.* Color emerald-green. Massive, and in oblique four-sided prisms of 110° . Cleavage double oblique. Glistening. Fracture splintery. Opaque. Streak verdigris-green. As hard as apatite. Brittle. Specific gravity 4 to 4.3. Fuses into a brownish globule. Its constituents are, oxide of copper 68.13, phosphoric acid 30.95. It is found at Virneberg on the Rhine, along with quartz, red copper ore, &c.

10. *Diprismatic olivenite, or lenticular copper.* Color sky-blue. Massive, but generally crystallised. In very oblique four-sided prisms. Bevelled. In rectangular double four-sided pyramids. Shining. Fracture uneven. Translucent. Harder than gypsum. Brittle. Specific gravity 2.85. Converted by the blow-pipe into a black friable scoria. Its constituents are, oxide of copper 49, arsenic acid 14, water 35.—*Chenevix.* Found in Cornwall.

11. *Acicular olivenite.* *a.* Radiated or cupreous arseniate of iron. Color dark verdigris-green. Massive, imitative, and in flat oblique four-sided prisms, acuminated or truncated. Lustre glistening pearly. Translucent on the edges. As hard as calcareous spar. Brittle. Specific gravity 3.4.

b. Foliated acicular olivenite, arseniate of copper. Color dark olive-green. In angular granular concretions, and in small crystals; which are oblique four-sided prisms; and acute double four-sided pyramids. Glistening. Fracture conchoidal. Translucent. Streak olive-green. As hard as calcareous spar. Brittle. Specific gravity 4.2 to 4.6. It boils, and gives a hard reddish-brown scoria before the blow-pipe. Its constituents are, oxide of copper 60, arsenic acid 39.7.—*Chenevix.* In the copper-mines of Cornwall.

c. Fibrous acicular olivenite. Color olive-green. Massive, reniform, and in capillary and acicular oblique four-sided prisms. Glistening and pearly. Opaque. As hard as calc-spar. Brittle. Fibres sometimes flexible. Streak brown or yellow. Specific gravity 4.1 to 4.2. Its constituents are, oxide of copper 50, arsenic acid 29, water 21. It occurs in Cornwall.

d. Earthy acicular olivenite. Color olive-green. Massive, and in crusts. Dull. Fracture fine earthy. Opaque. Very soft. It is found in Cornwall.

12. Atacamite or muriate of copper.

a. Compact. Color leek-green. Massive, and in short needle-shaped crystals, which are oblique four-sided prisms, bevelled or truncated. Shining and pearly. Translucent on the edges. Soft. Brittle. Specific gravity 4.4. It tinges the flame of the blow-pipe of a bright green and blue, muriatic acid rises in vapors, and a bead of copper remains on the charcoal. It dissolves without effervescence in nitric acid. Its constituents are, oxide of copper 73.0, water 16.9, muriatic acid 10.1.—*Klaproth.* It occurs in veins in Chili and Saxony.

b. Arenaceous atacamite, or copper-sand. Color grass-green. In glistening scaly particles. It does not soil. It is translucent. Its constituents are, oxide of copper 63, water 12, muriatic acid 10, carbonate of iron 1, mixed silicious sand 11. It is found in the sand of the river Lipis, 200 leagues beyond Copiapu, in the Desert of Atacama, which separates Chili from Peru.

13. Copper pyrites.

a. Octohedral copper pyrites. On the fresh fracture, its color is brass-yellow; but it is usually tarnished. Massive, imitative, and crystallised; in a regular octohedron, perfect, truncated or bevelled; and in a perfect or truncated tetrahe-

dron. Glistening. Fracture uneven. Hardness from calcareous to fluor spar. Brittle. Specific gravity 4.1 to 4.2. Before the blow-pipe, on charcoal, it decrepitates, emits a greenish-colored sulphureous smoke, and melts into a black globule, which assumes metallic lustre. It tinges borax green. Its constituents are, copper 30, iron 53, sulphur 12.—*Chenevir*. It contains sometimes a little gold or silver. It occurs in all the great classes of rocks. It is found near Tynedrum in Perthshire; at the mines of Ecton; at Pary's mountain; abundantly in Cornwall; and in the county of Wicklow in Ireland. The rich ores are worked for copper; the poor for sulphur.

b. Tetrahedral copper pyrites; of which species there are two sub-species, gray copper and black copper.

Gray copper. Color steel-gray. Massive and crystallised; in the tetrahedron, truncated or bevelled; and in the rhomboidal dodecahedron. Splendent. Fracture uneven. Hardness as calcareous spar and fluor. Brittle. Specific gravity 4.4 to 4.9. Its constituents are, copper 41, iron 22.5, sulphur 10, arsenic 24.1, silver 0.4.—*Klaproth*. It occurs in beds and veins in Cornwall, and many other places.

Black copper. Color iron-black. Massive and crystallised; in the tetrahedron, perfect, bevelled, or truncated. Splendent. Fracture conchoidal. Brittle. Specific gravity 4.85. Its constituents are, copper 39, antimony 19.5, sulphur 26, iron 7.5, mercury 6.25.—*Klaproth*. The mercury is accidental. It occurs in veins in the Hartz, and in Peru.

14. *White copper*. Color between silver-white and brass-yellow. Massive and disseminated. Glistening and metallic. Fracture uneven. Semihard. Brittle. Specific gravity 4.5. It yields before the blow-pipe a white arsenical vapor, and melts into a grayish-black slag. It contains 40 per cent. of copper; the rest being iron, arsenic, and sulphur. It occurs in primitive and transition rocks. It is found in Cornwall and Saxony.

15. *Copper-glaucé, or vitreous copper*. Rhomboidal copper-glaucé.

§ 1. Compact. Color blackish lead-gray. Massive, in plates and crystallised. Primitive form, a rhomboid. Secondary forms, a low equiangular six-sided prism, and a double six-sided pyramid. Glistening, metallic. Harder than gypsum. Perfectly sectile. Rather easily frangible. Specific gravity 5.5 to 5.8. Its constituents are, copper 78.05, iron 2.25, sulphur 18.5, silica 0.75.—*Klaproth*.

§ 2. Foliated. Its constituents are, copper 79.5, sulphur 19, iron 0.75, quartz 1.—*Ullmann*. It occurs in primitive rocks. It is found also in transition rocks, at Fassney-burn in East Lothian; in Ayrshire; at Middleton Tyas in Yorkshire; in Cornwall, &c.

16. *Variegated copper*. Color between copper-red and pinchbeck-brown. Massive, in plates, and crystallised in six-sided prisms. Glistening metallic. Soft. Easily frangible. Specific gravity 5. It is fusible, but not so easily as copper-glaucé, into a globule, which acts powerfully on the magnetic needle. Its constituents are, copper 69.5, sulphur 19, iron 7.5, oxygen 4.

—*Klaproth*. It occurs in gneiss, mica slate, &c. It is found in Cornwall.

There are seventeen places in Britain in which, according to Dr. Campbell, copper-mines are found. See 2d vol. p. 44, of his Political Survey of Britain. These are, Cardiganshire, Cheshire, Cornwall, Cumberland, Derbyshire, Devonshire, Lancashire, Isle of Man, Northumberland, Shropshire, Somersetshire, Staffordshire, Yorkshire, Wales, Warwickshire, Westmoreland, and North Britain.

COPPICE, *n. s.* } Fr. *coupeaux*, from
COPSE, *v. a. & n. s.* } *couper*, to cut or lop;
COPSEY, *adj.* } *κόπρω*. Coppice and
COPSE-WOOD, *n. s.* } *copse* are synonymous;
the latter being only a contraction of the former.
Both signify a wood, composed of underwood and small trees, which at stated times are cut for fuel. To *copse* is to preserve underwood.

A land, each side whereof was bounded both with high timber trees, and *copses* of far more humble growth.

Upon the edge of yonder *coppice*,
A stand, where you may have the fairest shoot

In *coppice-woods*, if you leave staddles too quick,
they run to bushes and briars, and have little clean underwood.

The willows, and the hazel *copses* green,
Shall now no more be seen

Fanning their joyous leaves to their soft lays.

The east quarters of the shire are not destitute of *copse-woods*.

Oaks and brambles, if the *copse* be burned,
Confounded lie, to the same ashes turned.

The rate of *coppice* lands will fall upon the discovery of coal-mines.

But in what quarter of the *copse* it lay,
His eye by certain level could survey.

The neglect of *copping* wood cut down, hath been of very evil consequence.

Raise trees in your seminaries and nurseries, and you may transplant them for *coppice* ground, walks, or hedges.

Beneath a *copse* of various hue
In barbarous luxuriance grew,
No knife had curbed the rambling sprays,
No hand had wove the implicit maze.

It chanced then on a winter's day,
But warm and bright, and calm as May,
The birds, conceiving a design,
To forestall sweet St. Valentine,
In many an orchard, *copse*, and grove,
Assembled on affairs of love,
And with much twitter, and much chatter,
Began to agitate the matter.

COPPLE-DUST, *n. s.* Probably for *coppel*, or *cupel-dust*. Powder used in purifying metals, or the gross parts separated by the *cupel*.

It may be also tried by incorporating powder of steel, or *copple-dust*, by pouncing into the quicksilver.

COPPLE-STONES are lumps and fragments of stone or marble, broke from the adjacent cliffs, rounded by being bowled and tumbled to and again by the action of the water.

COPPLED, *adj.* From *cop*. Rising in a conic form; rising to a point.

There is some difference in this shape, some being flatter on the top, others more *coppled*.

Woodward on Fossils.

COPTS, or **COPTNS**, in ecclesiastical history, a name given to those Egyptian Christians who are of the sect of Jacobites. Critics differ respecting the orthography, as well as the etymology of this word. It is sometimes written *Copliti*; at others *Copti*, *Cophtite*, *Coptites*, &c. Scaliger once thought the name derived from *Coptos*, an ancient town of Egypt, the metropolis of the Thebaid. Kircher mentions, that the word originally signifies cut or circumscribed; and was given them on account of their practising circumcision; Scaliger finally and more probably derives it from *Αιγυπτος*, the ancient name of Egypt, by retrenching the first syllable. The Malchese Christians are clearly a distinct race.

The Copts are of native Egyptian descent, and have partly on that account, as well as for their supposed heresies, been depressed and persecuted by both their Christian and Mahommedan masters. Their ancient language, in which a valuable version of the New Testament is extant, appears to have been vernacular in the seventeenth century. They have a patriarch who resides at Cairo, but he takes his title from Alexandria; and has under him their few remaining bishops. The rest of the clergy, whether secular or regular, are composed of the orders of St. Antony, St. Paul, and St. Macarius, who have each their monasteries. Besides the orders of priests, deacons, and sub-deacons, the Coptits have likewise Archimandrites, a dignity which they confer with all the ceremonies of ordination. This, besides the authority it gives them with regard to the religious, comprehends the functions of archpriests. By a custom of 600 years standing, if a priest elected bishop be not already archimandrite, that dignity must be conferred on him before episcopal ordination. The second person after the patriarch, is the titular patriarch of Jerusalem, who generally resides at Cairo, and goes to Jerusalem every Easter. To him belongs the government of the Coptic church, during the vacancy of the patriarchal see. To be elected patriarch, it is necessary that the person have lived all his life in continence. He confers the bishoprics. To be elected bishop, the person must be either in the celibate, or not have been married more than once. The priests and inferior ministers are allowed to be married before ordination. They have a great number of deacons, and are said to confer that order even on children. They have three liturgies, which they vary occasionally, and very long offices. The monastic life is in great esteem among the Copts. Divorce is said to be very frequent among them; with the church of Rome they have seven sacraments, viz. baptism, the eucharist, confirmation, ordination, faith, fasting, and prayer. They deny the Holy Spirit to proceed from the Son; and only allow of three œcumenical councils; those of Nice, Constantinople, and Ephesus. They are also considered as monophysitic in their sentiments respecting the person of Christ, or to acknowledge but one nature and will in him 'after the union of the deity and humanity.' To these peculiarities may be

added, 1. Their practice of circumcising their children before baptism. 2. Their ordaining deacons at five years of age. 3. Their allowing of marriage in the second degree. 4. Their belief of a baptism by fire, which they are said sometimes to endeavour to confer literally. 5. Their forbearing to eat blood.

In the time of pope Paul IV. a Syrian was despatched to Rome from the patriarch of Alexandria, with letters to that pope; wherein he is said to have acknowledged his authority, and desired a person to be despatched to Alexandria, to treat about a union. Pursuant to which, Pius IV. successor to Paul, sent E. Roderic, a Jesuit, in 1561, in quality of apostolical nuncio; and forwarded, through the Venetian consul, a sum of money to the patriarch; but the Jesuit, upon a conference with two Copts deputed by the patriarch, was told, that the titles of father of fathers, pastor of pastors, and master of all churches, which he had bestowed on the pope in his letters, were only matters of compliment; and that since the council of Chalcedon, and the establishment of several patriarchs independent of one another, each was master of his own church. Here the negotiation of course terminated. At present it is supposed that the Copts are about 500,000 in number.

COPULA, *n. s.* Lat. The word which unites the subject and predicate of a proposition; as books are dear.

The *copula* is the form of a proposition; it represents the act of the mind, affirming or denying.

Watts's Logic.

COPULATE, *v. a.*, *v. n.* & *adj.* } It. *copula*;
COPULA'TION, *n. s.* } *lare*; Sp. *copular*;

COPULA'TIVE, *n. s.* & *adj.* }

Lat. *copulare*. To conjoin; to link together; to come together as different sexes. Copulation is, the congress of the opposite sexes. Copulative is fully defined in the quotation from Watts.

Sundry kinds, even of conjugal *copulation*, are prohibited as dishonest. *Hooker.*

If the force of custom, simple and separate, be great, the force of custom *copulate*, and conjoined, and collegiate, is far greater. *Bacon.*

Not only the persons so *copulating* are infected, but also their children. *Wiseman's Surgery.*

Copulative propositions are those which have more subjects or predicates connected by affirmative or negative conjunctions: as, riches and honours are temptations to pride; Cæsar conquered the Gauls and the Britons; neither gold nor jewels will purchase immortality. *Watts's Logic.*

COPY, *v. a.* & *v. n.*, *n. s.* } Fr. *copier*; Ital.

COPY-BOOK, *n. s.* } *copiare*; Span. *copiar*;

COPY-HOLD, *n. s.* } *piar*; Dutch *copieren*;

COPY-HOLDER, *n. s.* } *pieren*; Low Lat. *copia*.

COPY-MONEY, *n. s.* } *copia*. 'Junius in-

COPY-RIGHT, *n. s.* } clines, after his

COPPER, *n. s.* } manner, 'drily ob-

COPYIST, *n. s.* } serves Dr. Johnson,

'to derive it from *κοπος*, labor; because, says he, 'to copy another's writing is very painful and laborious.' Another lexicographer also justly remarks, that 'perhaps this is rather too distant a derivation to be the right one; because many copies are taken with pleasure instead of wearisomeness.' To copy is, to transcribe; to

imitate; to strive to resemble. A copy is, a transcript from, or imitation of, an original; the original itself; an individual book; one of several books; an instrument by which any conveyance is made in law. Copier and copyist are synonymous, and signify a transcriber; an imitator; a plagiarist. The compound words are most of them of obvious meaning. Copyright and copyhold are fully described onwards.

The very having of the books of God was a matter of no small charge, as they could not be had otherwise than in written copies. *Hooker.*

It was the copy of our conference;
In bed he slept not, for my urging it;
At board he fed not, for my urging it.

Shakspeare. Comedy of Errors.

Thou knowest that Banquo and his Fleance lives;
But in their nature's copy's not eternal. *Id. Macbeth.*

If virtue's self were lost, we might
From your fair mind new copies write. *Waller.*

I have not the vanity to think my copy equal to the original. *Denham.*

Let him first learn to write, after a copy, all the letters in the vulgar alphabet.

Holder's Elements of Speech.

The first of them I have forgotten, and cannot easily retrieve, because the copy is at the press. *Dryden.*

Set the examples, and their souls inflame
To copy out their great forefathers' fame.

Dryden's King Arthur.

Without invention a painter is but a copier, and a poet but a plagiarist of others. *Dryden's Dufresnoy.*

Some imagine, that whatsoever they find in the picture of a master, who has acquired reputation, must of necessity be excellent; and never fail, when they copy, to follow the bad as well as the good things. *Id.*

When a painter copies from the life, he has no privilege to alter features and lineaments, under pretence that his picture will look better. *Dryden.*

He stepped forth, not only the copy of God's hands, but also the copy of his perfections, a kind of image or representation of the Deity in small.

South's Sermons.

He that borrows other men's experience, with this design of copying it out, possesses himself of one of the greatest advantages. *Decay of Piety.*

Several of our countrymen, and Mr. Dryden in particular, seem very often to have copied after it in their dramatic writings, and in their poems upon love. *Addison's Spectator.*

A coin is in no danger of having its characters altered by copiers and transcribers. *Id. on Coins.*

If a customary tenant die, the widow shall have what the law calls her free bench in all his copyhold lands. *Addison.*

The Romans having sent to Athens, and the Greek cities of Italy, for copies of the best laws, chose ten legislators to put them into form. *Swift.*

To copy her few nymphs aspired,
Her virtues fewer swains admired. *Id.*

He who hurts a harmless neighbour's peace,
Who loves a lie, lame slander helps about,
Who writes a libel, or who copies out. *Pope's Epist.*

Let the faint copier, on old Tiber's shore,
Nor mean the task, each breathing bust explore;
Line after line with painful patience trace,
This Roman grandeur, that Athenian grace. *Tichel.*

Whatever be the emotion the poet intends to raise in his reader, whether admiration or terror, joy or sorrow; and whatever be the object he would exhibit, whether Venus or Tisiphone, Achilles or Thersites, a palace or a pile of ruins, a dance or a battle, he generally copies an idea of his own imagination; considering each quality as it is found to exist in several individuals of a species, and thence forming an assemblage more or less perfect in its kind, according to the purpose to which he means to apply it. *Beattie.*

I threw off six hundred copies, of which I had got subscriptions for about three hundred and fifty. *Burns.*

Her memory was a mine: she knew by heart

All Calderon and greater part of Lope,

So that if any actor missed his part,

She could have served him for the prompter's copy.

Byron. Don Juan.

COPYHOLD, in English law, a tenure for which the tenant hath nothing to show but a copy of the rolls made by the steward of his lord's court; for the steward, as he enrolls other things done in that court, registers such tenants as are admitted to any parcel of land or tenement belonging to the manor; and the transcript of this is called the court-roll, the copy of which the tenant takes from him, and keeps as his only evidence. This is called a base tenure, because it holds at the will of the lord: yet not simply, but according to the custom of the manor; so that if a copyholder break not the custom of the manor, and thereby forfeit his tenure, he cannot be turned out at the lord's pleasure. These customs of manors vary in one point or other almost in every manor. Some copyholds are finable at an uncertain rate, and some certain; that which is finable uncertain, the lord rates at what fine or income he pleases, when the tenant is admitted: that which is certain is a kind of inheritance, and called in many places customary: because the tenant dying, and the hold being void, the next of blood paying the customary fine, as two shillings for an acre, or so, cannot be denied his admission. Some copyholders have, by custom, the wood growing upon their own land, which by law they could not have. Some hold by the verge in ancient demesne; and though they hold by copy, yet are they, in account, a kind of freeholders: for if such a one commit felony, the king hath annum, diem, and vastum, as in case of freehold. Others again hold by common tenure, called mere copyhold; and they committing felony, their land escheats to the lord of the manor.

Copyhold land cannot be made at this day; for the pillars of a copyhold estate are, That it hath been demised time out of mind by copy of court-roll; and that the tenements are parcel of, or within, the manor. (1 Inst. 58. 4 Rep. 24) Nor can a copyhold be created by operation of law: and therefore where wastes are severed from the manor, by a grant of the latter, with the exception of the former, though the copyholders continue to have a right of common in the wastes by immemorial usage; yet if afterwards a grant of the soil of those wastes be made to trustees for the use of the copyholders in free soilage, the lands when enclosed, will be freehold, and not copyhold.

If the lord refuses to admit he shall be compelled in Chancery, 2 Cro. 368. And if the

lord refuse to admit a surrenderee, on account of a disagreement about the fine to be paid, the court of B. R. will grant a mandamus to compel the lord to admit without examining the right to the fine. 2 Term Rep. 484.—But that court will not grant a mandamus to admit a copyholder by descent. A copyholder, so long as he doeth his services, and doth not break the custom of the manor, cannot be ejected by the lord: if he be, he shall have trespass against him: but, if a copyholder refuses to perform his services, it is a breach of the custom, and forfeiture of his estate.

Customs ought to be time out of memory, to be reasonable, &c. And a custom in deprivation or bar of a copyhold estate, shall be taken strictly; but when for making and maintaining, it shall be construed favorably. An unreasonable custom, as for a lord to exact exorbitant fines; for a copyholder for life to cut down and fell timber-trees, &c. is void. A copyholder for life pleaded a custom, that every copyholder for life might, in the presence of two other copyholders, appoint who should have his copyhold after his death, and that the two copyholders might assess a fine, so as not to be less than had been usually paid; and it was adjudged a good custom. 4 Leon. 238. But a custom to compel a lord to make a grant, is said to be against law; though it may be good to admit a tenant.

A copyholder may surrender in court, by letter of attorney, and out of court by special custom. 9 Rep. 75, 76. A copyholder being in Ireland, the steward of a manor here made a commission to one to receive a surrender from him there, and it was held good. 2 Danv. 181. The intent of surrenders is, that the lord may not be a stranger to his tenant, and the alteration of the estate. As a copyholder cannot transfer his estate to a stranger by any other conveyance than surrender; so if one would exchange a copyhold with another, both must surrender to each other's use, and the lord admit accordingly. Comp. Cop. s. 39.

With respect to the devising of copyholds, the law formerly was, that no such devise could be made without a surrender to the use of the party's will; and that the lands did not then pass by the will but by the surrender, the will being considered only as declaratory of the uses of the surrender. Many evils were found to result in the cases of creditors wives, and children, from this necessity of a surrender to a will, and the courts of equity were astute in finding reasons for supplying the surrender, with due precaution in favor of the claims of the several parties. See 3 P. Wms. 98 in n. All these questions are now set at rest by a statute passed for that purpose, 55 Geo. III. c. 192, by which it is enacted, That in all cases where, by the custom of any manor in England [or Ireland, though instances of copyhold are rare there], any copyhold tenant of such manor may by will dispose of, or charge land, surrendered to the use of the will, every disposition or charge of any such copyhold, made by the will of any person who shall hereafter die, shall be as valid and effectual, although no surrender shall have been made to the use of the will, as if such surrender had been actually made. On admissions under testamentary dispositions,

the steward is allowed to charge his fees, as in cases of surrender to the use of the will. But the act is not to affect the validity of devises.

Fines are paid to the lord on admittances: and may be due on every change of the estate by lord or tenant. The lord may have an action of debt for his fine: or may distrain by custom. 4 Rep. 27. 13 Rep. 2. A covenant made by a copyholder with a stranger to assign and surrender his copyhold to him, which covenant is afterwards presented by the homage, does not give the lord any right to a fine before admission. 2 T. R. 484. The lord may recover from a copyholder the fine assessed by him on admittance, not exceeding two years' value of the tenement, although there be no entry of the assessment of such fine on the court rolls, but only a demand of such a sum for a fine, after the value of the tenement had been found by the homage, 6 E. R. 56.

An heriot is a duty to the lord, rendered at the death of the tenant, or on a surrender and alienation of an estate: and is the best beast or goods, found in the possession of the tenant deceased, or otherwise, according to custom. And for heriots, reliefs, &c. the lord may distrain, or bring action of debt. Plowd. 96. It seems that a custom for the homage to assess a compensation in lieu of heriot, to be paid by an incoming copyholder on surrender or alienation, is not good. 1 Bos. & Pul. 282.

Relief is a sum of money which every copyholder in fee, or freeholder of a manor, pays to the lord on the death of his ancestor; and is generally a year's profits of his land.

Services signify any duty whatsoever accruing unto the lord from tenants; and are not only annual and accidental; but corporeal, as homage, fealty, &c. Comp. Court. Keep. 7, 8, 9, &c. 31 Geo. 2. c. 14, provides that no person holding by copy of court-roll should be entitled, from that property, to vote at the election of knights for the shire. See *Cruise, Screeen, and Walker on Copyholds*.

COPYING MACHINES are amongst the useful modern inventions of which it is proper that we should offer some account.

Dr. Franklin proposed to use the common copperplate-printers' rolling press as a machine for copying letters. He directs the letter to be written with gummed ink, and then sanded over with emery powder. Thus prepared, it is to be laid on a smooth plate of pewter, and passed through the press. The impression of the emery is left on the pewter, and printing-ink being applied to the plate, an impression may be taken, which is a copy of the letter. In 1780 Mr. Watt of Birmingham proposed and obtained a patent for the following method of copying recent manuscripts. A sheet of unsized patent paper, very thin, is wetted and laid between two woollen cloths, to absorb the redundant moisture. Being laid on the manuscript, the two are passed together through a rolling or screw-press; when the thin paper is found to have received a reverse impression of the letter, legible when read through the transparent substance of the paper. Mr. Watt says that the thin paper may be wetted advantageously with a mixture of water, vinegar, oyster shells, boracic acid, and grill-nuts.

Mr. Ralph Wedgwood has obtained two patents for inventions of this kind. The first was in 1806. In this he proposes to employ, 1st, A sheet of paper, over both sides of which printer's ink is spread; this is allowed to dry during six weeks, between leaves of blotting paper; 2dly, A smooth pewter, or copper plate. 3dly, On the metal plate is laid a leaf of letter paper; over it the blackened paper before mentioned; and over this a leaf of thin paper, previously oiled, that it may be the more transparent. 4thly, On the paper thus disposed, the writing is performed by a style of agate, ground and polished to a smooth round point. The effect is, that the letter paper receives an impression from the blackened paper, and this impression is in the right direction, and constitutes the letter to be used as the original.

The upper oiled paper receives an impression which is inverted, but may be read in the right direction by looking through the paper. This constitutes the duplicate or copy. The apparatus, for which he obtained a patent in 1808, consists of a certain disposition of two leaves of paper, by folding or rolling. The part of the sheet on which a line of the original is written, is brought close to the part of the other sheet on which the corresponding line of the duplicate is written. The line of the original and of the duplicate are formed at the same time, by two pens fixed in the socket of one handle. The handle is held like a pen in the usual way. See Repertory of Arts, vol. xxvii. and xxxi. For Mr. Hawkins' and Mr. Brunel's polygraphs, see POLYGRAPH.

COPYRIGHT.

COPYRIGHT is the right which an author, or the publisher, or other person, to whom he transfers it, possesses to the *copy*, or original manuscript, of his works, and to the use and benefit, or profit, derivable from publishing them.

PART I.

OF THE TERM OF COPYRIGHT.

SECTION I.—BY THE COMMON LAW.

It is only since the invention of printing that any question as to the extent or duration of copyright could be expected to occur in the courts of justice. To take an author's manuscript without his consent was, of course, a criminal act, and punishable in proportion to the amount of the offence; according as the circumstances might constitute a fraud or theft. A single copy was then of much more value than after printing had multiplied the number of copies. The great manual labor necessarily bestowed on each copy, and the few readers at that time, rendered the publication of insignificant importance compared with what it has since become. We are not, therefore, to look for any very ancient records of the legal recognition of literary property, or of remedies against its infraction.

Printing was first introduced in England about the year 1471. During the arbitrary reigns which succeeded its establishment, the works which issued from the press naturally became the immediate subject of state regulations. The earliest evidence which occurs on the subject is to be found in the decrees of the Star Chamber. The authority of that arbitrary tribunal we are quite willing should be estimated as low as possible; but, in adducing the authorities which support the right in question, we are justified in pointing out that even the Star Chamber respected the rights of authors, and prohibited the printing of works without the consent of their owners.

Of the judges in recent times, before whom the title to perpetual copyright has been discussed, the majority have decided that by the

common law of England an author is entitled to the exclusive enjoyment of his copyright *in perpetuity*. The judges, however, were not unanimous, either on the point of common law, or on that of the legal effect of the statute of Anne, and we cannot deem it sufficient merely to describe the actual state of the law; especially as the subject is one of literary interest, and the glaring injustice of the existing regulations can scarcely be permitted long to continue.

We purpose, therefore, to relate briefly the progressive stages of the law; to consider the question according to the best legal authorities; to examine the meaning of the statute of Anne; the decisions of the various courts of justice; the objections to a perpetuity of the right; and its general policy and justice.

1.—Recognition of the Right by Acts of State.

In 1556, by a decree of the Star Chamber, it was forbidden to print against the force and meaning of any ordinance, &c. in any of the statutes or laws of the realm. By another decree in 1585, every book, &c. is to be licensed; 'nor shall any one print any book, &c. against the form or meaning of any restraint contained in any statute or laws of the realm, or contrary to any allowed ordinance set down for the good government of the Stationers' Company.' In 1623, by a proclamation reciting the above decree, and that the same had been evaded 'by printing beyond sea such allowed books, &c. as have been imprinted within the realm by such to whom the sole printing thereof by letters patent, or lawful ordinance or authority, doth appertain.'—And then the proclamation enforces the decree. Again, in 1637, by another decree, no person is to print or import any book or copy which the Company of Stationers, or any other person, hath or shall by any letters patent, order, or entrance in the register book, or otherwise, have the right, privilege, authority, or allowance solely to print. This decree evidently supposes a copyright to exist 'otherwise' than by patent, &c. which clearly could be by no other authority than the common law.

These appear to be all the acts of state relative

to the matter. Most of the judicial proceedings of the Star Chamber being lost or destroyed, no case of prosecution for printing without licence, or pirating another man's copy, has been found. But it is certain that, down to the year 1640, copies were protected and secured from piracy by a much speedier and more effectual remedy than actions at law or bills in equity. No licence could be obtained 'to print another man's copy;' not from any prohibition, but because the thing was immoral, dishonest, and unjust, and he who printed without a licence was liable to great penalties.—(4 Burrow, 2313). In 1540 the Star Chamber was abolished, and afterwards all regulations of the press by proclamations or decrees were deemed illegal. The licentiousness of the press, however, induced the two houses to make an ordinance which prohibited printing, unless the book was first licensed and entered in the register of the Stationers' Company. Copyrights, in their opinion, then could only stand upon the common law—both houses take it for granted. The ordinance, therefore, prohibits printing *without consent of the owner*, or importing (if printed abroad) upon pain of forfeiting the same to the *owner or owners* of the copies of the said books, &c. This provision necessarily supposes the property to exist; it is nugatory if there was no owner, and an owner could not at that time exist but by the common law.—(Ibid). In 1644 Milton published his famous speech for the liberty of unlicensed printing against this ordinance, and among the glosses which he says were used to color the ordinance and make it pass, he mentions 'the just retaining of each man his several copy; which God forbid should be gainsaid!' As one of the judges remarked on the argument in *Miller v. Taylor*, the authority of Milton, an enthusiast for liberty, is worth all the abstruse reasoning deduced from the rules of property in a supposed state of nature.

2. Recognition of the Right by Acts of Parliament.

In 1649 the long parliament made an ordinance which forbids printing any book legally granted, or any book entered, without consent of the *owner*, upon pain of forfeiture, &c. In 1662 the act of 13th & 14th Charles II. (the licensing act) prohibits printing any book unless first licensed and entered in the register of the Stationers' Company. It also prohibits printing without the consent of the owner, upon pain of forfeiting the book and 6s 8d. each copy; half to the king and half to the *owner*; to be sued for by the *owner* in six months. The act therefore supposes an ownership at common law, and the *right* itself is particularly recognised in the latter part of the third section of the act, where the universities are forbid to meddle with any book or books, the *right* of printing whereof doth *solely and properly belong to any particular person or persons*.

The various provisions of this act effectually prevented piracies without actions at law or bills in equity by owner.

The licensing act of Charles II. was continued by several acts of parliament, but expired in

1679. Soon after which there is a case in Lilly's Entries, Hilary term, 31 Charles II., of an action brought for printing the Pilgrim's Progress 'of which he was and is the true proprietor, whereby he lost the profit and benefit of his copy.' But it does not appear that the action was proceeded in.

The licensing act was revived by 1 James II., cap. 7, and continued by 4 W. & M., cap. 24, and finally expired in 1694. Such is the state of the evidence as deduced from the acts of government and the legislature in the most despotic and unsettled times, and the inference is obviously strong, that if at those periods the rights of literature were respected, when, if ever, they were liable to abuse, they ought much more to be regarded and protected in an age like the present, which owes its improvements to the diffusion of knowledge.

We have next to turn to the only other source from which any public testimonials can be derived of the ancient usages and regulations which bear on the question, namely,

3. Ancient Custom of Entries in the Registry Books of the Stationers' Company.

It appears there is no ordinance or by-law relative to copies till after 1640; and yet from the erection of the Company, in 1556, copies were entered as property and pirating was punished. In 1558, and down from that time, there are entries of copies for particular persons. In 1559, and subsequently, there are persons fined for *printing other men's copies*. In 1573 there are entries which take notice of the *sale of the copy*, and the *price*. In 1582 there are entries with an express proviso 'that, if it be found *any other* has right to any of the copies, then the licence, touching such of the copies *so belonging to another*, shall be void.'

Before the reign of queen Anne it was usual to purchase from authors the perpetual copyrights of their works, and to assign them from hand to hand for valuable considerations; and to make them the subject of family settlements. Thus we find that, by the by-law of the Stationers' Company made in 1681, it is stated that divers of the members of the Company had great part of their estates in copies, and that, by the ancient usage of that company, when any books or copies were entered in their register to any of the members of that company, such persons were always reputed the proprietors of them, and ought to have the sole printing of them. By another by-law in 1694, after the above recitals, and stating that the copies were constantly bargained and sold amongst the members of the company as their property, and devised to their children and others for legacies and to their widows for their maintenance, it is ordained that, when any entry shall be made of any book or copy, by or for any member of the company, in such case if any other member shall, without licence or consent of the member for or to or by whom the entry is made, print, import, or expose to sale, &c., they shall for every copy forfeit twelve pence. Such is the legal and historical evidence down to the time of the act of 8 Anne.

SECT. II.—BY THE STATUTES.

It is evident from the preamble of the act passed in the year 1710, 8 Anne cap. 19, that the act was not introduced on the part of the public to restrain the duration of copyright. The imaginary evil of its perpetuity (which will be presently investigated) was not then suggested. It is manifest, on the face of the act, that it originated with the aggrieved authors and publishers. The important effects of the art of printing had become generally felt. The great demand for literary works excited the exertions of the booksellers and publishers, and it appears that all the members of the fraternity did not confine themselves to their own productions, but to supply the increased demand committed depredations on the literary property of their contemporaries. It was natural that the greater part, if not all, of these dishonorable transactions should be committed by the lowest class of publishers, who were incompetent to pay any damages that might be recovered against them. The proof of the extent of the damage was also difficult, and it was therefore desirable that penalties and forfeitures should be inflicted, to protect the growing importance of literary property.

The act recites that printers, booksellers, and other persons, had of late frequently 'taken the liberty' [not claimed the right] of printing and publishing books and other writings *without the consent of the authors or proprietors*, to their very great detriment, and too often to the ruin of them and their families. 'For preventing, therefore, such [mal] practices for the future, and for the encouragement of learned men to compose and write useful books, it was enacted that the authors of books already printed who had not transferred their rights, and the booksellers who had purchased copies, should have the sole right of printing them for the term of twenty-one years, and no longer; and the authors of books thereafter printed, and their assigns, should have the sole right for fourteen years, and no longer. But it was provided that, after the expiration of that term, the right should return to the author, if then living, for another fourteen years. And then it enacted the forfeiture of all books printed without the consent of the proprietor, and inflicted a penalty of one penny for every sheet: half the penalty to the crown, and the other to the informer. In 1801, by the 41st Geo. III. cap. 107, the penalty is increased to threepence per sheet. And, that 'persons may not through ignorance offend against the act,' the forfeitures and penalties do not attach unless the title to the copy of the book be entered in the register of the stationers' company. By the 15th Geo. III. cap. 53, sect 6, the title to the whole book and every volume thereof must be so entered. It was provided by 8 Anne that the act should not extend either to *prejudice or confirm* any right that the universities or any person had, or claimed to have, to the printing or reprinting any book or copy already printed or thereafter to be printed.

The act authorised the archbishop of Canterbury and other dignitaries to settle the prices of books, upon complaint made that they were un-

reasonable. This clause was repealed by 12 Geo. II. cap. 36, which at the same time prohibited the importation of books reprinted abroad which had been first composed and printed in Great Britain.

In 1814, by the 54th Geo. III. cap. 156, the term was extended from twenty-eight years *conditionally* on the life of the author, to the same term *absolutely*; with a further extension in favor of the author till his death, if he survived the twenty-eight years; and the advantage is given to the authors then living of books published before the act. We confine the statement of the statutory provisions in this place, to those which relate to the *duration* of the copyright, and refer to their appropriate sections the other enactments. The great question which has been discussed in the courts of justice regarding the limits of literary property depended on the construction of the 8th Anne. Before adverting to the grounds of the interpretation which was put upon it, we deem it appropriate, in the order of time, to notice the legal decisions which took place from the passing of the act in question down to the year 1774, when, contrary to all the previous decisions, it was for the first time determined by the house of lords that the common law right was merged in the statute.

SECT. III.—LEGAL DECISIONS ON THE QUESTION OF PERPETUITY.

1. The earliest decisions on the general question of literary property occurred in the *courts of equity*, which were resorted to as affording a more speedy remedy against invasions of copyright by an immediate injunction, than could be obtained by an action at law for damages. Numerous decisions took place, founded upon the principles of the common law, and on the supposition that a *perpetual* copyright belonged to authors and their assigns. The question upon the common law right to old copies of works could not arise till twenty-one years from the 10th of April, 1710, consequently the soonest it could arise was in 1731. In 1735 an injunction was granted by Sir Joseph Jekyll to restrain the printing of the *Whole Duty of Man*, the first assignment of which had been made seventy-eight years before that time. In the same year lord Talbot restrained the printing of Pope's and Swift's *Miscellanies*, though many of the pieces were originally published prior to the act, namely in 1701-2 and 1708. In 1736 Sir J. Jekyll granted another injunction for printing Nelson's *Festivals and Fasts*, though printed in 1703 in the life-time of the author, and he died in 1714. In 1739 an injunction was ordered by lord Hardwicke against printing Milton's *Paradise Lost*, the title to which was derived by an assignment of the author *seventy-two years* antecedently. And in 1752 another injunction issued in favor of Milton's *Paradise Lost*, with his *Life* by Fenton, and the notes of all the former editions. It was an injunction to the whole, so that printing the poem, or the life, or the notes, would have been a breach of the order. It has been urged in objection, that these injunction cases were only preliminary decisions, and that none of the suits were brought to a final hearing

Great caution, however, has been always exercised in granting injunctions at the commencement of a suit, because, if on further investigation it should be found erroneous, the loss of a defendant does not admit of reparation. The judgment therefore has been invariably given with great deliberation, and lord Mansfield said 'he looked at the injunctions which had been granted or continued before hearing as equal to any final decree; for that such injunction never is granted upon motion unless the legal property is made out, nor continued after answer unless it remains clear. The court of chancery never grants injunctions in cases of this kind when there is any doubt.' (4 Burrow, 2303). And lord Eldon, in *Hogg v. Kirby*, referring to the view taken by lord Mansfield, says that 'in these cases a court of equity takes upon itself to determine as well as it can the right in this period, and with a conviction that, if then the cause was hearing, they would act upon the same rule. The court takes upon itself that which may involve it in mistake, to determine the legal question. It is the decision of a judge sitting in equity upon a legal question, and therefore not having all the authority of a decision of a court at law, but giving an opinion, and pledged to maintain it, unless there should be occasion to alter it.' (8 Vesey, 224). So in the case respecting the publication of Lord Melville's Trial, lord Erskine observed that 'he was so much convinced by the arguments for the defendant as to the effect of an injunction, that unless he had a strong impression that at the hearing he should continue of the same opinion, and should grant a perpetual injunction, he would not grant the injunction then; which he only did as there was no probability that new facts would appear by the answer.' (*Gurney v. Longman*, 13 Vesey, 505). There are several cases reported upon questions regarding infringements of copyright *within* the period protected by the statutes: to these of course it is unnecessary to advert, as the general principle was not in any way included in the determination.

2. The general question was first argued in a *court of law* in the case of *Tonson v. Collins*, in the year 1762, relative to the copyright in the Spectator. It appears from the best authority, that so far as the court had formed an opinion, they all inclined to the plaintiff; but having received information that although the argument was conducted *bonâ fide* by the counsel, it was a collusive proceeding between the parties for the purpose of obtaining a judgment, which might be set up as a precedent, they refused to pronounce any decision. (1 Blackstone's Reports, 301. 321. 4 Burrow, 2327.) In the year 1769 the subject was discussed at great length with respect to Thomson's Seasons, in the case of *Millar v. Taylor* (4 Gurr. 2303.) There was a difference of opinion in the court. Lord Mansfield and judges Aston and Willes were in favor of the right, and judge Yates against it. Judgment was of course given according to the opinion of the majority. In 1774 the subject came before the house of lords in the case of *Donaldson v. Beckett*, when it was finally determined that an *author has no property in his*

copyright, otherwise than according to the terms of the statute. The majority of the judges were of opinion that there was a right at common law, namely, judges Ashurst, Blackstone, Willes, Aston, Gould, Adams, the lord chief baron, and the lord chief justice of the common pleas, besides lord Mansfield. Of the opposite opinion were lord Camden, barons Eyre, Perrott, and Adams, and judge Yates. But there was a majority of seven to four that the right was restrained, or taken away by the statute which prescribed the term of fourteen years, and no longer.

SECT. IV.—CONSTRUCTION OF THE ACT OF 8 ANNE.

1. It is remarkable in the constructions put on the statute of Anne, which it was contended had the effect of merging the common law right, that such right is admitted and recognised by providing a *remedy* for the injury, although at common law we are told there is *no injury* whatever. The statute professed to encourage learning, and to prevent 'the printing of books without the consent of the authors or proprietors, to their detriment,' &c. Its object was avowedly not to limit the right, but to facilitate the remedy; yet it has been construed to reduce a perpetuity to a short term of years! In giving an additional protection to literary property, by inflicting a penalty, there might be some reason for limiting that species of punishment to a definite period. The penalty is not reserved to the author, but given to any one who may sue for it; and it is obvious therefore that it was designed as an act of *public* justice, independently of the *private* right to compensation at common law.

2. It should be recollected also that it was a remedial statute, and ought to have been construed liberally; instead of which, the contrary principle was adopted, as if the object of the act, as well as justice and policy, had required the *suppression* of literature, rather than its encouragement.

3. It is important to observe that the bill on which the act was founded, went to the committee as a bill to secure the undoubted property of copies for ever. By the law and usage of parliament, a new bill cannot be made in a committee: a bill to secure the property of authors, could not be turned into a bill to *take it away*. What the act gives, with a sanction of penalties, is for a term: the words 'and no longer' add nothing to the sense. Besides which, the proviso is express that the act shall not extend, to *prejudice* any right, not only of the universities, but of *any person*.

4. It is admitted that there is a perpetual right in a literary work *before* publication, and that such right exists according to the common law. Various cases in equity have been decided on this point, all of which are allowed by the opponents of perpetual copyright to be correctly determined. It is evidently most inconsistent to deny the right *after* publication, which is admitted to exist before it. A man it is granted may maintain trover or trespass for taking his manuscript; but how are the damages to be estimated? Surely not by the price of the paper, but the profit of the publication; and yet we are told he cannot appropriate to himself the advan-

tage of publication. Whilst the work continues in manuscript, it can be of little or no value to him, and of none to the community. During that time he is welcome to it, but so soon as he is enabled to derive a profit for his labor, he is then told, 'it belongs to the public.' Such are the inconsistencies of injustice. 5. It has been also granted that the king's copyright continues *after* publication, and is in fact perpetual according to the common law. There are several cases reported in the law books for violating patents for prerogative copies after the expiration of the period limited by the statute (2 Shower's Reports, 258.—Modern Reports, 256). These cases prove that a copyright was a thing acknowledged at common law; since if the king had not the right, he could not grant it to the patentee. It is clear that the king by his prerogative has no power to *restrain* printing, which is a trade and manufacture; or to grant an *exclusive* privilege of printing any book whatsoever, except as a subject might, by reason of the copyright being his property. It is settled then that the king is owner only of the copies of all books or writings which he had the sole right originally to publish; as acts of parliament, orders of council, proclamations, and the common prayer book. These, and such like, are his *own* works, as he represents the state. So likewise where by *purchase* he had the right originally to publish; as the Latin Grammar, the year books, &c.; and in the last cases the property of the crown stands exactly on the same footing as private copyright: as to the year books, because the crown was at the expense of taking the notes; and the Latin Grammar, because it paid for the completing and publishing it.

The right of the two universities in England, and the four in Scotland, with the colleges of Eton, Westminster, and Winchester, and Trinity College, Dublin, to a perpetuity in their copies, is now founded upon the statute law; but it is evident they were as much astonished at the decision in Donaldson v. Beckett, as any private author or publisher. After that decision they flew to parliament to reinstate them in their rights, and the act, which was immediately passed in 1775, is a virtual overthrow of the principle on which the house of lords had proceeded. There can be neither sense nor justice in allowing to these wealthy corporations a right which is denied to individuals. The universities, in their *corporate* capacity, have done nothing to merit the exemption. They are collectively behind the literary and scientific world in modern improvement. Nothing materially great has originated from them to justify the granting of peculiar exemptions, and they are better able to bear the wrong which the laws inflict than individuals. The act obtained by the universities (15 Geo. 3, c. 53,) commences by reciting 'that authors may bequeath or give the copies of books composed by them to these universities and colleges, and may direct that the profits shall be applied as a fund for the advancement of learning, and that such useful purposes will frequently be frustrated, unless the sole printing and re-printing be secured to them in *perpetuity*.' Now is it not manifest that if the universities, as the

LEGATEES of authors, be entitled to this protection, the authors themselves are on every principle still more entitled to it? We admit of course that the universities are in possession of no more than their just and legal rights; but we maintain that private individuals, as well for their own sakes as for the interests of science and literature, are at least equally, if not in a higher degree, entitled to legal protection.

SECT. V.—OBJECTIONS TO THE PERPETUITY CONSIDERED.

1. The opponents of copyright insist that there is no authority at common law to support the claim of a perpetuity, and that *the custom* of exercising the right (if it ever existed) is not immemorial. The evidence on the first part of the objection has already been detailed in the first section, and the custom has been shown to exist ever since the invention of the art which gave value to the property in question. The claims of justice do not depend on antiquity. The principles of the unwritten law are indeed of the highest antiquity; but the objects to which they are applicable may be recent. There are many things, the uses of which were unknown in ignorant times, that have now become valuable, and it is as monstrous to shut out from legal protection the intellectual labors of ingenious men, as it would be to declare that the mariners' compass and gunpowder, which were inventions within the period of legal memory, cannot be included in the laws of property. The absence of judicial authority can form no objection to the claim. It was not decided till the year 1732 that a title to literary property could be maintained prior to publication; yet it is admitted, on all hands, that it was correctly determined (according to the principles of the common law) that no distance of time, however great, could authorise a publication without the consent of the author; as in the cases of Lord Clarendon's History and the Letters of Pope. Many points of law have been decided in recent times, for which there is no precedent. For instance, it is not many years since it was held actionable at common law to give knowingly a false character, on the faith of which credit had been given and loss sustained. The great maxim of the common law is, that there is *no injury without a remedy*.

2. Ideas, it is said, cannot be an object of property. Without entering into the abstract argument of the origin of property, it may be sufficient for all rational purposes to observe, that there is no real distinction between the rights of literary and landed property. Mr. Justice Blackstone classes literary compositions amongst the species of property acquired by *occupancy*, since they are grounded on labor and invention. On the question of the right to an exclusive enjoyment of the profit of the publication, he says, 'When a man by the exertion of his rational powers has produced an original work, he seems clearly to have a right to dispose of that identical work as he pleases; and any attempt to vary the disposition he has made of it, appears to be an invasion of that right.' (2 Commentaries 406.) The distinction cannot depend upon the degree of labor bestowed in the acquisition of land, for that is

quently possessed without labor, and originally acquired as often by good fortune as by merit. The property in a literary work may be acquired in the same way. The first thought may have been accidental, and labor has enlarged and improved it. Wherefore is it that the posterity of those who have produced intellectual treasures should not inherit them, as well as the descendants of the accumulators of land or money? To say that the *definition of property* in the old legal authorities does not include the property in question, is nothing to the purpose. If it does not include it, the definition is a bad one, because it is not sufficiently comprehensive. Besides, if it possesses none of the usual characteristics of property, let it form a class of itself. Injustice should not be done for the sake of preserving consistency in verbal or metaphysical distinctions.

‘Nothing is more erroneous (says professor Christian) than the practice of referring the origin of moral rights, and the system of natural equity, to that savage state, which is supposed to have preceded civilised establishments; in which literary composition, and of consequence the right to it, could have no existence. But the true mode of ascertaining a moral right is to enquire, whether it is such as the reason, the cultivated reason of mankind, must necessarily assent to. Under whatever denomination of rights literary property may be classed, it seems founded upon the same principle of *general utility of society* which is the basis of all other moral rights and obligations.’ 2 *Comm.* 407. *Notes.*

It is granted that an author possesses a legal property in his literary labors whilst they remain in manuscript. But what real distinction can there be in the nature of the property; as it respects either the sentiments or the language, before publication and after? The law prohibits the publication, of his manuscripts without his consent, why should it not also protect the printed copy, and prevent the appropriation of the profit by any other person than the author?

3. But it is said, *others may arrive at similar conclusions. It would be difficult to ascertain the right owner, and it would inconveniently increase litigation.*

There is here an unfounded assumption. It is impossible for any two men to compose a work precisely similar, for no two minds are alike. They may arrive, indeed, at the same ‘conclusions.’ Thinking upon the subject, the truth may be apparent to both; but each will proceed by different methods, and those who are skilled in criticism would have no difficulty in determining which of the two was the plagiarist; and an intelligent jury, aided by competent witnesses, by the learning of the bar, and by the assistance of the bench, would surely be able to determine whether the work was colorably pirated from another, or an original and *bonâ fide* production.

But admitting that there might be occasional difficulty in identifying the works of one author from another, such cases would be rare. Are we to abandon the property in general, because it sometimes may be troublesome to ascertain it? There is frequent difficulty in identifying other species of property, nay, even in identifying persons; but no one has yet been wild enough

to propose the abolition of the laws of property; because the evidence of ownership is often doubtful. We do not conceive the difficulty would be greater in this, than in many other kinds of property. There are no insuperable obstacles in identifying a literary work within the time already limited by the statute, and the same rules might be applied if the time were extended.

That it will give rise to litigation, so long as men are dishonest, cannot be doubted; but the same occasional evil prevails in every kind of property. He who prints and publishes another man’s copy, or makes such voluminous extracts from it as to injure its sale, knows, as well as the depredator of any thing else, that it is not his own; and if he has no sense of rectitude, he should be taught by the law that it is wrong, and punished either in purse or person for his transgression. There would be no greater degree of litigation than in proportion to the number of violations of the law of copyright, and the inclination of the injured to seek redress. Let the experiment be tried, and there will be no difficulty in providing remedies for any evil that may casually arise in the execution of the law.

4. *The composition is the property of the writer whilst in manuscript, but the act of publishing gives it to the world.* If there be any force as to mere legal reasoning in this objection, there is none as to reason or common sense. By the publication the author gives nothing whatever. He sells each copy for its price, and the purchaser may do what he pleases with the copy, except printing other copies. He may make use of the language and sentiments it contains in any way he thinks proper, except to the injury of the author. He may quote or abridge passages to improve his own works, provided the extracts be not of unreasonable length, or have not the effect of injuring the sale of the original. He may also lend or sell his copy, and may make a profit by the loan or sale. But he cannot appropriate to himself the profit derivable from the sale of other copies, the right to print which was never sold. The purchase he has made is for his own use, not the use of the public, and he must abide by the reasonable conditions of his bargain. It may be compared to the case of a proprietor of a theatre, who grants for a certain price a ticket of admission, which, if transferable, the purchaser may lend or let on hire; but who ever supposed that he had a consequent right to multiply copies, and sell them to the injury of the proprietor? So in the instance of a public water company, the contract includes the unlimited use by the person who pays for it, but conveys no right to vend the smallest portion. By analogy, therefore, to other kinds of limited sale, as well as from the reason of the case, it is clear that the act of publishing is no dereliction to the public, so as to make the property common to all.

5. Another objection is, that the *patentees of mechanical inventions possess but a limited term*, and therefore, that the authors of literary or scientific works should be satisfied with the same measure of legal protection.

We shall not enter into the argument of the distinction between the superior and immediate profit derivable from machinery compared with literary improvement, for we are not satisfied it is well founded. 'It would be difficult,' said Mr. (afterwards lord) Thurlow, 'to confine this right merely to books, and not to extend it to other inventions. A learned author (bishop Warburton) has endeavoured at it, and mangled it and made sad stuff of it, he attempts a distinction between the labors of the head and of the hand; but in some machines the labor of the head is greater than that of the hand. Sir Isaac Newton had no other property in his Principia than lord Orrery had in his machine. If the labor of the head gives the right, the property is just the same; and it is possible that the invention of the mouse-trap cost its author the same labor of the head, that the Orrery did its nobler contriver; so that this ground of property depends entirely upon the difference of heads.' Tonson v. Collins, (Bl. Rep. 301.) But we rest on this. If there is a distinction in fact, we are glad the patentees suffer less wrong. If not, they are common sufferers, and should take part in seeking redress. It is a proof of the straits to which our opponents are driven, when they excuse one act of injustice by another.

6. It is objected, that it would prolong the power of the owner to deal with the public as he chose, and that he might *either suppress a valuable work, or put an exorbitant price upon it*; in both of which events the public would be injured.

The fear of *suppression* may be easily provided against. If the proprietor does not reprint the work when required, within a reasonable time, there would be no injustice in considering the copyright as abandoned. It is replied, that there would be a difficulty in proving an abandonment. We do not perceive the difficulty, at least in the majority of instances; and regulations, which experience would suggest, might be adapted to circumstances. Generally speaking, if it were worth while to reprint a work, the copies of which were exhausted, it would not be abandoned. Where it was out of print, notice might be given to the last publisher, and entered in the registry of the Stationer's Company; and if at the expiration of a certain length of time, (perhaps proportioned to the magnitude of the work,) it were not reprinted, it might then become common property.

There is no probability that the *price* of literature will be enhanced more than the price of land. Some ages ago a large price might have been required, and, as the demand was then limited, a higher price was not unjustifiable. But since the development of the true principles of trade, there can be no apprehension of such a result. Every publisher now knows that the cheaper he sells his books, the greater is the sale, and what a small profit upon a rapid and extensive sale is ultimately more advantageous than a larger profit upon a slow and limited one. The more valuable the work, the cheaper it might be sold, on account of the greater number of purchasers. It is only of indifferent works which

are little demanded, that a high price could be necessary. So that the evil cures itself, and both the cause of literature and the interest of the public would be promoted, by enabling the proprietors of this kind of property to deal with it as unreservedly as with any thing else. Surely if the principle of free trade should any where be acted upon, it ought to prevail in favor of the press, that great instrument of national knowledge and improvement, and by which all other improvements are so much extended and promoted. Besides, the price might be restrained by a jury. Compensation for property is settled on many occasions under acts of parliament for roads and canals. It would be competent for an author or proprietor to prove the *capital* invested, and learned men might be called to estimate the *skill*, and publishers to prove what would be a fair or liberal remunerating price.

But then it is said there be an actual right, it is improper to restrain it. We have no wish that it should be restrained: we do not apply for the restraint; we think it not only needless, but objectionable and unjust. We conceive that every man's own interest will be the best protection to the public for the fair exercise of the right. It is so in all other arts and trades, and why should it not be the same in those of printing and publishing? But if we cannot have the right without the restraint, we will submit to it. It is an odd objection that denies a right, because if exercised it may be injurious, and then rejects the restraint, because all restraints are reprehensible.

7. Glory (say the advocates of limited copyrights) is the reward of science, and those who deserve it scorn all meaner views. It was not for gain that Bacon, Newton, Locke, &c. instructed the world. There are various unanswerable replies to this piece of rhetoric. First. The question is not what are the motives of an author, glory or gain! but what is due in justice from the public to those who have conferred benefits upon it. *What is right?* If the benefit be perpetual, why should not the reward? If Shakspeare has left us volumes of intellectual gratification, which can die only (nay not even then) with the language in which they are written, why should not his descendants (long reduced to poverty) derive the benefit which justice demands, and which gratitude would cheerfully pay? Granting that Nelson and Wellington were stimulated to their immortal exertions by glory alone, do we owe them nothing because they have their reward? Were the titles and the wealth that were bestowed upon them needless? Besides, it may be asked, how do the national rewards of *substantial* property act in the way of excitement upon the conduct of others? Has the perpetual entailment of Blenheim had no influence upon the minds of subsequent warriors?

Secondly. Different men are compounded of different materials. The objection supposes all men alike; that all are influenced by the predominant passion of ambition. It is an objection founded in utter ignorance of human nature. A very large class certainly are desirous of renown. But there are *other classes besides*

the ambitious: many men love their parents, wives, children, and kindred, and to that intense degree, that they will exert their powers more eminently for them than for the empty buzz of strangers or of distant posterity. Do these lawyer-like reasoners suppose that all men of warm affections are dots, and that the stern and cold man of ambition is the only inheritor of genius and greatness? Now a man of this kind may care but little for 'gain' so far as he is personally concerned; but, for the sake of those who are dearer to him even than 'glory,' he may bestow more labor than the merely ambitious man, and wherefore should he not be permitted to receive that which the public would readily and gladly pay? Who is there that reads the *Paradise Lost*, that would not be delighted to know that, in paying its price, he had contributed his mite to avert the penalty in which had died the last descendant of its author? It is any thing but philosophical to talk of men in general as exerting themselves *disinterestedly*, and as 'scorning all mean views.' Small must be the knowledge of human nature which ventures upon such declamation. There are men of the strictest integrity, who far surpass the generous and the ambitious in acts of justice, and yet are influenced by motives of gain. Are all men who desire to be paid for the services they perform, mean?

Authors are not a peculiar race of men, able to live on the air, 'glory-crammed.' Neither, we suspect, were the judges who reasoned with such loftiness, able to live on the renown of administering the laws with impartiality!

There is yet another class, the most numerous of all, who are not actuated by any simple predominant motive, to whom neither glory, nor gain, are master passions, but who are influenced by *mixed motives*, that would bestow greater exertions if their social as well as their selfish feelings were gratified. Why should we not use all the means which justice permits, to incite men to the exertion of their best faculties? He who can by his works obtain not only the prospect of future fame, but the substantial advantage of immediate recompense, with a provision for his family after his death, will labor with greater diligence than those who are incited only by the desire of posthumous renown.

The reward of glory may indeed stimulate the production of works of pure genius, and the more especially as the exercise of the imagination is so peculiarly delightful; but this cannot be the case in an equal degree in the department of philosophy. Great, persevering, and often painful labor, is necessary to the accomplishment of many works of science, and therefore every possible inducement should be *added*, instead of being *diminished*, that may tend to encourage the prosecution of such labors.

Besides, an author, who wished for no other reward than 'renown,' might still exercise his liberality, and either present his labors gratuitously to the public, or bestow them on some meritorious object. He can do so now in favor of the universities, and the glory of the bequest would be the greater, because it would be more rare and generous.

SECT. VI.—OF THE JUSTICE AND POLICY OF UNLIMITED COPYRIGHT.

1. In examining the objections to a perpetuity of the right, we have stated several arguments, which prove both the justice and policy of placing literary on the same footing as other kinds of property. Referring to those statements, we have now to point out some general considerations, which could not appropriately be introduced in any other place. It is boasted of the laws of England, that they provide a remedy for every injury; and therefore, we demand, should the wrongs of literary men be the only exception to this wide rule of general relief? The labor of the mind surely deserves as much protection as that of the body. Whatever may be suggested by the subtlety of legal reasoning, or the abstract definitions of the origin of property, no just (not to say liberal) man would deny *that* protection to the fruits of literary labor, which is given to those of every other kind. The same principle which establishes the policy as well as the justice, of guarding from invasion the accumulations made by *manual* industry, must confirm the right to the acquisitions of *intellectual* industry. If property be not protected, it will not be acquired. The interest, the very existence of society, is inseparably connected with the encouragement of industry. And, as national wealth depends upon national labor, so does knowledge depend on intellectual exertion. But neither the corporeal nor the mental powers will be freely or fully exerted, unless they receive *without restraint* the beneficial produce of their exertion. Above all, this great principle should always be remembered that *whatever is the most just will ultimately be the most beneficial*. Honesty is at all times the best policy.

2. It is always a great evil that laws, if just, should be evaded; for there is not only the immediate injury to justice of the specific violation, but a general weakening of the salutary reverence which is entertained for national laws when founded on principles of reason and equity. Now both authors and the publishers to whom they have assigned their works, have a strong feeling that the limitation of copyright to the period of twenty-eight years is inconsistent with the regulations of all other arts and professions, at variance with the commonest principles of free trade, and equally injurious to authors and publishers; without any correspondent benefit to the public. It is natural, therefore, that every effort should be made to elude the consequences of that which they correctly think is an arbitrary and irrational infringement of their own rights, and of the property of their families: of a patrimony often earned at the expense of health and of the abridgment of life. And whilst acting under such feelings, there are few even of the coldest-hearted legislators, who would visit with much censure the plan of ingenuity and contrivance which has been resorted to by the parties interested, in saving themselves as much as possible from injury or diminishing its magnitude.

The proprietor of the copyright prior to its expiration takes care to prepare a new *elite* with

notes, and though the original work becomes common property, the notes are protected, on the ground of their constituting an original composition. By a sort of combination also amongst the principal booksellers, these new editions 'with notes,' receive a preference over others. The interpretation which the judges have put on this mode of publication, is exceedingly liberal; but, if it be right that publishers should resort to these expedients to protect their property, the law should allow it to be done openly instead of surreptitiously. An honorable man must revolt against a system, which subjects him to lose his property, or to practise devices and evasions which out of respect to the laws of his country he must dislike. And although by these means the mischief is somewhat practically diminished, much of it unavoidably remains. The work may not really require any notes, either of explanation or addition, or they may be such as the humblest talents can supply. There are, it is true, some subjects which are undergoing continued change, and the publications which treat of them require proportionate alterations. But if not so, the work is encumbered with useless comments, or the name of some eminent author is appended to a new edition, which the commonest writer might equally well supply.

3. On the policy of perpetual copyright, it has been demanded, What good would it produce to the public? The question ought to be, 'What evil?' for if there be no evil, there ought to be no restraint. But it is obvious that justice and policy are here (as they always are upon the whole) inseparable. By the extension of copyright the public would have *superior and cheaper publications*. By the present system, authors are discouraged from undertaking works which would become of standard usefulness, because such works demand the labor of a large portion of life; and, as that labor is not now rewarded in a sufficient degree, they apply their talents to the hasty composition of publications of merely temporary interest. Instead of selecting the important and useful, they consult the fashion of the age, and write to gratify some peculiar excitement which is productive of immediate profit, but generally terminates with the novelty of the occasion. The labor and expense of a work of great utility or magnitude, and the research and care which it demands, cannot be encountered in many instances so long as the law remains in its present state. We do not here speak of the works which are costly in their embellishments and illustrations, but of the purely scientific and literary labor which they demand; of the investigation of ancient records and scarce and abstruse works; of the comparison of conflicting documents, and the task of judicious selection from large masses of materials; of the accuracy with which all these things should be done, in collecting the materials, in adopting the best arrangement, and in selecting the most appropriate language; for all which much time and leisure must be allowed, or with the greatest talents the work will be imperfectly executed. We have here supposed a production chiefly of learning, research, and judgment. But if it be one of striking originality, the invention of a new sys-

tem, the task of experiment and induction may require a still wider range of exertion and longer continued perseverance, which it is not reasonable to suppose will be often bestowed without superior recompense. Now it is manifest that, if the period were extended, publishers could afford to pay a larger price to authors for their copyright in works of this valuable kind, because their interest in them would be of an enduring nature; and though the profit might not be rapid, its perpetuity would encourage them to undertake it. Furthermore, an author who possessed capital as well as talent might choose to embark it, and retain the entire copyright to himself and transmit it to his family.

The *cheapness* of a work would also be promoted, since the proprietor would not depend upon a sudden return for his capital, but might proportion his gain to the extent of its duration. As he would ultimately receive a better remuneration, he could afford to diminish its present amount. In order, however, to effect a sufficient reduction in the price of books, correspondent with that which they bear on the continent, the imposition of the presentation copies, the tax upon paper, and the duty on advertisements, should be abolished or greatly moderated; still the extension of copyright would be a commencement of a better state of things, and afford encouragement to effecting other improvements. Supposing, however, that no sensible diminution in the price of literary works should take place, it is evident at all events that the price would not be *increased*. And it is clear also that both the author and publisher would gain by it. The former would naturally obtain a superior price for that which was assigned *for ever*, compared with the limited period of twenty-eight years. And surely no one would object to the increase of the pittance which authors are in the habit of receiving, even if it should in a small degree enhance the price of literature; an effect, however, which we conceive would not take place; for the price is now as high as it can possibly be carried, and every means should be adopted to enable the booksellers to reduce it.

Not only individual publishers would gain by the extension, but it would promote the interest of publishers in general, if the property in a work were vested in the author and his assigns. Suppose that the moment a valuable book were published, every one had a right to pirate it, the effect would be that a general scramble would ensue to reprint cheaper editions than the original. A great number of persons would be engaged in doing the same thing; the market would be overstocked; none would be sufficiently remunerated; and all would be more or less injured. It would be analogous to perverting the land of a deceased person to be retained by any one who could by stratagem or force obtain possession. Now something of the same kind must take place, though in a less degree, at the expiration of the statutory period; and although the evil is partially averted by the evasions and combination before averted to still it cannot be generally avoided.

4. The consequences of the *injustice falls on the most useful authors*, whom it is the interest

of the public, in the highest degree, to protect and recompense. The best and most original works make the slowest advances in general circulation. Smith's Wealth of Nations, the labor of half a life, passed only through two editions in eight years. Hume's History, as well as his early philosophical works, fell dead-born from the press: and every one knows the obscurity in which Milton's immortal poem remained for many years. Before critics have passed their judgment, the public attention is not excited. Reviewers are not always impartial, nor always correct. Some of them may condemn from malice and prejudice; some from mistake and ignorance. The judgment of the public, therefore, may be misled, and it often requires many years to correct its erroneous impressions. Such will more particularly be the case with productions of a novel and original character. Discoveries, however important, are not always encouraged, particularly if they attack existing systems. Long time is often necessary to obtain even a candid hearing on some subjects, still more to render the works which treat of them sufficiently popular to recompense the author. It is a fact proved by indisputable evidence before a committee of the house of commons, that many important works of an expensive nature have not been published, owing to the hardships imposed by the law. A great part of that hardship is attributable to the heavy tax of the eleven presentation copies for the public libraries, which we shall presently examine; but much also of disadvantage arises, even as regards these costly publications, from the limitation of time, because the splendid engravings, which occasion the chief expense of many of these works, are equally doomed to common depredation after the end of twenty-eight years.

5. No doubt it is wise to provide against evils; and if there were any good grounds for apprehending that the extension of the period would be productive of mischief to the public, it should certainly be refused. But we are *not without experience* on the subject.

It is now upwards of fifty years since the universities, by the 15 Geo. III. c. 53, obtained a confirmation of their right to the perpetual printing and publishing of their copies, and no disadvantage to the public, that we can learn, has yet arisen from its exercise; and to those fifty years must be added all the antecedent time during which they possessed the same undisturbed right. We, therefore, conclude that it may now be safely granted to the persons who were originally, and most naturally entitled to it; namely, the authors, from whom the universities themselves derived the advantage, and to whom they still look for similar donations.

6. *The state of the law in other countries* affords not only an additional and strong argument in favor of the policy of extending the rights of authors; but shows what other nations must think of the injustice of our regulations.

In France, the term of copyright is extended to twenty years after the author's decease. In Germany, it is *perpetual*. What is the consequence to literature and the public of this just system? Do authors and publishers abuse the

power they possess? Do they suppress valuable works, or limit their usefulness by exorbitant prices? No! In France, as Dr. Johnson observed, they have a book on every subject. In Germany, the abundance of literary works is still more extensive. In both countries, the price of books is beyond all proportion lower than in Great Britain. Compare also the literature of France and Germany, where the one is limited (though *not* to the contracted period of twenty-eight years), and the other is free. Does the perpetuity of German copyrights render the writers less original or profound than those of France? Does it tend to superficiality? No! We believe there are of late years more great and original works of enduring excellence published by the German press than by that of any other country.

Let it be recollected also that most of the great works which constitute the glory of English literature were published prior to the interpretation of the law in 1775. True it is that, in spite of that interpretation, some additions of a standard nature have been made to the stock of national learning, but these have been encouraged by other means than acts of parliament; by the evasions of their exactions, and the irrepressible energy of a few of our distinguished countrymen.

SECT. VII.—OF THE TERM OF COPYRIGHT IN PRINTS, ETCHINGS, ENGRAVINGS, MODELS, STATUES, AND BUSTS.

The 8th Geo. II., cap. 13, is an act intended for the encouragement of the arts of designing, engraving, and etching historical and other prints, and vests the sole right and liberty of printing them for fourteen years from the time of publication, the date to be engraved, with the name of the proprietor, on each plate and print; but it seems doubtful whether the name and date are essential to the recovery of damages in an action for piracy, though it is clear they are necessary in actions for penalties under the statute. 5 Term Rep. 41; 1 Campbell 94. The act is not confined to inventions, strictly, but comprises the designing or engraving anything that is already in nature. 2 Atkins 293. The *degree of originality* which entitles the inventor to the protection of the statute has been well defined by lord Ellenborough, who states the question thus: 'Whether the defendant has copied the main design? Whether there be such a similitude and conformity between the prints, that the person who executed the one set must have used the others as a model? In that case he is a copyist of the main design. But if the similitude can be supposed to have arisen from accident, or necessarily from the nature of the subject, or from the artist having sketched his designs merely from reading the letter-press of the plaintiff, the defendant is not answerable.' Roworth v. Wilkes, 1 Campbell 94.

The act inflicts a forfeiture for pirating either the whole or a part, and a penalty of five shillings for every print. By the 7th Geo. III., cap. 38, the right is extended to twenty-eight years. (Sect. 1.) And it includes the prints of any portrait, conversation, landscape, or architecture,

map, chart, or plan, or any print.' By the 2nd section, engravings, etchings, or works taken from 'any picture, drawing, model, or sculpture, either ancient or modern,' are entitled to the protection of the act. By the 17th Geo. III., cap. 57, an action for damages and double costs is given for engraving, etching, or printing any historical print, or print of any portrait, &c., without the consent of the proprietor, within the time limited by the former acts. The 38th Geo. III., cap. 71, vests in the same manner the sole right and property of making *models, copies, or busts*, for fourteen years, provided the name and date of publication be put thereon; and persons making copies without the written consent of the proprietor may be sued for damages. These provisions were rendered more effectual by the 54th Geo. III. cap. 56, by which double costs were given, and an additional term of fourteen years in case the maker of original sculptures, models, &c., should be living, except he should have divested himself of the right previous to the passing of the act.

PART II.

OF THE COPIES TO BE DELIVERED TO THE PUBLIC LIBRARIES.

SECT. I.—OF THE LAW.

The 8th Anne, cap. 19, which professed to encourage learning, and to prevent invasions upon the rights of authors, revived the tax of the three copies for the king's library, and for the universities of Oxford and Cambridge (originally imposed by the 13th and 14th Charles II., and revived at intervals, but discontinued about six years after the Revolution), and imposed six additional copies, namely, one for Sion College, one for the Faculty of Advocates at Edinburgh, and one for each of the four Scotch universities, making in all nine copies, to be delivered to the warehouse keeper of the Company of Stationers before publication. By the 41st Geo. III. cap. 107, in addition to the nine copies, one other copy was imposed for Trinity College, Dublin, and one also for the society of the King's Inn, Dublin. The 54th Geo. III. cap. 156, directs the eleven copies to be delivered on demand, within twelve months after publication, for the use of the libraries. The penalty for neglect is £5 for each copy not so delivered. Such penalty to be recovered on the part of the library to which the delivery ought to have been made.

Second and subsequent editions are exempted, unless they contain additions or alterations. And the additions may be printed and delivered separately, if done in a uniform manner with the former edition. The copy for the British Museum must be on the *best paper* on which the work shall be printed; the other copies upon the paper on which the largest number or impression shall be printed for sale, together with maps and prints belonging thereto. It seems that the University of Cambridge is entitled to a copy on the best paper (16 East, 317); but, though it is stated in the report as the *result* of the decision, the quality of the paper is not any where noticed in the judgment pronounced by the court.

The title to the copy of every book, and the name and place of abode of the publisher, must be entered in the Stationers' Register, within one month for the bills of mortality, and three months for other parts, and in case of default the penalty on each book is £5, and eleven times its price. It is sufficient for magazines, reviews, and other periodical publications, to make the entry within one month after the publication of the first number or volume. The publishers, at their option, may deliver the copies to the libraries which are entitled to them, instead of the warehouse keeper of the Stationers' Company.

SECT. II.—OF BOOKS NOT REGISTERED AT STATIONERS' HALL.

1. *Analysis of the Acts of Parliament.*

It was for a long series of years considered as the sound and unquestionable interpretation of the statute of 8 Anne, that the universities were entitled to copies of such books only as were registered at Stationers' Hall, and to no others. It is, by the second section of the 8th Anne, that the entry at Stationers' Hall is directed to be made. The *object* of the provision is recited to be, *that persons may not, through ignorance, offend against the act*; but that the property in the book may be ascertained. And the penalties do not attach for printing without the consent of the proprietor, *unless* the title to the book shall be entered before publication in the registry of the Company.

It has been contended that this provision, as to the registry, is confined to the penalties mentioned in the first section of the act; and that in the fifth section, by which the nine copies are given, there is no reference to the prevention of persons being unwarily led into the penalties given by the first section. For the intention of the legislature, we ought, however, to look at the *preamble* of the act, which, after reciting the invasions upon the rights of authors and proprietors, 'to their very great detriment and ruin,' proceeds to enact the remedies contained in the statute; and the whole object of the act is to prevent the injuries in future, and to encourage learned men to compose and write useful books. The tax of the copies surely cannot, by possibility, be construed as a protection to literary property, or to prevent the ruin of authors. It is evidently a payment, exacted for the supposed benefits conferred by the statute, and a condition precedent to any claim on the remedies it provides.

The first section (after stating the general object of the act) secures the copyright for a term of years by certain penalties. The second provides that the work shall be registered. The third imposes a penalty on the Stationers' clerk for breach of his duty. The fourth regulates the price of books (since repealed). The fifth contains the proviso that nine copies shall be delivered to the warehouse keeper for the use of the university libraries, &c. Now it is true that the words 'provided always,' which commence the sections of many acts of parliament, are not invariably to be taken as referring to all the previous enactments; and sometimes these words very absurdly introduce an enactment perfectly

distinct from any thing that precedes it: yet here the common sense of the whole statute stands thus:—‘Authors have sustained very great detriment: to prevent which, in future, and to encourage the composition of useful books, we (the legislature) inflict certain penalties on the invasion of your rights, *provided* you register your books, and provided *also* that you present nine copies to the public libraries.’ Although there are two intervening sections on other subjects, the first, second, and fifth, are, in all fair construction, one enactment. It is impossible that the fifth section can be connected with either the third or fourth, which relate to the stationers’ clerk, and the price of books. If the conditions of registry and delivery are not complied with, the party cannot avail himself of the remedies afforded by the act. They are conditions precedent, and he has no claim under the act unless he performs them; but if he is satisfied with the remedy at common law, and chooses to abandon the protection of the statute, there seems no ground for imposing on him the tax inflicted by the statute, when he seeks no benefit under its provisions.

It was the understood practice for nearly a century, that the entry was necessary for no other purpose than to enforce the penalties against pirating the copyright. In the majority of cases no entry was made, because it is only in relation to some peculiar works that the remedy under the statute for the penalties is preferable to the ordinary action for damages. It appears that the books entered in the registry of the Stationers’ Company, during a period of fifty years subsequent to the statute of Anne, were not altogether at the rate of fifty annually. And it was the invariable custom to deliver to the libraries those works only which were so entered. Such was not only the understanding of the publishers and the Stationers’ Company, but of those who, acting for the libraries, were the most interested in a contrary construction. Until the case of the Cambridge University v. Bryer (which was decided in November 1812) it was never pretended that the statute entitled the universities to copies of unregistered books. Nay, further, it appears by the journals of the house of commons in 1775 (p. 351), that the house ordered, ‘That the committee make provision in the bill,’ then pending in parliament, ‘for enforcing the execution of a clause in the act of Anne, which provides that the several copies of each book printed and registered under the direction of the act, be delivered to the warehouse-keeper of the Stationers’ Company for the use of the several libraries therein described.’

Then the act 15 Geo. III. cap. 53, sect. 6, recites, that the provision relative to the delivery of the copies had not proved effectual, but had been eluded by the entry only of the title to a single volume, or of some part of the book; and enacts that no person should be subject to the penalties, unless the title to the copy of the whole book, and every volume, should be entered, and unless nine copies of the whole should be actually delivered for the use of the several libraries, &c. Here it is evident that the delivery of the presentation copies was a mere condition attached to the remedy, by way of penalty, given by the

statute against pirating. So also the 41st Geo. III., cap. 107, directs that in addition to the nine copies required by law to be delivered of each book, *which should be entered into the register book of the Stationers’ Company*, one other copy should be delivered for Trinity College, and one for the King’s Inns, Dublin, of all books which should thereafter be printed and published, and the title to the copyright whereof should be entered in the register book of the Company. It is clear therefore that before the right of the universities could attach, the entry must be made. There is nothing in the act to compel the entry. It was necessary only that those who sought protection under the statute should conform to its conditions: the one was to enter the book, the other to deliver certain copies. If the protection was not needed, the entry was not made, and consequently the copies ought not to have been required.

2. Legal Decisions.

It was decided by the court of king’s bench, in the case of the University of Cambridge v. (16 East. 317), that it is necessary to deliver a copy to the warehouse-keeper of the Stationers’ Company, although the book was *not* entered in the registry. This determination was founded on the construction put by the court on the 8th Anne, cap. 19, and is admitted to be a construction opposed to the provisions of the subsequent statutes of 15 Geo. III. and 41 Geo. III. Besides this conflict of legislative enactment, it also appears that lord Ellenborough, before whom the cause was tried, observed that he would reserve his opinion, as it might very fitly be made the subject of discussion elsewhere, and perhaps in some ulterior court of appeal, to which it might not *unfitly* be carried. On the argument of the case in the court of king’s bench, the court held, that though there arose some difficulty in the construction arising out of the two statutes of 15 and 41 Geo. III., the construction which was to be collected from those statutes, as being intended by the legislature at subsequent periods, was not sufficiently strong and cogent to overturn what the court understood to be the clear distinct sense of the statute of 8 Anne, in which the court was of opinion there was nothing ambiguous.

The court having decided in favor of the university, some discussion took place as to the defendant’s right to take the case into the court of exchequer chamber; and lord Ellenborough observed, that the question affected a great quantity of interest, and that no person could blame the defendant for having it further considered. It appears, however, that the defendant did not avail himself of the opportunity afforded him. On a question which seems to depend rather on the technical constructions of lawyers, than on the rational grounds of the subject, it may not be unimportant to state (on the authority of Mr. Sharon Turner) that when the action was brought by the university of Cambridge, the opinion of the attorney general was taken on behalf of the printer, and he thought that the 15th Geo. III., and 41st Geo. III., were legislative expositions of the statute of Anne, and showed that the nine copies directed to be delivered, were nine copies

of such books as should be entered at Stationers' Hall. And on a view of all the statutes taken together, and on the reason of the thing, he was of opinion that the universities and other public libraries mentioned in the statutes, were not entitled to have copies of such books of the Stationers' Company.

SECT. III.—INVESTIGATION OF THE GROUNDS OF THE LIBRARY-TAX OF ELEVEN COPIES.

That the law is beneficial to the universities need not be disputed. The gratuitous contributions to their several libraries save their funds. But is the saving necessary or just? Have they not sufficient means to purchase every useful publication? Do they really make use of the current literature of the age? It cannot be requisite that every work that issues from the fertility of the press should be deposited in all the libraries. The works which are esteemed in these ancient colleges are those which have long maintained their rank as standard productions. The great bulk of modern publications are not introduced, and cannot, perhaps, with propriety, be introduced into the course of study pursued at the universities. A large part of the system of education is confined to ancient authors, and to subjects which do not admit of modern improvement. Indeed, the general plan of instruction is opposed to whatever is novel and speculative. Nothing is adopted but that which has been long tried and established; and we cannot conceive, therefore, what the heads of colleges have to do with those valuable but modern works, which they do not permit to be used.

Even if it were necessary to the welfare of the universities that each should possess a copy of every publication, it is iniquitous to exact them at the expense of individual authors or proprietors. The colleges, of which they are composed, are in general richly endowed, and if each college could not afford to possess itself of the modern publications, their united funds would certainly be amply sufficient. It may be true, that some of the Scottish colleges have but little surplus wealth to dispose of in the purchase of every kind of publication; but, whatever a few individuals may think to the contrary, we are persuaded that the intelligent people of Scotland in general possess too much just pride to plead the *poverty* of their universities as a ground for unjust exactions.

It is said, that 'the universities cannot purchase the *splendid editions* of great and expensive works, and yet they are works of which they stand in the greatest need. They give a university dignity and respectability; and, in some departments of liberal education, accurate drawings and engravings are essentially requisite.' Now, however agreeable to the eye are '*splendid editions*,' and however suited to the taste of the affluent, we exceedingly question their utility not only to the student but to the professed author. Fine plates and bindings are suited to the literary idler and looker-on, but can scarcely stimulate any one to intellectual exertion. These splendid trappings are for holidays, and not for days of learned labor. They tend, like great luxuries in general, more to enervate than invi-

gorate. That the welfare of a college is at all dependent on splendid editions, we, therefore, altogether deny. If they should be rich enough to purchase these luxuries, there can be no objection; for though not necessary to the real student and man of letters, they are agreeable. The '*respectability*' of the establishment surely cannot be promoted by robbing an author of any portion of his fair-earned reward, and drawing down upon itself the odium of the whole republic of letters. And its '*dignity*' can scarcely be increased by any other means than the opportunity it affords to attain sound, comprehensive, and accurate knowledge in the highest departments of philosophy and literature. It is beneath its real dignity to owe any of its attractions to the splendid decoration of its library; in which, indeed, there should be as little as possible addressed to the external sense, and every thing adapted to excite the intellect.

It is true, that the student may be assisted in his pursuits by occasional engravings, but those which are useful, are of a very different class to the splendid drawings which render some works so costly. Even in architecture, we apprehend, it is not necessary that the plates, for purposes of study, should be very costly; and besides, it is not in a college, that the education of an architect can be completed. Antiquarian works are of course expensive, but we are not aware that the universities profess to induct their pupils in the knowledge of antiquities, the study of which may safely be left to the Antiquarian Society. So also botany and zoology may be effectually studied without the aid of magnificent plates, which, indeed, are rather calculated to excite a taste for drawing, and to encourage a love of show and splendor, than to induce philosophical and studious habits. We can see no advantage to public education in attracting the pupil to quit the hard study, which can alone render him eminent in society, for the purpose of gratifying his taste in examining splendid folios, and admiring the productions of the arts of drawing and engraving.

'But the law is said to be beneficial to general literature, by affording to men of literary talents and industry the means of information, and enabling them to accomplish works of the highest merit and utility.' This is too barefaced an excuse for injustice; it is robbing Peter not to *pay* Paul, but to enable him dishonestly to live at the expense of Peter. The men of '*literary talents and industry*,' who *have* accomplished works of merit and ability, are to be deprived of a large part of their profit, where any exists, in order that others may avail themselves of the results of their industry gratuitously. Surely, the fellows of the learned universities who favor the world with their collegiate lubrications, and who set their own price upon them, should stand on the same footing as other literary men, and purchase the materials which they require in the course of their labors. It may be very convenient, but it cannot be just, that by the aid of these universities a writer should possess himself of the property of his predecessors, for which no remuneration whatever has been made. And, after all, there is not the plea of *necessity*

in favor of the injustice. For it is the common practice of an author, who is engaged on a work in the preparation of which he has occasion to refer to a variety of books, to obtain them from his publisher, and it is a part of the understanding between them, that all the books which are necessary should be lent him. Of course, there is of all others the least difficulty in supplying the modern publications. And we presume no one who is tolerably acquainted with the history and circumstances of literature, can believe that it has been or is likely to be benefited or improved by the doctrine, for the first time laid down in 1812, that the universities are entitled to copies of every publication. We may venture to say, that if not the *best* authors of the present age, at least as good as any others are unconnected with the universities, and derive no advantage whatever from the accumulations which have been made in their libraries, either since 1812 when every book has been supplied, or prior to that time when the registered books only were delivered. Indeed it is absurd to suppose that the intellect of the country is to be advanced by such paltry means, and the true friends of academical learning are no doubt as much ashamed of the folly of such an argument as of the dishonesty of its principle. Supposing, however, all these considerations set aside, let us enquire what is really the use of the single copy given to any one university? In general the books are of no use whatever, to any one of the colleges. Of the far greater portion not a single page is ever read. It either is utterly useless, or is so considered for all collegiate purposes. Indeed how can it be otherwise when the libraries indiscriminately demand their copies of every publication? Of all the trash, folly, and obscenity, which find their way out of the press? But suppose the work to be really valuable, either for its profound philosophy or learning, or for the popularity of the subject, and the talent it indicates; then every one becomes desirous to read it; thousands of students apply for it. And what is the consequence? As but few can possibly obtain it, the book is either purchased, or borrowed from the common circulating libraries, and the copy in each of the eleven libraries has precisely the effect of preventing purchases from the author, for the sole benefit of a few individuals who can either do without the book, or afford to pay for it.

Another benefit of the law, however, is said to consist in *preserving the books* from the danger of loss, some of which are valuable, and others will to future times prove curious. The really valuable works there is no probability will ever be destroyed. The art of printing has disposed of all reasonable apprehension of that contingency; and we think it bad morality, even on the coldest application of the doctrines of expediency, to do an act of positive injustice for the sake of preserving something which may become *curious*. Certainly many a production, intrinsically worthless, may, from its extreme rarity or antiquity, obtain an artificial value in the estimation of those who are pleased with such things; but it is not politic (to say nothing of honesty) to injure and discourage the writers of the pre-

sent age, in order that a biblical antiquary may, some centuries hence, feed his idle vanity with the possession of a specimen of unique absurdity! To meet, however, the object of preserving a copy of every kind of publication, whether the offspring of the talented or the foolish; the moral or the vicious; it would be sufficient to deposit a single copy in the British Museum, or rather in a *national library*. To this, we are sure, no author or publisher would offer an objection, and this copy, so deposited, would serve the purpose, and render unnecessary the extra copy which every printer by the 39th Geo. III. cap. 79, sect. 27, 29, is obliged to reserve of every work he prints.

SECT. IV.—MISCHIEFS AND IMPOLICY OF THE TAX.

1. *Injury to Literature.*

The law has the effect of preventing the publication of expensive and valuable works. There are some books, so costly in the execution, and of which there are naturally so few purchasers, that a very small number only are published. However valuable of themselves, on account of the talent and expense bestowed on them, their *scarcity* increases the value. It is important that as few as possible should be printed, in order to afford an adequate and reasonable remuneration for the skill and capital embarked. To exact eleven copies of these is, in many instances, to take away the whole profit.

From the following list some judgment may be formed of the effect of the tax on this class of publications. It amounts almost to a prohibition.

	No. of Copies Printed.	Price of 11 Copies.		
		£.	s.	d.
Lord Valentia's Travels	50	577	10	0
Bloomfield's Norfolk	120	254	2	0
Sir R. Hoare's Wiltshire	60	207	18	0
Pallas's Travels	50	78	13	0
Morier's Travels	75	46	4	0
Nichols's Hogarth	250	184	16	0
Dibden's Bibliomania	18	92	8	0
Johnes's Froissart	26	335	10	0
——— Monstrelet	26	335	10	0
Philosophical Transactions	150	605	0	0
Boke of St. Albans	150	55	0	0
Dilletanti specimens	350	165	0	0

In some of these instances it will be observed that the eleven copies amount to a tax of upwards of £40 per cent. In others of £20, and the average of the whole exceeds £10 per cent. So that part of the works must have occasioned a great loss, and none of them would afford an adequate profit. The consequence will be, that such undertakings must generally be abandoned. There may indeed be a few enterprising publishers who may continue to embark their capital amidst such disadvantages, but the probability of course is that they will sustain a loss, and it is surely contrary to every principle of policy to continue such a system. It has been contended that the university libraries cannot purchase expensive books, and therefore the tax does not injure the

sale.' But the fact is not so: their ample funds enable them to patronise, and they have often purchased such publications. As instances, it may be mentioned that the public library at Cambridge, and the British Museum, both subscribed for Mr. Dibden's Typographical Antiquities, and Mr. Nichols's Leicestershire. And the library of the Faculty of Advocates at Edinburgh also subscribed for the former work. And the Bodleian Library and Trinity College, Dublin, for the latter. Such instances of encouragement were formerly numerous, and tended to increase the number of such undertakings; but the present law has obviously an opposite tendency. The names of these eminent libraries in the list of subscribers formed a strong recommendation, and probably produced an extension of the list. No such recommendation can now exist; in addition to which there is the loss of profit on the copies which they were accustomed to take. It is asserted that 'the law favors the sale of valuable publications, by affording an opportunity of seeing such works, and thus awakening a relish for them!' Can any thing be more ridiculous or unfounded in fact? If the public knew nothing of books but from their being deposited in the eleven libraries, we suspect few would be sold. It is unnecessary to say, that one single advertisement in a newspaper or review, has a better effect than if the work were deposited in every college in the kingdom. There is no want of relish for such publications if they could be obtained at a cheap rate; and the only true way to increase the demand is to remove all the imposts and burdens on literature so that the price may be reduced. The opportunity of seeing such works is afforded far more conveniently than in the university libraries: they may be seen in the shops of every respectable bookseller.

2. Injury to Authors and Proprietors.

The consequences of the tax upon *expensive* publications have already been pointed out. They are so injurious as to prevent many publications that might otherwise be prepared. Even in *ordinary* publications the tax is very burdensome. The publisher makes the most accurate computation he can of the number of copies which will probably be sold. According to the long established custom of the printing trade, the charge of the printing is made on each 250 copies, and therefore the loss on the eleven copies is precisely the whole price for which they would sell; or if eleven extra copies were printed, the expense would be of equal amount, because the charge for printing the eleven would be the same as for 250. Thus, supposing a work of forty sheets, the press-work at 4s. a sheet would be £8; and if the price were 16s. a copy, eleven copies would be £8 16s., whilst the printing of the eleven copies would cost £8 exclusive of the paper. But then it is said, 'the tax does not affect the authors or proprietors; it may be charged to the public.' It is not enough to tell us that the tax, whatever it is, may be charged in the price of the publication: will the public pay it? It need scarcely be replied that the smaller the price, the more extensive the sale. If the tax upon paper and

advertisements, as well as this library imposition, were removed, and the period of copyright extended, so that books might be published and made known for two-thirds of the present expense, the sale of them would increase not only in the proportion of that third which is now consumed in preliminary expense, but in a much greater degree; for not only the same sum would naturally be expended which has been applied in the purchase of literary works, and therefore the sale increased upwards of thirty per cent; but the reduced price would as naturally induce a still greater number to become purchasers, who are now deterred by the heavy amount of the present price. 'The tax is also alleged to be of trifling amount, and it is urged that where the work is popular, and a great number of copies are sold, the deduction of eleven can scarcely be felt. And when the work does not sell, the eleven copies may as well be placed in the public libraries as in the lumber-room of the publisher.' 'Will the universities be content to take copies of successful works only, and let the criterion of success be the sale of 1000 copies? It is true, that the far larger proportion of books are unsuccessful, and this fact should induce the legislature to give every possible encouragement. Out of the large profit on a few very fortunate publications, the proprietor may well afford to make a donation of eleven copies. But the question is a general one. To proceed on principle, the tax should be calculated on the general result. It is a cruel mockery to say that when all the copies are not sold, some of them may as well be placed in a library as in a lumber-room. They may be sold for something, and at the worst will always sell as waste paper. Besides, the argument is fallacious in itself; if the work will only sell for waste paper, it can be of no value to the universities; it can only 'lumber' their shelves in the same way that it is supposed to fill the publisher's warehouse: and though it has been insinuated, we presume it cannot be true, that the universities make a profit by the sale of their useless books. On the other hand, if the publication be really valuable, and tend to promote the great objects for which colleges were endowed, it is a wretched, and despicable, and bad spirit that will not remunerate the talent and industry by which they are benefited. Books are either good, bad, doubtful, or indifferent. The good (which perhaps are not extremely numerous) they ought to pay for; the bad they should of course reject; and the doubtful and indifferent no university can require, for the time of youth is valuable, and should not be thrown away in the perusal of questionable or idle productions.

SECT. V.—STATE OF THE LAW IN OTHER COUNTRIES, AND ANALOGY OF OTHER TAXES.

1. In America, Prussia, Saxony, and Bavaria, only one copy is required at the hands of authors and proprietors. In Austria, the imposition is extended to two copies; and, in the Netherlands, the libraries are entitled to three copies. In France, prior to the revolution, the law required two copies for the king's public library, one for the Louvre, and two for the chancellor and the

keeper of the seals. The two latter were evidently required with a view to the supervision of the police. Subsequently to the revolution, the number of copies has been reduced, and two only are now required for the use of the national library. But in all these cases the tax applies only where the copyright is reserved; and in these countries the duration of the right of exclusive printing is either perpetual, or considerably more extensive than the term allowed in Great Britain.

2. Nothing can be more unprincipled than this anomalous taxation of literary property. No other class than the literary was ever proposed to be so taxed. There is, indeed, no instance in which any art, profession, or trade, is subjected to such an imposition. It is a direct tax upon industry, and an odious restraint upon the press. It has been said that authors of literary works ought not to be better protected, or to have a longer term of exclusive property, than the inventors of new machines. For the purpose of the present argument, be it so. But if the period of protection be the same, let the author also stand on the same footing in other respects. What would be the feeling of those who possess mechanical genius, if the law compelled them to present eleven copies of every machine which they invented or improved? What, indeed, would the intelligent people of England think, if it should be suggested to parliament that it was expedient to deliver to the Royal Society, the Societies of Arts and Antiquaries, and other

scientific institutions, eleven specimens of every engine, however expensive, that ingenuity devised? What would have been the public feeling, if any one had possessed the audacity to propose that Mr. Watt should not be permitted to sell any of his steam engines, until he had deposited eleven of them gratuitously in the warehouse of the Royal Society?

3. We trust the time is not far distant when this disgrace to the government of a free and civilised country will cease to exist. We ask only that our literary brethren may be placed on equal footing with the fabricators of the commonest merchandise. If the tax on the *raw material* of paper must be still continued, at least the impost on the *manufactured article* of books, on every principle of trading policy and even-handed justice, ought immediately to be removed. If our literature be equal to that of the continental states, let us imitate their example; let us cease to injure, and really encourage, those to whom we are indebted for our emance. If it be inferior, let us lose no time in removing every impediment from its way, and introducing every means that can facilitate its improvement and promote its rise. Let not Great Britain be the country in which literary property is burdened more oppressively, in a six-fold degree, than every other nation of the civilised world; rather let her abolish the imposition altogether, and surpass even the republics of the new world, as she undoubtedly might the monarchies of the old.

COQUET, *v. a., v. n., n. s. & adj.* } Fr. *co-*
COQUETTE, *n. s.* } *quette*. Dr.
COQUETRY, *n. s.* } Johnson
COQUETTSU, *adj.* } refers to the
origin of coquet to *coquart*, a prattler, which latter word Mr. Todd thinks may be from *co-quette*, tattle. Skinner, from the French *coquette*, i. e. to chuck, as a cock among hens. Cotgrave, however, to whom this derivation and definition belonged, seems to have overlooked the most obvious circumstance of similarity,—the cock's extension of his notice to more than one. Thomson says '*coquette*, *quetter*, from Lat. *quæ-sito*, to seek after, to affect, corresponding with Fr. *rechercher*.' To these conjectures we are tempted to add another. In the old French, *coquette* is, 'a seller of eggs, or of egge shells.' May not this be the origin of coquette, the name of a woman who gives merely a semblance of that which she professes to give; who pretends to offer an egg, which is nothing more than a shell. Coquette is also a sea phrase, meaning, to propel a boat by sculling, that is, by the use of one oar in the stern, which is rapidly moved from side to side, like the tail of a fish. A coquette, then, if this be the etymology of the word, would be, one who keeps on in her amorous course by a constant alternation from side to side. 'A coquette,' says Johnson, 'is a gay airy girl; a girl who endeavours to attract notice.' But his definition is hardly copious enough. In its principal sense, both in French and English, a coquette means a general lover; a flirt; and,

it is almost unnecessary to add, a jilt. The derivatives require no explanation.

I was often in company with a couple of charming women, who had all the wit and beauty one could desire in female companions, without a dash of *coquetry*, that from time to time gave me a great many agreeable torments. *Addison's Spectator.*

The light *coquettes* in sylphs aloft repair,
And sport and flutter in the fields of air. *Pope.*
A *coquette* and a tinder-box are spark-led.
Arbuthnot and Pope.

Coquet and coy at once her air,
Both studied, though both seem neglected;
Careless she is with artful care,
Affecting to seem unaffected. *Congreve.*

You are *coquetting* a maid of honour, my lord looking on to see how the gamesters play, and I railing at you both. *Swift.*

Phyllis, who but a month ago
Was married to the Tunbridge beau,
I saw *coquetting* t' other night,
In publick, with that odious knight. *Id.*
Such is your cold *coquette*, who can't say 'No,'
And won't say 'Yes,' and keeps you on and off-ing
On a lee shore, till it begins to blow—
Then sees your heart wrecked, with an inward
scoffing. *Byron. Don Juan.*

Nine times in ten 'tis but caprice or fashion,
Coquetry, or a wish to take the lead;
The pride of a mere child with a new sash on,
Or wish to make a rival's bosom bleed. *Id.*

COQUIMBO, a jurisdiction or intendency of Chili, forming the entire northern division of

Chili Proper, and containing the provinces of Copiapo, and Coquimbo Proper. For the former, see COPIAPO.

Coquimbo, Proper, is mountainous, extending from the Cordillera to the Pacific, and from the Guasco north, to the Chuapa south; being about seventy miles from east to west, and 190 miles from north to south. It is watered by the three small rivers Coquimbo, Linari, and Chuapa; the latter alone having any constant flow of water, even in the summer, and being then incapable of navigation, from its rapid descent, bad bottom, and insufficient depth. The sides are nearly perpendicular; and a hanging lasso bridge serves for the passage of loaded mules and travellers, at times when it would be dangerous to ford the river. The chief places of this province are the towns of Coquimbo and Illapel. The chief copper mines of this province are situated in the Cuestas or ranges of Combalamba, of Llam bangüi, of Huamalata, and of Las Vacas: those in the southern parts are copper and gold. Its population is estimated at about 15,000 souls. The most fertile part of the province is the small valley of Elque, watered by a branch of the Linari; and on the road between Illapel and Coquimbo. It is divided into several farms, which cultivate corn, the vine, fruit, and vegetables. The most important mines are in the interior, near the central Cordillera. A short distance to the north-east of the town of Coquimbo are some small copper mines, one of which called Cerro ore is worked. Illapel is also a mining town of some consideration, situated on a branch of the Chuapa, about eight leagues from its mouth.

The copper prepared at the mines of Illapel for sale, Mr. Miers informs us, is not suffered to be exported from any of the bays upon the bordering coast, nor even to be conveyed in small craft, either to Coquimbo or Valparaiso, but must be carried on the backs of mules to one of these places: Valparaiso at eighty leagues distance is the nearest of the two, and, as the road is better than that to Coquimbo, nearly all the copper produced is carried to that port. This is a great discouragement to the working of the mines: other circumstances during the revolution have also militated greatly against the success of mining, so as to cause many who have hitherto employed their capital, to withdraw it and employ it in agricultural occupations. Hence the cultivation of land in the valley of the Chuapa, as well as in the ravines leading into it, has somewhat increased. From the disadvantageous situation of Illapel with respect to the two sea-ports, the increasing demand for labor in Chili, and the consequent rise of wages, greatly enhanced as these will become from the influx of British capital and competition about to be attempted there, we may conclude that before long the mines of Illapel will cease to be worth working. Little indeed can be reasonably expected in the way of profit from any attempts by foreigners to carry on mining operations in Chili.

Coquimbo, the residence of the Governor Intendent, is situated on the south bank of the river of that name near its estuary, and is watered by a canal brought from the river at a higher level,

and distributed by artificial channels through the houses and gardens. It is a small place but its houses generally of brick, and of a neat appearance, being arranged in squares or quadras; the plaza or public square being at the southern extremity. The commerce of Coquimbo consists of the export of copper and a small quantity of the precious metals: the imports are, clothing, provisions, and other necessaries. The harbour of Coquimbo, twelve miles distant from the town, is of considerable size, well sheltered on the southern and western sides, and, though open towards the north, is secure at most seasons of the year, as the northerly tempestuous winds do not prevail at Coquimbo. It is formed by a promontory running into the sea about two miles. There are nine fathoms 300 yards off, and near three fathoms close in shore. To the southward of the promontory of the harbour is another bay, of a circular form, two miles in diameter, entered by an opening to the west three quarters of a mile broad, called La Herradura, Horse-shoe Bay; it possesses a good clay bottom, sixteen fathoms water in the middle, twenty-eight fathoms in the entrance, and five fathoms 250 yards off. But it is rocky on the north and south sides. A hill forming a promontory to the south of this bay is named the Cerra de La Gloria, and here copper was formerly worked.

COR. Lat. *corus*. A Hebrew measure

Ye shall offer the tenth part of a bath out of the *cor*, which is an homer of ten baths. *Ezek. xlv. 14.*

CORACIIE. A sea-port town of Afghaunistan, in the district of Tatta, and province of Sinde, fifty-seven miles from the city of Tatta, in lat. 24° 51', long. 67° 16' E., and supposed to be the Sangada of ancient history.

The bay affords shelter for vessels of 300 or 400 tons burden, from the beginning of September to the end of May. The entrance is narrow, and the deepest water about 200 yards from the western point, which is defended by a castle. On the eastern side are six rocky isles, and the water is shoal. At low water there is not more than one fathom and a half fine hard sand on the bar; but the tide rises twelve feet. The town contains 3000 houses, and is surrounded by a mud wall flanked with towers of no strength. The inhabitants, who are principally Hindoo merchants and traders, carry on a considerable trade, (this being the only sea-port in the province), in the export of saltpetre, rice, cotton, butter, oil, horses, and many other valuable commodities, brought from Cabul and the northern provinces. Its imports are metals, ivory, tea, sugar, spices, and the manufactures of India and Europe. During the rainy season a considerable intercourse is maintained with Tatta, by means of a creek navigated by dhingies or flat-bottomed boats. They import thence black pepper and spices, tin, iron, lead, steel, elephants' teeth, cochineal, quicksilver, sandal, and scented woods. The vicinity is level and sandy, covered with brushwood and other hardy plants, on which a number of camels are reared. The place belongs to the Ameers of Sind, who reside at Hyderabad, and are tributary to the king of Cabul. There is a constant communication kept up between Co-

rachie and Muscat, a journey of about twenty days.

CORACIAS, the roller, in ornithology, a genus of birds of the order of picæ: the characters are these:—The bill is straight, bending towards the tip, with the edges cultrated; the nostrils are narrow and naked; the legs for the most part short; the toes placed three before and one behind, and divided to their origin. One or other of the different species may be met with in all quarters of the globe. Ornithologists enumerate twenty-five species, though some of these are supposed to be only varieties. The following are the most remarkable:—

C. garrula, the garrulous roller, is about the size of a jay, the bill black, and at the base beset with bristles, but which do not cover the nostrils; the head, neck, breast, and belly, are of a light bluish green; back and scapulars reddish-brown; coverts on the ridge of the wing rich blue, beneath pale green; upper part and tips of the quills dusky; the lower parts and rumps of a fine deep blue; tail forked of a light blue; the outer feathers tipped with black above, and beneath with deep blue, as is the case with such part of the quill-feathers as is black above; the other tail feathers are dull green: the legs are short, and of a dirty yellow. Mr. Pennant observes that these birds are common in several parts of Europe, in most parts of which it is a bird of passage. They are found in Sweden and Denmark on the one hand, and as far as Africa on the other. Willoughby tells us, that in Germany, Sicily, and Malta, they are sold in the markets.

C. Sinensis, the Chinese roller, is of the size of a jay: The bill and irides are red: the head, hind part of the neck, back, rump, and upper tail coverts, are green: through the eyes on each side is a black stripe: the under parts of the body, from chin to vent, are yellowish-white, tinged with green; but the thighs are gray: the wing-coverts are olive brown; the quills the same, with a mixture of chestnut in some; and others, nearest the body, tipped with white; the tail is five inches in length, and wedge-shaped, the outer feathers shortening by degrees, like that of a magpie; all of them are more or less green, verging to black near the ends; the tips white: the legs and claws are of a pale red, and longer than in other rollers. It inhabits China, and is called at Canton *sauts hoang*, but is not very common.

CORACLE, *n. s.* Welsh *cwrugle*, probably from Lat. *corium*, leather. A boat used in Wales, and some of the adjoining counties, by fishers, made by drawing leather or oiled cloth upon a frame of wicker work. It is nearly of an oval shape, from five to six feet long, and four feet broad, and is guided by a paddle. It is not capable of carrying more than one person conveniently, and can be managed only by those who are accustomed to this sort of conveyance.

CORAH, or Jehanabad, a district of the province of Allahabad, Hindostan, situated in the Dooab, or country between the Jumna and Ganges. It is enclosed in the collectorship of Cawnpore. It is a level fertile country, well watered, and producing abundance of grain,

sugar-cane, tobacco, and cotton; having also good roads, and navigable rivers east and west, it offers good mercantile advantages. The British first obtained an influence in this province in the middle of the last century, when it was a condition of the treaty of peace with the Mahrattas, that Corah should be made over to the emperor Shah Alum; who regranted it to that power, in violation of the treaty, in 1771. After this it was tributary to the British for many years, at the rate of fifty lacks of rupees annually, and was finally transferred to them by Saadub Ali Khan in 1801.

CORAH, the capital of the district, is situated on the high road between Lucknow and the Deccan, about half way between the two rivers. Most of the houses are of mud, and have flat roofs, and the town is surrounded with a mud wall. Some of the better houses are of brick, and, as the residence of the collector, it is a large and flourishing town, and carries on a good trade in cotton and grain. It had formerly a mint, the rupees of which were inferior to those of Lucknow, but formed the general currency, both in the Dooab and Bundelcund.

CORAIR, a district of the province of Gundwanah, Hindostan, tributary to the Mahrattas, lying between the twenty-third and twenty-fourth degrees of north latitude, and about the eighty-third degree of east longitude. It is a poor country, but abounds in game. It is tributary to the Mahrattas. The inhabitants are called Chohans; the present capital is Sonchut.

COR'AL, *n. s. & adj.* Lat. *corallium*;
COR'ALLINE, *n. s. & adj.* } *κοραλλιον*. For a
COR'ALLOID, *adj.* } description of coral,
COR'ALLOIDAL, *adj.* } and the means of obtaining it, see the next article. Coral is also the name of an ornamented piece of coral, which infants wear round their necks when cutting their teeth. Coralline is, consisting of coral; approaching to coral; likewise one species of coral. See **CORALLINE**. Coralloid, and coralloidal, signify, having a resemblance to coral.

Ful fetise was hire cloke: as I was ware,
 Of smal *corall* about hire arm she bare
 A pair of bedes gauded all with grene.

Chaucer. Prolog. to Cant. Tales.

My mistress' eyes are nothing like the sun,
Coral is far more red than her lips' red.

Shakspeare. Sonnet cxxx.

In the sea, upon the south-west of Sicily, much coral is found. It is a submarine plant; it hath no leaves; it brancheth only when it is under water. It is soft, and green of colour; but, being brought into the air, it becometh hard and shining red, as we see.

Bacon's Natural History.

This gentleman, desirous to find the nature of coral, caused a man to go down a hundred fathom into the sea, with express orders to take notice whether it were hard or soft in the place where it groweth.

Browne's Vulgar Errors.

Now that plants and ligneous bodies may indurate under water, without approachment of air, we have experiment in *coralline*, with many *coralloidal* concretions.

Browne.

He hears the crackling sound of coral woods,
 And sees the secret source of subterranean floods.

Dryden's Virgil.

A turret was inclosed

Within the wall, of alabaster white,
And crimson coral, for the queen of night,
Who takes in Sylvan sports her chaste delight.

Dryden.

Or where's the sense, direct or moral,
That teeth are pearl, or lips are coral? *Prior.*

Her infant grandame's coral next it grew;
The bells she gingled, and the whistle blew.

Pope.

At such time as the sea is agitated, it takes up into itself terrestrial matter of all kinds, and in particular the *coralline* matter, letting it fall again, as it becomes calm.

Woodward.

The pentadrous, columnar, *coralloid* bodies, that are composed of plates set lengthways of the body, and passing from the surface to the axis of it.

Id. on Fossils.

Coralline is a sea plant used in medicine; but much inferior to the coral in hardness, sometimes greenish, sometimes yellowish, often reddish, and frequently white.

Hill.

In Falmouth there is a sort of sand, or rather *coralline*, that lies under the owse.

Mortin. Husb.

Trim you the morning's lonely star,

Or do you guide pale Cynthia's car?

Pour you the runnels rippling wave,

Or sleep you in a coral cave? *Leftley*

Then, Lesbia! wake thy beauties, fresher far

Than Galatea boasted when she laved

In the smooth deep her coral-axled car,

And the stern heart of Neptune's son enslaved!

Huddesford.

Unknown to sex the pregnant oyster shells,

And coral insects build their radiate shells. *Darwin.*

These perpendicular *coralline* rocks make some parts of the Southern Ocean highly dangerous. *Id.*

The granite, or moorstone, or porphyry, constitute the oldest part of the globe, since the limestones, shells, *coralloids*, and other sea productions, rest upon them; and upon these sea productions are found clay, iron, salt, and silicious sand or grit stone. *Id.*

CORAL. See CORALLINA. There are properly but three kinds of coral; red, white, and black: the black is the rarest, and most esteemed. The red was formerly used in medicine, but is now scarcely ever prescribed by any intelligent practitioner, having no virtues superior to the common testacea. When coral is newly taken up out of the sea, the small protuberances on its surface are soft, and yield, on being pressed, a milky juice which effervesces with acids. The cortical part with which the coral is all over covered, is not near so compact as the internal, and may easily be taken off whilst fresh; and from this part it is usually freed before it comes to the market. The greatest coral trade is in Genoa and Leghorn. Coral is often imitated by artificial compositions, some of which are made to resemble it exactly; but the fraud may be discovered by fire, the counterfeit not affording alkaline earth like the genuine coral. The coloring ingredients in the artificial coral are cinnabar and minium, which are easily discovered. The natural coral seems to receive its color from iron; or spirit of vitriol acquires from it a ferruginous tinge; and on calcining the coral, some particles are found among the ashes that are attracted by the magnet. According to Neumann, sixteen ounces of coral, distilled in an open fire, yield out six scruples and a half of volatile alkaline

VOL. VI.

sprit, with two or three grains of an empyreumatic oil: from the caput mortuum calcined, five scruples and a half of fixed salt may be extracted.

CORAL FISHERY. Red coral is found in the Mediterranean, on the coast of the ci-devant Provence, from Cape de la Couronne to that of St. Tropez; about the isles of Majorca and Minorca; on the south of Sicily; on the coasts of Africa; and in the Ethiopic Ocean, about Cape Negro. The divers say, that the little branches are found only in the caverns whose situation is parallel to the earth's surface, and open to the south. The manner of fishing is nearly the same wherever coral is found. The method used at the bastion of France, under the direction of the company established at Marseilles, is to send out seven or eight men in a boat, and when the net is thrown by the caster, the rest work the vessel, and help to draw the net in. The net is composed of two rafters of wood tied cross wise, with leads fixed to them: to these they fasten a quantity of hemp twisted loosely round, and intermingled with some large netting. This instrument is let down where they think there is coral, and pulled up again when the coral is strongly entangled in the hemp and netting. For this purpose, six boats are sometimes required; and if in hauling in, the rope happens to break, the fishermen run the hazard of being lost. Before the fishers go to sea, they agree for the price of the coral, which is sometimes more, sometimes less, a pound; and they engage, on pain of corporal punishment, that neither they nor their crew shall embezzle any, but deliver the whole to the proprietors. When the fishery is ended, which amounts one year with another to twenty-five quintals for each boat, it is divided into thirteen parts; of which the proprietor has four, the casters two, and the other six men one each; the thirteenth belongs to the company, to whom the boat belongs.

CORAL RIVER, a river in New Mexico, which runs a course west by south, and falls into the head of the gulf of California, close by the mouth of the Collerado.

CORAL-STONE, a kind of red and white agate, found in Italy and some parts of Saxony, which breaks in veins. That of Rochlitz in Saxony is the most celebrated, and is found in globules which have a kind of crust about them.

CORAL-TREE, *n. s.* Lat. *coraliodendron*. See ERYTHRINA.

It is a native of America, and produces very beautiful scarlet flowers; but never any seeds in the European gardens. *Miller.*

CORALLINA, or **CORAL,** in zoology, a genus belonging to the order of vermes zoophyta. The trunk is radicated, jointed, and calcareous. The species are thirty-eight, distinguished by the form of their branches, and are found in the ocean adhering to stones, bones, shells, &c. The corals were formerly believed to be vegetable substances hardened by the air; but are now known to be composed of congeries of animals, which are even endued with the faculty of moving spontaneously. The islands in the South Sea are mostly coral rocks covered over with earth.

The little creatures, which have scarce sensation enough to distinguish them from plants, build up a rocky structure from the bottom of that sea, too deep to be measured by human art, till it reaches the surface. Some of these coralline islands appear to be of a much older date than others; particularly the Friendly Islands: and it is probable that as these submarine works are still going on, new islands may be that means frequently be produced. M. De Peyssonnel of Marseilles, in consequence of a series of experiments, from 1720 to 1750, seems to have been the first who threw a proper light upon the nature and production of coral and similar marine substances. Those bodies, which the count de Marsigli imagined to be flowers, this ingenious naturalist discovered to be insects inhabiting the coral; for upon taking branches of it out of the water, the flowers, which proceeded from a number of white points answering to the holes that pierced the bark, and the radiation of which resembled the flower of the olive tree, entered into the bark and disappeared; but upon being again restored to the water, they were some hours after perceptible. These flowers spread on white paper lost their transparency, and became red as they dried. The holes in the bark correspond to small cavities upon the substance of the coral; and when the bark is removed, there may be seen an infinite quantity of little tubes connecting the bark with the inner substance, besides a great number of small glands adhering to them; and from these tubes and glands the milky juice of coral issues forth: the holes in the bark are the openings through which the insects that form the substances for their habitation come forth; and those cavities which are partly in the bark and partly in the substance, are the cells which they inhabit. The organs of the animal are contained in the tubes, and the glandules are the extremities of its feet, and the milky liquor is the blood and juice of the animal, which are more or less abundant in proportion to its health and vigor. When the insects are dead, they corrupt, and communicate to the water the smell of putrid fish. This juice or liquor runs along the furrows perceived upon the proper substance or body of coral, and stopping by little and little becomes fixed and hard, and is changed into stone; and being stopped in the bark, causes the coral to increase proportionably and in every direction. In forming coral, and other marine productions of this class, the animal labors like those of the testaceous kind, each according to his species; and their productions vary according to their several forms, magnitudes, and colors. The coral insect, or polype, M. Peyssonnel observes, expands itself in water, and contracts itself in air, or when it is touched with the hand in water, or acid liquors are poured upon it: and he actually saw these insects move their claws or legs, and expand themselves, when the sea water containing coral was placed near the fire, and keep them in their expanded state when separated from the coral in boiling water. Broken branches of coral have been observed to fasten themselves to their branches, and have continued to grow; and this is the case when they are connected with detached pieces of rock and other substances, from

which no nourishment could be derived. The coral insects in their cells, not having been injured, continue their operations; and as they draw no nourishment from the stone of the coral they are able to increase in a detached and separate state. Coral was found to be equally red in the sea as out of it: it was more shining when just taken out of the water than even when it is polished; and the bark by being dried becomes somewhat pale. M. Peyssonnel found that it grows in different directions, sometimes perpendicularly downwards, sometimes horizontally and sometimes upwards; and in the caverns of the sea, open to every exposure. This system was little regarded, when first communicated to the Academy of Sciences at Paris in 1727, till Mr. Trembley's discovery of the fresh water polype; but since that time, it has been confirmed by the observations of M. Bernard de Jussieu or the sea coasts of Normandy, and those of M. de Reaumur near Rochelle. Mr. Ellis distributes corallines into four kinds: viz. corallines, *articulated*, consisting of short pieces of a stony or cretaceous brittle matter, whose surface is covered with pores or cells, which are joined by a tough membranous, flexible substance, composed of many small tubes of the like nature compacted together. The stony part is soluble in vinegar and the other part remains entire. It is fixed to rocks and shells by stony joints, which, as they rise, are united to others by extremely fine and slender tubes: these may be discovered by the eye, or a common magnifier. As the stems extend themselves, they become pennated by side branches which come out opposite to each other and are jointed in the same manner; the joints of this species are like the upper part of an inverted cone, but a little compressed: the whole surface is covered over with very minute circular shaped cells like pores. If a branch of this coralline is put into vinegar, these cells are dissolved with the whole cretaceous surface; instead of which there appear rows of minute ramifications, which seem to have communicated with each of these cells. Upon some specimens of this coralline, are seen small figures like seed vessels, with which the branches frequently terminate: they are also found on the sides. We frequently find these corallines of different colors as red, green, ash, and white; but all of them when exposed to the sun and air on the shore become white. Corallines, *celliferous*, those which appear, when magnified, to be fine thin cells, the habitations of small animals connected together, and disposed in a variety of elegant forms like branches. These effervesce with acids. Corallines, *tubular*, are composed of a number of simple tubes, growing up nearly together; or of such branched ones as have neither denticle nor vesicles. These are horny and elastic, and recover their original form in water. Some of them appear wrinkled like the wind-pipe, and others like the intestines of small animals. Corallines, *vesiculated*, are distinguished by their horny hollow ramifications; most of them are furnished with little denticles on their branches like leaves on mosses; and at certain seasons of the year they have small bodies like bladders proceeding from their stems and branches, and

differing in form according to the different species. Their color, when dry, is of a yellowish or pale brown, and their nature is elastic. They are found adhering to rocks, shells, and fucuses, by small root-like tubes: they recover their form in water, after having been dried; and when put into vinegar, they cause no effervescence.

CORALLODENDRON. See **ERYTHRINA**.

CORALLOIDES FRUTICES. See **ESCHARA** and **KERATOPHYLUM**: also **POLYPUS** and **SPONGIA**.

CORAM (Captain Thomas), was born about 1668, and spent the early part of his life in the station of master of a vessel trading to the colonies. Afterwards residing in the eastern part of London, among seafaring people, where business often obliged him to come early into the city and to return late, he frequently saw young children exposed in the streets, through the indigence, or cruelty of their parents. This excited his compassion, and induced him to project the foundation of an hospital for foundlings. In this humane design he labored with indefatigable diligence for seventeen years; and by his application procured a number of the nobility and gentry to patronise and carry the scheme into execution, and at length obtained the royal charter for it. He was also highly instrumental in promoting the trade of America, by procuring a bounty upon naval stores imported from our colonies. He was likewise eminently concerned in founding the colonies of Georgia and Nova Scotia. His last charitable design, in which he lived to make some progress, was a scheme for uniting the North American Indians more closely to the British interest, by an establishment for the education of Indian girls. In short, he spent the greatest part of his life in laboring for the public, and experienced a fate too common with those who devote their talents to such purposes; being at last indebted for subsistence to the voluntary subscriptions of some public-spirited persons, at the head of whom was the late Frederic Prince of Wales. He died in 1751; and was interred, at his own desire, in a vault under the chapel of the Foundling Hospital.

CORAN. See **ALCORAN**, and **MAHOMETANISM**.

CORANICH, among the Scotch and Irish, the custom of singing at funerals, anciently prevalent in those countries, and still practised in several parts. Mr. Pennant having assisted at a funeral in the south of Ireland, gives the following account of it. 'The cries are called by the Irish uloghone and hullulu, two words very expressive of the sound uttered on these occasions; and being of Celtic stock, etymologists would swear to the origin of the *αοληγων* of the Greeks, and the ululatus of the Latins. Virgil is very fond of using the last whenever any of his females are distressed; as are others of the Roman poets, and generally on occasions similar to this.' 'It was my fortune to arrive at a certain town in Kerry at the time that a person of some distinction departed this life; my curiosity led me to the house, where the funeral seemed conducted in the purest classical form. The conclamation was set up by the friends, in the same manner as Virgil describes that consequential of Dido's death. Immediately after this followed another

ceremony, fully described by Camden in his account of the manners of the ancient Irish; the earnest expostulations and reproaches given to the deceased for quitting this world, where she enjoyed so many blessings, so good a husband, and such fine children. But when the time approached for carrying out the corpse, the cry was redoubled, Tremulis ululatus aethera complent: a numerous band of females waiting in the outer court to attend the hearse, and to pay in chorus the last tribute of their voices. The habits of this sorrowing train, and the neglect of their persons, were admirably suited to the occasion; their robes were black and flowing, resembling the ancient pallia; their feet naked, and their hair long and dishevelled. The corpse was carried slowly along the verge of a most beautiful lake, the ululatus was continued, and the whole procession ended among the venerable ruins of an old abbey.' A custom similar to this prevailed among the Hebrews, and bishop Lowth has given a beautiful description of it in his justly celebrated Lectures on the Sacred Poetry of the Hebrews.

CORANT, } French *courant*. A lofty
CORANTO, or } sprightly dance, says John-
COURANTO, n. s. } son. Sir John Hawkins, however, remarks that the coranto is the most solemn of all dance tunes. Corant, or courant, was also a name formerly given to a newspaper.

He like a maid the better while I have a tooth in my head; why he is able to lead her a *couranto*.
Shakspeare. All's Well.
After this they danced galliards and *corantos*.

Ben Jonson.
Corants, avises, correspondences. *Id.*

The weekly *courants* with Paul's seal. *Id.*
It is harder to dance a *corant* well than a jig; so in conversation, even, easy, and agreeable, more than points of wit. *Temple.*

I would as soon believe a widow in great grief for her husband, because I saw her dance a *corant* about his coffin. *Walsh.*

Here Mermaids press their liquid pillows,
And sing to sleep the growling billows;
Or make the ravished whales they chant to
In the churned ocean dance *coranto*. *Huddesford.*

CORAX. See **CORVUS**.

CORBACH, a town of Germany, in the late circle of the Upper Rhine, and principality of Waldeck, of which it is the capital. It was formerly imperial. It is divided into the Old and New town, the latter of which contains an academy; and near it on a high mountain is the castle of Eissenberg. The Hanoverians were defeated by the French near this town, in 1760. It lies twelve miles N. N. W. of Waldeck, and seventy east of Cologne.

CORBAN, n. s. An alms-basket; a receptacle of charity; a gift; an alms. See below.

They think to satisfy all obligations to duty by their *corban* of religion. *King Charles.*

CORBAN, in Hebrew קרבן, a gift or offering, made on the altar, and also the treasury of the temple where the offerings of money, &c. were deposited. Corban was also applied to those offerings which had life, in opposition to the minchab, or those which had not. It is derived from the word karab, which signifies to approach; because the victims were brought to the door &c.

the tabernacle. Corban is also a ceremony which the Mahommedans perform at the foot of mount Ararat in Arabia, near Mecca. It consists in killing a great number of sheep, and distributing them among the poor.

CORBE, *n. s. & adj.* Fr. *courbe*. Corbe, a diminutive of corbel, signifies, as a noun, an architectural ornament. The adjective means crooked.

It was a bridge ybuilt in goodly wize
With curious *corbes* and pendants graven faire.
Spenser. Faerie Queene

For siker thy head very tottie is,
So thy *corbe* shoulder it leans amiss.

Id. Pastorals.

CORBELL, a town of France, in the department of the Seine and Oise, and ci-devant province of the Isle of France. Its chief trade is in tanned leather. It is seated on both sides of the Seine, at its conflux with the Juine. Population 3500. Nine miles N. N. W. of Melun, and seventeen south of Paris.

CORBELS, *n. s.* Little baskets used in fortification, filled with earth, and set upon the parapet, to shelter the men in firing upon the besieger.

CORBEL, *n. s.* In architecture, the representation of a basket, sometimes placed on the heads of the caryatides.

CORBEL, or **CO'RBIL**, *n. s.* A short piece of timber sticking out six or eight inches from a wall, sometimes placed for strength under the semigirders of a platform; a niche or hollow left in walls for figures or statues.

CORCHORUS, in botany, a genus of the monogynia order and polyandria class of plants; natural order thirty-seventh, columnæ: **COR.** is pentapetalous: **CAL.** pentaphyllous and deciduous: **CAPS.** many-valved and many-celled. There are fourteen species; of which the most remarkable is the *C. oltorius*, an annual, found in Asia, Africa, and America. It rises with a round, striated, upright, branched stalk, near two feet, furnished with leaves differing in shape; some being oval, some cut off straight at their base, and others almost heart-shaped. They are of a deep green color, and have a few teeth on the margins of their base, that end in bristly, reflexed, purplish, filaments. The flowers come out at the sides of the branches opposite to the leaves. They stand singly on very short peduncles; are composed of five small yellow petals, and a great number of stamina surrounding an oblong germen, which becomes a long, rough, sharp-pointed capsule, opening in four parts, each filled with greenish angular seeds. This plant is sown by the Jews about Aleppo, and is therefore called Jews' mallow. The leaves are a favorite salad among these people, which they boil and eat with their meat.

CORCYRA, in ancient geography, an island in the Ionian Sea, opposite to Thesprotia, a district of Epirus, called Scheria and Phæacia by Homer. By Callimachus it is called Drepane; its most ancient name, according to the Scholiasts from its curved figure. It was famous for the shipwreck of Ulysses and the gardens of Alcinoüs: and is now called Corfu.

CORCYRA, a town in the above island, formerly powerful; situated about the middle of the east side, called the Town of the Phæacians by Homer; and now Corfu, from the Κορυφή of the middle age, the name of the citadel. It was a colony of Corinthians.

CORCYRA NIGRA, an island in the Adriatic, on the coast of Dalmatia; called Melæna by the Greeks to distinguish it from the above island. The epithet Nigra was added, from its woods of tall trees with which it is almost covered. It is now named Curzola.

CORD, *v. a. & n. s.* } Fr. *corde*; Ital. *corda*;
CO'RDAGE, *n. s.* } Span. *cordel*; Dut. *korde*;
CO'RDED, *adj.* } Welsh *cort*; Lat. *chorda*.

A rope; a string composed of several strands or twists, commonly of hemp; a quantity of wood for fuel, supposed to be measured with a cord; a pile eight feet long, four high, and four broad. Cordage is a quantity of cords; the ropes employed in rigging a ship. To cord is, to fasten with ropes; to tie up a package; to close by a bandage. Corded signifies that which is formed of ropes; secured with ropes.

She let them down by a *cord* through the window.
Joshua ii. 5.

Thine eyes shall see Jerusalem a quiet habitation,
a tabernacle that shall not be taken down; none of the stakes thereof shall ever be removed, neither shall any of the *cords* thereof be broken.
Isaiah xxxiii. 20.

He set him up withouten wordes mo,
And with his axe he smote the *corde* atwo,
And down goth all. *Chaucer. Cant. Tales.*

Nor in this world there is none instrument
Delicious through winde or touch on *corde*,
As ferre as any wight hath er iwent,
That tonge tell or her'te maie record,
But at that fest it was well herd accorde.

Id. Troilus and Creside.

In depe dispayre as did a wretch go,
With reedy *corde* out of his life to spede,
His stumbling foot did fynde an hoerde. *Wyat.*

She bore before her lap a dolefull squyre,
Lying athwart her horse in great distresse,
Fast bounden hands and feet with *cordes* of wire.

Spenser. Faerie Queene.

Fair Stenobœa that herself did choke
With wilfull *chord*, for wanting of her will. *Id.*
This night he meaneth, with a *corded* ladder,
To climb celestial Silvia's chamber window.

Shakspeare.

Our *cordage* from her store, and cables, should be
made,
Of any in that kind most fit for marine trade.

Dray't. n.

They fastened their ships, and rid at anchor with
cables of iron chains, having neither canvas nor *cordage*.

Raleigh.

Formed of the finest complicated thread,
These numerous *cords* are through the body spread.

Blackmore.

Spain furnished a sort of rush called spartum, useful
for *cordage* and other parts of shipping.

Arbutnot on Coine.

Redoubling *cords* the lofty canvas guide,
And through inextricable mazes glide. *Falconer.*

Each lofty yard with slackened *cordage* reels,
Rattle the creaking blocks, and ringing wheels. *Id.*

Such he appeared as when, in battle slain,
The victor's chariot rapt him o'er the plain.

Black bloody dust his lineaments defaced ;
And through his wounded feet the cords were braced.
Symmons' Æneis.

Thus by acclaim the public sentence known,
The walls we sever, and unfold the town.
All labour : some the encircling cordage tie ;
Some the wheel's motion to the feet supply. *Id.*

COR'D-MAKER, *n. s.* From cord and make. One whose trade is to make ropes ; a ropemaker.

COR'D-WOOD, *n. s.* From cord and wood. Wood piled up for fuel, to be sold by the cord.

CORDAGE, **ANCIENT**. The naval cordage of the earlier ages was, in all probability, only thongs of leather. These primitive ropes were retained by the Caledonians in the third century. The nations north of the Baltic had them in the ninth or tenth centuries : and the inhabitants of the western isles of Scotland still use them ; cutting the skin of a seal, or the raw and salted hide of a cow, into long pieces, and fastening the plough to their horses with them, or even twisting them into strong ropes of twenty or thirty fathoms length. But these, in the south of our island, and on the continent, were early superseded by the use of iron chains. The Veneti, who were so intimately connected with the Belgæ of Britain, used iron chains for their cables in the days of Cæsar. But in the more refined countries of the south, both thongs and these had long given place to vegetable threads. The Greeks appear to have used the common rushes of their country, and the Carthaginians the spartum, or broom of Spain. And as all the cordage of the Romans was made of these materials at their last descent on our island, so the art of manufacturing them would necessarily be introduced, with the Roman settlements, among the Britons. Under the direction of Roman artists their thongs of leather would naturally be laid aside, and the junco, or rushes of the plains, worked up into cordage. And what remarkably coincides with this opinion is, that the remains of old cables and ropes are still distinguished among the British sailors by the name of old junk. The Roman sails, which were composed of flax in the days of Agricola, were afterwards made of hemp ; and our own are therefore denominated cannabis or canvas by our mariners at present. And doubtless about the same period did the junk of the British cordage give way to the same materials ; the use of hempen ropes upon land, and of hempen nets for hunting, being very common among the Romans in the first century. See **ROPE-MAKING**.

COR'DATE, *adj.* Lat. *cor, cordis*. Heart-shaped.

CORDATED, an appellation frequently given by naturalists to things somewhat resembling a heart.

CORDE' (Charlotte), a celebrated heroine during the French revolution, was born in 1768, of a good family near Seez in Normandy, and lived chiefly at Caen, where she was greatly admired for her beauty and spirit. She is described by J. Baptist Louvet as 'a stout, handsome, young woman, of a most engaging air—gentle yet noble, modest and beautiful ;—in her face and carriage, which were those of a fine and handsome woman, there was a mixture of gen-

teness and majesty, which indicated the strength of her mind. Among the many officers who were massacred by the soldiery at the instigation of Marat, there was one Belsunce, a major, for whom Charlotte Cordè had a particular regard ; and the melancholy fate of this man animated her with sentiments of vengeance against the incendiary, whom she considered as the chief cause of all the bloodshed and anarchy that then distracted her country. Regardless of her own life, and determined to avenge the death of her lover, and rid the nation of a tyrant, she hastened to Paris, was introduced to the presence of Marat, to whom she presented a paper to read, and while he was thus employ'd, she stabbed him to the heart with a dagger, July 12th, 1793. Far from attempting to escape, she confessed the action ; and from the conclusion of a letter which she wrote to her father on the occasion, 'Crime begets disgrace, and not the scaffold,' she seems to have considered it no crime nor disgrace. She was guillotined on the 16th of July, 1793 ; manifesting at her execution, as she had also done at her trial, the most undaunted courage. The extraordinary conduct of this woman was accompanied with conduct no less extraordinary ; for as she was conveyed to the scaffold, a deputy of the city of Mayence, named Adam Lux, a young man, was so transported with admiration of her beauty, that he hastened to the tribunal and demanded to suffer death under the same instrument ; and he was accordingly condemned and executed.

CORDED, in heraldry, a cross wound about with cords as in the annexed diagram. He beareth, *argent* a St. George's cross, corded, *azure*, name Wilkinson.

CORDELIER, *n. s.* A Franciscan friar : so named from the cord which serves him for a cincture.

And who to assist but a grave *cordelier*. *Prior.*

CORDELIERS, or Franciscan friars, are clothed in thick gray cloth, with a little cowl, a chaperon, and cloak, of the same ; having a girdle of cord tied with three knots, whence the name. Their original name was Minor friars. The denomination Cordelier is said to have been first given them in the war of St. Louis against the infidels ; wherein the Friars Minor having repulsed the barbarians, and that king having enquired their name, it was answered, they were people cordeliez, 'tied with ropes.' They are professed Scots.

CORDEMOI (Gerald de), a learned Cartesian philosopher and historian, born at Paris. Being appointed reader to the dauphin, he instructed that prince with great assiduity ; and in 1675 was received into the French Academy. He wrote a general history of France during the first races of the French Kings, in 2 vols. ; and six Discourses on the Distinction between Body and Soul, which were printed together in 1702, in 4to. He died in 1684.

CORDIA, in botany, a genus of the monogynia order, and pentandria class of plants ; natural

order forty-first, asperifolia: cor. funnel-shaped: style dichotomous or divided into two threads, and each of these divided into other two. There are eighteen species, of which the principal are, 1. *C. myxa*, the Assyrian plum, native of Assyria, Egypt, and the coast of Malabar. It rises to the height of a middling plum-tree; and its branches are furnished with oval, woolly leaves, standing without order. The flowers are produced in bunches, are white, and consist of one tubular petal, and a like calyx, nearly of an equal length, and both are cut into five parts at their brims. In their centre are five very small stamina, and one slender style crowned with an obtuse stigma. The germen is roundish, and swells to a plum of the same form, and about the size of a damson, of a dark brown color, a sweet taste, and very glutinous. These plums were formerly kept in the shops; and were accounted good for obviating acrimony, and thereby stopping deluxions of rheum upon the lungs; but they are now little used. In some parts of Turkey they cultivate this tree in great abundance, not only for the sake of the fruit, but to make birdlime. 2. *C. s. l'estena*, the rough-leaved sebasten, grows naturally in both the Indies, and sends forth several shrubby stalks eight or ten feet high. The young leaves are serrated, but the full grown ones are not. They are of an oblong oval form, rough, of a deep green on the upper side, and stand alternately on short foot-stalks. The flowers terminate the branches in large clusters, are nearly of the shape and color of those of the marvel of Peru, and make a most beautiful appearance. Each has five stamina and one bird style. The plums are much of the shape of those of the myxa, and are eaten in the same manner. The fruit of this tree is less valuable than the wood, a small piece of which thrown upon a clear fire will perfume a room with a most agreeable odor.

COR'DIAL, *n. s. & adj.* } Fr. *cordial*; Ital. *cordiale*; Span. *cordial*; Lat. *cor.* A medicine to increase the strength, or raise the spirits; that which comforts or exhilarates a person; that which puts him in heart. The adjective signifies reviving; strength-restoring; sincere; warm, as a cordial friend, a cordial reception. Brown uses cordiality to denote, relating to the heart; but its common meaning is sincerity; iriendliness of intercourse; heartiness. Cordialness is synonymous with it. Cordially is sincerely; heartily.

Many restoratives of virtues rare,
And costly *cordialles*, she did apply,
To mitigate his stubborn malady.

Spenser. Faerie Queene.

It is a thing I make, which hath the king
Five times redeemed from death: I do not know
What is more *cordial*. *Shakspeare. Cymbeline*

If nor a dramme of treacle soveraigne,
Or aqua vite, or sugar candian,
Nor lutehen *cordials* can it remedie,
Certes his time is come, needs mought he die.

Hell.

Cordials of pity give me now,
For I too weak for purges grow. *Cotley.*

He, with looks of *cordial* love,
Hung over her enamoured. *Milton.*
That the antients had any such respects of *cordiality*,
or reference unto the heart, will much be doubted. *Brown.*

Doctrines are infused among Christians, which are apt to obstruct or intercept the *cordial* superstructing of Christian life of renovation, where the foundation is duly laid. *Hammond.*

Where a strong inveterate love of sin has made any doctrine or proposition wholly unsuitable to the heart, no argument, or demonstration, no nor miracle whatsoever, shall be able to bring the heart *cordially* to close with, and receive it *South's Sermons.*

Your warrior offspring that upheld the crown,
The scarlet honour of your peaceful gown,
Are the most pleasing objects I can find,
Charms to my sight, and *cordials* to my mind. *Dryden.*

He only took *cordial* waters, in which we infused sometimes purgatives. *Wiseman's Surgery.*

A *cordial*, properly speaking, is not always what increaseth the force of the heart; for, by increasing that, the animal may be weakened, as in inflammatory diseases. Whatever increaseth the natural or animal strength, the force of moving the fluids and muscles, is a *cordial*: these are such substances as bring the serum of the blood into the properest condition for circulation and nutrition; as broths made of animal substances, milk, ripe fruits, and whatever is ended with a wholesome but not pungent taste. *Arbuthnot on Aliments.*

If Heaven a draught of heavenly pleasure spare,
One *cordial* in this melancholy vale,
'Tis when a youthful, loving, modest pair,
In others' arms breathe out the tender tale,
Beneath the milk-white thorn that scents the ev'ning Buns. *Burns.*

We must take human nature as it is: and, if a rude multitude cannot readily comprehend a moral or political doctrine, which they need to be instructed in, it may be as allowable to illustrate that doctrine by a fable, in order to make them attend and understand it, as it is for a physician to strengthen a weak stomach with *cordials*, in order to prepare it for the business of digestion. *Beattie.*

That *cordial* thought her spirits cheered,
And through the cumbrous throng,
Not else unworthy to be feared,
Conveyed her calm along. *Cooper.*

Tenon was the *cordial* poured, and mantle flung
Around his scarce clad limbs; and the fair arm
Raised higher the faint head which o'er it hung. *Byron. Don Juan.*

COR'DILLERAS. See ANDES.
COR'DINER, *n. s.* Fr. *cordonnier*. A shoemaker. It is so used in divers statutes.

CORDON, *n. s.* French. In fortification, a row of stones jutting out before the rampart and the basis of the parapet.

CORDONNIERS, FRERES, Fr. i. e. Brothers Shoemakers, the title of two pious societies, which existed in Paris before the revolution. They were established by authority about the middle of the seventeenth century; the one under the protection of St. Crispin, the other of St. Crispianus, two saints who had formerly honored the profession. They lived in community, and under fixed statutes and officers by which they were directed both in their spiritual and secular concerns. The produce of their shoes was put into a common stock, to fur-

nish necessaries for their support ; the rest to be distributed among the poor.

CORDOVA, a small but fertile province of Spain, in Andalusia, formerly an independent kingdom. After the fall of the Roman empire it was subjected to the dominion of the Goths ; but in the eighth century it was raised by the Moors to a state of unequalled splendor. In 755 Abdelrahman, the heir male of the Omniad line, having passed over from Africa, at the head of a few desperate followers, raised a rebellion in Spain ; when, after a battle fought on the banks of the Guadalquivir, in which he overthrew the lieutenant of the caliph of Damascus, he became king of all the Moorish possessions in the south of Spain, and fixed, in 759, his royal residence at Cordova. Then began those flourishing ages of Arabian gallantry and magnificence, which rendered the Moors of Spain superior to all their contemporaries in arts and arms, and made Cordova one of the most splendid cities in the world. Agriculture and commerce prospered under the happy sway of this hero ; and the face of the country was changed from a scene of desolation, which the long wars and harsh government of the viceroys had brought on, into a most populous and flourishing state, exceeding in riches, number of inhabitants, activity, and industry, any prior or subsequent era of the Spanish history. He added new fortifications to the town, built a magnificent palace with delightful gardens, laid causeways through the marshes, made excellent roads to open ready communications between the great towns, and in 786 began the great mosque, which he did not live to finish. During two centuries, this court continued to be the resort of all professors of polite arts, and of such as valued themselves upon their military accomplishments : whilst the rest of Europe was buried in ignorance, debased by brutality of manners, or distracted by superstitious disputes. England, weakened by its heptarchy, was too inconsiderable even to be mentioned in the political history of the times ; France, though it had a gleam of reputation under Charlemagne, was still a barbarous, unpolished nation ; and Italy was in utter confusion ; the frequent revolutions and change of masters rendered it impossible for civilisation to acquire a permanent footing in so unstable a soil. Twelve caliphs succeeded to the throne of Abdelrahman at Cordova, but its repose was disturbed, and the power of the monarchs shaken, by those repeated insurrections to which despotic governments are exposed. In the reign of Abdalla, Suar Alcaisi, and afterwards Said, a native of Syria, raised the standard of revolt in the mountains of Alpujarras, between Cordova and Granada, and though joined by numbers of the discontented, was, after numerous conflicts, quelled by the general of Abdalla. The calm which succeeded these revolts was disturbed by Mahomed ben Abdallatiph, of a Persian family, established in Alhama, who, supported by a body of insurgents, proclaimed himself caliph, and maintained a long and doubtful war with his sovereign ; but was conquered, and finally met the fate of a traitor, during the reign of Abdelrahman the Third, in the year 924 of the Christian era. For nearly a century after

this period the sovereigns of Cordova enjoyed an undisturbed repose, till Soliman ben Alhaken, an adventurer from Africa, led a numerous army of Moors into Spain, where he was joined by the discontented Arabs ; and, after a rapid career, entered the city of Cordova, seated himself on the throne of the caliphs, and transmitted to his son Almanzor the power of the Mahommedans, who transferred the royal residence to Granada, in 1013, and whose successors made it their capital till its final subjugation by the Christians.

The modern province is divided into two naturally distinct districts by the Guadalquivir ; west of which the country is mountainous, and a perfect plain to the east. It is bounded on the north by Estremadura and La Mancha, on the east by Jaen and Granada, south by Seville, and west by Seville and Estremadura ; and occupies a space of about 4580 square miles. The entire population is between 250,000 and 260,000.

The valleys between the mountains, as well as the plain districts, are very productive in wine, oil, grain, and figs ; on the hills is the finest pasturage. The Guadalquivir is fed by several streams of less note. The chief towns besides Cordova, are Lucina and Montilla.

CORDOVA, or CORDUBA, an ancient city of Spain, the capital of the above province, is seated on the Guadalquivir, (over which it has a fine stone bridge), in a very extensive plain. The circumference is large, and the river winds round it very beautifully ; but it is not peopled in proportion to its extent, there being many orchards and gardens within the walls. There are many superb structures, palaces, churches, and religious houses. The bridge was built by the Moors, and is supported by sixteen arches. The ancient palace of the Moorish kings was large and beautiful, but has long since been converted into stables.

This city had anciently a university in which all the sciences were cultivated, and in which the elder Seneca, who wrote the Art of Persuasion ; Seneca, preceptor to Nero ; Gallio, the orator ; Lucan, author of the Pharsalia ; Seneca, the tragedian ; Seneca, the historian, and many other eminent men, prosecuted their studies : this university likewise flourished under the Moors. Cordova is the see of a bishop ; and contains, besides the cathedral, sixteen parish churches, forty convents, twenty-one hospitals, and two colleges. The cathedral church was built by the Moors for a mosque, out of the ruins of an ancient Roman temple, and it still retains the name of mezquita, or the mosque. This building is 334 feet in length, and 387 wide. It stands in an insulated position at the head of four of the principal streets. It is very rich in plate. Apart from the rest of the building is a square chapel in which the Moors preserved the book of the law. It is adorned with fine marbles, the entablature being supported by twelve columns, placed upon the shafts of other twelve, with a handsome dome. This building adjoins another square one, which has a cupola supported by eighty four columns of fine marble, and eight windows with sky-lights in alabaster ; and this last leads to a magnificent octagen building.

thirteen feet in height and width, and ornamented with marbles like the other buildings. In 1523 the cathedral was formed into a cross, by building a chapel in the middle, forming as it were a second church. The ancient church of the Martyrs is also a handsome building, containing several fine paintings, and a beautiful marble monument of Ambrosio Moralez; it belongs to the Dominican convent. The church of the Capuchins, and that of St. Francis also, contain several excellent paintings. The royal palace resembles a citadel, and is encircled with walls. The episcopal palace formerly occupied by the Inquisition, is a large building with a noble marble staircase, spacious garden, and an orchard of orange trees. It contains various paintings of respectable masters. But the college of St. Paul is, perhaps, the finest public edifice in this noble city. Its entire front and magnificent staircase are of marble. The cloisters consisting of two ranges of porticoes one above the other, and supported by eighty marble columns, are also much admired. The library contains many rare books and pictures. The whole belongs to the Dominicans. The square called the Plaza Major is surrounded with very fine houses, under which are piazzas. The silk and gold lace manufactures are gone to decay, but a tolerable trade (for Spain) is carried on in gold and silver articles, and the staple manufactures of lace, ribbands, hats, Cordova leather, and baize. Though the art of softening leather and giving it a fine polish was invented at Cordova, the town possesses few tan yards. In the neighbourhood are vast numbers of orange and lemon trees, which render their fruits exceedingly cheap. The best horses in Spain come from hence. Population about 40,000. This city is seventy-five miles north-east of Seville, and 180 S. S. W. of Madrid.

CORDOVA, a province of La Plata, South America, formerly belonging to the vice-royalty of La Plata, or Buenos Ayres, but now ranking among the independent provinces. It is about 300 miles in length, and 210 broad, being bounded by the province of Tucuman to the north, by Buenos Ayres to the east, vast Indian plains or pampas south, and Cuyo west. It is traversed throughout its whole length by an immense chain of mountains, known as the Sierra de Cordova, the Campachin, or Achelan chain, and covered with perpetual snow. It is watered by the Torcera, which joins the La Plata, and some minor streams. This province is celebrated for its numerous herds of cattle, its horses, mules, and woollen manufactures: the young women of all ranks unite in the labors of the loom, and dye the wool themselves, according to Mr. Caldeleugh, most durably. 'The yellow color,' says this writer, 'is produced by the roots of the romeiro, or rosemary, and the blue by anil or indigo; the red is obtained from anotto. The ink and all the black dyes are produced by bruising the pods of the algarabilla, and mixing them with warm water and native sulphate of iron, which is carried a great distance as an article of trade; it is termed *carrosa*, whence perhaps our *copperas* is derived. The *algaraba*, which is I believe, an *acacia*, is

a tree of great value, particularly the *algaroba blanca*. The pods are made by fermentation into a kind of *chicha* or drink, and it serves as well to feed cattle when the maize crop is deficient.' The looms he often found at work under the shade of trees. Cordova joined early in the late revolutionary movements, and a general congress of the then United Provinces was held in its capital in 1821; but it imbibed a jealousy of the preponderance obtained in the new republic by Buenos Ayres, and became detached from the Union. Its population is reckoned at 44,000. Its chief towns, beside the city of Cordova, are Mendoza, San Juan de Jasban, and San Luis de la Punta. The whole country has been frequently disturbed of late by incursions of the Indians from the south.

CORDOVA, or CORDUBA, a city of South America, the capital of the foregoing province, is said, proverbially, to be situated, *en un pezo*, in a well, and the site has the appearance of having been once a considerable depository of water, which has escaped in the direction of the river Primere, or Pune, near which it stands, in lat. 31° 30' S., and long. 63° 15' W. It was founded by the Spanish governor Carbera, in 1573. The streets are regular, and the houses built of brick are higher than the usual style of Spanish towns; most of them are adorned with balconies; but the ground on three sides of the town overtops the highest of them. The great square has one side covered with a neat *cabildo*, and the other with a cathedral. There are fourteen other churches. The population is estimated at 14,000. The neighbourhood is marshy, but very fertile in grain, fruits, and pasturage. A trade in the woollen manufactures and mules of the province was once very flourishing, but the revolution has almost entirely suspended the latter. The university, which comprises the ancient college of the Jesuits, is perhaps one of the finest remnants of the former magnificence of the order. It contains still about 100 students. The church is superb, rich enough, says a late traveller, to show the wealth of the founders, and sufficiently elegant to prove that men with enlightened minds, even without the assistance of models and designs, can possess a chastened and correct taste. The rooms are conveniently arranged, spacious, and numerous. One of the upper apartments was filled with the most expensive physical apparatus, all rapidly going to decay, and the names and purposes of which are now unknown to every inhabitant of the city. Another smaller apartment, in the rear of the pile, had been occupied by the printing press, the only one for a century which existed in this part of the world. The press remained concealed in this retreat for many years after the expulsion of the company.' The climate is intensely hot during summer, and ripens some fine grapes. The mountains of the vicinity contain veins of silver, lead, and copper; and a gold mine is said once to have been worked at Punilla, a short distance off. Old Dobrizhoffer speaks with his usual accuracy of a curious phenomenon yet observed here. 'Lofty rocks rise in every part of the Corduban district. I heard terrible noises like the explosion of cannon; but the natives as-

sured me, that these sounds were common to the neighbouring rocks, and happened perpetually. The air confined in the cavities of the mountain, and attempting a forcible passage through the chinks, when stopped by opposing rocks, and reverberated by their windings, bellows after this fearful manner. In the city of Corduba itself, a hollow murmur, resembling the knocks of a pestle in a wooden mortar, is frequently heard by night. This low mournful sound runs from one street to another, and is called by the Spaniards, *el pison*, or the paving hammer. 'The vulgar,' he adds, 'believe it to be the tramp of some spectre-horsemen riding through the city.' Captains Lewes and Clarke tell us of the same noises being heard by them in the rocky mountains of North America. Mr. Caldecleugh says he listened for it the three evenings he passed here in vain, but heard of it from respectable inhabitants, and by no means discredits, though he could not account for, the alleged sounds.

CORDOVA, or CORDOBA, a large and old city of Mexico, in the intendancy or state of Vera Cruz. Its structures, both public and private, are surmounted by numerous handsome domes and towers, and there is a large square in the centre with Gothic arcades. The cathedral of the town, surrounded on three sides, occupies the fourth, and a fountain of water runs in the middle. The cathedral is considered as one of the most splendid structures in Mexico. All the streets are wide, straight, and well paved, and the houses mostly of stone. The vegetation around is extremely luxuriant, producing all the fine tropical fruits; but the inhabitants are said to be very indolent, and insensible of these advantages. A considerable trade is here carried on in sugar, which, as well as tobacco, flourishes in this neighbourhood. Cordova is 150 miles E. N. E. of Mexico. Inhabitants about 4000.

CORDOVAN, *n. s.* } Fr. *cordovan*; Ital. *cordovano*; Span. *cordovano*; Swed. *kardovan*; Dut. *kordevaine*. A Spanish leather. It is generally supposed to derive its name from Cordova. Thomson, however, seems disposed to look for the origin of it in two Spanish words, which he states to mean sheep's leather. But to this there are two objections, namely, that his Spanish is incorrect, and that cordovan is not made from sheep skins. Cordwainer is a shoemaker.

His here, his berde, was like safroun,
That to his girdle raught adown;
His shoon of *cordewane*. Chaucer. *Cant. Tales*.

Buskins he wore of costliest *cordwayne*,
Pircht upon gold and paled part per part,
As then the guize was for each gentle swayne.
Spenser. *Faerie Queene*.

CORDWAINERS, or CORDINERS, is still the title of the incorporation of shoe-makers in Edinburgh. The first of the above etymologies is best warranted; for, the French workmen who prepare the corduas are still called *corduaniers*.

CORDUBA, in ancient geography, an illustrious city of Bætica, on the right or north side of the Bætis. It was the first colony sent into

those parts by the Romans, and named *Colonia Patricia*, because at first inhabited by principal men, both of the Romans and natives. It is mentioned by Silius Italicus in the second Punic war; and hence it is probable the first Marcellus, and not the second, was the founder. It was famous for the birth of the two Senecas and Lucan, and for its rich produce in oil. See CORDOVA.

CORDUROY, *corde du roi* (Fr.), in manufactures, a stuff originally formed of silk cloth, but now extensively imitated in cotton in our clothing districts. Thicket, velveret, and velveteen, are varieties of it; and the comfortable clothing made from it for the poorer classes, are proofs that kingly garments like all others, change their owners. See COTTON MANUFACTURE.

CORDUS (Valerius), a learned botanist, the son of Etricius Cordus, a physician and poet of Germany. In the prosecution of the study of botany, he examined the mountains of Germany, and travelled into Italy; but being wounded in the leg by the kick of a horse, died at Rome in 1544. He wrote Remarks on Dioscorides, and other works.

CORE, *n. s.* Fr. *cœur*; Lat. *cor*. The heart; the central part of any thing; the capsules which contain the kernels in some fruits, as in the apple and pear; the pus in a boil. Bacon also uses it, corruptly from the French *corps*, to signify a body or collection.

Give me that man

That is not passion's slave, and I will wear him
In my heart's *core*; ay, in my heart of heart.

Shakspeare. *Hamlet*.

It is reported that trees, watered perpetually with warm water, will make a fruit with little or no *core* or stone. Bacon.

He was more doubtful of the raising of forces to resist the rebels, than of the resistance itself; for that he was in a *core* of people whose affections he suspected. Id. Henry VII.

In the *core* of the square she raised a tower of a furlong high. Raleigh's *History of the World*.

Lance the sore,

And cut the head; for, till the *core* be found,
The secret vice is fed, and gathers ground.

Dryden's *Virgil*.

Dig out the *cores* below the surface. Mort. *Husb*.

They wasteful eat,

Through buds and bark, into the blackened *core*.

Thomson.

Never was this one unextinguishable truth destroyed from the heart of man, placed, as it is, in the very *core* and centre of it by his Maker, that man was not made the property of man; that human power is a trust for human benefit; and that when it is abused, revenge becomes justice, if not the bounden duty of the injured. Burke.

Alas! our young affections run to waste,

Or water but the desert; whence arise
The weeds of dark luxuriance, tares of haste,
Rank at the *core*, though tempting to the eyes.

Byron. *Childe Harold*.

And if she met him, though she smiled no more,
She looked a sadness sweeter than her smile,
As if her heart had deeper thoughts in store
She must not own, but cherished more the while
For that compression in its burning *core*.

Id. *Don Juan*.

COREA, a peninsula north-east of China, between 99° and 109° of E. long., and between 32° and 46° of N. lat., said by the Jesuits to be divided into eight provinces, which contain forty cities of the first rank, fifty-one of the second, and seventy of the third. The capital is Hanching, where the king resides. They add that the people are well made, of a sweet and tractable disposition, fond of learning, music, and dancing; and in general resemble the Chinese; but they have little silk, and make use of linen cloth in its room. Their trade consists in paper, pencils, gold, silver, iron, varnish, sables, &c. In general it is a fertile country, though abounding in mountains, and tributary to China. The voyage of captains Hall and Maxwell into this neighbourhood has proved the breadth of this peninsula to be less than was supposed, as a great part of what was thought its western coast, proves to consist of an archipelago of innumerable small islands. Its length may now be taken at about 400 miles, and its average breadth at 150: but the interior is still only known by accounts received through China, and those of Humel, a Dutchman, who was shipwrecked here in the middle of the seventeenth century. According to these accounts a considerable quantity of the paper of Corea is annually imported as tribute into China. It is made of cotton, and is as strong as cloth, being written upon with a small hair brush or pencil; but must be covered with alum-water before it can be written upon in the European manner. It is not purchased by the Chinese for writing, but for filling up the squares of their sash-windows; because, when oiled, it resists the wind and rain better than that of China. It is used likewise as wrapping paper; and is said to be sufficiently tough to serve as the finest cotton cloth in lining clothes. It has also this singular property, that if it be too thick for the purpose intended, it may be easily split into two or three leaves. Like China, Corea has its men of letters, who form a distinct class by themselves, and undergo a similar course of examinations. Its written language is the same, though the spoken dialect is different. The British vessels in sailing along this coast were received hospitably, and a friendly intercourse took place with several chiefs; but great efforts were made to prevent the officers and crews from coming on shore; and when they landed they were, with a singular mixture of anxiety and civility, induced as soon as possible to re-embark.

CORELA, in antiquity, a festival in honor of Proserpine, named Core, Κορη, which in the Molossian dialect signifies a beautiful woman.

COREIGNERS, *n. s.* Those who rule or reign in conjunction.

CORELLI, (Archangelo), a famous Italian musician and composer, born at Fusignano, in Bologna, in 1653. About 1672 his curiosity led him to visit Paris, but, notwithstanding the character which he brought with him, he was driven back to Rome by Lully, whose jealous temper could not brook so formidable a rival. In 1680 he visited Germany, and met with a reception suitable to his merit from most of the German princes, particularly the elector of Bavaria; in whose service he was retained, and

continued for some time. After about five years stay abroad he returned to Rome. His proficiency on the violin was so great, that his fame soon spread throughout Europe. He was highly favored by that great patron of poetry and music cardinal Ottoboni, and regulated the musical academy held at his palace. Here Handel became acquainted with him; and a serenata of Handel's, entitled *Il Triomfo del Tempo*, being performed, the overture was in a style so new and singular, that Corelli was confounded in his first attempt to play it. While Corelli resided at Rome, many persons from other countries were ambitious of becoming his disciples. Of these it is said the late lord Edgcombe was one. Corelli died at Rome in 1717; and was buried in the church of the Rotunda. A monument with a marble bust was erected to his memory by Philip William, count palatine of the Rhine, under the direction of cardinal Ottoboni. For many years after his death, he was commemorated by a solemn musical performance in the Pantheon; where some of his concertos were performed by those who had been his pupils, in the same slow, distinct, and firm manner, without graces, in which they were played by the author himself. He was a passionate admirer of pictures, and lived in an uninterrupted friendship with Cignani and Carlo Marat; who presented him at times with pictures, both of their own painting, and by other masters: whereby he became possessed of a valuable collection of original paintings; all which, together with about £6000 sterling, he left to his friend Ottoboni; who, reserving the pictures to himself, generously distributed the rest among the relations of the testator.

COREOPSIS, tick-seeded sunflower, a genus of the polygamia frustanea order, and syngenesia class of plants, natural order forty-ninth, composite. Receptacle is paleaceous; pappus two-horned: CAL. erect and polyphyllous, surrounded with patent radiated leaflets at the base. There are twenty-five species, most of them herbaceous perennials. They are very flowery, and rise from three to eight feet, terminating by clusters of compound radiated flowers of a yellow color. They have all perennial fibrous roots, and annual stalks, which rise in the spring, flower from July to October, and decay to the root in November. The flowers are all shaped like sun-flowers, but smaller, and are very ornamental. They are easily propagated by slipping or dividing the roots in autumn, when the stalks decay; planting the slips at once where they are to remain; after which they require only to be kept free from weeds, and to have the decayed stalks cut annually in autumn.

CORFE-CASTLE, a borough and market town of England, in the county of Dorset, situated in the centre of what is called the Isle of Purbeck, governed by the mayor and barons, who claim the same privileges as the cinque ports. It takes its name from a castle, said to have been built by king Edgar, but now in ruins. Here Edward, king of England, called the Martyr, was murdered by order of Elfrida, to obtain the throne for her son Ethelred. It sends

two members to parliament. The town is built on a rising ground that declines to the east, and consists of two streets. The houses are mean, but built of stone. It is the only town in the island; and its parishes are very extensive. Its only trade is in stone, and knit stockings. It is separated from the castle by a stately bridge of four very high arches over a deep dry ditch. It has a market on Thursday, nearly disused; and fairs on May 12th, and Oct. 10th. It is eighteen miles S.S.W. of Poole, and 116 west of London.

CORFU, an island of the Mediterranean, at the mouth of the Adriatic, near the coast of Albania, about fifteen leagues long, and eight broad; anciently known under the names Scheria, Phaacia, Coreyra, and Drepane. In the best days of Greece, the Coreyrians formed a powerful republic; in succeeding times it belonged to the king of Naples; and was afterwards sold for 30,000 ducats to the Venetians, who maintained a fleet of galleys in the port, and a strong garrison, to defend this and the neighbouring islands. It was ceded to the French republic in Oct. 1797, by the treaty of Campo Formio; but was surrendered by capitulation to the united forces of the Turks and Russians on the 3rd of March, 1799. The island contains above 50,000 inhabitants, and is divided into four bailiwicks, or governments. The air is healthy, the land fertile, and the fruit excellent. Citrons, oranges, and the most delicious grapes, honey, wax, and oil, are exceedingly abundant. Some places are mountainous and barren, and good water scarce. The manufacture of salt is a source of great wealth, as well as employment to the inhabitants. The religious establishment is said to partake partly of the Greek, and partly of the Roman Catholic rites. The latter are followed by the members of the government. Under the Venetians an archbishop, named by the senate, was appointed by the pope. The population of Corfu generally profess themselves of the Greek church, at the head of which is a protopapa, chief priest, or bishop, chosen by an assembly of the clergy and noblesse. He is of a noble family, and distinguished from the chief priests of the other Ionian islands by his title of great protopapa. On his election, he generally gives an elegant and expensive entertainment to the higher order of the islanders, who will not scruple, we are told, to carry away part of the feast. He remains in office five years, and then returns to the ordinary class of papas.

Superstition and unaccountable vanity predominate in the character and manners of the Corfiotes. On the slightest provocation any one, it is said, may obtain the dreaded anathema of the protopapa, who, on receiving a sufficient bribe, will appear before the house of the victim at the head of his clergy, habited in black, and preceded by a crucifix and black flag, to pronounce the sentence. Sometimes the anathematized person obtains, at considerable expense, a counter-communication from the same ecclesiastic; and sometimes retaliates by the use of the poniard.

Marriages and funerals, in Corfu, are celebrated according to the Greek ritual. To prepare for the former a table is spread in the best apartment, on which a Bible is laid between two

wax tapers; having a salver at one side with a glass or small phial of wine and a little bread, and on the other a salver containing rose-colored garlands. The ceremony being performed, a crown is made, by interlacing the two tapers, and is placed over the nuptial bed. The bride is now seen dissolved in tears in order to express her modesty; but if, at the moment of consent, any bystander shall cast three knots on a cord and throw it in the fire, it is confidently believed that the husband will be completely encraved.

Preparations for burial are made the instant a person expires, and scarcely two hours elapse before it takes place. The body is clothed in the best apparel it ever wore, and on this occasion nothing but the head and hands are left exposed. It is now laid on carpeted tressels, with a cushion under the head and a crucifix in the hands; the whole being covered, if the person was unmarried, with artificial flowers. At the church, after the funeral service, all the friends kiss the deceased, at the same time muttering over him in a low whisper: it is thought a great token of regard to a stranger to invite him to pay this tribute of respect. The graves are frequently visited and crowned with flowers for the first three months after interment.

CORFU, the capital of the above island, the seat of a bailiff, a proveditor, a captain, &c. and the see of an archbishop, is four miles in circumference; and seated on the east coast. It is strongly fortified, and usually defended by a garrison of about 10,000 men. A number of excellent brass and iron cannon are mounted on the different forts; and the works have been much improved by major-general Paterson. In the last war between the Venetians and the Turks, this town was attacked by an army of 80,000 men, and attempted to be stormed several times by the enemy; but the garrison, which consisted of 12,000 men, under the command of count Schulenburg, made so gallant a defence, that they obliged them to raise the siege with considerable loss. For this service a magnificent statue was erected in memory of the count. In the city are many handsome Greek churches, the principal of which is that of St. Speridione, or the cathedral; it is embellished with some excellent paintings, and is most superbly ornamented. The body of the saint is preserved entire in a rich shrine within the church. It is deposited in a silver coffin ornamented with precious stones; and is in high preservation, though the saint died at Cyprus above 700 years ago. The Greeks, under the Venetian government, were most of them such fanatics, as to be continually offering their devotions at this shrine, believing that through the intercession of the saint, they would obtain all their wants, and that by offerings of money their sins would be forgiven them; by which means the church had amassed an immense treasure. Corfu has a good harbour, and a considerable traffic. The chief diversions of this place in winter are operas. By an accidental explosion of one of the powder magazines in the fortifications, towards the earlier part of the eighteenth century, not less than 2000 persons were killed and wounded; and by a similar catastrophe, in 1789,

600 individuals lost their lives, four galleys and several other vessels were sunk in the harbour, and many houses shattered. The inhabitants have erected a most excellent lazaretto, and are very particular in their precautions against the plague. N. lat. 39° 40', E. long. 19° 48'.

CORIA'CEOUS, *adj.* Lat. *coriaceus*. Consisting of leather; of a substance resembling leather.

A stronger projectile motion of the blood must occasion greater secretions and loss of liquid parts, and from thence perhaps spissitude and *coriaceous* concretions. *Arbutnot on Aliments.*

CORIA'NDER, *n. s.* Lat. *coriandrum*. A plant.

Israel called the name thereof manna; and it was, like *coriander* seed, white. *Exodus* xiii. 31.

The species are, 1. Greater *coriander*; 2. Smaller testicated *coriander*. The first is cultivated for the seeds, which are used in medicine: the second sort is seldom found. *Miller.*

CORIANDRUM, **CORIANDEr**, a genus of the digynia order, and pentandria class of plants; natural order forty-fifth, umbellatæ: cor. radiated; the petals inflexed-emarginated; the involucre universal and monophyllous; the partial involucre halved; the fruit spherical. There are only two species, both herbaceous annuals, the leaves of which are useful for the kitchen, and the seeds for medicine. Both species have divided small leaves, somewhat resembling parsley. The species most generally cultivated is the *C. sativum*: it has a small fibrous white root, crowned by many parted leaves, having broadish segments; and in the centre an upright, round, branchy stalk, two feet high, having all the branches terminated by umbels of flowers, which are succeeded by globular fruit. It is propagated by seeds, which ought to be sown in March, either in drills a foot asunder, or by broad cast, and then raked in. When the plants are an inch or two high, they should be hoed to six or eight inches distance. The seeds when fresh have a strong disagreeable smell, which improves by drying, and becomes sufficiently grateful: they are recommended as carminative and stomachic. They are also much used by the brewers both in England and Holland, to give a flavor to their strongest beer. The ancients had an idea, that the juice of coriander would deprive people of their senses, and even of life. The leaves are sometimes used for culinary purposes in soups, and as an ingredient in salads; but as they are of a fetid smell, they are not esteemed in this country.

CORIARIA, the tanners', or myrtle-leaved sumach, a genus of the decandria order, and dioecia class of plants. Male, *cal.* pentaphyllous: cor. pentapetalous, very like the calyx, and united with it; the antheræ bipartite. Female, *cal.* pentaphyllous; the *styles* five, *seeds* five, covered with five succulent petals, forming altogether the resemblance of a berry. There are three species: *C. foemina*, and *C. myrtifolia*, are both natives of the south of France, but the latter is most commonly cultivated in this country. It is a pretty ornamental plant, with a shrubby pithy brown stem, closely branching

from the bottom, and forms a bushy head three or four feet over, thickly garnished with oblong, pointed, bright green leaves, having small spikes of whitish flowers at the ends of the branches. It is easily propagated by suckers from the root, which it affords plentifully, and may be taken off with fibres every autumn or winter. It may be also propagated by layers in autumn, which will take root in a year. It is much used in the south of France, where it naturally grows, for tanning of leather, whence its name of tanners' sumach. It also dyes a beautiful black color. The berries are dangerous, and when eaten generally occasion vertiges and epilepsies. The old leaves have the same effect upon cattle that eat them, but the young leaves are innocent.

CORIDOR, Italian and Spanish, in architecture, a gallery or long aisle round a building, leading to several chambers at a distance from each other, sometimes wholly enclosed, and sometimes open on one side.

CORIDOR, or **CORRIDOR**, in fortification, a road or way along the edge of the ditch, without side, about twenty yards broad, encompassing the whole fortification. It is also called the covert way, because covered with a glacis, or esplanade, serving as a parapet.

CORINNA, a celebrated Theban poetess, who is said to have gained the prize in competition with Pindar himself, five different times. She flourished about A.A.C. 450, and wrote fifty books of epigrams.

CORINGA, a sea-port in the Northern Circars of Hindostan, district of Rajahmundry, on the western side of the bay of Bengal. It is reckoned a very safe port for middling-sized vessels during the south-west monsoon, and has lately been improved by a wet dock. It carries on a considerable trade with Bengal and Pegu in teak wood, salt, and piece goods. The French were first established here, and part of their factory remains, but the English obtained possession of the place, together with the district in 1759, and established a factory at Ingeram, five miles to the south. In 1787 the greater part of the town, and nearly the whole of the inhabitants were swept away by a dreadful inundation from the sea.

CORINTHII, *n. s.* } From the city of that
CORINTHIAN, *adj.* } name in Greece. A small
fruit, commonly called currant: that which belongs to, or is derived from, Corinth.

Now will the *corinths*, now the rasps, supply
Delicious draughts. *Phillips.*

The chief riches of Zant consist in *corinths*, which the inhabitants have in great quantities. *Broome.*

CORINTH, a celebrated city of antiquity, for some time the most illustrious of all the Greek cities. It is said to have been founded 1514 years before Christ, by Sisyphus the son of Æolus, and grandfather of Ulysses. Various reasons are given for its name, but most authors derive it from Corinthus, the son of Pelops. It was situated in the south part of the Isthmus which joins the Peloponnesus to the continent. As the genius of the Corinthians led them to commerce rather than martial exploits, their city became the finest in all Greece. It was adorned

with the most sumptuous buildings, as temples, palaces, theatres, porticoes, &c. all enriched with a beautiful kind of column, which was called Corinthian, from this city. But though the Corinthians seldom or never engaged in a war with a view of enlarging, but rather of defending their little state, they did not forget to cultivate a good discipline both in time of peace and of war. Hence many brave and experienced generals have been furnished by Corinth to the other Grecian cities, and it was not uncommon for the latter to prefer a Corinthian general to any of their own. This city continued to preserve its liberty till A.A.C. 146, when it was pillaged and burnt by the Romans. It was at that time the strongest place in the world; but the inhabitants were so disheartened by a preceding defeat, and the death of their general, that they had not the presence of mind even to shut their gates. The Roman consul, Mummius, was so much surprised at this, that at first he could scarce believe it; but afterwards, fearing an ambuscade, he advanced with all possible caution. As he met with no resistance, his soldiers had nothing to do but destroy the few inhabitants who had not fled, and plunder the city. The men who had staid, were all put to the sword, and the women were sold for slaves. After this the city was ransacked by the greedy soldiers, and the spoils were said to have been immense. There were more vessels of all sorts of metal, more fine pictures and statues, done by the greatest masters, in Corinth, than in any other city in the world. All the princes of Europe and Asia, who had any taste in painting and sculpture, furnished themselves here with their richest movables: here were cast the finest statues for temples and palaces, and all the liberal arts brought to their greatest perfection. Many inestimable pieces of the most famous painters and statuary fell into the hands of the ignorant soldiers, who either destroyed them, or parted with them for trifles. Polybius, the historian, was an eye witness to this barbarism of the Romans. He had the mortification to see two of them playing at dice on a famous picture of Aristides, which was accounted one of the wonders of the world. The piece was a Bacchus, so exquisitely done that it was proverbially said of any extraordinary performance, 'It is as well done as the Bacchus of Aristides.' This masterly piece of painting, however, the soldiers willingly exchanged for a more convenient table to play upon; but when the spoils of Corinth were put up to sale, Attalus king of Pergamus offered for it 600,000 sesterces, near £5000 of our money. Mummius was surprised at the high price offered for it, and imagined there must be some magical virtue in it. He therefore interposed his authority and carried it to Rome, notwithstanding the complaints of Attalus. Here this famous picture was lodged in the temple of Ceres, where it was at last destroyed by fire, together with the temple. Another extraordinary instance of the stupidity of Mummius is, that when the pictures were put on board the transports, he told the masters of the vessels very seriously, that if any of the things were either lost or spoiled, he would oblige them to find others at their own

cost; as if any other pieces could have supplied the loss of those inestimable originals, done by the greatest masters in Greece. When the city was thoroughly pillaged, fire was set to all the corners of it at the same time. The flames grew more violent as they drew near the centre, and uniting there made one prodigious conflagration. At this time the famous metalline mixture is said to have been made, which could never afterwards be imitated by art. The gold, silver, and brass, which the Corinthians had concealed, were melted, and ran down the streets in streams; and, when the flames were extinguished, a new metal was found, composed of several different ones, and greatly esteemed in after ages. Corinth lay desolate until Julius Cæsar settled there a Roman colony: when, in removing the rubbish and digging, many vases were found of brass, or earth finely embossed. The prices given for these curiosities excited industry in the new inhabitants. They left no burying-place unexamined; and Rome, it is said, was filled with the furniture of the sepulchres of Corinth. Strabo was at Corinth soon after its restoration by the Romans, and describes the Acrocorinthus, and its surrounding wall, as including a circuit of nearly eleven miles; the temple of Venus, &c. Strabo saw likewise Cleonæ from thence. Cenchræa was then a village. Lechæum had some inhabitants.

Corinth had flourished 217 years when it was visited by Pausanias. It had then a few antiquities, many temples and statues, especially about the Agora, or market place, and several baths. The emperor Adrian introduced water from a famous spring at Stymphalus in Arcadia; and it had various fountains alike copious and ornamental. The stream of one issued from a dolphin, on which was a brazen Neptune; of another, from the hoof of Pegasus, on whom Bellerophon was mounted. On the right hand, coming along the road leading from the market-place towards Sicyon, was the odeum and the theatre, by which was a temple of Minerva. The old gymnasium was at a distance. Going from the market-place towards Lechæum was a gate, on which were placed Phaeton and the Sun in gilded chariots. Pirene entered a fountain of white marble, from which the current passed in an open channel. They supposed the metal called Corinthian brass to have been immersed while red-hot in this water. On the way up to the Acrocorinthus were temples, statues, and altars; and the gate next Tenea, a village with a temple of Apollo, sixty stadia or seven miles and a half distant, on the road to Mycenæ. At Lechæum were a temple and a brazen image of Neptune. At Cenchræa were temples; and by the way from the city a grove of cypress trees, sepulchres, and monuments. Opposite was the Bath of Helen, tepid and salt water, flowing plentifully from a rock into the sea. Mummius had ruined the theatre of Corinth, and the munificence of the great Athenian, Atticus Herodes, was displayed in an edifice with a roof inferior to few of the most celebrated structures in Greece. The Roman colony was destined to suffer the same calamity as the Greek city, and from a conqueror more terrible than Mummius, Alaric the savage

destroyer of Athens and all Greece. In a country harassed with frequent wars, as the Peloponnesus has since been, the Acrocorinthus was a post too consequential to be neglected. It was besieged and taken in 1549 by Mahomet II.; the lords of the Morea, brothers of Constantine XIII. refusing payment of the arrears of the tribute, which had been imposed by Amurath II. in 1447. The country now became subject to the Turks, except such maritime places as were in the possession of the Venetians; and many of the principal inhabitants were carried away to Constantinople. Corinth, with the Morea, was yielded to the republic at the conclusion of the war in 1698, and again by it to the Turks in 1715.

Corinth, now called Coranthe and Gerame, is of considerable extent, standing on high ground, beneath the Acrocorinthus, with an easy descent towards the gulph of Lepanto; the houses being scattered, or in groups, except in the bazaar or market-place. Cypresses, among which tower the domes of mosques, with corn-fields, and gardens of lemon and orange trees, are interspersed. The air is reputed bad in summer, and in autumn exceedingly unhealthy. A modern traveller relates that, from the top of the Acrocorinthus, he enjoyed one of the most agreeable prospects which the world can afford. He conjectured the walls to be about two miles in compass, enclosing mosques, with houses and churches mostly in ruins. An hour was consumed in going up on horseback. It was a mile to the foot of the hill; and from thence the way was very steep, with many traverses. The families living below were much infested by corsairs. Dr. Clarke represents it as a straggling place. Above the bazaar are some beautiful relics of a temple, supposed to have been erected in honor of Octavia, the sister of Augustus. The Doric order pervades the building, which, in the time of Sir G. Wheeler, had eleven pillars; but the governor of the fortress had blown up four of them a short time before Dr. Clarke visited Corinth. Five out of the remaining seven support an entablature, and each consists of one entire piece of stone; but their dimensions are not accurately Doric. This distinguished traveller conjectures that he found the site of Schœnus, where the ancient Isthmian games were celebrated, near the spot where the Isthmian wall makes a sudden turn from the Corinthian (or Crissæan) to the Saronic Gulf, bearing away towards Mount Oneus and embracing the whole of the port of Schœnus. The ruins of the temple, stadium, Theatre, and wells, and other indications of the Isthmian town, surround this port, and are for the most part situated upon its sides, sloping towards the sea. The remains of the temple of Neptune are to the west end of the Isthmian wall; and a Greek chapel, also in a ruined state, now stands upon the area of the temple. It is built of white limestone, and the workmanship of its ornamental parts is extremely beautiful. It appears to have been of the Corinthian order; but all its columns and entablatures have fallen. To the south wall of its area adjoined the theatre; the colon of which, almost filled and overwhelmed by the ruins of the temple, yet remains, facing the port. West of the theatre is

the Stadium, at right angles to the Isthmian wall, it has very high walls, and the stone front work, and some of its benches, remain at the upper end. It extends east and west, parallel to one side of the area of the temple. Just at the place where the Isthmian wall joins Mount Oneus, there is a tumulus, which is, perhaps, that supposed to contain the body of Melicertes, in honor of whom the Isthmian Games were celebrated, above 1300 years before the Christian era. It stands on a very conspicuous eminence above the wall, which here passes towards the S.S.E. quite to the port. *Travels*, vol. vi.

CORINTH, THE ISTHMUS OF, is a neck of land in the Morea, which joins the Morea to Greece, and reaches to the Gulf of Lepanto to that of Egina. The narrowest part of it is six miles over.

CORINTHIA, the daughter of Dibutas, a native of Sicyon or Corinth, and daughter of a potter there. She is said to have sketched the profile of her sleeping lover on a wall, by lamp-light, and afterwards to have made a model of clay. This incident, said to be the origin of the arts of design among the Greeks, is thus beautifully alluded to by Montgomery:—

Trembling with extacy of thought,
Behold the Grecian maid,
Whom love's enchanting impulse taught
To trace a slumberer's shade.
Sweet are the thefts of love;—she stole
His image while he lay,
Kindled the shadow to a soul,
And breathed that soul through clay.

Corinthia lived six or seven centuries before the Christian era.

CORINTHIAN, *n. s. & adj.* A native of Corinth; a licentious person. Relating to Corinth, or the licentious manners of Corinth. For the order, see ARCHITECTURE.

O ye *Corinthians*, our mouth is open to you, our heart is enlarged. 2 *Cor.* vi. 11.

I am so proud, Jack, like Falstaff, but a *Corinthian*, a lad of metal.

Shakspeare. King Henry IV. Part 1.

The sage and rheumatick old prelatess, with all her young *Corinthian* laity. *Milton.*

Behind these figures are large columns of the *Corinthian* order, adorned with fruits and flowers.

Dryden.

CORIO (Bernardine), an Italian historian, of an illustrious family, born at Milan, in 1460. He was secretary of state to that duchy; and the D. Lewis Sforza appointed him to write the history of Milan. He died in 1500. The best edition of his history is that of 1603, in folio. It is printed in Italian, and is very scarce.

CORIOLANUS (Caius Marcius), a famous Roman general; who took Corioli, whence his surname: but who, at last, was banished from Rome by the tribune Decius. He went to the Volsci, and persuading them to take up arms against the Romans, they encamped within four miles of the city. He would not listen to proposals of peace till he was prevailed upon by his wife Veturia, and his mother Volumnia, who were followed by all the Roman ladies in tears.

He was put to death by the Volsci as a traitor that had made them quit their conquest; upon which the Roman ladies went into mourning; and in the same place where his blood was shed a temple was consecrated to Feminine Virtue. See ROME.

CORIS, in botany, a genus of the monogynia order and pentandria class of plants: cor. monopetalous and irregular: CAL. prickly: CAPS. quinquevalved; superior. There is only one species, viz. the C. Mospeliensis, or blue maritime coris of Montpellier. There are two varieties, one with a red, and the other with a white flower; but these are only accidental, and arise from the same seeds. They grow wild in most places in the south of France; they seldom exceed six inches high, and spread near the surface of the ground like heath; in June, when full of flowers, they make a very pretty appearance. They may be propagated by sowing their seeds in a bed of fresh earth, and afterwards removing the young plants, some into pots, and others into a warm border.

CORISPERMUM, tickseed, a genus of the digynia order, and monandria class of plants; natural order twelfth, holoraceæ: CAL. none: PET. two: SEED one, oval and naked. There are two species; neither of them remarkable for beauty.

CORITANI, an ancient people of Britain, who possessed the inland parts now included in the counties of Northampton, Leicester, Rutland, Lincoln, Nottingham, and Derby.

CORIVAL, } Lat. *rivalis*.
CORRIVAL, *v. a., n. s. & adj.* } to assume an
CORRIVALRY, *n. s.* } equality with;
CORRIVALSHIP, *n. s.* } to endeavour to
attain the same object. A competitor; that which rivals or competes with.

Where's then the saucy boat,
Whose weak untimbered sides but even now
Corivalled greatness.

Shakspeare. Troilus and Cressida.

And many more *corivalns*, and dear men
Of estimation and command in arms.

Id. 1 Henry IV.

Not thinking, perhaps, that this would be to erect a
power equal and *corival* with that of God.

Bishop Fleetwood.

CORK, *v. a. & n. s.* } Span. *corcho*; Dut.
CORKY, *adj.* } *korch*; Ger. *kork*; Lat.
CORKING PIN. } *corlex*. The tree de-
scribed in the next article; a stopper for a bottle
made from the exterior bark of the cork-tree.
To stop with, or elevate upon, cork. Consisting
of, or resembling, cork. A corking-pin is a pin
of the largest size; so called, perhaps, from its
being used for the purpose of fastening up any
thing securely.

I pr'ythee take the *cork* out of thy mouth, that I
may drink thy tidings. *Shakspeare. As You Like It.*
Bind fast his *corky* arms. *Id. King Lear.*

And tread on *corked* stilts a prisoner's pace,
And make their napkin for their spitting place.

Hall.

Be sure, nay very sure, thy *cork* be good;
Then future ages shall of Peggy tell,
That nymph that brewed and bottled ale so well.

King.

Nor stop, for one bad *cork*, his butler's pay.

Popo.

When you put a clean pillow-case on your lady's
pillow, be sure to fasten it well with three *corking-*
pins, that it may not fall off in the night.

Swift's Directions to the Chambermaid.

The *cork* tree grows near the Pyrenean hills, and
in several parts of Italy, and the north of New Eng-
land.

Mortimer.

So the cold rill from Cintra's steepy sides,
Headlong, abrupt, in barren channels glides;
Round the rent cliffs the bark-bound Suber spreads,
And lazy monks recline on *corky* beds.

Darwin.

Young Juan wandered by the glassy brooks,

Thinking unutterable things; he threw

Himself at length within the leafy nooks

Where the wild branch of the *cork* forest grew.

Byron. Don Juan.

CORK, the largest county in Ireland, is situated in the province of Munster, and has in it a city of the same name, with the united sees of Cork and Ross. It is bounded on the north by Limerick, on the west by Kerry, on the south by the Atlantic Ocean, and on the east by Waterford. Its greatest length is 108, and its average breadth fifty-six, English miles. It contains 269 parishes, twenty-two baronies, and three boroughs; and returns seven members to parliament. Anciently the principality of the McCarthys it was converted into a shire by king John, the first English lord of Ireland: and it abounds in military and ecclesiastical antiquities, as well as natural curiosities. The surface of the country is finely diversified; in one place presenting the boldest pictures imaginable, as at Glengariff and Gougane Barra; in another, a continuous plain. The rivers are the Lee, Blackwater, Ouvain, Antreg, &c. The harbours are the deepest and best sheltered in Ireland. Within a comparatively short period, this county has undergone considerable change in its magisterial or civil government, and also in statistical improvement. It has been divided into two ridings, east and west, and subjected to the judicial authority of two barristers; an obvious advantage to the speedy administration of justice; and its inaccessible districts, which were many and widespread, have been brought within a few hours reach of the principal towns in the county. The road, for instance from Listowel to Cork, sixty-seven English miles, through the beautiful and romantic scenery of the Bogra mountains, saves thirty-six miles, passes through a region hitherto inaccessible, and reaches a summit level of 900 feet, by an ascent of only one foot in sixty. The road from Newmarket to Charleville, fourteen English miles, also through a hitherto unexplored country, is also a great improvement, as is the projected road from Tralee to Cork, by Castle Island, to fall in with the Bogra road at Bantyre Bridge, being only sixty-one miles, while the present road measures seventy-eight English miles.

The mineral productions of Cork are considerable; amongst the valuable districts of this class is Dromagh, the property of N. P. Leader, Esq., a coal-field of great extent. Here culm and coal are raised by 360 laborers, supporting

thereby about 1000 souls: 20,000 horse loads are sold annually at the pit mouth. This coal is chiefly used for agricultural purposes, and upwards of 40,000 acres of land, in that neighbourhood, derive the advantage of its vicinity. Potters' clay abounds here, and good coarse pottery is now manufactured, and finds a speedy sale at Mallow and elsewhere. In 1826 bolting mills were erected, and a distillery is building contiguous to the collieries. Dromagh is distant from Cork thirty miles; from Mallow twelve; from Killarney twenty-five; from Tralee thirty-five, and lies on the direct road from Cork to Tralee. The mines of Cappagh, six miles south-west of Skibbooran, have been leased by lord Audley to the Mining Company of Ireland, and have been found singularly productive; the dressed ore shipped from Roaring-Water Bay contiguous to the mine, having brought a higher price at Swansea, than the copper ore of Cornwall. A second copper mine, of even greater promise, lies four miles west of Beerhaven, from this mine (in 1826) £10,000 worth of ore was exported to Swansea. There is a slate quarry at Glandore, now at full work, leased to the Imperial Mining Company. The pier erected in this little harbour by the Fishery Board, has proved peculiarly advantageous, as an export quay for the Glandore slates. The principal coast improvements are the piers erected by the Fishery Board, the most useful of which are those at Castlehaven, Clonakilty, and Dunworley. At the first of these stations a breakwater and pier have been constructed, affording shelter and safe lying, in fourteen feet depth at low water. There is nine feet of water at Clonakilty pier, at a place called Ring, and sometimes Faughen; the safest approach is between the east side of Inirdoney and Arundel Castle. At Dunworley Cove, besides a pier, there is also an inner basin, formed from a noxious morass, where vessels may now float in safety at high water, and lie securely on the strand at ebb, when they are also conveniently disposed for repairing. The ebb current from this basin forms the channel of communication between it and the Cove.

CORK, a city of Ireland, the second in that country, and the capital of the county of this name, stands partly on an island in the river Lee, and is said to be coeval with the foundation of its cathedral (St. Finhar's), i. e. in the sixth century. The ancient city stood entirely on the island; was approached by two bridges, one at either end, and was intersected by canals, or rather branches of the river, somewhat resembling a Dutch town. These canals are now filled up, the town extends along the opposite banks: there are Parliament, Patrick's, New, and Clarke's bridges, thrown across the Lee, and a grant has lately been made for the erection of an additional bridge, having one arch of cast metal, turning on a swivel, so as not to impede the navigation. Wide and handsome streets are now erected, where formerly were unwholesome marshes. The county of the city of Cork contains twenty-two parishes and parts. It is under the surveillance of a corporation, whose charter was

granted by Charles I. and consisting of a mayor, two sheriffs, a recorder, several aldermen, and an unlimited number of freemen. Cork abounds in charitable foundations, hospitals, poor-schools and literary associations. There are 4000 children in the city deriving the benefit of education at schools supported by voluntary subscription solely. Several of the public buildings are of a respectable class: the commercial buildings, and Chamber of Commerce in particular. The Exchange, the design of an Italian artist, was a handsome elevation, but it is miserably situated. The appearance of the cathedral is venerable, as well as that of the deanery house adjacent to it. The new city gaol, built in the castellated style, is probably the most architectural edifice in Cork. The custom-house, a massive structure, stands on a piece of ground formerly called Lapp's Island, but now united to the main land, as well as Grafton Law, the spot on which the unfortunate duke of Grafton fell in 1690, which has long since lost its insular appellation. There are, also, a spacious market-house, built in the Tuscan order; a linen hall; a new market, under cover; an extensive barrack capable of accommodating 4000 infantry, and 1000 cavalry; several very elegant churches, Roman Catholic chapels, and religious meeting-houses for all classes of Christians. The most valuable, perhaps, of the public associations, is the Royal Cork Institution, incorporated in 1807, for scientific and literary objects, having a botanic garden, mineralogical collection, models of agricultural implements, &c. &c. Though the cessation of hostilities, upon the deposition of Napoleon, checked for a while the very rapid progress of city improvement, yet that interruption has been followed by a slow, and perhaps more wise, system of melioration in all civic and statistic matters. The erection of the new custom-house, in front of which vessels of 200 tons burden can discharge. The facing of the quay-wall from the custom-house to parliament bridge; the deepening of the river and levelling the bottom, so as to permit colliers of 150 tons burden to reach Parliament Bridge, and lie there at low water without liability to damage; and, lastly, the continuation of the magnificent quay-wall on the north side of the river, for a distance of one mile and a half, faced with hewn stone, are improvements, the result of good taste in the first instance; but, secondly, the consequence of an union of the most creditable description between two useful public bodies, the Harbour and Wide-street Commissioners, for the best interests of this promising city. Though the trade of Cork has diminished, it is still considerable; and owing to the spirited conduct of its inhabitants in river improvements, must of necessity increase. The chief trade here is victualling, which is still carried on with vigor and with advantage. The principal manufactures are glass, paper, glue, and sail-cloth. The West India fleets generally put into Cove for sea stores, and the British navy was once victualled from this place. See COVE.

CORK is the bark of a species of quercus. See QUERCUS. To take off the bark an incision is

made from the top to the bottom of the tree, and at each extremity another round the tree, perpendicular to the first. When stripped from the tree, which does not, therefore, die, the bark is piled up in a pond or ditch, and loaded with heavy stones to flatten it, and reduce it into tables: hence it is taken to be dried; and, when sufficiently dry, put in bales for carriage. If care be not taken to strip the bark, it splits and peels off of itself; being pushed up by another bark formed underneath. The bark of cork, as well as the acorn, is of some use in medicine; both being reputed astringents, after being burnt and powdered when used externally; but the chief use of the former is, to put in shoes, slippers, &c. and to stop bottles. The Spaniards burn it to make that kind of light black we call Spanish-black, used by painters. Cups made of cork, are said by some to be good for hectical persons to drink out of. The Egyptians made coffins of cork; which, being lined with a resinous composition, preserved dead bodies uncorrupted. The Spaniards line stone walls with it, which not only renders them very warm, but corrects the moisture of the air.

CORK, FOSSIL, a name given to a kind of stone. It seems to be a species of amianthus, consisting of flexible fibres loosely interwoven, and somewhat resembling vegetable cork. It is the lightest of all stones; by fire it is fusible and forms a black glass. It possesses the general qualities of AMIANTHUS. See that article.

CORK JACKET, or CORK WAISTCOAT, an invention of one Mr. Dubourg, a gentleman very fond of swimming, but subject to the cramp, which led him to consider of some method by which he might enjoy his favourite diversion with safety. The waistcoat is composed of four pieces of cork, two for the breast and two for the back: each pretty near, in length and breadth, to the quarters of a waistcoat without flaps; the whole is covered with coarse canvas, with two holes to put the arms through: there is a space left between the two back pieces, and the same between each back and breast piece, that they may sit the easier to the body. Thus the waistcoat is only open before, and may be fastened on the wearer with strings, or, if it should be thought more secure, with buckles and leather straps. It does not weigh above twelve ounces, and may be made up for about five or six shillings. Mr. Dubourg tried his waistcoat in the Thames, and found that it not only supported him on the water, but that two men could not sink him, though they used their utmost efforts for that purpose. This invention is calculated to be of vast service to those who, for the sake of health, bathe in the sea; and even the most delicate and timorous young lady might, by the help of one of these jackets, venture into a rough sea. Dr. Wilkinson of Woodford has improved this jacket, and rendered it much more accommodating to the motions of the body in swimming, by cutting the cork into small pieces, and quilting them between two waistcoats of canvas. A cork spencer has lately been invented, to save from drowning in cases of shipwreck; which consists of a belt, containing refuse pieces of cork, or old bottle-corks enclosed in any kind of light

stuff, and fastened round the body with tapes. See AIR-JACKET, and BAMBOO.

CORMAC M'CUINAN, king and archbishop of Cashel, in Ireland, was a prince greatly celebrated by the Irish historians for his learning, piety, and valor. He wrote, in his native language, a history of Ireland, commonly called the Psalter of Cashel, which is still extant, and contains the most authentic account we have of the annals of the country to that period, about A. D. 900.

CORMANLINE, a native town on the Gold Coast of Africa, containing the Dutch fort of Amsterdam. This was originally built by the English; but as early as 1663 it was taken by admiral De Ruyter, and has ever since remained a Dutch possession. It is said to be airy and salubrious, but it has suffered dreadfully in the late wars with the Ashantees. It is three miles east of Anamaboa.

COR-MASS, a ci-devant grand procession, annually made at Dunkirk, on St. John's day, June 24th; and said to have been established under king Charles V. After the celebration of high mass, the procession, consisting of the tradesmen of the town, began. Each person had a burning wax taper in his hand; and, after each company came a pageant, followed by the patron saint, usually of solid silver richly wrought and adorned. The companies were followed by music; next the friars in the habits of their order, the secular priests, and then the abbot magnificently adorned, and preceded by the host. Machines of various fantastical forms and devices, and as variously accoutred, formed a part of the show on this occasion.

COR-MEILLE, a noted plant common in the Highlands of Scotland. Its roots when dried are the support of the Highlanders in long journeys, amidst the barren hills, and a small quantity, like the alimentary powders, will for a long time repel the attacks of hunger. Infused in liquor it is an agreeable beverage, and like the nepenthe of the Greeks, exhilarates the mind. From the similitude of sound in the name, it seems to be the same with chara, the root discovered by the soldiers of Cæsar at Dyrrhachium, which steeped in milk was such a relief to the famished army. Perhaps it may have been the Caledonian food described by Dio, of which the quantity of a bean would prevent both hunger and thirst: and which, he says, they had ready for all occasions.

CORMORANT, n. s. Fr. *cormoran*; either from Lat. *corvus marinus*, or *corvus vorans*. A bird that preys on fish; a glutton; one who is rapacious.

The hote *cormèrant*, full of gluttonie.

Chaucer. *The Assembly of Fowles.*

To which nor fish nor fowle did once approach,
But yelling meawes, with sea gullies hoars and bace,
And *cormygraunts*, with birds of ravenous race.

Spenser. *Fuerie Queene*

Let fame, that all hunt after in their lives,
Live registered upon our brazen tombs;
When, spite of *cormorant* devouring time,
The' endeavour of this present breath may buy
That honour which shall 'bate his scythe's keen edge.

Shakspeare.

Those called birds of prey, as the eagle, hawk, puttock, and *cormorant*. *Peucham on Drawing.*

Thence up he flew, and on the tree of life
Sat like a *cormorant*. *Milton's Paradise Lost.*

Not far from thence is seen a lake, the haunt
Of coots, and of the fishing *cormorant*.
Dryden's Fables.

CORMORANT. See PELICANUS.

CORN, *v. a. & n. s.* } *Mæs. Goth. kaurno* ;
CORN, *adj.* } *Dan. Swed. Ger. korn* ;
Ang.-Sax. *corn* ; *Dut. korn*. *Martinius* and *Skinner* consider the Lat. *granum* to be the parent word. *Junius* contends that it is derived from the Greek, *κορεω, κορεννυμι, satio, saturo*, to satisfy or fill. Much may be said on both sides. *Corn* is the seeds which grow in ears, as wheat, barley, &c. ; unreaped grain ; unthreshed grain ; any minute particle. To *corn* is to salt meat ; to form into small grains. *Corny* signifies producing grain or corn ; containing, or made from, corn.

Thou shalt not muzzle the ox when he treadeth out
the corn. *Deut. xxv. 4.*

Thou shalt come to thy grave in a full age, like as
a shock of *corn* cometh in his season. *Job v. 26.*

Except a *corn* of wheat fall into the ground and die,
it abideth alone. *John xiii. 25.*

Wel coude he stelen *corne* und tollen thries ;
And yet he had a thomb of gold parde,
A white cote and a blew hode wered he.

Chaucer. Prof. to Cant. Tales.

He wolde sowen som difficulce,
Or springen cockle in our clene *corne*.
Id. Cant. Tales.

By corpus Domini but I have triacle,
Or elles a draught of moist and *corny* ale,
Or but I here anonc a mery tale,
Myn herte is lost for pitee of this maid. *Id.*

The people cry you mocked them ; and, of late,
When *corn* was given them gratis, you repined.
Shakespeare.

All the idle weeds that grow *Id. King Lear.*

In our sustaining *corn*.
Landing his men, he burnt the *corn* all thereabouts,
which was now almost ripe.

Knolles' History of the Turks.

They lodge in habitations not their own,
By their high crops and *corny* gizzards known.
Dryden.

Tell me why the ant,
'Midst summer's plenty, thinks of winter's want ;
By constant journeys careful to prepare
Her stores, and bringing home the *corny* ear. *Prior.*

Still a murmur runs
Along the soft inclining fields of *corn*.
Thomson. Autumn.

Through rustling *corn* the hare astonished springs ;
Slow tolls the village-clock the drowsy hour ;
The partridge bursts away on whirring wings ;
Deep mourns the turtle in sequestered bower,
And shrill lark carols clear from her aerial tower
Beattie.

Come let us stray our gladsome way,
And view the charms of nature ;
The rustling *corn*, the fruited thorn,
And every happy creature. *Burns.*

And hills all rich with blossomed trees,
And fields which promise *corn* and wine,
And scattered cities crowning these,
Whose far white walls along them shine.
Byron. Child Harold.

To strive too with our fate were such a strife
As if the *corn*-sheaf should oppose the sickle.
Men are the sport of circumstances, when
The circumstances seem the sport of men. *Byron.*

In fight or chace accomplished to prevail,
Her foot outstripped the pinions of the gale :
Light o'er the standing *corn* could urge its speed,
Nor in its flying passage bend the reed.
Symons' Æneis.

CORN, INDIAN, or maize. See ZEA.

CORN, EARLIEST ACCOUNTS OF THE CULTURE OF. Authors differ much with regard to the first discovery and culture of corn. A very general opinion is, that in the first ages men lived on the spontaneous fruits of the earth ; as acorns, and the nut or mast produced by the beech ; which, they say, took its name, fagus, from the Greek *φαγω*, to eat. It is added, that they had neither the use of corn nor the art of preparing it. *Ceres* has the credit of being the first who taught the use of corn ; others give that honor to *Triptolemus* ; others share it between the two, making *Ceres* the first discoverer, and *Triptolemus* the first cultivator, of corn. Many of the learned, however, maintain that it was in Egypt the art of cultivating corn first began ; and it is certain there was corn in Egypt and the East long before the time of *Ceres*.

CORN, METHODS OF PRESERVING. *Corn* is very different from fruits, with respect to the manner of its preservation. It is capable of being preserved in public granaries, for pressing occasions, and of being kept for several centuries.—A short time after the siege of Metz, under Henry II. of France, in 1578, the duke of Espernon laid up vast stores of corn in the citadel, which was preserved in good plight to the year 1707, when the French king and his retinue, passing that way, eat bread baked thereof. The chief thing that contributes to the preservation of corn is, a crust which forms on its surface, by the germination of the grain next underneath, to the thickness of an inch and a half. On that at Metz people walked without its giving way in the least. At Sedan was a granary cut in a rock, wherein a heap of corn was preserved 110 years : it was covered with a crust a foot thick. For the preservation of corn, the first method is to let it remain in the spike ; the only expedient for conveying it to the islands and provinces of America. The inhabitants of those countries save it in the ear, and raise it to maturity by that precaution : but this method of preserving it is attended with several inconveniencies among us : corn is apt to rot or sprout, if the least moisture is in the heap ; the rats likewise infest it, and our want of straw also obliges us to separate the grain from the ear. The second is to turn out and winnow it frequently ; or to pour it through a trough or mill-hopper, from one floor to another. Being thus moved and aired every fifteen days, for the first six months, it will require less labor for the future, if lodged in a dry place : but if, through neglect, mites should be allowed to slide into the heap, they will soon reduce the corn to a heap of dust. This must be avoided by moving the corn anew, and rubbing the places adjacent with oils and herbs, whose strong odor may chase them away ; for which garlic and dwarf elder are

very effectual: they may likewise be exposed to the open sun, which immediately kills them. When the corn has been preserved from all impurities for the space of two years, and has exhaled all its fires, it may be kept for fifty or even 100 years, by lodging it in pits covered with strong planks, closely joined together: but the safer way is to cover the heap with quicklime, which should be dissolved by sprinkling it over with a small quantity of water; this causes the grains to shoot to the depth of two or three fingers, and encloses them with an incrustation, as above mentioned, through which neither air nor insects can penetrate.

CORN, in fariery. See FARRIERY.

CORN-CHANDLER, *n. s.* From corn and chandler. One that retails corn.

CORN-FIELD, *n. s.* A field where corn is growing.

It was a lover and his lass,
That o'er the green *corn-field* did pass.

Shakspeare. As You Like It.

You may soon enjoy the gallant sights of armies,
encampments, and standards waving over your brother's *corn-fields*.

Pope.

CORN-FLAG, *n. s.* From corn and flag. A

plant. Miller enumerates eleven species of this plant, some with red flowers, and some with white. See GLADIOLUS.

CORN-FLOOR, *n. s.* The floor where corn is stored.

Thou hast loved a reward upon every *corn-floor*.

Hos. ix. 1.

CORN-FLOWER, *n. s.* From corn and flower. See CENTAUREA.

There be certain *corn-flowers*, which come seldom or never in other places, unless they be set, but only amongst *corn*; as the blue-bottle, a kind of yellow marygold, wild poppy, and furnitury.

Bacon's Natural History.

Corn-flowers are of many sorts: some of them flower in June and July, and others in August. The seeds should be sown in March: they require a good soil.

Mortimer.

CORN-HEAP. Store of corn.

CORN-LAND, *n. s.* From corn and land. Land appropriated to the production of grain.

Pastures and meadows are of such advantage to husbandry, that many prefer them to *corn lands*.

Mortimer's Husbandry.

CORN LAWS.

CORN LAWS. This is a topic which some of our readers, we apprehend, may be disposed to consider as wholly speculative; while others will imagine that the practical details connected with it can only be interesting to a small portion of the community. We would not attempt to disturb these conclusions, were not the amplest proof to the contrary pressing upon us. In one sense, the laws and the trade in corn involve speculative questions enough, no doubt; that is, they have become respectively, and in the different spheres of Parliament and Mark Lane, the speculations of interested law-makers and law-breakers, in the price of every Englishman's loaf, and, we might add, of every laboring man's pint of beer. For while the state of the wheat market determines the former, that of the barley market is, in its own peculiar way, the regulator of the latter. But this topic, for these very reasons, is, to the furthest possible degree, removed from being a mere abstract question.

Nor are the agriculturists, whether landlords or tenants, the only parties interested in its details. Corn laws are designed to make corn dear; a large portion, the major part, of the community, we contend, are always interested in having corn cheap: it becomes exceedingly important, therefore, to this part of the community, to enquire why it is thought necessary to uphold a system that is meant to secure its general dearness; and which, in aiming at a price that shall always be relatively higher than an equally good article can be procured for abroad, is principally felt in producing a perpetual fluctuation of price, that perplexes all the calculations of business, and disorganises every relation of society connected with the production or sale of that article.

The community at large, we are happy to be-

lieve, begin to feel the importance of this plain view of facts. The manufacturer, the tradesman, the merchant, and the banker, unite with many respectable agriculturists, both tenants and landlords, in calling for a full and final examination of the question. It is expected to be fully examined in the ensuing session of parliament, and the public are highly indebted to his majesty's ministers for the manly method of their procedure in preparation for the pending enquiry. We allude particularly to the measure adopted in the close of last year of employing Mr. Jaeb on a mission to the continent to obtain accurate information as to the present state and resources of the corn countries of Europe, and the well-timed appearance of his Report on Foreign Corn and Agriculture. This is proceeding with the candour and confidence of a good cause; and if the public do not sufficiently watch over and secure their own interests in the issue, it cannot be from information being withheld from them by government in this instance.

Assisted by this important document, and the valuable labors of many predecessors, we shall offer a few observations in the present paper, on the origin and history of our corn laws; on the probable consequences of their entire repeal; and on that practical measure which may at once and for a time secure those interests which would be effected by an entire repeal of them.

The landlords having been the legislators, our corn laws exhibit three several efforts on their part to obtain and maintain high rents. For, as it has been well and plainly said:—

‘Whatever raises the average price of corn, raises rent. A rise in the price of corn must evidently redound to the benefit either of the farmer or the landlord. But the farmer is effect-

ly prevented, by the competition of other capitalists, from obtaining more than the ordinary profits of stock. The benefit, therefore, of the increase of price, can belong to nobody but the landlord. Or, more shortly, rent is all that portion of the produce of the soil which remains after replacing the capital expended, together with the ordinary profit: and this surplus must obviously be greater when corn is dear, the quantity of corn being the same, than when it is cheap.'

The three efforts of our legislators alluded to are those of encouraging and rewarding exportation; of discouraging and even forbidding *all* trade in corn; and of prohibiting its importation;—measures equally enlightened, and equally efficacious, in producing immense public evils, without even any considerable private good. By an act of the 14th Henry VI. exportation was permitted without license when the price of wheat did not exceed 6s. 8d. per quarter, and barley 3s. 4d.; the pound sterling of silver being then, according to Dr. Kelly, worth about £1. 18s. 9d. of our present money, and therefore, these prices about equal to 12s. 11d. and 6s. 5½d. of our money.

In the enlightened reign of Edward IV. occurs the first of our statutes against importation, which was prohibited whenever the price of corn in England should be under the exportation price. The political agitations of these periods prevented the rigid execution of those enactments, but here is the nucleus of the system against which the whole power of administration, and the interests and common sense of nine-tenths of the people, have to contend in the reign of George IV. In the 5th and 6th of Edward VI. cap. 14, it was enacted, That whoever should buy any corn or grain, with intent to sell it again, should be reputed an unlawful engrosser, and should, for the first fault, suffer two months imprisonment, and forfeit the value of the corn; for the second, suffer six months imprisonment and forfeit double the value; and for the third, be set in the pillory, suffer imprisonment during the king's pleasure, and forfeit all his goods and chattels. By the same law no person could transport corn from one part to another, without a license, ascertaining his qualifications as a man of probity and fair dealing. Neither could corn be purchased to be laid up in granaries for home sale, until the quarter of wheat was at or under 6s. 8d. and oats at 2s. money of the time. The authority of three justices of the peace was necessary in order to grant a license. By 5 Eliz. cap. 12, no person might buy corn to sell again without license from the justices, at the quarter sessions.

'Our ancestors seem to have imagined,' says Dr. Smith, 'that the people would buy their corn cheaper of the farmer than of the corn merchant, who, they were afraid, would require, over and above the price which he paid to the farmer, an exorbitant profit to himself. They endeavoured, therefore, to annihilate his trade altogether. They even endeavoured to hinder as much as possible any middle man of any kind from coming in between the grower and the consumer; and this was the meaning of the many restraints which they imposed upon the trade of those whom they called kidders or carriers of corn.'

The periods of the civil wars and the early part of the reign of Charles II. were distinguished by high prices of corn, and great fluctuations in the price. By several successive statutes, therefore, an intermediate and regulated trade in corn was allowed, as when the price of wheat should not exceed 20s., 24s., 32s. and 40s. per quarter. Until by the 15th Car. II. cap. 7, the engrossing or buying of corn in order to sell it again, as long as the price of wheat did not exceed 48s. per quarter, and that of other grain in proportion, was declared lawful to all persons not being forestallers, that is, not selling again in the same market within three months. 'All the freedom which the trade of the inland corn dealer has ever yet enjoyed,' adds the author of the *Wealth of Nations*, 'was bestowed upon it by this statute.'

By the 12th of Charles II. cap. 4, the exportation of corn was permitted whenever the price of wheat did not exceed 40s. the quarter, and that of other grain in proportion. By the 15th of the same prince, this liberty was extended till the price of wheat exceeded 48s. the quarter; and by the 22nd to all higher prices. A poundage, indeed, was to be paid to the king upon such exportation. But all grain was rated so low in the book of rates, that this poundage amounted only upon wheat to a shilling, upon oats to four pence, and upon all other grain to six-pence the quarter. By the 1st of William and Mary, the act which established the bounty, this small duty was virtually taken off whenever the price of wheat did not exceed 48s. the quarter; and by the 11th and 12th of Will. III. cap. 20, it was expressly taken off at all higher prices.

The BOUNTY act alluded to remained in force, in its substance and spirit, to the fifty-fourth year of the reign of George III. The bounty payable under it at first amounted to 5s. for every quarter of wheat exported, while the price continued at or below 48s.; 2s. 6d. for every quarter of barley or malt, while their price did not exceed 24s.; and 3s. 6d. for every quarter of rye, when the price did not exceed 32s. It was importantly modified and enforced, however, by the 11th and 12th Will. III. cap. 20.

A further important modification of this act took place in the year 1773. The old bounty of 5s. upon the exportation of wheat was to cease by the statute now introduced, so soon as the price rose to 44s. the quarter, instead of 48s., the price at which it ceased before; that of 2s. 6d. upon the exportation of barley ceased so soon as the price rose to 22s. instead of 24s., the price at which it ceased before; and the bounties upon other grain in like manner. It is remarkable that at this time a bounty of 2s. per quarter was allowed on the exportation of oats, a species of grain that had never before been thus distinguished.

The exportation of wheat was *prohibited* by this statute so soon as the price rose to 44s. per quarter; that of rye so soon as it rose to 28s.; that of barley so soon as it rose to 22s.; and that of oats so soon as they rose to 14s.

To trace the history of the bounty system to its close: By the statutes 31 Geo. III. cap. 30, and 33 Geo. III. cap. 65, bounties were granted on exportation at certain prices, and the exportation

prohibited at higher prices. The quantity of corn to be exported was also settled by these acts, and 34 Geo. III. cap. 71, and 53 Geo. III. cap. 38. The maritime counties of England were divided into districts, and the exportation as well as importation of corn was to be regulated in London, Kent, Essex, and Sussex, by the prices at the Corn Exchange. The proprietors of this establishment were to appoint an inspector of corn returns, to whom weekly returns were to be made; and by whom, weekly accounts were to be transmitted of the average price to the receiver of the returns, and inserted in the London Gazette. The exportation in Scotland and other districts, was to be regulated by the prices at different appointed places, for which mayors, justices, &c. were to elect inspectors. By 44 Geo. III. cap. 109, and 45 Geo. III. cap. 86. this most extraordinary mode of ascertaining the average price, to regulate the importation and exportation of corn to and from Great Britain, is further provided for; and such average is to result from the prices in the twelve maritime districts of England and Wales.

By several subsequent acts made from time to time with a view to relieve the public against the scarcity or dearness of corn, and too numerous to particularise, the exportation and importation of corn and provisions are allowed to be prohibited and regulated by order of the king, or lord-lieutenant of Ireland, and council; until, by 54 Geo. III. cap. 69, grain, meal, malt, and flour, from any part of the United Kingdom, are permitted to be exported without payment of duty or receiving of bounty, all duties and bounties on the exportation of corn being repealed; and it is enacted, that it shall be lawful for any person to export at all times from any part of the United Kingdom, any corn, &c. without the payment of any duty of customs thereon.

The bounty system was clearly introduced, like all the other expedients of our legislators, with regard to corn, to raise its price, which had been gradually falling from 1649 to 1688, the period of its first adoption. In the preamble it is stated, 'that the exportation of corn and grain into foreign parts, *when the price thereof is at a low rate in this kingdom*, hath been a great advantage, not only to the owners of land, but to the trade of this kingdom in general.'

'The bounty, by extending the foreign market, contributed, no doubt,' as the able writer on this subject in the Supplement to the Encyclopedia Britannica argues, 'materially to the extension of cultivation; although, by forcing recourse to be had to worse soils in order to obtain the additional supplies of corn, it must have raised prices. In the period from 1740 to 1751, the cheapest in the last century, the bounties paid on exportation amounted in all to £1,515,000; and in 1749 alone they somewhat exceeded £324,000. The bounty, however, had by this time been much

too long in operation to permit the growers or exporters to realise any but the common and ordinary profits of stock; and, therefore, if it had never been granted, not only the quantity of corn exported, but the home price, which must have been regulated by the expense *necessary* to produce the increased supply required by the bounty on the poorest soils in cultivation, would have been reduced. But it is of importance to remark, how much this forced exportation must have raised the real price of corn.'

'That system of laws, therefore, which is connected with the establishment of the bounty,' says Dr. Smith, 'seems to deserve no part of the praise which has been bestowed upon it. The improvement and prosperity of Great Britain, which has been so often ascribed to those laws, may very easily be accounted for by other causes. That security which the laws in Great Britain give to every man, that he shall enjoy the fruits of his own labor, is alone sufficient to make any country flourish, notwithstanding these and twenty other absurd regulations of commerce; and this security was perfected by the Revolution, much about the same time that the bounty was established. The natural effort of every individual to better his own condition, when suffered to exert itself with freedom and security, is so powerful a principle, that it is alone, and without any assistance, not only capable of carrying on the society to wealth and prosperity, but of surmounting a hundred impertinent obstructions with which the folly of human laws too often incumbers its operations; though the effect of these obstructions is always more or less either to encroach upon its freedom, or to diminish its security. In Great Britain industry is perfectly secure; and, though it is far from being perfectly free, it is as free or freer than in any other part of Europe. Though the period of the greatest prosperity and improvement of Great Britain has been posterior to that system of laws which is connected with the bounty, we must not upon that account impute it to those laws. It has been posterior likewise to the national debt. But the national debt has most assuredly not been the cause of it.' We cannot turn from the history of this one absurdity in our system to its close, without hoping that the other and remaining factitious stimulants to price may be destined soon to follow its fate.

To return to the progress of the laws respecting importation. By the 22d of Charles II. cap. 13, the importation of wheat, whenever the price in the home market did not exceed 53s. 4d. the quarter, was subjected to a duty of 16s. the quarter; and to a duty of 8s. whenever the price did not exceed £4. Prior to the act of the 13th of the reign of Geo. III, the following were the duties payable upon the importation of the different sorts of grain, as collected by Dr. Smith:—

<i>Grain.</i>	<i>Duties.</i>	<i>Duties.</i>	<i>Duties.</i>
Beans to 28s. per quarter.	19s. 10d. after	till 40s.	16s. 8d. then 12d.
Barley to 28s.	19s. 10d.	32s.	16s. 12d.
Malt is prohibited by the annual Malt-tax bill.			
Oats to 16s.	5s. 10d. after		9½d.
Peas to 40s.	16s. 0d. after		9¾d.
Rye to 36s.	19s. 10d. till	40s.	16s. 8d. then 12s.
Wheat to 44s.	53s. 9d. till	53s. 4d.	17s. 8s.
till £4. and after that about 1s. 4d.			
Buck wheat to 32s. per quarter, to pay 16s.			

These different duties were imposed, partly by the 22d of Charles II. in place of the Old Subsidy, partly by the New Subsidy, by the One-third and Two-thirds Subsidy, and by the Subsidy, 1747.

‘By the memorable statute, 13th Geo. III. a new system, in some respects better than the ancient one, was established,’ says the great author we have just quoted: ‘with all its imperfections we may perhaps say of it what was said of the laws of Solon, that though not the best in itself, it is the best which the interests, prejudices, and temper of the time would admit of. *It may perhaps in due time prepare the way for a better.*’

By this statute the high duties upon importation for home consumption were taken off so soon as the price of middling wheat rose to 48s. the quarter; that of middling rye, peas or beans, to 32s.; that of barley to 24s.; and that of oats to 16s.; and instead of them a small duty was imposed of only *sixpence* upon the quarter of wheat, and upon that of other grain in proportion.

This statute also originated our warehousing system with regard to corn. It permitted, at the lowest prices, the importation of corn for exportation duty free; provided it was lodged in warehouses appointed in twenty-five of the different ports of Great Britain, under the joint-looks of the king and the importer.

By an act of the 31st Geo. III. the price, when importation could take place from abroad, at the duty of six-pence, was raised to 54s., under 54s. and above 50s. a middle duty of 2s. 6d., and under 50s. a prohibitory duty of 24s. 3d. was to be paid. It was also enacted, that foreign wheat might be imported, stored under the king’s locks, and again exported free of duty; but, if sold for home consumption in the kingdom, it became liable to a warehouse duty of 2s. 6d.

In 1804 a clamor was raised by the farmers respecting the low price of corn: it resulted in the act of the 44th of the late king, which actually imposed a *prohibitory* duty of 24s. 3d. per quarter on all wheat imported when the home price was at or below 63s.; between 63s. and 66s. a middle duty of 2s. 6d.; and above 66s. the nominal duty of 6d. The price at which bounty was allowed on exportation was extended to 40s. and importation without bounty to 54s. We are happy to record the miscarriage of a second bill of this kind in 1814, by which foreign wheat imported when the home price was at or under 64s. was to pay a duty of 24s.; when at or under 65s. a duty of 23s. and so on, till the home price should reach 86s. when the duty was reduced to 1s., at which sum it became stationary. Corn imported from Quebec, or from the other British

colonies in North America, was to pay only half the duties on other corn.

The Resolutions respecting the corn trade, submitted to the house of commons, February 17th, 1815, by Mr. Robinson, the present chancellor of the exchequer, became, after much opposition, the basis of the 55th Geo. III. cap. 26. They were as follows:—

1st, That it is the opinion of this committee, that any sort of foreign corn, meal, or flour, which may by law be imported into the United Kingdom, shall at all times be allowed to be brought to the United Kingdom, and to be warehoused there, without payment of any duty whatever.

2d, That such corn, meal, and flour, so warehoused, may at all times be taken out of the warehouse, and be exported, without payment of any duty whatever.

3d, That such corn, meal, or flour, so warehoused, may be taken out of the warehouse, and be entered for home consumption in the United Kingdom, without payment of any duty whatever, whenever foreign corn, meal, or flour, of the same sort, shall be admissible into the United Kingdom for home consumption.

4th, That such foreign corn, meal, or flour, shall be permitted to be imported into the United Kingdom, for home consumption, without payment of any duty, whenever the average prices of the several sorts of British corn, made up and published in the manner now by law required shall be at or above the prices hereafter specified, viz.

	Per Quarter
Wheat	80s.
Rye, peas, and beans	53s.
Barley, bere, or bigg	40s.
Oats	26s.

But that whenever the average prices of British corn shall, respectively, be below the prices above stated, no foreign corn, or meal, or flour, made from any of the respective sorts of foreign corn above enumerated, shall be allowed to be imported or taken out of warehouse for home consumption, nor shall any foreign flour be at any time importable into Ireland.

5th, That the average prices of the several sorts of British corn, by which the importation of foreign corn, meal, or flour, into the United Kingdom is to be regulated and governed, shall continue to be made up and published in the manner now required by law; but that hereafter, if it shall at any time appear that the average prices of British corn, in the six weeks immediately succeeding the 15th February, 15th May, 15th August, and 15th November in each year,

shall have fallen below the prices at which foreign corn, meal, or flour, are by law allowed to be imported for home consumption, no such foreign corn, meal, or flour, shall be allowed to be imported into the United Kingdom, for home consumption, from any place between the rivers Eyder and Garonne, both inclusive, until a new average shall be made up and published in the London Gazette, for regulating the importation into the United Kingdom for the succeeding quarter.

6th, That such corn, meal, or flour, being the produce of any British colony or plantation in North America, as may now by law be imported into the United Kingdom, may hereafter be imported for home consumption without payment of any duty, whenever the average prices of British corn, made up and published as by law required, shall be at or above the prices hereafter specified, viz.

Per Quarter.

Wheat	67s.
Rye, peas, and beans	44s.
Barley, bere, or bigg	33s.
Oats	22s.

But that whenever the prices of British corn, respectively, shall be below the prices above specified, corn, or meal, or flour, made from any of

the respective sorts of corn above enumerated, the produce of any British colony or plantation in North America, shall no longer be allowed to be imported into the United Kingdom for home consumption.

7th, That such corn, meal, or flour, the produce of any British colony or plantation in North America, as may now by law be imported into the United Kingdom, shall at all times be permitted to be brought there and warehoused, without payment of any duty whatever.

8th, That such corn, meal, or flour, so warehoused, may at all times be taken out of the warehouse and exported, without payment of any duty whatever.

9th, That such corn, meal, or flour, so warehoused, may be taken out of warehouse, and entered for home consumption in the United Kingdom, whenever corn, meal, or flour, of the like description, imported direct from any such colony or plantation, shall be admissible for home consumption, but not otherwise.

By the 3d of Geo. IV. cap. 60, the Act of 1815 was repealed, and importation was permitted, when, for three months preceding the 15th of February, May, August, or November, the average prices exceeded the rates stated below, at the rates of duty affixed, viz.

When the average prices rate as below :

Description of Grain.	From British Possessions in America.	From all other parts.	Rate of Duty p. Quar.	Extra for the first 3 Months.
Wheat	If at 59s. per Quarter, but under 67s.	If at 70s. but under 80s.	12s.	5s.
Ditto	67s. 71s.	80s. 85s.	5s.	5s.
 If at or above 71s.	or if at or above 85s.	1s.	
Beans, peas, or rye	39s. 44s.	44s. 53s.	8s.	3s. 6d.
	44s. 46s.	53s. 55s.	3s. 6d.	3s. 6d.
Barley, bere, or bigg If at or above 46s.	or if at or above 55s.		3d.
	30s. 33s.	33s. 40s.	6s.	2s. 6d.
Oats	33s. 35s. 6d.	40s. 42s. 6d.	2s. 6d.	2s. 6d.
 If at or above 35s.	or if at or above 42s. 6d.		6d.
Ditto	20s. 22s. 6d.	25s. 28s.	4s.	2s.
	22s. 6d. 24s.	28s. 30s.	3s.	2s.
 If at or above 24s.	or if at or above 30s.		4d.
Wheat Meal or Flour, and Oatmeal, are admitted for Consumption, either from British Possessions in America or from any other part, at the rates of duty hereunto affixed, when the average prices of		WheatMeal or Flour, at per Cwt. Oatmeal pr. Boll.	3s. 3d.	1s. 7d.
Wheat and Oats respectively correspond with the Rates above specified.—Peas, when prohibited as corn, are admitted for seed or any other purpose at			1s. 7d.	1s. 7d.
			4s. 10d.	2s. 2d.
			2s. 2d.	2s. 2d.
		7s. per Bushel.	6d.	

By 7 Geo. IV. cap. 70. foreign corn, meal, and flour warehoused, were permitted to be taken out for home consumption, until the 16th day of August, 1826, at the following rates of duty, viz.

Wheat	12s. per quarter.
Beans, peas or rye	8s. ditto.
Barley, bere, or bigg	6s. ditto.
Oats	4s. ditto.
Wheat meal or flour	3s. 3d. per cwt.

7 Geo. IV. cap. 71, an Act to empower his Majesty to admit foreign corn for home consumption, under certain limitations, until the 1st of January, 1827, or for six weeks after the commencement of the next ensuing session of par-

liament, if parliament shall not then be sitting. The following is the detail, viz.

‘Whereas it may become expedient, for a time to be limited, to admit a further quantity of corn or flour for home consumption, in addition to the foreign corn, grain, meal, or flour, which had been warehoused, or reported inwards to be warehoused, on or before the 2d day of May, 1826: Be it therefore enacted, by the Kings’ Most Excellent Majesty, by and with the advice and consent of the lords spiritual and temporal, and commons, in this present parliament assembled, and by the authority of the same, that at any time after the end of the present session of parliament, and until the 1st day of January,

1827, or for six weeks after the commencement of the then ensuing session of parliament, if parliament shall not then be sitting, it shall be lawful for his Majesty, by any order or orders to be by him issued, by and with the advice of his privy council, to admit to entry for home consumption any quantity of warehoused wheat or wheat flour not exceeding 500,000 quarters in the whole, or payment of such duty as shall be declared in any such order to be payable upon the entry of the same: provided always, that no such order in council shall continue in force for more than two calendar months from the day of the date thereof; and provided also, that no such order shall extend to admit to entry any wheat or wheat flour which had been warehoused, or reported inwards to be warehoused, before the said second of May.

'Provided always, that the duty so to be declared in any such order shall not in any case exceed the duty enacted by 3 Geo. IV. cap. 60.'

We should, perhaps, add that by the 12th Geo. III. c. 71, forestalling and regrating are declared to be offences at common law, and not done away by the repeal of the statute of 5 & 6 Ed. VI. c. 14, viz. *Forestalling* the market being considered an offence against public trade, and described by the said statute 5 & 6 Ed. VI. c. 14, as the buying or contracting for any cattle, merchandise, or victual coming in the way to the market, or dissuading persons from bringing their goods or provisions there; or persuading them to enhance the price when there: and *regrating* the buying of corn, or other *dead* victual, in any market; and selling it again in the same market, or within four miles of the place. Such is a brief, but we believe pretty complete, view of the history and present state of our corn laws.

We look forward confidently to their entire *repeal*, that is, ultimately; for we advocate a preparatory measure, as we shall proceed to show. Although we have not the happiness to believe all that Dr. Smith asserts, in support of the following observation, there is great weight in it. 'The laws concerning corn may every where be compared to the laws concerning religion. The people feel themselves so much interested in what relates either to their subsistence in this life, or to their happiness in a life to come, that government must yield to their prejudices, and, in order to preserve the public tranquillity, establish that system which they approve of. It is upon this account, perhaps, that we so seldom find a reasonable system established with regard to either of those two capital objects.' The supposition of an entire final repeal of the corn laws enables us best to meet the question, Who would be injured by it?

1. Not the *laborer*, or any *consumer*. The former certainly would not be so suddenly or largely benefited by it, as some declaimers flatter him. The principal mischief of high prices being in his case, the perpetual disarrangement of his relations with his employer: the 'changing of his wages ten times,' (as the Scripture phrases it, no slight evil however), when the peaceable and natural state of those relations might not require them to be changed at all. That is, he must receive, speaking generally, the same *real* wages

under all the changes of price: he must receive that which shall support him; or the lowest possible wages for producing the corn, or commodity on which he labors. His money-wages therefore rise and fall perpetually in value, when his real wages remain the same. But he would be benefited by not being *deceived*. The institutions of society, in the case of steady wages being afforded him, would no longer invite him to settle in this spot and marry in that: we add,—to be extravagant (often through being misled) at one season, while they compel him to beg, to receive parish allowance, or starve at another. None of the consumers of corn would be injured by the repeal of all the corn laws; all would be benefited: and who are not consumers? The landlord, as well as the farmer and laborer, belongs to this class; the banker, the merchant, the trader, the manufacturer, and all the professions. Various opinions have been offered as to the practical effects of an unrestricted importation of corn, in respect to its price. We shall attend to them again before we close this paper: but as the only classes opposing this measure do it avowedly in fear of a low price of corn, and we are arguing in hope of it, we may take it at 8s. 10s. 12s., or any supposed permanent diminution. Now the consumption of wheat in Great Britain only, in 1814, is estimated by Mr. Weston to have been 9,170,000 quarters; of barley, 6,335,000: if an unrestricted importation allowed us to receive the former at only 5s. a quarter cheaper, here would be a clear gain of £2,292,500 to the consumers, on wheat only,—to say nothing of the difference in regard to barley, which would more rapidly and steadily affect the price of all malt liquors and spirits distilled from malt. But,

2. Would the *farmer* be injured by an entire repeal of the corn laws? Not at all we contend. He is a capitalist. His interests are entirely confined to the amount of profit on his capital; and this is more uniformly increased by low wages and a quick return than from any other sources. As a consumer of corn he is positively and directly injured by its high price; and as a considerable employer of laborers still more. If, indeed, he is possessed of a lease, taken at a low rental, and continued through the period of high prices, he is so far benefited by that state of the markets; but at its termination will he not be raised accordingly,—his own improvements valued to him,—or his removal be made expedient?

3. It is quite clear that the *manufacturer* and *tradesman* must suffer by high prices of corn in their own consumption of it, and in the higher rate of wages they must pay—consequently in diminished profits, with regard to their home trade, and in the curtailing or extinguishing their power to meet foreign manufactures in the market. With these claims the banker and the wholesale merchant suffer in the same direct and almost incalculable way. There remains, therefore,

4. But the isolated class of *landlords* who could by any possibility be injured by a repeal of the statutes in question. They are estimated, according to some able modern writers, as owning one-fifth of the value of the produce of the land. That is, the entire rental they receive is equal to

about one-fifth of the value of the annual produce. Let us suppose it to be a fourth: the rest of the produce belongs to those who farm their own land, or to the actual cultivator of the soil. Here then are three-fourths of the produce of the whole country taxed at the rate of millions per annum, to ensure the greater rental of those interested in the remaining one-fourth! Or rather, the corn of the whole country, including that which belongs to them, is thus raised in price to the whole country.

It is of great moment here to consider the quantity of grain that would probably be imported into this country, in case of the restrictions of importation being removed, and its relative proportion to the consumption of the country. Dr. Colquhoun's estimate of that consumption in 1812 and 1814, concurs with the one we have before alluded to, i. e. Mr. Western's, and is as follows:—

Species of Grain.	Estimated Average of the Population of Great Britain and Ireland.	Each person averaged.	Consumed by man.	Consumed by Animals.	Used in Beer and Spirits.	Used in various Manufactures.	Total of Quarters.
		Quarters.	Quarters.	Quarters.	Quarters.	Quarters.	
Wheat . . .	9,000,000	1	9,000,000			170,000	9,170,000
Barley . . .	1,500,000	1½	1,875,000	210,000	4,250,000		6,335,000
Oats . . .	4,500,000	1½	6,750,000	10,200,000			16,950,000
Rye . . .	500,000	1½	625,000	59,000		1,000	685,000
Beans and Peas } . . .	500,000	1	500,000	1,360,000			1,860,000
Totals . . .	16,000,000		18,750,000	11,829,000	4,250,000	171,000	35,000,000

But here, as the Edinburgh Reviewer, No. 88, has observed, is no allowance for seed; and there can be no doubt that Dr. Colquhoun has underrated the consumption of oats by at least one-half quarter in the consumption of each of the 4,500,000 individuals he supposes fed on them, or by 2,250,000 quarters. 'Adding, therefore,' says this writer, to Dr. Colquhoun's estimate 5,500,000 of quarters for seed, and 2,250,000 for the deficiency of oats, it will bring it to 42,750,000 quarters. And, taking the increase of

population since 1813 into account, it does not appear to us that the annual average consumption of the different kinds of grain in the United Kingdom can now be estimated at less than 42,000,000 of quarters, exclusive of seed, and at 48,000,000 when it is included.'

On the basis of this estimate, or assuming 12,000,000 quarters of wheat to be the annual consumption of the empire, that consumption by a very simple calculation may be thus exhibited, in regard to smaller portions of time:—

The Consumption of	Wheat.	Other Grain.	Total.
	Quarters.	Quarters.	Quarters.
A year	12,000,000	36,000,000	48,000,000
Six months	6,000,000	18,000,000	24,000,000
Three months	3,000,000	9,000,000	12,000,000
Six weeks	1,500,000	4,500,000	6,000,000
One month	1,000,000	3,000,000	4,000,000
Two weeks	500,000	1,500,000	2,000,000
One week	250,000	750,000	1,000,000
One day	35,714	107,143	142,857

Let us now see what proportion the largest importations that have taken place, bear to this the total consumption of the empire. The total imports of wheat from all parts of the world, from the year 1800 to 1820, both inclusive, according to papers printed by order of the house of commons, amounted to only 12,577,029 quarters, giving an annual average of 589,906 quarters.

These were years of high, unprecedentedly high, prices: the whole commercial world, as the Reviewer observes, was ransacked with a view to the supply of the British market; yet such is the magnitude of our consumption, that the whole supply obtained did not amount, according to the official statements, to one-thirteenth part of it, or that of one month! This statement is of

itself, surely, as this writer triumphantly insists, 'sufficient to show that nothing can be more perfectly futile than the fears and apprehensions entertained by the agriculturists with respect to the excessive importations of foreign corn that would take place, were our ports thrown open.'

We are very happy to see Sir James Graham's able tract on 'Corn and Currency' in an Address to the Land Owners, confirm much of our forgoing reasoning. 'Since the year 1815,' he says to this important body, 'when the prohibition of the importation of foreign corn, excepting at a fixed price, was first substituted for a protecting duty, your constant and avowed object has been to raise the price of agricultural produce in this country greatly above the level

of the continental market; the obvious effect of this has also been to raise the rate of wages, and to reduce the rate of profits. By the rise of wages the laborer gains nothing, because, when corn is dear, all the articles of first necessity are also dear. Therefore, though his wages be increased, his real reward is no greater; but by the diminution of profits, every class of productive industry is deeply injured. For on all hands it is allowed, that profits fall as wages rise, and the capital of a nation is but the accumulation of the profits of its inhabitants. Rents, however, are raised by high prices, which force inferior soils into cultivation; since the lower the degree of fertility of the worst land in tillage, which yields no rent, but only reimburses the cultivator—the higher, on all land of superior quality, is the extra profit beyond the ordinary return of capital, when expended on the worst. This extra profit is rent; or, in the words of Mr. Mill, ‘rent increases in proportion as the effect of the capital successively bestowed upon land decreases.’ High prices, therefore, by increasing rents, benefit the landlords, but they confer no advantage on the laborer; they are an injury to the productive, and a tax on the unproductive, classes of the community.

‘It may be doubted even whether the existing system of prohibition be so entire a benefit to the land owner himself, as he would seem to imagine; for, in the variety of seasons, it is impossible that the land cultivated within these islands can, year by year, from one harvest to another, produce a supply of corn exactly commensurate with the demand. At one time the prohibitory system is unjust to the grower; at another, to the consumer. The grower is injured, when, after a harvest somewhat deficient, the ports are opened by a sudden rise of price, and a large accumulation of foreign corn is poured at once into this country; bringing on the farmer the losses incident to over-production, and ultimately on the landlord a correspondent decline of rent. The consumer is injured, in the interval between the rise of price and the importation of foreign grain; he is even exposed to the horrors of famine; for, in proportion as the demand for foreign grain is unusual, the supply in case of emergency must be precarious. Thus the alternate evils of redundancy and scarcity, unsteady prices and uncertain rents, are the inevitable consequences of the present system of our Corn Laws.’

But the peculiar burdens of the agriculturists have been often dwelt upon in this discussion, and should be, in fairness, estimated. They are said to consist of all the *tithes*, the far greater proportion of the poor rates, and the land tax. With regard to the first of these burdens it is a rental paid by the landlords, in point of fact, we presume to the state, rather than the church, for specific purposes; that is, it is a part of the tenure on which all existing landholders have entered upon their property for the last ten or twelve centuries, and the method of its appropriation by the state, however obnoxious and objectionable, on some grounds, renders the supposed burden no more a hardship on landlords than other peculiarities of the respective tenures. Their deeds never conveyed to them

more than the value of nine-tenths of their estates, and other deeds or laws secure the other tenth to the state in trust for the church. But it seems that about a third part of the land in England and Wales, large tracts in Ireland and the whole of Scotland are *tithe free*. This impost is therefore by no means universal.

To the land-tax, as an ancient impost, some portion of these remarks may also be applied. Estates have been acquired under it; and as the existing relations of landlord and tenant (for it is in fact a tax on the rent) have grown up; it was originally imposed, we believe in the year 1693, at the rate of one shilling in the pound, on an ascertained rental, and has since been increased to four shillings. We do not, however, perceive the force of a distinction drawn by the Edinburgh Reviewer between a tax on rent, as the excess, or value of the excess, of produce obtained from the superior lands of a country over that portion of their produce, of value that is required to defray the expenses of cultivation, and to yield the farmer his profit—and a tax that should be laid more directly on the profits of the grower of corn. If the land-tax be imposed on the rents as an excess, so as to reduce that excess below the fair expectation of the landlord from his land, is he not entitled to require the farmer or the community to bear it with him? And, in point of fact, will he, and does he, not require the farmer to bear it with him in the shape of greater rent than he would otherwise pay? As far, therefore, as the land-tax is a species of impost on the agricultural interests (whether falling on the landlord or tenant, which amounts to an excess of duties not laid on other raw produce, it is entitled we apprehend to consideration at the present time, and to compensation in the project of finally opening the ports. The poor-rates is the only other burden stated to fall peculiarly on this class of society, and the Reviewer, to whom we have more than once adverted, admits it to fall at the rate of one per cent. ad valorem heavier on this than on other parts of the community. We should rate the land-tax as equal to an ad valorem duty of five per cent. more. At this stage of our enquiry, therefore, we admit a claim for protecting duties of seven per cent.

But one evil consequence affecting the whole community has been loudly predicted as likely to follow from the free importation of corn. The placing our subsistence at the mercy of foreigners in the case of war: an argument, as Mr. Mills has well said, which ‘implies an ignorance, both of history and of principle; of history, because, in point of fact, those countries which have depended the most upon foreign countries for their supply of corn, have enjoyed, beyond all other countries, the advantage of a steady and invariable market for grain; of principle, because it follows unavoidably, if what in one country is a favorable is in other countries an unfavorable season, that nothing but obtaining a great part of its supply from various countries can save a nation from all the extensive and distressing fluctuations which the variety of seasons is calculated to produce. Nor is the policy involved in this argument better than the political economy. It sacrifices a real good to escape the

chance of a chimerical evil; an evil so much the less to be apprehended, that the country from which another derives its supply of corn is scarcely less dependent upon that other country for a vent to its produce, than the purchasing country is for its supply. It will not be pretended that a glut of corn in any country, from the loss of a great market, with that declension of price, that ruin of the farmers, and that depression of rents, which are its unavoidable consequences, is an immaterial evil.' 'Upon this subject however,' says Mr. Whitmore, 'we may proceed upon proof and experience, and need not, therefore, trust to general reasoning. It is well known that this country constantly imports nearly all the hemp it uses; it is equally clear that, if deprived of it, the consequences to us, a maritime and commercial people, would be to the last degree injurious. If there be one article more than another, of which a hostile country would wish to deprive us, it would be this very article of hemp, which may fairly be considered the sinews of naval warfare. But were we ever deprived of it? Was there ever any serious obstruction, either to our naval armaments or to our commercial speculations, arising from a deficiency of this important article? If not, it is chimerical to imagine that we shall ever be deprived of the corn we are in the habit of importing.'

We feel that we have bestowed sufficient attention on the ordinary objections to a repeal of our present corn laws. Mr. Whitmore, one of the most sensible writers on this subject, concurs with Mr. Ricardo in recommending a duty of 10s. per quarter as a sufficient compensation for the excessive taxes on agriculture to which we have adverted. But the latter gentleman advised, as a measure of indulgence to the agriculturists, to give them time for gradually withdrawing their capital from the land, or that the duty should be originally fixed at 20s., and lowered 1s. every year until reduced to 10s. This we must consider a plea for excessive indulgence. The Edinburgh Reviewer has expressed our opinion that an ad valorem duty of ten per cent would be sufficient, or, what is preferable, a fixed duty of five or six shillings per quarter; for an ad valorem duty, as it has been often remarked, increasing with the price, falls heaviest in dear years; when it is of the greatest consequence that it should be least felt; and lightest in plentiful years, when the burden would be of little comparative consequence. Sir James Graham asks in behalf of the land owners for a fixed protecting duty of 15s. per quarter; and adds, with no slight appearance of justice, 'Since we must have a free trade in corn, let us have also a free trade in money, and destroy that fatal connexion between the government and a single chartered bank, which facilitates the prodigality of the ministers, and invests an irresponsible body with the most delicate and important function of the state—the control over the circulating medium. Nor will it be wise to stop even at this point; if the land owner is to give up his monopoly, for the public good, shall the East India Company and the West India proprietors be suffered, for one day, to retain the full enjoyment of their exclusive privileges? Shall the consumer be forced to pay an exorbitant price for his tea and for his

sugar, that particular interests may be benefited; and shall the nobility and gentry of these realms, the owners of the native soil, *alone* be sacrificed? On the contrary, let us adopt the sound principles of free trade; but let us not limit their application to the staple produce of our land. Let us destroy the heavy duties on timber, which, at the expense of every man building a ship or a house in the mother country, are at best a paltry premium to our colonies; and since we are bent on establishing an open competition with the foreign manufacturer, let us at once reduce largely those taxes which affect both the commerce and manufactures of our country. It is not the price of bread alone, which is a check to our industry; on the contrary, I am well convinced that its effect is insignificant, compared with the weight of taxation to which I have here alluded; and every notion of free trade is worse than visionary, unless accompanied by a large reduction of taxes and of duties. It is clear that the government itself so considers it; for, notwithstanding the boasted triumph of principles termed *liberal*, it has been deemed necessary, in the recent example of the silk trade, to protect the British manufacturer by a duty of thirty per cent on foreign silks imported, although he is subject to no direct tax on the raw material which he uses; but his claim for compensation, in the shape of this large protecting duty, is founded and admitted distinctly on the ground that competition with the foreigner must be ruinous, while in this country taxes on consumption are enforced to an extent unknown abroad; and oppressive, not to the manufacturer alone, but equally to the agriculturist and every member of the community. The experiment of the destruction of monopoly in one branch of industry, while it is suffered to continue with unabated force in others, is an outrage even of the semblance of justice; it is a shifting of the burthen from the protected to the unprotected, from the strong to the weak; and the landed interest is lost indeed, if it allow for one moment an experiment of this nature to be made on its property. The course, therefore, to be adopted by them, is to consent to a revision of the corn laws, to consent to free importation with a moderate protecting duty, but to force also at the same time a revision of all other monopolies, and to carry a reduction of taxes to a very large amount.'

On the whole our views embrace, as we are happy to believe those of the government and most modern writers do, not a great *alteration*, but a *greater steadiness* of price as the result of a free importation of corn. The details of Mr. Jacob's Report support this view of the subject in every page. He makes it evident that the resources of Poland, and the North of Europe, for furnishing any considerable supply of corn, have been vastly overrated. He found little of agricultural science and much less corn than he expected every where. The soil of the provinces near the sea is thin, sandy, and unproductive; while the more distant fertile provinces of Poland incur an expense, attending the carriage of their produce to Dantzic, amounting on an average to from 12s. to 18s. per quarter. Dantzic is clearly the principal foreign port from which we could obtain any regular supply. On its capabilities and past

history this intelligent gentleman therefore bestowed his principal attention.

'The commerce of corn generally,' he observes, 'in the countries whose connexion with the sea is maintained by the river Vistula, has been extensive during a long series of years. The shipment to foreign countries was, during a long period, almost exclusively confined to the city of Dantzic.

'The government of Prussia viewed with some jealousy the trade of that city, which was then one of the independent Hanse Towns, and, having the land on both sides the river, from the boundaries of Poland to those of Dantzic, endeavoured, by forming the city of Elbing into a free mart, to draw the trade through that place and its port of Pillau.

'Some success attended this plan, and the trade was carried on through the two rival channels, with a competition which has been continued to the present time; for though Dantzic has been since added to the Prussian territories, and the preference given to Elbing consequently withdrawn, the latter city seems to have retained its proportionate share of the export of corn.

'Attempts are at this time making by Russia, to divert the corn trade of Poland, but especially of the provinces of that country which have been separated from it, and are now comprehended in Russia, to the port of Riga as the place of shipment. For this purpose canals are now constructing, which are intended to facilitate the conveyance of goods to the river Duna. It is not however probable, that a very great proportion of the trade will be drawn into that channel. The port of Riga is closed by frost a much longer time than that of Dantzic; the passage from it to the countries where corn is wanted is longer; the climate is less favorable for drying the grain, after removing it from the barges preparatory to shipment; and it, at present, has not those spacious and well-adapted warehouses for the secure deposit of corn, by which Dantzic is eminently distinguished. Some portion of the corn is at present brought down to the sea-shore by the river Neimen, and after paying a transit duty to Prussia at the town of Schmaleningken, is conveyed to Memel. This branch of the trade is, however, but small, as it appears that in the three years 1816, 1817, and 1818, a period when the general trade was the greatest, the whole quantity that paid the transit duty was only 49,596 quarters of wheat, 21,830 quarters of barley, 185,292 quarters of rye, and 108,482 quarters of oats.

'From the southern provinces of Poland, viz. Sandomir and Cracow, in which the greatest quantity of the best wheat is produced, a portion is annually sent into the neighbouring Prussian province of Silesia, by land, where a part of it is consumed by the few inhabitants of Breslaw, and the other cities, who eat wheaten bread. The greater part is, however, conveyed by the river Odo, and then by the canal which unites that river with the Havel, to the city of Berlin. It forms an article in the weekly returns of the corn-market of that capital; and, by the whiteness of its flour, is preferred for pastry and confectionary. In those years when the prices of grain have been the most raised in England, some of it has been sent here from Stettin, whilst those

of the inhabitants of that neighbourhood who used wheat, were supplied with an inferior kind of their own growth. Those other channels by which the surplus corn of Poland is distributed, bear however but a small proportion to that which passes by the mouths of the Vistula, at Dantzic and Elbing; and the manner in which the trade by these places is carried on may deserve detailed notices.

'On the banks of the Vistula there are many warehouses well adapted for preserving corn at the places whence it is most convenient to embark it. The crops are generally removed from the farms of the proprietors as speedily as possible, and remain there in the power of the creditor, who either allows for it a stipulated price, or undertakes to convey it to Dantzic, to be sold at the risk of the debtor; but with the proceeds to be received by the creditor. The charges for warehousing, shipping, freight, tolls, commission, and other demands, have been lately so high, in proportion to the prices, that very small sums have been carried to the credit of the landholder; and, where estates are mortgaged, they have been generally insufficient in amount to keep under the growing interest.

'There are two modes of conveying wheat to Dantzic by the Vistula. That which grows near the lower parts of the river, comprehending Polish Prussia, and part of the province of Plock and of Masovia, in the kingdom of Poland, which is generally of an inferior quality, is conveyed in covered boats, with shifting boards that protect the cargo from the rain, but not from pilfering. These vessels are long, and draw about fifteen inches water, and bring about 150 quarters of wheat. They are not, however, so well calculated for the upper parts of the river. From Cracow, where the Vistula first becomes navigable, to below the junction of the Bug with that stream, the wheat is mostly conveyed to Dantzic in open flats. These are constructed on the banks, in seasons of leisure, on spots far from the ordinary reach of the water; but which, when the rains of autumn, or the melted snow of the Carpathian mountains, in the spring, fill and overflow the river, are easily floated.

'Barges of this description are about seventy-five feet long, and twenty broad, with a depth of two feet and a half. They are made of fir, rudely put together, fastened with wooden treenails, the corners dovetailed, and secured with slight iron clamps, the only iron employed in the construction. A large tree, the length of the vessel, runs along the bottom, to which the timbers are secured. This roughly cut keelson rises nine or ten inches from the floor, and hurdles are laid on it which extend to the side. They are covered with mats made of rye-straw, and serve the purpose of dunnage; leaving below a space in which the water that leaks through the sides and bottom is received. The bulk is kept from the sides and ends of the barge by a similar plan. The water, which these ill constructed and imperfectly caulked vessels receive, is dipped out at the end and sides of the bulk of wheat. Vessels of this description draw from ten to twelve inches of water, and yet they frequently get aground in descending the river. The cargoes usually consist of from 180 to 200 quarters of wheat.

'The wheat is thrown on the mats, piled as

high as the gunwale, and left uncovered, exposed to all the inclemencies of the weather, and to the pilfering of the crew. During the passage, the barge is carried along by the force of the stream, oars being merely used at the head and stern, to steer clear of the sand-banks, which are numerous and shifting, and to direct the vessel in passing under the several bridges. These vessels are conducted by six or seven men. A small boat precedes with a man in it, who is employed in sounding, in order to avoid the shifting shoals. This mode of navigating is necessarily very slow; and during the progress of it, which lasts several weeks, and even months, the rain, if any falls, soon causes the wheat to grow, and the vessel assumes the appearance of a floating meadow. The shooting of the fibres soon forms a thick mat, and prevents the rain from penetrating more than an inch or two. The main bulk is protected by this kind of covering, and, when that is thrown aside, is found in tolerable condition. The vessels are broken up at Dantzic, and usually sell for about two-thirds of their original cost. The men who conduct them return on foot.

When the cargo arrives at Dantzic or Elbing, all except the grown surface is thrown on the land, spread abroad, exposed to the sun and air, and frequently turned over till any slight moisture that it may have imbibed is dried. If a shower of rain falls, as well as during the night, the heaps of wheat on the shore are thrown together in the form of the steep roof of a house, that the rain may run off, and are covered with a linen cloth. It is thus frequently a long time after the wheat has reached Dantzic before it is fit to be placed in the warehouses. The warehouses are very well adapted for storing corn. They consist, generally, of seven stories, three of which are in the roof. The floors are about nine feet asunder. Each of them are divided by perpendicular partitions, the whole length about four feet high, by which different parcels are kept distinct from each other. Thus the floors have two divisions, each of them capable of storing from 150 to 200 quarters of wheat, and leaving sufficient space for turning or screening it. There are abundance of windows in each floor, which are always thrown open in dry weather, to ventilate the corn. It is usually turned over three times a week. The men who perform the operation throw it with their shovels as high as they can, and thus the grains are separated from each other and exposed to the drying influence of the air.

The whole of the corn warehouses now left for many were burnt during the siege of 1814) are capable of storing 500,000 quarters of wheat, supposing the parcels to be large enough to fill each of the two divisions of the floors, with a separate heap; but as, of late years, it has come down from Poland in smaller parcels than formerly, and of more various qualities, which must of necessity be kept distinct, the present stock of about 280,000 quarters is found to occupy nearly the whole of those warehouses which are in repair, or are advantageously situated for loading the ships. Ships are loaded by gangs of porters with great despatch, who will complete a cargo

of 500 quarters in about three or four hours. It is seen by Table No. 19, that within the last five or six years the whole quantity that has been brought down has been diminishing; but I was told that no sensible decrease had been observed in the number of the separate bulks, only that each bulk, or the growth of each estate, or of each consignor, was smaller.

The trade in wheat from Poland and Prussia, through Dantzic, is said to have been attended with most ruinous losses to all the persons who have been engaged in it. The growers asserted that none, for the last eight or nine years, had yielded sufficient to cover the expenses of cultivation, and that it has been regularly getting worse and worse ever since the year 1818. The Jews, who have taken the crops from the growers, have found the decline of the prices such, that if they sold on their arrival at Dantzic, it was attended with loss; and if they were in a condition to withhold from selling, and placed it in warehouses, the loss was eventually much greater. The trade of Dantzic, which is chiefly confined to corn, has been for several years in a very distressed state. The commodity in which the traders have dealt has of late so vastly declined in value, that what was purchased cheap at one period, became in a short time dear; the advances they made on what was consigned to them for sale, with the expense of conveyance, and of storing and preserving, soon amounted to more than the value of the wheat; and the consignors, in Poland, seldom united the ability and the disposition to make payments to indemnify them. The corn now in the warehouses has cost the merchants much more than the present value. The royal bank of Prussia, which has branches in the different cities of the kingdom, has advanced, on the security of the wheat now in store, half of what was the value at the time the several advances were made; and, as the price has declined, has required additional security.' We subjoin the Table adverted to.

An account of the quantities of grain shipped down the Vistula, through the city of Thorn, from Russia and Poland, to Dantzic and Elbing, from the years 1816 to 1825.

I do herewith duly certify, that the quantities, as above stated (scheffel anzahl in the original German account), have been extracted from authentic papers, and the registers of the custom-house.

MELLIN, Burgomaster.

Thorn, Aug. 23rd, 1825.

The stock of wheat in Dantzic and Elbing, at the period of his visit (Aug. 1825), was furnished to him as follows :

Dantzic 288,000 quarters.
Elbing 73,500 quarters.

The whole stock in the provinces connected with the Vistula, he afterwards brings into one point of view as consisting of

Pomerania	67,103	Quarters.
Dantzic and Elbing	361,500	
Lubeck	29,900	
	458,503	

Conjectural :

Denmark	25,000
Rostock and Wismar	25,000
Petersburgh, Riga, and Memel	100,000

Carried forward 608,503

Brought forward 608,503
In ports in the North Sea, as ascertained :
Hamburgh 105,000
Bremen 27,970

Total 741,473

‘Of the wheat to which we have referred, as accumulated in the several ports, I was assured,’ says he, ‘nearly one-fourth part is of so bad a quality, as to find no market in this country, except in seasons of uncommon dearth. If, then, out of the whole 741,473 quarters, 556,330 quarters were to be sent to England, it would not be more than the consumption of ten days.’

His exhibition of the general agricultural distress of these provinces is very singular and affecting.

‘An estimate was made by a person eminently skilled in the value of land, who formed it upon actual sales made in the last four years. He divided it into three classes, according to their fertility. The lowest land in a state of cultivation, with good buildings and a competent number of peasants, he stated to be worth 1000 florins the huff. Valuing the florins at sixpence, though worth a fraction less, and taking the huff of thirty Magdeburg morgens, as equal to twenty-two English acres, the estimate would be a fraction less than 22s. sterling the English acre. The other kinds of arable land, of superior qualities, vary. The great mass is of the second class, or worth about 30s. but some is estimated at 5000 florins the huff, or £5. 10s. but little, however, is in this class, and that little is in the vicinity of the cities on the banks of the great rivers, or in some favored spots in the southern provinces. This estimate was rather founded on the state of affairs three or four years ago, than on their present condition; for I was told that such a number of estates had lately been offered for sale, that no price could be obtained for the greater part. All the enquiries I was enabled to make, in various parts of the country, led me to the belief, that the estimation here stated was, in the main, as correct as could be expected to be framed.

‘The Jews are almost exclusively the dealers in money. They are precluded from becoming landed proprietors, and their exclusion from the market tends to depress the prices in a very great degree. Though some of the richer individuals of that people pass through the ceremony of baptism, especially when they have mortgages on large estates, and mean to foreclose; the whole number of those who thus become qualified to purchase bears a small proportion to that of the properties that are offered for sale. I was assured from so many, and such various quarters, that I have no reason to doubt of the report, that almost every estate is deeply involved in debt. The fact is so notorious, that few proprietors feel any delicacy in acknowledging themselves to be partakers of the common lot of their neighbours. More than one, without any reserve, spoke to me on the sum annually required to pay interest on his mortgages, with as much coolness as an English farmer would speak of his rent, tithes, and taxes.

‘Among the mortgagees, the king of Prussia and some of his monied subjects are by far the greatest, in that part of Poland which was included in his dominions, till Poland was erected into a Grand Duchy by Buonaparte, under the government of the king of Saxony. It had long been the practice of the court of Berlin to assist agriculture, by loans to the proprietors of estates. This practice began under Frederick the Great, and was continued to the disastrous period that followed the battle of Jena. This assistance was extensively afforded to the newly acquired subjects of the part of Poland, which, in the division of that unfortunate country, fell to the share of Prussia. Though the king of Prussia has lost the government, his claims, and those of his subjects, on the individuals indebted to them, have been recognised; and though in many instances the interest has gone on increasing, the claims have not been rigidly enforced. It was rumoured in Warsaw, but not on any authority, that the emperor Alexander, in his character of king of Poland, was negotiating a treaty with the court of Berlin, which had for its object the relief of the Poles, by purchasing the claims of the Prussians and assuming the debts to himself. The amount of the claims of Prussia was stated to me to be two millions of Prussian dollars, or £300,000 sterling, secured on various estates extending over near 1,500,000 acres.

‘A more numerous class of mortgagees comprises the corporations of cities and towns, the trustees of hospitals, schools, colleges, monasteries, convents, and charitable institutions. Whatever capitals these may possess is lent on land; and the difficulty of obtaining the interest as it accrues, and, in some instances, of getting any, causes those establishments to languish, and decrease in their capacity to relieve distress.

‘Family settlements are mostly made on the security of land: for a long period there was no other means of making provision for the young and the helpless; and, in the flourishing periods of agriculture, the interest was paid with punctuality. Of late, however, the widows and orphans, whose incomes were deemed free from risk, have become victims to the general depression of the value of the produce of the soil. The Jews, with all their characteristic shrewdness and sagacity, have become, in many instances, from mere necessity, mortgagees. When the debts of proprietors accumulated, and the price of produce fell, the monied men were often induced to secure themselves, as well as they could, by accepting mortgages where no payment could be obtained. The representation here given, is abundantly confirmed by the proceedings adopted in the diet when assembled in May last. The two houses, consisting almost exclusively of landed proprietors, settled a plan to administer relief, which received the emperor’s sanction.

‘A national bank is to be established, in which land-owners who are in debt, whether on mortgage or on simple contracts, may deposit a schedule of their estates, and a valuation of them: this valuation is to be made by themselves, and it is calculated it will not be made too high, because, as the present land tax is collected on the income, and future imposts are to be levied according to

this valuation, few will be induced to give in more than the true value. On the valuation, an annual interest is to be paid to the bank, at the rate of six per cent. for twenty-eight years. This is to be considered as interest at the rate of four per cent.; and two per cent. is to form the means of discharging, by compound interest, the principal in twenty-eight years. The bank, on receiving the documents, is to deliver to the proprietors its debentures or certificates; which, twenty per cent. being deducted from them, are made a legal tender for the payment of all debts; and on which four per cent. interest is to be paid by the bank. When the instalment of the first year is paid, the two per cent. is to be divided among all the holders of the bank debentures, by a lottery. The drawers of the fortunate numbers will then be paid in full. The others will receive their interest, at the rate of four per cent. till their numbers are drawn prizes, some of which must, of course, wait till the expiration of the twenty-eighth year; at which period, upon this plan, if it should work well, all the debts will be liquidated. I have only noticed this project as a corroboration of the accounts I collected of the general state of embarrassment in which the land-owners in Poland are involved.’

We are particularly struck with the coincidence between the following remarks derived from an actual survey of the facts, and the previous reasoning of many able writers.

‘If we calculate that the consumption of wheat in Great Britain is one quarter for each person for food, and about a seventh part more for seed and minor purposes, it will appear that in the first of the series we have been comparing, the quantity of wheat exported from Dantzig and Elbing would, with the then amount of our population, 11,000,000, be equal to twelve days consumption. In fact, however, out of the 5,059,163 quarters of wheat, which Dantzig exported, 1,000,014 were despatched to other countries. As we have only the gross exports from Elbing, without distinguishing what was sent to Great Britain from what was sent elsewhere, it may not be incorrect to assume, that one-fourth as from Dantzig was not sent to our markets; and then there will be a further reduction of 299,205 quarters. This will leave the whole quantity really furnished to us in the eleven years, 3,459,944 quarters, or an annual quantity of 314,540 quarters, being equal to about nine days of our consumption.

‘At the second series our population had advanced, as numbered in 1821, the middle year of that series, to 14,000,000. The quantity of wheat sent to us from the Vistula had declined, and during the eleven years had been 1,252,271 quarters, or 113,842 annually. This would be equal to the whole of our consumption for betwixt two and three days.

‘In the Appendix, No. 24, is shown the whole export of corn from Dantzig, for the last 166 years. By those tables, it appears that the wheat exported from that city, during that long period, was 19,581,947 quarters, or 117,963 quarters on the annual average of the period. In fact, the whole that Dantzig has exported in 166 years is not equal to the consumption of this kingdom,

with its present population, for more than fifteen or sixteen months. The annual importation would not now amount to two days and three quarters' consumption.'

We may now we think dismiss all fear of an overwhelming supply of corn from this part of the world.

Mr. Jacobs afterwards endeavoured to ascertain the quantity of corn conveyed by the Niemer to Memel; and by the Duna to Riga. He considers that the larger share of the produce of the fertile Russian provinces of this neighbourhood finds its market in the latter direction; and furnishes an account of the exportation of wheat from Riga for the last twelve years, which make it to average 21,381 quarters only annually; that of rye 134,822 quarters. He speaks of the fertility and comparative prosperity of Moravia. Wheat was selling last year for 20s. per quarter at Olmutz, while, on one side of the province, at Cracow, it only obtained 14s. and at Vienna 14s. 7d.

In France, through which he passed on his return, our traveller had not time to make minute observations.

'I was assured, however,' he says, 'that, for several years past, every cultivator of grain has been selling at far less than it has cost him. Some of the best judges of the subject have calculated that wheat, in the four classes of districts formed of the departments for the purposes of regulating the importation and exportation of corn, costs to the grower, on an average from twenty to twenty-two francs the hectolitre, or from 6s. 4d. to 6s. 11d. the Winchester bushel.

How far this calculation may be correct, it would be presumption in me to assert. The corn laws of France are, however, founded on a supposition of this being the price necessary to secure a profit to the farmer. The kingdom is divided, for the purposes of the corn law, into four districts, each including departments in which the prices of grain are nearly alike. When wheat is below eighteen francs the hectolitre, or 5s. 7½d. the bushel in the cheapest of those districts, twenty francs or 6s. 4½d. in the next, twenty-two francs or 7s. 0½d. in the next, and twenty-four francs or 7s. 8d. in the highest, the importation of foreign wheat is prohibited. As the whole of the four districts form the regulating price, the average of wheat throughout the whole kingdom must rise to 6s. 8d. per bushel, before any foreign wheat can be introduced. The laws which regulate the corn trade of France, were passed in 1819 and 1821; and the price of corn has not, since the end of the year 1818, ever risen so high as to effect the opening of their ports. Since that year the price has been fluctuating, but declining at the following ratio.

Average of the whole of France.

	s.	d.
1820	5	3½
1821	4	11
1822	4	3½
1823	4	11
1824	4	6½
1825	4	3½

'Your lordships,' adds Mr. Jacob in the conclusion of his able report, 'have been pleased, in my instructions, to direct me 'to consider, with reference to the provinces communicating with the Baltic Sea by the Vistula, from the view I take of the country, what increase of cultivation would be likely to take place in consequence of such a stimulus being constantly in action, as would be applied, if an alteration were made in our laws, so as to leave our markets at all times accessible to the corn grown in Poland;' and further, 'I have been instructed, 'that, as it may be necessary to assume some given price in this country, in forming such an estimate, it was thought desirable to proceed upon a supposition of an average price of wheat at home, of 60s. to 64s. per quarter.

'This question involves so many considerations, depending not only on the present condition of the country, but on the political regulations to which it may hereafter be subject, that any reasonings applied must be in a great measure hypothetical and speculative; and any conclusions we may arrive at, must be liable to be affected by changes which cannot now be contemplated, or taken into calculation. The utmost that can be done is to approximate to a result, by a consideration of the principal circumstances on which it will depend, by reference to the fluctuations in past periods, and by an examination into the causes from which those fluctuations have proceeded.

'In obedience to this direction, I presume, with the diffidence which must be always felt in anticipating the effects of untried, and consequently doubtful experiments, to state my views on the subject. The effect of the stimulus here proposed must depend, in a great measure, on the assurance of its duration. The market for wheat which England presents, is the great object of attention to the cultivators in Poland, and to the merchants at the ports from whence its corn must be exported. Those persons have been accustomed to observe such frequent alterations in our laws relative to the corn trade, that any new enactments would, at first, be thought temporary and mutable, like those of former periods. This uncertainty has been the cause of heavy losses to them, and would therefore have the effect of causing the cultivators to pause before they made any great changes in their rotation of crops, or in the kinds of corn they would sow.

'The statements which are given in the part of this report more immediately relating to the kingdom of Poland, will show that the want of capital among the cultivators has proceeded to such an extent, from the losses they have sustained, that they must, in a great degree, be disabled from making any considerable improvement in cultivation, or raising any very large increase of produce in a short period. The great deficiency of live stock, which indeed may be resolved into a deficiency of capital, would be an impediment in the way of a rapid extension of the growth of wheat. Without manure, wheat cannot be grown beneficially, and without a stock of cattle, in some degree commensurate to the extent of the land, manure

cannot be obtained; and though to a certain degree the profit arising from the wool, and not from the meat, enables the landowners to support some few sheep, yet the want of a class of consumers, who can afford to make animal food their subsistence, must operate to prevent any great increase in the stocks of cattle. Such a class is not to be expected there, till a great improvement, or an increase of manufacturers, shall have taken place. The greater portion of the population of Poland is too poor to allow of their using animal food; the want of it is scarcely felt by persons always accustomed to live, with very little variation of diet, on rye bread.

'The labouring classes, too, being assured of a supply of the bare necessities of life, are little disposed to any great changes in their mode of work, or any exertion of strength or skill beyond that to which they have been accustomed. They have been, perhaps not without some reason, always represented as indolent, unskilful, filthy, and drunken, and averse to the improvements which their wiser and better superiors have attempted to introduce.

'Whilst the present low price of corn continues, and the corresponding low rate of wages, and the markets of Russia are open to the woollen cloths of Poland without duty, the profit of capital employed in that branch of industry must offer to it temptations that agriculture does not present. But if by any alterations the cloths of Poland should in the Russian custom-houses be placed on the footing of the cloths of other countries, or if a rise of corn and of wages should take place to such an extent as to make the Polish cloths dearer than those which are charged with duty, the effects might be to drive the capital from the cloth trade to the business of cultivation. The present want of capital may possibly be supplied by influx from other countries, but this must depend in a great measure on the internal government and political regulations of the country. The increase of manufactories in Poland, and the augmented population which they usually induce, might produce such a number of internal consumers as to leave much less surplus corn to export to other countries. It is true that wheat would be but little eaten by the manufacturers, but the increased demand for rye might make that kind of grain the most profitable to the grower; and he would then devote to the cultivation of it some portions of the land which, under different circumstances, would have been appropriated to the growth of wheat. The manufacturers in Poland are however of too little importance, at present, to make it desirable to hazard any conjectures on what the effects of their increase or diminution would be on the surplus quantity of exportable grain.

'A view of the past exportation from the Vistula, at different periods and under different circumstances, will perhaps give some assistance in forming an idea of what may be the result of future changes.'

He then shows, from a consideration of the returns of 166 years, the little variation that has taken place in the actual quantity of corn exported.

When divided into periods of about twenty-five years, the returns from Dantzic, exhibit the following annual exportation of wheat and rye from that port.

YEARS.	WHEAT.	RYE.	TOTAL.
	Quarters.	Quarters.	Quarters.
1651 to 1675	81,775	225,312	307,087
1676 to 1700	124,837	227,482	352,319
1701 to 1725	59,795	170,100	229,895
1726 to 1750	80,624	119,771	200,395
1751 to 1775	141,080	208,140	349,220
1776 to 1800	150,299	103,045	253,344
1801 to 1825	200,330	67,511	267,841

Giving an annual quantity of wheat and rye, of 279,794 quarters.

'During the ten years, from 1791 to 1801, there was a constant demand in France for foreign corn; several deficient harvests had been experienced at the beginning of the revolution. The agents of France were employed, both in Europe and America, in purchasing corn and hiring neutral vessels to convey it to France; paying but little regard to the price they gave for it, or to the rate of freight at which it could be transported. Holland, which scarcely has ever grown corn sufficient for its own consumption, felt a great want, owing to its internal sources of supply from Germany and Flanders being diverted from the usual channels by the circumstances of the war.

'Sweden for many years had looked for some supply from Prussia, not, indeed, of wheat to any extent, but chiefly of rye. During the period we are now considering, that country had been afflicted with several successive deficient harvests; and such was the distress from want of corn, that a large part of the population had been compelled to use the bark of trees as a substitute for rye. That kingdom thus became a market which could take as much as her poverty could find the means of paying for. In addition to these external circumstances, the land in Poland was less burthened with taxes than it is at present. The tenth Groschen war-tax was not then enacted. Some other taxes, then imposed, have not been since abandoned. In Prussia, likewise, taxation is higher now than from 1801 to 1805.

'These combined circumstances gave to the agriculture of Poland and Prussia a portion of capital, and motives to exertion, which produced the vast surplus that was exported from 1801 to 1805. Ten years of unexampled prosperity were, however, needed to reach the point which those years exhibit, and it was only by gradual steps that it was attained.

'The impulse given by the open markets, and by the high prices which had opened them, acted with accumulated force in the next five years, and raised the surplus, as we have seen, somewhat higher.

'If the same powerful stimulus could now be applied to excite the cultivators in Poland and in Prussia, to increase their supplies of corn, as

was experienced from 1791 to 1801, it would be reasonable to conclude that the result might be the same as is exhibited in the quantities of wheat exported from 1801 to 1805. It might produce, with ten years' increased exertion, and with the application of the capital created in those ten years of prosperity, a quantity equal to that which was exported in the years of the greatest surplus. I was told, when in Poland, that during those prosperous years, wheat was brought by land carriage to the Vistula, from distances far too great to bear the expenses without the enormous prices which it bore in the markets of England and France. It was sent, not only from the farthest parts of Galicia, but even from the vicinity of Brunn and Olmutz, in Moravia. It was said, that some of the wheat of Hungary was conveyed over the Carpathian mountains to Cracow, and there shipped in flats for Dantzic and Elbing, whilst Volhynia and Podolia were emptied of their stores.

‘Whether these reports are true, or to whatever extent they are true, it is natural to suppose that the very high price which wheat had reached, in the years under consideration, must have vastly extended the limits of the circle from which it would be collected, and would induce the inhabitants to despatch to the high markets whatever could be spared by the exercise of the most rigid economy.

‘By the constant application of all these powerful stimuli, which were in operation during ten years, we have seen that at length the surplus of wheat, which the Vistula and its borders extended to unusual dimensions, could yield, amounted to 550,000 quarters annually, or about sufficient, supposing the whole to be sent here, for the consumption of this kingdom, with its present population, during the space of twelve days.

‘It is scarcely to be calculated that the same recurrence of circumstances, propitious to the agricultural prosperity of the lands on the border of the Vistula, should again present itself. Neither the demands of France or England are likely to be so great, or to continue for so long a period, as at that time. It is scarcely to be calculated upon, that any future wars will be so long in duration, or spread over so extensive a field of operations, as those which rose out of the revolution of France; and it is therefore not likely that the quantity exported will ever rise to so great an amount. Whatever stimulus may be applied to excite the agricultural improvement of the banks of the Vistula, its effect must be weak and powerless, when compared with the excitement it received from 1791 to 1805.

‘If we suppose the cost of wheat to the grower in the vicinity of Warsaw, to be about 28s. per quarter, and all the expenses of conveyance to our markets to be 20s. more, and that it could be sold here for 60s. or 64s. we may presume that such a stimulus would produce great exertions, and a correspondent increase of supply; some abatement in the force of that stimulus would be probably felt in an increase of freight, and other charges, but the prospect of a profit of 12s. or 14s. would give a powerful impulse to cultivation. What is here stated, is upon the supposition, of course a mere supposition, that no duty would be imposed on foreign wheat on its introduction into this kingdom. Supposing a duty should be imposed, it will of course weaken the force of the stimulus; and if it should be so high, as, when added to the costs and charges, to raise it above the price at which it could be sold in our markets, it would become a repellent instead of a stimulus, especially if it should be viewed as a permanent enactment.

‘If a duty in this country of 10s. or 12s. per quarter was imposed, it would not allow of such a profit, on the supposition of the price being from 60s. to 64s. as to induce any great exertions to increase cultivation in the bordering districts on the Vistula. The chance of a rise occasioned by war, by a winter so severe as to injure vegetation, or by a rainy harvest season, might induce those of a speculative turn to increase their growth of wheat; but those who have that turn, and have the means of indulging it, are so few, that they would produce no sensible increase in the general surplus.

‘I see no reason to believe, that with such a duty as I have mentioned for England, and a price from 60s. to 64s. and with some similar regulation in France, that the surplus corn produced in Poland, including all the countries near enough to the Vistula to send their corn to that stream, would materially increase in common seasons, or very much, if at all, exceed the average produce of that country; the greater part of this might probably be wheat, and if the duty were alike on all the various qualities of that grain, none would be sent here but that part which is the driest, heaviest, and whitest. The inferior descriptions would not pay for importation, unless the average in England was much more than 64s.’

We subjoin the following documents respecting the modern prices of grain in all the great corn markets of Europe, from the Appendix of Mr. Jacob, and other sources.

** 1810. The prices of corn were only noted till the month of July.—1811. The exports restricted by French, and prohibited in 1812. At the end of the year 1813 the prices rose considerably on account of scarcity during the siege.

The Hectolitre of Wheat weighs 154lbs. or 75,384 killogrammes. According to Kelly, the Hectolitre = 283,796 bushels Winchester measure.

The last four months of 1815, the years 1816, 1817, and the two first months of 1819, cannot be given.

Taken from the Monitor 12th November, 1825.

CORN-LOFT. A granary.

CORN-MASTER, *n. s.* From corn and master.

One that cultivates corn for sale. Not in use.

I knew a nobleman in England, that had the greatest audits of any man in my time; a great grasier, a great sheep-master, a great timber-man, a great collier, a great *corn-master*, and a great leadman.

CORN-METER. One who superintends the measuring of corn.

CORN-MARIGOLD, *n. s.* From corn and marigold. A flower. See CHRYSANTHEMUM.

CORN-MILL, *n. s.* From corn and mill. A mill to grind corn into meal.

Save the more laborious work of beating of hemp, by making the axle-tree of the *corn-mills* longer than ordinary, and placing pins in it to raise large hammers. *Mortimer.*

CORN-PIPE, *n. s.* From corn and pipe. A pipe made by slitting the joint of a green stalk of corn.

Now the shrill *corn-pipes*, echoing loud to arms, To rank and file reduce the straggling swarms. *Tichel.*

CO'RN-ROCKET, *n. s.* From corn and rocket. A plant. A species of bunias.

CO'RN-ROSE, *n. s.* A species of poppy. See PAPAVER.

CO'RN-SALLAD, *n. s.* From corn and sallad. See VALERIANA.

Corn-sallad is an herb, whose top-leaves are a sallet of themselves. *Mortimer's Husbandry.*

CORN, *n. s.* Lat. *cornu*. A hard and painful excrescence, CO'RN, *adj.* of a horny substance, on CO'RN-CUTTER, *n. s.* the feet; which excres- CO'RNEOUS, *adj.* cence it is the profession CO'RNICLE, *n. s.* of the corn-cutter to CO'RN'ICULATE, *adj.* eradicate. Milton uses CO'RN'ICK, *adj.* corny to signify stiff and CO'RN'IGEROUS, *adj.* hard as horn. Corneous CO'RNAGE, *n. s.* is, horny; like horn: cornicle, a little horn: corni-

fick, horn-making: cornigerous, horn-bearing. The definition of corniculate will be seen in the quotation from Chambers. Cornage is, a tenure by which a landholder is bound to blow a horn, in order to give notice of an invasion; also a mode of transferring property.

Ladies, that have your feet
Unplagued with *corns*, we'll have a bout with you.
Shakspeare. Romeo and Juliet.

The man that makes his toe
What he his heart should make,
Shall of a *corn* cry woe,
And turn his sleep to wake.

Id. King Lear.

Even in men, aches, and hurts, and *corns*, do en-
grieve either towards rain or towards frost.

Bacon's Natural History.
Such as have *corneous* or horny eyes, as lobsters,
and crustaceous animals, are generally dimsighted.

Brouene.
There will be found, on either side, two black fila-
ments, or membranous strings, which extend unto the
long and shorter *cornicle*, upon protrusion. *Id.*

Nature, in other *cornigerous* animals, hath placed the
horns higher, and reclining; as in bucks. *Id.*

Up stood the *corny* reed,
Embattled in her field.

Milton's Paradise Lost.

The hardest part of the *corn* is usually in the mid-
dle, thrusting itself in like a nail; whence it has the
Latin appellation of *clavis*. *Wiseman.*

The nail was not loose, nor did seem to press into
the flesh; for there had been a *corn-cutter*, who had
cleared it. *Id.*

I have known a *corn-cutter*, who, with a right educa-
tion, would have been an excellent physician. *Spectator.*

He first that useful secret did explain,
That pricking *corns* foretold the gathering rain.
Gay's Pastorals.

It looks as there were regular accumulations and
gatherings of humours, growing perhaps in some peo-
ple as *corns*. *Arbuthnot.*

Thus Lamb, renowned for cutting *corns*,
An offered fee from Raddliū scorns. *Swift.*

The various submarine shrubs are of a *corneous* or
ligneous constitution, consisting chiefly of a fibrous
matter. *Woodward.*

Corniculate plants are such as produce many dis-
tinct and horned pods; and *corniculate* flowers are such
hollow flowers as have on their upper part a kind of
spur, or little horn. *Chambers.*

CORNS, in surgery, consist of indurations of
the skin arising on the toes, and sometimes on
the sides of the feet, where they are much exposed
to the pressure of the shoes. By degrees they
press farther down between the muscular fibres
of these parts, and by their irritation occasion
extreme pain. Many cures have been prescribed,
but the total removal of them is always found to
be attended with great difficulty. It has been
recommended to soften them with plasters, and
then to pull them up by the roots, to apply caustic,
&c. A muscle laid on, by way of plaster, is
also said to be effectual; but the best cure is to
bathe them frequently in warm water, and pare
away as much as possible of the indurated skin
without drawing blood; taking care to remove
the tightness of the shoe.

CORNAGE was very frequent in the northern

countries near the Picts' wall; and the horn was
blown when any invasion of the Scots was ob-
served. By stat. 12 Car. II. all tenures are
converted into free and common socage. An
old rental calls cornage, newt-geldt, q. d. neat-
geld. Lord Coke says, in old books it is called
horngeld.

CORNARIUS (John), a celebrated German
physician, born at Zwickow, in Saxony. His
original name was Haguénbot, but he is best
known by that of Cornarius. At twenty years
of age he taught grammar, and explained the
Greek and Latin classics to his scholars; and at
twenty-three was licentiate in medicine. He
objected to most of the remedies provided by the
apothecaries; and observing that the greatest
part of the physicians taught their pupils only
what is to be found in Avicenna, Rasis, and the
other Arabian physicians, he carefully sought
for the writings of the best physicians of Greece,
and employed about fifteen years in trans-
lating them into Latin, especially the works of
Hippocrates, Aetius, Eginetes, and a part of
those of Galen. He meanwhile practised phys-
ic with reputation at Zwickow, Frankfort, Mar-
purg, Nordhausen, and gena, where he died of
an apoplexy in 1558, aged fifty-eight. He also
wrote several medicinal treatises; published
editions of many poems of the ancients on medi-
cine and botany; and translated some of the
works of the fathers, particularly those of Basil,
and a part of those of Epiphanius.

CORNARO (Helena Lucretia), a learned Venetian
lady, daughter of John Baptist Cornaro.
She not only acquired a complete knowledge of
the languages and sciences, but went through the
philosophy of the schools; and at last took her
degree at Padua, being the first lady that ever
was made a doctor. She made a vow of perpet-
ual virginity, and devoted her time entirely to
study. The fame of her learning attracted the
attention of Louis XIV. who ordered the cardinals
Bouillon and D'Etrees to wait on her; and
they reported that her talents had not been exag-
gerated. She died in 1685.

CORNARO (Lewis), a Venetian noble, memo-
rable for having lived in health and activity to
above 100 years of age, by a rigid course of tem-
perance. By the ill conduct of some of his rela-
tions he was deprived of the dignity of a Venetian
noble; and, seeing himself excluded from all
employments under the republic, he settled at
Padua. In his youth he was of a weak constitu-
tion, and by irregular indulgence reduced him-
self, at about forty years of age, to the brink of
the grave, under a complication of disorders; at
which extremity he was told, that he had no
other chance of his life, but by becoming sober
and temperate. Being wise enough to adopt
this counsel, he reduced himself to a regimen of
which there are very few examples. He allowed
himself no more than twelve ounces of food and
fourteen ounces of liquor each day; which be-
came so habitual to him, that when he was about
seventy years of age, the experiment of adding
two ounces to each by the advice of his friends,
had nearly proved fatal to him. At eighty-three
he wrote a treatise which has been translated into
English, and often printed, entitled, Sure and

Certain Methods of Attaining a Long and Healthful Life; in which he relates his own story, and extols temperance to a degree of enthusiasm. At length the yolk of an egg became sufficient for a meal, and sometimes for two, until he died with much ease and composure, at Padua, in 1566. The Spectator, No. 195, confirms the fact from the authority of the then Venetian ambassador, who was a descendant of the Cornaro family.

CORNAVII, an ancient people of Britain, who dwelt in the country, beginning in the heart of the island, and extending to Chester: now divided into the counties of Warwick, Worcester, Salop, Stafford, and Cheshire.

CORNEA, Lat. The horny coat of the eye.

There is a bright spot seen on the *cornea* of the eye, when we face a window, which is much attended to by portrait painters; this is the light reflected from the spherical surface of the polished *cornea*, and brought to a focus. *Darwin.*

CORNILLE (Michael), a celebrated painter, born at Paris in 1642, and instructed by his father, who was himself a painter of great merit. Having gained a prize at the Academy, young Corneille obtained a pension from Louis XIV. and was sent to Rome, where that prince had founded a school for young artists of genius. Having studied there some time, he gave up his pension, and applied to the antique with great care. He is said to have equalled Caracci in drawing, but in coloring he was deficient. Upon his return from Rome, he was chosen professor in the Academy at Paris; and was employed by Louis in all the great works he was carrying on at Versailles and Trianon, where are still to be seen some noble efforts of his genius.

CORNILLE (Peter), a celebrated French poet, born at Rouen in 1606. He was brought up to the bar, which he attended for some time; but, being formed with a genius too elevated for such a profession, he soon deserted it. An affair of gallantry occasioned his writing his first piece, entitled *Malite*; which had prodigious success. Encouraged by the applause of the public, he wrote the *Cid*, and other tragedies that have immortalised his name. In his dramatic works he discovers a majesty, a strength and elevation of genius, scarcely to be found in any other of the French poets; and like our immortal Shakspeare, seems more acquainted with nature, than with the rules of critics. Corneille was received into the French Academy in 1647, and died dean of that academy in 1684, aged seventy-eight. Besides his dramatic pieces, he wrote a translation in French verse, of the *Imitation of Jesus Christ*, &c. The best edition of his works is that of 1682, in four volumes 12mo.

CORNILLE (Thomas), brother of the above, was a member of the French Academy, and of that of Inscriptions. He discovered in his youth a great inclination to poetry; and published several dramatic pieces in 5 vols. 12mo, some of which were applauded by the public, and acted with success. He also wrote, 1. A Translation of Ovid's *Metamorphoses*, and some of Ovid's Epistles. 2. *Remarks on Vaugelas*. 3. A Dictionary of Arts, 2 vols. folio; and 4. A Univer-

sal, Geographical, and Historical Dictionary, in 3 vols. folio.

CORNE'L, *n. s. & adj.* } Old Fr. *cornille*;
CORNELIAN-TREE, *n. s.* } from Lat. *cornus*. A species of tree. See CORNUS.

The *cornel-tree* beareth the fruit commonly called the *cornel* or *cornelian cherry*, as well from the name of the tree, as the *cornelian stone*, the colour whereof it somewhat represents. The wood is very durable, and useful for wheel-work. *Mortimer.*

Take a service-tree, or a *cornelian-tree*, or an elder-tree, which we know have fruits of harsh and binding juice, and set them near a vine or *gr* fig-tree, and see whether the grapes or figs will not be the sweeter.

Bacon's Natural History.

A huntress issuing from the wood,

Reclining on her *cornel* spear she stood. *Dryden.*

On wildings and on strawberries they fed;
Cornels and bramble-berries gave the rest,
And falling acorns furnished out a feast.

Dryden's Ovid.

Mean time the goddess, in disdain, bestows
The mast and acorn, brutal food! and strows
The fruits of *cornel*, as they feast around.

Pope's Odyssey.

A mount stood near: thick *cornels* shagged its head;
And there, with tall straight shoots, a myrtle spread.

Symmons' Æneis.

Two *cornel* javelins armed with steel they bear;
And some, bright quivers o'er their shoulders wear.

Id.

CORNEL TREE, in botany. See CORNUS.

CORNELIA, daughter of Scipio Africanus, and the mother of Tiberius and Caius Gracchus. She was courted by a king, but she preferred being the wife of a Roman citizen to that of a monarch. When a Campanian lady once made a show of her jewels at Cornelia's house, and intreated her to favor her with a sight of her own, Cornelia produced her two sons, saying, 'These are the only jewels of which I can boast.'

CORNELIA LEX, Cornelian law, in antiquity, a name given to sixteen Roman laws: viz. 1. De civitate, enacted A. U. C. 670, by Sylla; confirming the Sulpician law, and requiring the citizens of the eight newly elected tribes to be divided among the thirty-five ancient tribes. 2. De judiciis, in 673, ordaining, that the prætor should always observe the same invariable method in judicial proceedings, and that the process should not depend upon will. 3. De sumptibus, limiting the expenses of funerals. 4. De religione, in 677, restoring to the college of priests the privilege of choosing the priests, which by the Domitian law had been lodged in the hands of the people. 5. De municipiis, revoking all the privileges which had been granted to the towns that had assisted Marius and Cinna in the civil war. 6. De magistratibus, giving the power of bearing honors, and being promoted before the legal age, to those who had followed the interest of Sylla; while the sons and partizans of his enemies, who had been proscribed, were deprived of the privilege of standing for any office of the state. 7. De magistratibus, in 673, ordaining that no person should exercise the same office within an interval of ten years, or be invested with two different magistracies in one year. 8. De magistratibus, in 673, divesting the tribunes of the privilege of

making laws, interfering, holding assemblies, and receiving appeals. All such as had been tribunus were incapable of holding any office in the state by that law. 9. De majestate, in 670, making it treason to send an army out of a province, or engage in a war without orders, to influence the soldiers to spare or ransom a captive general of the enemy, to pardon the leaders of robbers or pirates, or for the absence of a Roman citizen to a foreign court without previous leave. The punishment was aquæ et ignis interdictio. 10. Giving the power to a man accused of murder, either by poison, weapons, or false accusations, and the setting fire to buildings, to choose whether the jury that tried him should give their verdict palam vivâ voce, or by ballot. 11. Making it aquæ et ignis interdictio to such as were guilty of forgery, concealing and altering of wills, corruption, false accusations, and the debasing or counterfeiting of the public oath. All who were necessary to this offence were deemed as guilty as the offender. 12. De pecuniis repetundis; by which a man convicted of peculation or extortion in the provinces was condemned to suffer the aquæ et ignis interdictio. 13. A law giving power to such as were sent into the provinces with any government, of retaining their command and appointment, without a renewal of it by the senate. 14. Another ordaining that the lands of proscribed persons should be common, especially those about Volaterræ and Fesulæ in Etruria, which Sylla divided among his soldiers. All the above were enacted by Sylla. 15. A law by C. Cornelius tribune of the people, in 686; it ordains that no person should be exempted from any law according to the general custom, unless 200 senators were present in the senate; and no person thus exempted could hinder the bill of his exemption from being carried to the people for their concurrence. 16. Another by Nasicæ, in 582, to make war against Perseus, son of Philip king of Macedonia, if he did not give proper satisfaction to the Roman people.

CORNELIAN-STONE. See **CARNELIAN.**

The seal a sunflower; 'Elle vous suit partout,'
The motto, cut upon a white *cornelian*;
The wax was superfine, its hue vermilion.

Byron. Don Juan.

CORNEMUSE, or } French *cornemuse*. A
CORNAMUTE, *n. s.* } kind of rustic flute,
says Johnson; but this definition is incorrect.
Cornemuse signifies the bagpipe. Both words
are obsolete.

CORNER, *n. s.* } French *corniere*. An
CORNERED, *adj.* } angle; the point at
CORNER-STONE, *n. s.* } which a perpendicular
CORNERWISE, *adv.* } line cuts a horizontal;
a secret or remote place; the utmost limit: thus
every corner is, the whole, or every part. *Corner-stone*
is the principal stone; the stone which unites the two
walls at the corner. *Cornered* is, having corners.
Cornerwise is, with the angle placed in front.

The stone which the builders refused is become the
head stone of the *corner*. *Psalms cxviii. 22.*

It is better to dwell in a *corner* of a house top, than
with a brawling woman and in a wide house.

Proverbs xxv. 24.

I am persuaded that none of these things are hidden
from him; for this thing was not done in a *corner*.

Acts xxvi. 26.

And are built upon the foundation of the apostles
and prophets, Christ himself being the chief *corner-
stone*.

Ephesians ii. 20.

And eke about at the *corner*

Men seien ovir the walle stonde

Gret engins, which ywere nere honde.

Chaucer. Romaunt of the Rose.

All these together in one heape were throwne,
Like carcases of beastes in butchers stall;
And in another *corner* wide were strowne
The antique ruins of the Romanes fall.

Spenser. Fieric Queene.

Thou in dull *corners* doest thyself inclose,
Ne tastest princes pleasure,

Id

There's nothing I have done yet, o' my conscience,
Deserves a *corner*.

Shakespeare. Henry VIII.

Might I but through my prison, once a day,
Behold this maid, all *corners* else o' the' earth
Let liberty make use of.

Id. Tempest.

See you yond' coign o' the' capitol, yond *corner-
stone*?

Id. Coriolanus.

All the inhabitants, in every *corner* of the island,
have been absolutely reduced under his immediate
subjection.

Davies.

A mason was fitting a *corner-stone*.

Howel's Vocal Forest.

I turned, and tried each *corner* of my bed,
To find if sleep were there; but sleep was lost.

Dryden.

Those vices, that lurk in the secret *corners* of the
soul.

Addison.

The cattle mourn in *corners*, where the fence
Screens them, and seem half petrified to sleep
In unrecumbent sadness. There they wait
Their wanted fodder; not like hungering man,
Fretful if unsupplied; but, silent, meek,
And patient of the slow-paced swain's delay.

Cowper.

I should like to support the present minister on fair
ground; but what is he? a sort of outside passenger—
or, rather, a man leading the horses round a *corner*,
while reins, whip, and all, are in the hands of the
coachman on the box!

Sheridan.

CORNER-TEETH OF A HORSE, are the fore-teeth
between the midding teeth and the tusches; two
above and two below, on each side of the jaw,
which shoot when the horse is four years and a
half old.

CORNET, *n. s.* } Fr. *cornet, cornette*; It.

CORNETCY, *n. s.* } *cornetto*, from Lat. *cornus*.

CORNETTER, *n. s.* } Cotgrave and Sherwood
give a full definition of the word *cornet*. 'A
cornet, a trumpet; a little horn; also a sea-cut,
or cuttle-fish; a bugle, hutchet, or little horn;
also a doctor's tippet; also a *cornet* of horse; and,
the ensigne of a horse company; also a fashion
of shadow, or boone grace, used in old time, and
at this day, by some old women; also the tuft, or
tipping, of a hawk's hood.' A *cornet* of paper is,
'the *cornet*, or coffin of paper, wherein a grocer
makes up his retailed parcel of spice;' so called
from its being twisted into a horn-like form.
'The shadow or boone grace' was a sort of head-
dress, which appears to have entirely veiled the
face; for Surrey, in the sonnet quoted below,
complains that it kept the face of his mistress
always 'hydden from him,' so that he lost 'the
lyghte of her fayre looks.' *Cornetcy* is the com-

mission of a cornet. Cornetter is one who blows the cornet.

Israei played before the Lord on psalteries, and on timbrels, and on cornets. 2 Sam. vi. 5.

I never sawe my lady laye apart
Her cornet blacke, in colde nor yet in heate,
Sith fyrst she knewe my griefe was grovn so great.
Surrey.

These noblemen were appointed, with some cornets of horse and bands of foot, to put themselves beyond the hill where the rebels were encamped. *Bacon.*

Other wind instruments require a forcible breath; as trumpets, cornets, and hunters' horns.

Bacon's Natural History.

Seventy great horses lay dead in the field, and one cornet was taken. *Hayward.*

So great was the rabble of trumpeters, cornettiers, and other musicians, that even Claudius himself might have heard them. *Hakewill on Provid.*

They discerned a body of five cornets of horse very full, standing in very good order to receive them. *Clarendon.*

Cornets and trumpets cannot reach his ear;
Under an actor's nose, he's never near.
Dryden's Juvenal.

CORNET, in the ancient military art, a musical instrument, much in the nature of a trumpet, as in the diagram. When it only sounded, the ensigns were to march alone without the soldiers; whereas, when the trumpet only sounded, the soldiers were to move without the ensigns. Cornets and buccinæ gave the signal for the charge and retreat; and the cornets and trumpets sounded during the battle.

CORNET, in the modern military economy, is the third officer in the company, and commands in the absence of the captain and lieutenant. He takes his title from his ensign, which is square; and is supposed to be called by that name from cornu, because placed on the wings, which form a kind of points or horns of the army. Others derive the name from cornet; alleging that it was the ancient custom for these officers to wear coronets or garlands on their heads. Cornette was likewise the term used to signify the standard peculiarly appropriated to the light cavalry. Hence, cornettes and troops were synonymous terms to express the number of light-horse attached to an army. The standard so called was made of glazed silk, eighteen inches square, upon which the arms, motto, and cypher of the general who commanded the cavalry were engraved. A scarf, of white silk, was tied to the cornette whenever the cavalry went into action, in order to render the standard conspicuous.

CORNET OF A HORSE, is the lowest part of his forehead, that runs round the coffin, and is distinguished by the hair that joins and covers the upper part of the hoof.

CORNET-STOP, on an organ, is a compound treble stop, in the use of which, each finger-key acts upon, and occasions five pipes to sound at the same time, viz. one in unison with the note proper to that finger-key, and also with the same note in the stop, called diapason; another which is tuned a true major third above it; another a fifth, another an eighth, and the uppermost a true major seventeenth above the note.

CORNIERT (Theodore), an enthusiastic secretary of the States of Holland. He wrote at the same time against the Catholics, Lutherans, and Calvinists. He maintained that every religious communion needed reformation; but, he added, that no person had a right to engage in accomplishing it, without a mission supported by miracles. He was also of opinion, that a person might be a good Christian without being a member of any visible church.

CORNICE. Fr. *corniche*; Ital. *cornice*; Span. *corniga*, *cornisa*, *cornuvis*. The highest projection of a wall or column.

The cornice of the Palazzo Farnese, which makes so beautiful an effect below, when viewed more nearly, will be found not to have its just measures.

Dryden's Dufresnoy.

The walls were massy brass, the cornice high
Blue metals crowned, in colours of the sky.

Pope's Odyssey.

But lo! from high Hymettus to the plain,
The queen of night asserts her silent reign.
No murky vapour, herald of the storm,
Hides her fair face, nor girds her glowing form;
With cornice glimmering as the moon-beams play,
There the white column greets her grateful ray.

Byron. The Corsair.

CORNICE RING, in gunnery, the next ring from the muzzle backwards.

CORNICULARIUS, in antiquity, an officer in the Roman army, whose business was to assist the military tribune in quality of lieutenant. The cornicularii went the rounds in lieu of the tribune, and visited the watch. The name was given them from a little horn, called corniculum, which they used in giving orders to the soldiers; though Salmasius derives it from corniculum, the crest of a head-piece; it being an observation of Pliny, that they wore iron or brass horns on their helmets; and that these were called cornicula. In the Notitia Imperii we find a kind of secretary or register of this title. His business was to attend the judge, and enter his decisions. The critics derive the word, in this sense, from corniculum, a little horn to put ink in.

CORNICULUM, in ancient geography, a town of the Sabines, east of Crustumenum, towards the Anio. It was burnt by Tarquin; but restored again after the expulsion of the kings. It is now in ruins, and called Il Monte Gennaro.

CORNICULUM. See CORNICULARIUS.

CORNISH, a town of New Hampshire, in Cheshire county, on the east bank of the Connecticut, between Claremont and Plainfield, about fifteen miles north of Charlestown, and sixteen south of Dartmouth College. It was incorporated in 1763.

CORNU AMMONIS, in natural history, a species of fossile shells, called also serpent stones, or snake stones. They are found of all sizes,

from the breadth of a sixpence to more than two feet in diameter; some of them rounded, others greatly compressed, and lodged in different strata of stones and clay; some again are smooth, and others ridged in different manners, their striæ and ridges being either straight, irregularly crooked, or undulated. See SNAKE STONE.

CORNŪ CERVĪ. See HARTSHORN.

CORNŪCŌPIA, *n. s.* Latin. The horn of plenty; a horn topped with fruits and flowers in the hands of a goddess.

In the honeysuckle the petal terminates in a long tube, like a *cornucopia*, or horn of plenty; and the honey is produced at the bottom of it. *Darwin.*

CORNUCŌPIÆ, among the ancient poets, a horn out of which proceeded abundance of all things, by a particular privilege which Jupiter granted his nurse, the goat Amalthea. The fable is thus interpreted: that in Lybia there is a little territory shaped like a bullock's horn, exceedingly fertile, given by king Ammon to his daughter Amalthea, whom the poets feign to have been Jupiter's nurse. See ÆGIS and AMALTHEA.

CORNUCŌPIÆ, in botany, a genus of the digynia order, and triandria class of plants; natural order fourth, gramina. The involucreum is monophyllous, funnel-shaped, crenated, and multiflorous: CAL. bivalved: COR. one valved. Species two; natives of the East Indies and of the south of Europe.

CORNUS, cornel-tree, cornelian cherry, or dog-wood, a genus of the monogynia order, and tetrandria class of plants; natural order forty-seventh, stellatæ. The involucreum is most frequently tetraphyllous; the petals above the receptacle of the fruit four; the fruit itself a bilocular kernel. Of this genus there are twelve species; the most remarkable are the following:

1. *C. Florida*, or Virginian dog-wood, has a tree-stem branching twelve or fifteen feet high, and fine red shoots, garnished with large heart-shaped leaves: and the branches terminated by umbellate white flowers, having a large involucreum succeeded by dark red berries. Of this species there are several varieties, chiefly distinguished by the color of their berries, which are red, white, or blue.

2. *C. mas* or cornelian cherry-tree, has an upright tree-stem, rising twenty feet high, branching, and forming a large head, garnished with oblong leaves, and small umbels of yellowish-green flowers at the sides and ends of the branches, appearing early in the spring, and succeeded by small, red, cherry-like, eatable, acid, fruit.

3. *C. sanguinea*, bloody twig, or common dog-wood, has an upright tree-stem, branching ten or twelve feet high, having blood-red shoots, garnished with oblong pointed nervous leaves two inches long; and all the branches terminated by umbellate white flowers succeeded by black berries; of this there is a kind with variegated leaves. All the species may be propagated by seeds, which ought to be sown in autumn, otherwise they will lie a year on the ground. When the plants come up, they should be duly watered in dry weather, and kept clean from weeds. The following autumn they may be transplanted into

the nursery; and, having remained there two or three years, they may then be removed to the places where they are to remain. They may also be propagated by suckers, of which they produce great plenty, or by laying down the young branches.

CORNŪTE, *v. a.* } *Lat. cornutus.* To bestow horns; to cuckold;
CORNŪTED, *adj.* }
CORNŪTO, *n. s.* } horned; cuckolded. A
CORNŪTOR, *n. s.* } cuckold. A cuckold-maker.

The peaking *cornuto*, her husband, dwelling in a continual larum of jealousy.

Shakspeare. Merry Wives of Windsor.

A barber's wife in Aristenetus threatened to *cornute* him. *Burton.*

He that thinks every man is his wife's suitor,
Defiles his bed, and proves his own *cornutor.*

Jordan.

I hope he cannot say that ever I gored any of my superiors, or that my being *cornuted* has raised the price of posthorns, lanthorns, or pocket ink-horns.

L'Estrange's Quevedo.

CORNUTIA, in botany, a genus of the angiospermia order, and didynamia class of plants; natural order fortieth, personatæ; CAL. quinque-dentated; STAM. larger than the corolla: STYL. very long: the berry monospermous. There are two species, viz.

C. pyramidata, with a blue pyramidal flower, and hoary leaves, which grows plentifully in several islands in the West Indies; at Campeachy, and at La Vera Cruz. It rises to the height of ten or twelve feet, with rude branches, the leaves being placed opposite. The flowers are produced in spikes at the end of the branches, and are of a fine blue color. They usually appear in autumn, and will sometimes remain in beauty for two months or more. The plant is propagated either by seeds or cuttings, and makes a fine appearance in the stove; but is too tender to bear the open air in this country: and *C. punctata*, a shrub with axillary trichotomous corymbs, opposite, ovate, painted slightly; serrate leaves; blue flowers, with small white dots.

CORNWALL, the most westerly county of England, and extending also farther to the south than any other part of Great Britain, is bounded by the sea on its north, west, and south sides, and on the east by the river Tamar, which separates it from Devonshire except in a few places. Its general shape resembles a cornucopia. The Bristol Channel washes it on the north, and the British Channel on the south; the Land's End being the point where these two seas appear to unite. It is situated in the diocese of Exeter, and belongs to the western circuit. Its extreme length from its north-eastern angle to the Land's End is about ninety miles; and from the Land's End to the Ram's Head seventy miles. Its greatest breadth, from Moorwinstow to the Ram's Head, is a little more than forty-three miles. It rapidly contracts, however, towards its south-western promontory; so that its medium breadth between Padstow and Fowey does not exceed eighteen miles, and in its narrowmost part, between Mount's Bay and the Heyle River, it is not more than four miles. Its circuit is estimated at 200 miles, and its extent has been found by actual

survey to contain 758,484 statute acres; a little more than 1185 square miles.

Cornwall is divided into nine hundreds, 206 parishes, and twenty-three market towns, and contains about 183 inhabitants to each square mile, or one to every three acres and a half. The climate is on the whole healthy, although as in all other peninsular situations, especially those lying to the south-west, the weather is very inconstant. The south and west with their intermediate winds, sweeping over the waves of the Atlantic, collect in the passage huge bodies of clouds, which being rent by the hills discharge their contents in torrents of rain in the interior of the county. There is an adage, founded on the frequency of rain in this county, which says, that 'Cornwall will bear a shower every day of the week, and two upon a Sunday.' The storms around the coasts are frequently very violent; the damages they occasion, however, are principally confined to vessels at sea. Fogs are of very rare occurrence in this county, the constant circulation of adverse currents of air not allowing them time to arrive at any considerable degree of condensation.

Notwithstanding this mutability in the weather, the seasons are more equal in Cornwall than in almost any other county in England. The cold in winter is generally very moderate; snow seldom lying on the ground more than a few days; and the heat of the summer is rarely intense. In the southern part of this county the temperature is so mild, that myrtles, the balm of Gilead, hydrangea, geraniums, and many other tender plants flourish in the open air. Fruit-trees are very plentiful and productive, and even the fruit of the mulberry ripens in these quarters. On the coasts, however, the hardest trees will not thrive. The tamarisk is the only shrub which seems capable of bearing the sea spray; it sometimes grows to the height of ten or twelve feet in the course of seven years, and forms an admirable shelter. Till quite lately, every attempt to raise plantations had proved abortive; but the more tender trees being now protected by rows of the pineaster fir, they are beginning to assume a more promising appearance.

The general surface of this county is remarkably dreary.—A ridge of bleak and rugged hills rising to the height of from 1000 to 1300 feet extends through its whole length; and the roads winding over these hills, or across rude and uncultivated moors and commons, impress upon the traveller's mind an idea of the excessive sterility of the soil. Yet amidst this dreary waste, some beautifully picturesque valleys, smiling in a romantic diversity of corn, woods, coppices, orchards, meandering rivulets, and verdant meadows, burst upon the sight; while the stupendous rocks, particularly about the Lizard and the Land's End, which form the mighty barriers to the fertile plains on the one hand, and frown defiance to the chafing of the angry ocean on the other, impress the mind with the sublimest and most agreeable sensations. The soil is extremely various in Cornwall:—in the higher lands it consists of a blackish earth, intermixed with gravel, and small particles of granite (or grown as it is called by the Cornish men), and bedded in a stratum of quartz. A light loam, mixed with

slaty matter, prevails principally on the low lands and banks of rivers. Various qualities of clay are found in different places; one kind is made into bricks, which are in great request for the erection of furnaces and smelting houses; and another is much valued when formed into moulds for casting metals. The mixture of the clayey loam, with the gravel on the surface, forms a very fine and productive soil.

Agriculture being but a subordinate concern in Cornwall, and the fines paid for the long leases, to which the farmers are subject, depriving them of that capital which ought to be invested in the improvement of the soil, it is not surprising that most of their farming operations should be conducted in a rude manner. In the eastern districts more grain is raised than is sufficient for the maintenance of the inhabitants, but in the less fertile parts the produce is by no means adequate to the consumption. The crops commonly cultivated are wheat, barley, and oats; a large proportion of the arable land, however, is appropriated to the production of potatoes, for which Cornwall is very celebrated. In the neighbourhood of Penzance two crops of this valuable vegetable are produced every year. Sea-wrack, sea-weed, damaged pilchards, and the refuse salt used in curing them, mixed with lime and sea-sand, is the principal manure used in this county. Nearly 200,000 acres of the interior are unenclosed and waste lands, affording scarcely sufficient pasturage for a miserable breed of goats and sheep. The best cattle found here are of the Devonshire breed, and are much used in labor. The true Cornish breed of sheep, now nearly extinct, is one of the worst descriptions in England. Of late years many different breeds have been introduced. Few horses are kept for ostentation, or live in idleness in this county; they, with mules, being more frequently used for transporting of burdens than carts or wag-gons.

Springs are every where abundant, and, uniting into rivulets and streams, form some not inconsiderable rivers, the principal of these are the Tamar, the Lynher, the Looe, the Fowey, the Camel or Alan, and the Fale. The Tamar rises on the summit of a moor, in the parish of Warminster, the most northern in the county; and hence taking a southerly direction, it is augmented by many tributary streams; and, after winding a course of forty miles, at length empties itself into a spacious basin called the Hamoaze. The farms are, for the most part, very small, seldom letting for more than from thirty to fifty pounds per annum, even in the most fertile parts of the county. What are denominated the duchy lands, however, are very extensive; the income derived from them, and the duty on the tin ore, being the only remaining parts of those immense hereditary revenues, which were anciently appropriated as a provision for the heir apparent to the crown. This provision was in the first instance made by Edward III. for his son Edward, the Black Prince, whom he created duke of Cornwall, with special limitation to the eldest son of him and his sons, kings of England for ever. The lands are at present let off under lease granted by the duchy; the consideration being a fine paid at the grant, and a reserved

rent during the lease. They are generally purchased for three lives.

The principal wealth of Cornwall arises from its mineral productions, which have been celebrated in all periods of its history. By an accurate survey of the mines, made in 1800, it was found that there were then forty-five of copper, twenty-eight of tin, eighteen of copper and tin, two of lead, one of lead and silver, one of copper and cobalt, one of tin and cobalt, and one of antimony; and since that time, especially during the late speculating mania, great numbers more have been opened. Such is the variety of minerals in Cornwall, that indications of almost every known metal have been traced here. By far the most important ores, however, are tin and copper.

The strata in which they are found extend from the Land's End to the Dartmoor Hills, Devonshire, in a direction from east to west, and consisting of granite and a variety of the graumacke, called by the miners killas. The principal mines at present in course of working are situated in the neighbourhood and to the westward of St. Austel, from which place, as far as the Land's End, they extend along the northern coast, embracing a breadth of about seven miles. They extend also to Kemyn, Gwennap, Stithians, Wendron, and Breage on the south, and to St. Agnes, Redruth, Illogan, Cambourne, Guinear, in a straight line through Lelant, Senor and Moroaas, to the parish of St. Just on the north. The metals are found in veins or fissures called lodes: many lesser veins branch from the main lode, terminating in threads. There are various criteria by which experienced miners can immediately detect the existence of a lode of metal, such, for instance, as scattered fragments of ore, called shades, the metallic taste of the springs, and the presence of particular herbs. The course of the metals being from west to east, many rich lodes have been discovered by working drifts across the country in an opposite direction, that is, from north to south. Tin is nowhere found native: it occurs sometimes collected and fixed, and at others loose and dilated. In its fixed state it is either found in an horizontal layer of earth, or interspersed in grains or small masses in the natural rock. In its dispersed form, it is found either in a pulverised state, in stones called shades, or in a continued course of shades, called a stream. These streams extend, in many parts, to a considerable length, seldom less than a fathom in breadth, and from one to ten feet in depth. One of the tin-mines, in the neighbourhood of St. Austle, produced the amazing quantity of 2500 blocks per annum. The Poldue mine has also yielded as much as 1000 blocks yearly. When the ore is raised, it is divided into as many shares, or doles, as the miners call them, as there are adventurers and lords engaged in the undertaking. It is generally beaten into small pieces on the spot, and when it will pass through the holes of an iron grate, fixed in every mine, to one end of a box, in which the lifters work, it is carried by a stream into pits, and thence into vats, where it is washed and rendered sufficiently clear for the purposes of smelting. The tin is cast into blocks, weighing from $2\frac{3}{4}$ cwt. to $3\frac{3}{4}$ cwt.

they are not saleable, however, until assayed by the proper officers, and stamped with the duchy seal; this operation is called coining. Since the reign of Henry VIII. coinages have been held four times every year, namely, at Lady-Day, Midsummer, Michaelmas, and Christmas. The original towns for this purpose were, Launceston, Lestwithiel, Truro, and Helston. Charles II. added Penzance to the number, as affording greater facilities to the miners of the western districts.

The duke of Cornwall receives 4s. for every cwt. of white tin that is coined; and it is calculated, that the present average of the tin-mines amounts, annually, to 25,000 blocks, each block worth from £8 to £10: so that, according to this calculation, the income of the duchy of Cornwall, arising from the tin-mines alone, is not less than £10,000. The mining business is entirely regulated by a code, called the stannary laws, enacted by a court of stannators, or proprietors. These acts divide the tin-men into four divisions, under the superintendance of one warden: they have an appeal, however, from his decisions, in all suits of law and equity, to the duke of Cornwall in council; or in case this title should be in abeyance, to the crown. A vice-warden is appointed every month, whose office is to decide all stannary disputes; he also constitutes a steward for each precinct, who holds his court, called a stannary court (from the Latin word *stannum*, tin), every three weeks, when a jury, composed of six persons, decide disputes with a progressive appeal, however, to the vice-warden, lord-warden, and lords of the duke of Cornwall's council. The mines are under no other jurisdiction, excepting in such cases as affect land or life.

The copper-mines of Cornwall are very numerous, producing, on the average, 4700 tons annually, which, on a moderate calculation, are worth £350,000. The most productive copper-mines now working are Crennis and Huel Alfred, the former near St. Austle, and the other in the parish of Hayle. Veins of copper are not unfrequently found in cliffs, that are left bare by the sea, and sometimes in the fissures of rocks, in thin films, deposited by the impregnated water, running from the lodes of the copper ore. The most encouraging sign of a rich ore is the gossan, an earthy ochreous stone, of a red color, which crumbles like the rust of iron. The lodes of copper ore generally lie deeper than those of tin, and are chiefly of the pyritous and sulphureted kinds, with a small proportion of arsenic. The process of refining it is the same as that employed for the tin; when sufficiently refined, the scoria is removed, and it is emptied with ladles, coated with clay, into oblong moulds, containing about 150 pounds weight.

There are also a few lead-mines in this county; the kind of ore most frequently found is denominated galena, or pure sulphuret of lead, which is met with both in crystallisations, and in masses of a bluish-gray color, and foliated texture. The principal lead-mines are, Huel Pool and Huel Rose, in the neighbourhood of Helston. Gold has been found in Cornwall, but in such small quantities as not to warrant any expensive operations to procure it. The miners

are in the habit of carrying a quill about their person, in which they put the particles which are frequently found among the stream tin, and when full, sell it to the goldsmiths. The largest quantity ever found together, weighed fifteen penny-weights and sixteen grains. Silver is found in larger quantities, and the mine of Hucl Mexico and the Herland copper-mine produced considerable returns of this metal. A particular account of this latter mine is published in the Transactions of the Royal Society for 1801. It is said, that this metal was found in such abundance, during the reigns of Edward I. and III., as to furnish the means for these monarchs to undertake their warlike enterprises.

Iron-mines are also common in Cornwall. Sulphuret of iron, called by miners *mundie*, of the different colors of green, blue, purple, gold, silver, and copper, are often blended with the copper and tin lodes. Great abundance of the semi-metals, bismuth, zinc, antimony, cobalt, molfram, menachanite, arsenic, manganese, molybdena, or the sulphuret of molybdenum, are also found here. The number of men, women, and children employed in the different processes of mining, and deriving their sole subsistence therefrom, has been estimated at 14,000.

Besides the metals enumerated, the county of Cornwall abounds in fossil substances of great value. Amongst these, the moor-stone, or granite, is of the first consequence. Slate and snap-rock, swimming-stone, Cornish diamonds, and China-stone may also be mentioned. This last-mentioned stone is the principal ingredient in the Staffordshire pottery. The Cornish diamonds are supposed to be the finest in England, consisting of beautifully crystallised and transparent quartz, in six-sided pyramids.

The fish which frequent the Cornish coast, are the pilchard, the blomer, or fin-fish (the physeta of the ancients), the grampus, the blue shark, the monk, or angel-fish, the sea adder, the sun-fish, &c. &c.; but of all these the most abundant and valuable is the pilchard. In size and form this fish very much resembles the common herring; immense shoals of them appear during the summer and autumn months, generally making their appearance at the Land's End in July. The number of persons employed in the pilchard fisheries, and in the different processes of salting the fish, &c., is about 5000, and the capital invested in the trade at least £300,000. From 40,000 to 60,000 hogsheds of these fish are caught in a season. Each hogshed, on the average, contains 3000 fish, and forty-eight hogsheds are computed to produce a ton of 252 gallons of oil, the price of which, some few years ago, was from £24 to £27. The principal fisheries on the southern coast are Mount's Bay, thence eastward to Devonshire; and on the northern, at St. Ives. Besides the fish already mentioned, mackarel are caught in great plenty; also, the red mullet, and John Dories. Conger eels, of a most extraordinary size, weighing from sixty to 120 pounds are frequently caught; and oysters are in great abundances.

Cornwall can boast of but few manufactories, if we except those connected with the preparation of metals. There is a cloth manufactory at

Callington, a manufactory of crucibles at Calenjo; at Truro a carpet-manufactory; at Penryn extensive paper-mills, and breweries that supply Falmouth; at Hayle there are extensive works for making copper spikes and nails for ship-building; and at Launceston, St. Austle, Bodmin, &c. coarse woollen-cloths are made. The chief exports of Cornwall are tin, copper, moor-stone, China-stone, fish, cattle, pigs, and potatoes. The chief trading ports are Padstow, Boscastle, Portrieth, the river Hayle, St. Ives's, Falmouth, Pezance, Fowey, Looe, and Truro.

The ancient Roman name of this part of Britain is *Cornubia*, the inhabitants were called *Cornubii*, both names probably originating in the circumstance of the land terminating in a point or promontory. Cornwall abounds in antiquities supposed to be Druidical, the most remarkable of which are, cairns, circles, and cromlechs. The celebrated loggan-stones consist of immense blocks of granite, one of them upwards of ninety tons in weight, so critically poised on the top of high rocks, that the slightest force is sufficient to stir them. Cornwall returns no less than forty-four members to the house of commons. It possesses more boroughs than any county in England: many of them, however, are places of little consideration, as it respects wealth and population; the number of voters scarcely ever exceeding fifty. The assizes are held at Launceston and Bodmin alternately. The population, in 1821, amounted to 262,500 souls.

CORNWALL, a township of the United States, in Addison county, Vermont, on Lake Champlain. Population 1000. Also, a township of the United States, in Orange county, New York; and the name of another township in Connecticut.

CORNWALL, CAPE, a cape on the west coast of Cornwall, at the extremity of England. Long. $5^{\circ} 55' W.$, lat. $50^{\circ} 10' N.$

CORNWALL, CAPE, the south-west point of land on the north-west of the passage of Endeavour Straits, New Holland. Long. $141^{\circ} E.$, lat. $10^{\circ} 43' S.$

CORNWALL, CAPE, a cape on the south-west side of an island near the north coast of New Holland. Long. $219^{\circ} W.$, lat. $10^{\circ} 43' S.$

CORNWALL, New, a country in the western part of North America, bordering on the Pacific, and situated N. N. W. of New Hanover. It extends from Gardner's canal, lat. $53^{\circ} 15'$ to Frederick's Sound, $57^{\circ} 5' N.$ On this coast are the Prince of Wales's Archipelago, Queen Charlotte's Islands, Pitt's Archipelago, Duke of York's Island, Island of Revilla Gigedo, and various other smaller ones.

CORNWALLIS (Charles), marquis of, the eldest son of Charles, first earl of Cornwallis, was born in 1738, and received his education at Eton and St. John's College, Cambridge. In 1765 he was appointed aid-de-camp to the king, and colonel of foot. After passing through various promotions, he obtained, in 1793, the rank of general, and represented the borough of Eye, in parliament. In 1762 he succeeded to the peerage, but did not distinguish himself in parliament. He accepted, in 1776, a command in America, and distinguished himself at the

battle of Brandywine the following year, and at the siege of Charlestown. Being made, soon after, governor of South Carolina, he obtained the victories of Camden and Guildford, and formed a plan of invading Virginia, in which he failed, and was made prisoner, with his whole army. Pamphlets were published, on this occasion, in which lord Cornwallis blamed Sir Henry Clinton for not coming up to his aid in time; but, soon after his return to England, he was removed from his place of governor of the Tower. He was re-appointed, however, in 1784. In 1786 lord Cornwallis was sent out to India with the appointment of commander-in-chief and governor-general; and, not long after, the government of Bengal found it necessary to declare war against the sultan of the Mysore, for an attack upon the rajah of Travancore, the ally of the English. The first campaign was indecisive. In March, 1791, his lordship invaded Mysore, and in the year after besieged Seringapatam, and obliged Tippoo Saib to sue for peace; to give up part of his dominions; to pay a large sum of money, with a promise of a more considerable portion of treasure; and, as hostages for the performance of this treaty, to entrust two of his sons to the care of the British. On the conclusion of the peace, lord Cornwallis returned to England, and was created a marquis, appointed master-general of the ordnance, and admitted a member of the privy-council. In 1798 he was appointed lord-lieutenant of Ireland, which office he filled until 1801, conducting himself with great firmness, judgment, and conciliation. In the same year he was sent to France, and signed the peace of Amiens. In 1804, on the recall of marquis Wellesley, lord Cornwallis was again appointed governor-general of India, and died the following year at Ghazepore, in the province of Benares. Lord Cornwallis, as a military man, was active, vigilant, and persevering; his personal character was amiable and unassuming; and, if his talents were not brilliant, his good sense, aided by a just ambition, effected much. He married Jemima, the daughter of James Jones, Esq. by whom he had one son, Charles, the late marquis, who has since died without issue.

CORO, a sea-port of the province and government of Venezuela, South America, situated in a dry sandy plain. The inhabitants, who amount to 10,000, carry on some commerce in mules, hides, goats, sheep-skins, &c., which are shipped at the port. The town has no aqueducts, and little water. That used by the inhabitants is brought to them and sold in barrels, on the backs of asses. The seat of government, civil and ecclesiastical, has been removed hence on account of its unfavorable situation. It is a league distant from the sea, and 240 miles west of Caraccas.

COROLLARY, *n. s.* Fr. *corollaire*; Lat. *corollarium*, from *corolla*; *finis coronat opus*. A conclusion from premises; something which follows in addition to the proposition demonstrated; formerly surplus, something more than was absolutely necessary.

Now since we have considered the malignity of this sin of detraction, it is but a natural *corollary*, that we enforce our vigilance against it.

Government of the Tongue.

Bring a *corollary*

Rather than want.

Shakspeare. Tempest.
As a *corollary* to this preface, in which I have done justice to others, I owe somewhat to myself.

Dryden's Fables. Preface.

COROMANDEL, or **CHOLAMANDA**, is a line of coast extending along the east side of the bay of Bengal, from the Point Calymere to the mouths of the Krishna River, or about 350 miles. Its proper name is Chola Mandala, which signifies, in the Sanscrit language, the orbit or circle; though, probably, it received its name from the Chala dynasty, the ancient sovereigns of Tanjore. It is written Choramandel in the records of Madras, up to the year 1779. The coast of Coromandel is, for the most part, open roadstead; and, although it contains a number of flourishing towns, it does not possess a single harbour. Considerable difficulty is experienced in landing, on account of the surf, except in the bay of Coringa, and in those places where proper boats are provided. During the period the northerly wind, or monsoon, prevails here, a southerly wind reigns on the coast of Malabar, and vice versa. The northerly winds blow on this coast from about the middle of October till April, and such is their violence during the first months, that it is dangerous for any ships to be near the coast; the government's and company's are consequently ordered to quit it by the 15th of October. This period is called the great monsoon. The southerly winds set in about the middle of April, and continue till October; during these months Coromandel may be approached with perfect safety. Parching hot winds prevail in the course of these latter months, which wither up every trace of vegetation, and even check respiration; but when the rains fall, the plants revive, and the whole face of nature is restored to a beautiful verdure. It is an observation of the natives, which has been confirmed by the experience of many Europeans, that the longer these hot land winds blow, the more healthy are the following months, as they serve to purify the air.

Coromandel being situated within the tropics, has two rainy seasons; the first when the sun passes it in going to the north, and the other on the sun's return to the south. The climate, notwithstanding its fluctuations of temperature, is considered, on the whole, healthy, at least to those who do not expose themselves too much to the influence of the sun, or sleep in the dew.

CORON, a strong sea-port of the Morea, in the province of Belvedere, situated on a peninsula in the gulf to which it gives name. It was anciently called the gulf of Messene, and has a secure harbour, and some trade in corn and oil. In the middle of the peninsula is a high rock, which commands the fortifications; and on the opposite side stands a small suburb. It is the see of a Greek archbishop: sixteen miles south of Modon, forty south-west of Misitra, and eighty S.S.W. of Corinth.

CORONA, *n. s.* Latin. A large flat member of the cornice, so called because it crowns the entablature and the whole order. It is called by workmen the drip.

In a cornice the gola or cymatium of the *corona*, the coping, the modillions or dentelli, make a noble show by their graceful projections.

Spectator

CORONA, in anatomy, denotes that edge of the glans penis where the preputium begins.

CORONA, in architecture. See **ARCHITECTURE**.

CORONA, in botany, a name given by some to the circumference or margin of a radiated compound flower. It corresponds to the radius of Linnæus; and is exemplified in the flat, tongue-shaped petals, which occupy the margin of the daisy and sun-flower.

CORONA, in antiquity, a crown of which there were several kinds, as corona civica, muralis, &c. See their respective articles.

CORONA, in natural history and optics, a luminous circle surrounding the sun, moon, planets, or stars. See **ANTHELION**, **HALO**, and **PARHELION**.

CORONA IMPERIALIS, in conchology, a name given by some to a species of voluta, differing from the other shells of that family, by having its head ornamented with a number of points, forming a sort of crown. See **VOLUTA**.

CORONA MONTE, an important place of Austria, in Tirol, to which the French retreated on the 24th February 1757, after being repulsed from Salurn by the Austrians, who soon after dislodged them also from this place.

CORONÆ, in ancient geography, the name of two towns: 1. In Bœotia near mount Helicon, famous for the defeat of the Athenians and Bœotians by Agesilaus: 2. In Thessaly, having Narthacium on the east, and Lamia, near the Sperchius, on the north.

CORONAL, *n. & adj.* Fr. and Sp. *coronal*; *adv.* *coronally*; Lat. *corona*. A **CORONARY**, *adj.* coronal is a crown; a garland. As an **CORONATION**, *n. s.* adjective. As an **CORONET**, *n. s.* relating to the top of the head. Coronally is circularly; in a crown-like manner. Coronary signifies, relating to a wreath or crown; placed on the head like a crown; it is also applied to arteries, which are fancied to encompass the heart like a garland. See **ANATOMY**. Coronation is the act of crowning a king; the assembly present at that act; likewise the name given by some of our old writers to a species of flower, but the modern appellation of which I am unable to ascertain. Coronet is an inferior kind of crown, worn by peers; poetically, any ornamental head-dress. See **HERALDRY**.

And all should be within a terme,
Without more excusation,
Both feste and coronation. *Chaucer's Dream.*

And crowne your heades with heavenly coronall,
Such as the angels wear before God's tribunal.
Id. Faerie Queene.

And on his hed like to a coronet
He wore, what seemed strange to common view. *Id.*

Bring coronations, and sops in wine,
Worn of paramours.
Spenser. Shepherd's Calendar.

Fortune smiling at her work therein, that a scaffold
of execution should grow a scaffold of coronation.
Sidney.

The rest was drawn into a coronet of gold, richly set
with pearl. *Id.*

Willingly I came to Denmark,
To shew my duty in your coronation.
Shakspeare. Hamlet.

A cough, Sir, which I caught with ringing in the
king's affairs upon his coronation day. *Id. Henry IV.*

In his livery
Walked crowns and coronets; realms and islands
were
As plates dropt from his pocket.

Id. Antony and Cleopatra.
All the rest are courteses
— Their coronets say so.
Id. Henry VIII.

The pomp of coronation
Hath not such power my fame to spread,
As this my admiration. *Darvies.*

Under a coronet his flowing hair,
In curls, on either cheek played.
Milton. Paradise Lost.

The basilisk of older times was a proper kind of
serpent, not above three palms long, as some account;
and differed from other serpents by advancing his
head, and by some white marks, or coronary spots,
upon the crown. *Browne.*

Now empress fame had published the renown
Of Shadwell's coronation through the town.
Dryden's Macfl.

Nor could our nobles hope their bold attempt,
Who ruined crowns, would coronets exempt.
Dryden.

A man of about forty-five years of age came to me,
with a round tubercle between the sagittal and coronal
suture. *Wiceman.*

Peers and dukes, and all their sweeping train,
And garters, stars, and coronets appear. *Pope.*

In pensive thought recal the fancied scene,
See coronations rise on ev'ry green. *Id.*

The substance of the heart itself is most certainly
made and nourished by the blood, which is conveyed
to it by the coronary arteries. *Bentley's Sermons.*

If there is an evil in this world, 'tis sorrow and
heaviness of heart. The loss of goods—of health—
of coronets and mitres, are only evil, as they occasion
sorrow;—take that out—the rest is fancy, and dwel-
leth only in the head of man. *Sterne.*

We boast some rich ones, whom the gospel sways,
And one who wears a coronet and prays;
Like gleanings of an olive-tree they show,
Here and there one upon the topmost bough. *Cowper.*

The flesh (of the sturgeon) was so valued at the time
of the emperor Severus, that it was brought to table
by servants with coronets on their heads, and preceded
by music. *Darwin.*

Courtiers for coronets their conscience pawn;
Clerks in prunello crawl, then soar in lawn.
Huddesford.

Thick leaves shall form our coronal, like Spring's,
And round our necks shall glance the Hooni strings.
Byron. The Island.

CORONALE OS, the os frontis. See **ANATOMY**.

CORONARY ARTERIES. See **ANATOMY**.

CORONARY STOMACHIC, a vein inserted into
the trunk of the splenic vein, which, by uniting
with the mesenteric, forms the vena porta.

CORONARY VEIN, a vein diffused over the
exterior surface of the heart.

CORONATION CEREMONIES, speaking histori-
cally, seem to appertain to monarchical govern-
ment, in every form of it, and abound with
political, feudal, and national peculiarities, that

throw considerable light on history. Our French neighbours have their *Historical Treatises* on the subject by M. Merlin and others: and we have often pored over the splendid folio of Mr. Sandford, describing, with great exactitude, the coronation of James II. We cannot here enter very minutely into the subject; but the coronation of our monarchs presents too wide a field of meditation to an intelligent age to be wholly overlooked.

A brief account of the entire *regalia*, royal vestments, and principal *offices* of the splendid scene, is what we shall endeavour to furnish to the reader.

SECT. I.—OF THE REGALIA AND ROYAL VESTMENTS.

1. *The Regal Chair*.—The regalia of England are the symbols of a monarchical authority that has been transmitted by coronation ceremonies for upwards of ten centuries. But the incorporation of England, Scotland, and Ireland, into one united kingdom, was an event peculiar to the coronation of George IV. to have recognised.

The history of the Fatal Stone, called also by the Irish the Stone of Fortune, is very curious; and has induced the learned Toland to call it ‘the ancientest respected monument in the world.’ It is to be traced, on the best authorities, into Ireland; whence it had been brought into Scotland, and had become of great notoriety in Argyleshire, some time before the reign of Kenneth, or A. D. 834. This monarch found it at Dunstaffnage, a royal castle; enclosed it in a wooden chair, and removed it to the abbey of Scone, where for 450 years ‘all kings of Scotland war crownit’ upon it; or quhil ye tyme of Robert Bruce. In quhais tyme, besyde mony othir crueltis done be kyng Edward Lang Schankis, the said chair of merbyll wes taikin be Inglismen, and brocht out of Scone to London, and put into Westmonistar, quhaer it remains to our dayis.’

An ancient Irish prophecy, quoted by Mr. Taylor in his learned ‘*Glory of Regality*,’ assures us, that the possession of this stone is essential to the preservation of regal power. It runs literally, ‘The race of Scots of the true blood, if this prophecy be not false, unless they possess the Stone of Fate, shall fail to obtain regal power.’ King Kenneth caused the leonine verses following to be engraved on the chair:—

Ni fallat fatum
Scoti quoecunque locatum
Invenient lapidem
Regnare tenentur ibidem.

Thus given by Camden,
Or Fate is blind,
Or Scots shall find,
Where'er this stone
A royal throne.

A prophecy which is said to have reconciled many a true Scot to the Union in queen Anne's time; and which, since the extinction of the Stuart family, is remarkably fulfilled in the claims of the house of Brunswick,—George IV. being now the legitimate heir of both lines

Among the northern nations, the practice ‘was to form a circle of large stones, commonly twelve in number, in the middle of which one was set

up, much larger than the rest: this was the royal seat; and the nobles occupied those surrounding it, which served also as a barrier to keep off the people who stood without. Here the leading men of the kingdom delivered their suffrages, and placed the elected king on his seat of dignity.’ From such places, afterwards, justice was frequently dispensed.

The old man early rose, walked forth, and sate
On polished stone, before his palace gate;
With unguent smooth the lucid marble shone,
Where ancient Neleus sate, a rustic throne,
Homér's Odysse. Pope's Tr. 1. 496—10

Thus arises the name of our court of king's bench.

At the coronation of our kings, the royal chair is now disguised in cloth of gold: but the woodwork, which forms its principal parts, is supposed to be the same in which Edward I. recased it, on bringing it to England.

2. *Of the Crowns*.—We can only speak to the growth and antiquity of their present ‘fashion,’ none of those now used being of older date than the reign of Charles II. This monarch issued a commission for the ‘remaking such royall ornaments and regalia’ as the rebellious parliament of his father had destroyed, in which ‘the old names and fashions’ were directed to be carefully sought after and retained. Upon this authority, we still have the national crown with which our monarchs are actually invested, called St. Edward's, although the great seal of the Confessor exhibits him wearing a crown of a very different shape.

Whether the parent of our present crowns was the eastern fillet, in the tying on of which there was great ceremony, according to Selden,—the Roman or Grecian wreath, a ‘corruptible crown’ of laurel, olive, or bay,—or the Jewish diadem of gold,—we shall leave to antiquarian research.

‘This high imperial type of [England's] glory’

has slowly advanced, like the monarchy itself, to its present commanding size and brilliant appearance. From the coins and seals of the respective periods, several of our Anglo-Saxon princes appear to have worn only a fillet of pearl, and others a radiated diadem, with a crescent in front. Æthelstan's crown was of a more regular shape, resembling a modern earl's coronet. On king Alfred's there was the singular addition of ‘two little bells;’ and the identical crown worn by this prince seems to have been long preserved at Westminster, if it was not the same which is described in the Parliamentary Inventory of 1642, as ‘king Alfred's crowne of gould wyer worke, sett with slight stones.’ Sir Henry Spelman thinks, there is some reason to conjecture that ‘the king fell upon the composing of an imperial crown;’ but what could he mean by this accompaniment?

Gradually the crown grew from ear to ear, and then from the back to the forehead; sometimes it is represented as encircling a cap or helm, and sometimes without. William the Conqueror and his successor wore it on a cap adorned with points, and with ‘labels hanging at each ear;’ the Plantagenets, a diadem orna-

mented with fleurs-de-lis or strawberry leaves; between which were small globes raised, or points rather lower than the leaves; Richard III. or Henry VII. introduced the crosses; about the same time (on the coins of Henry VII.) the arches first appear; and the subsequent varieties of shape are in the elevation or depression of the arches. The maiden queen wore them remarkably high. Blood's exploit with the new crown of Charles II. is told to all the young visitors at the Tower. It is only wonderful that, in that age of plots, no political object or accusation was connected with it.

3. *The Sceptre* is a more ancient symbol of royalty than the crown. Homer speaks of 'sceptred kings'—*σκηπτῶχοι βασιλῆες*; and the book of Genesis, 'of far elder memory,' of a sceptre, as denoting a king or supreme governor. There is a very early form of delivering this ensign of authority preserved in the Saxon coronation services; and the coins and seals of succeeding reigns usually place it in the hand of our monarchs. Very anciently, too, our kings received at their coronations a sceptre for the right hand, surmounted by a cross; and for the left, sometimes called the verge, one that terminated in a globe, surmounted by a dove. The two great symbols of the Christian religion are thus professedly embraced; but the monarch never appears with two sceptres except on this occasion.

4. *The Ampulla, or Golden Eagle*, and the 'holy oil' which is poured from it, are connected, like the royal chair, with some of the miracles that no one now believes, and with some interesting historical facts.

Amongst the honors bestowed by the Virgin on St. Thomas à Becket (according to a MS. in the Cotton Library), he received from our Lady's own hands, at Sens, in France, a golden eagle, and a small phial of stone or glass, containing an unction, on whose virtues she largely expatiated. Being then in banishment, he was directed to give them in charge to a monk of Poitiers, who hid them in St. Gregory's church at that place, where they were discovered in the reign of Edward III., with a written account of the vision; and, being delivered to the Black Prince, were deposited safely in the Tower. Henry IV. is said to be the first prince anointed with these vessels.

'Holy oil' still retains its use, if not its virtue, in our coronations. The king was formerly anointed on the head, the bowings of the arms, on both shoulders, and between the shoulders, on the breast, and on the hands; but the ceremonials of the last two coronations only prescribe the anointing of the head, breast, and hands. In these, too, nothing is said of the 'consecration' of the oil, which seems anciently to have been performed on the morning of the coronation.

With the spread of Christianity, or rather of the papal domination, over the kingdoms of western Europe, came the adoption of this rite into the coronation ceremonies of its princes. It at once increased the influence of the church, and surrounded the monarch with a popular veneration. The three distinct anointings yet retained, (i. e. on the head, breast, and hands or

arms,) were said by Becket to indicate glory, holiness, and fortitude: another prelate, one of the greatest scholars of his age, assured our Henry III., that as all former sins were washed away in baptism, 'so also by this unction.' Richard II. is made to say, by Shakspeare, on the invasion of Bolingbroke,

Not all the water in the rough rude sea
Can wash the balm from an anointed king.

Sir Walter Scott, in his notes to *Marmion*, speaks of a singular ancient consecration of the kings at arms in Scotland, who seem to have had a regular coronation down to the middle of the sixteenth century,—only that they were anointed with wine instead of oil.

5. *The Royal Swords* are named, *Curtana*, or the *Sword of Mercy*; the *Sword of Justice to the Spirituality*; the *Sword of Justice to the Temporality*; and the *Sword of State*. Of these the last alone is actually used in the coronation, being that with which the king is girded after his anointing; the rest are only carried before him by certain great officers. But *Curtana* has been honored with a proper name since the reign of Henry III., at whose coronation it was carried by the earl of Chester. It is a flat sword, without a point; looking to which circumstance, and to its being also entitled the *Sword of Mercy*, some etymologists have traced it to the Latin *curto*, to cut short; while other writers, among whom is the learned Mr. Taylor, would transfer our researches to the scenes of ancient chivalry, and the exploits of Oger the Dane, or Orlando, as affording the title to this appendage of the monarchy. 'The sword of Tristan,' says this writer, 'is found (*ubi lapsus!*) among the regalia of king John; and that of Charlemagne, *Joyeuse*, was preserved to grace the coronation of the kings of France. The adoption of these titles was, indeed, perfectly consonant with the taste and feeling of those ages, in which the gests of chivalry were the favorite theme of oral and historical celebration; and when the names of *Durlindana*, of *Curtein*, or *Escalibere*, would nerve the warrior's arm with a new and nobler energy.'

The *Sword of Justice to the Spirituality* is obtuse, that of *Justice to the Temporality* sharp at the point. 'Henry VIII.,' says a writer in a respectable periodical publication for July, 'seems to have exercised his taste in endeavouring to abolish this discrepancy.'

6. *Of the Ring, Spurs, and Orb; and St. Edward's Staff*.—In the book of Genesis we read of Pharaoh's ring being given by him to Joseph, as a method of investing him with power: and thus the Persian monarch *Ahasuerus* transferred his authority to *Haman* and to *Mordecai*. What is added in the Scripture narration of one of these latter cases; (*Esther*, iii. 10. and viii 2.) will illustrate the significancy of this mode of investiture.

By the exact mode that we have quoted from Scripture, do we find *Offa*, king of the East Angles, appointing *Edmund* as his successor; and with the ring, it is noticed, with which he had been invested at his own promotion to the royal dignity. On the detention of *James II.* by the fishermen of *Sheerness*, in his first attempt

at escape from this country, in 1688, it is particularly noticed in his Memoirs, 'The king kept the diamond bodkin which he had of the queen's, and the coronation ring, which for more security he put into his drawers.'

This is said to have been originally a favorite ring of the beautiful but unfortunate Mary queen of Scots; to have been sent by her, at her death, to James I.; through whom it came into the possession of our Charles I., and on his execution, was transmitted by bishop Juxon to his son. It lately came into the possession of his present Majesty, through the channels by which he has obtained all the remaining papers of the house of Stuart.

Richard II. resigned the crown to Henry IV. by transferring to him his ring. A paper was put into Richard's hands, from which he read an acknowledgment of being incapable of the royal office, and worthy, from his past conduct, to be deposed; that he freely absolved his subjects from their allegiance, and swore by the holy Gospels never to act in opposition to this surrender: adding, that if it were left wholly to him to name the future monarch, it should be Henry of Lancaster, to whom he then gave his ring.

The *Spurs* are a very ancient emblem of knight-hood; in later coronations, the abundance of ceremonies has only allowed time for the king's heel to be touched with them. At the battle of Crecy, when Edward III. was requested to send reinforcements to his son, his reply was: 'No; tell Warwick he shall have no assistance. Let the boy win his spurs.'

The *Orb*, or *Mound* (Fr. monde), is an emblem of sovereignty, said to be derived from imperial Rome; and to have been first adorned with the cross by Constantine, on his conversion to Christianity. It first appears among the royal insignia of England on the coins of Edward the Confessor; but Mr. Strutt authenticates a picture of Edgar, 'made in the year 996,' which represents that prince kneeling between two saints, who bear severally his sceptre and a globe surmounted by a cross. This part of the regalia being indicative of supreme political power, has never been placed in the hands of any but kings or queens regnant. In the anomalous case of the coronation of William and Mary as joint sovereigns—the 'other world,' that Alexander wept for, was created; and the spare orb is still to be seen among the royal jewels of England!

The only remaining member of the regalia now in use is *St. Edward's Staff*; but whether so called from any of the pilgrimages of the Confessor—from its being designed to remind our monarchs of their being but pilgrims on earth—or simply from its being offered with the other regalia at that monarch's shrine, on the coronation of our kings, we have not the means of determining. All the regalia are supposed, indeed, to be in the custody of the dean, as the successor of the abbot of Westminster, at the period of each coronation.

7. *The Royal Vestments*, of England, are amongst the most gorgeous 'makings of a king' known to history. In the robes ordinarily designed to be worn in parliament, and consisting of a surcoat of the richest crimson velvet, and a mantle and hood of the same, furred with ermine,

and bordered with gold lace, the king first makes his appearance on the coronation day, (on which he wears a cap of state, of the same materials, and at this time only). These are, therefore, called his Parliament Robes, in distinction from the Robes of Estate, for which he exchanges them in the abbey, at the close of the coronation, and which only differ from the former in being made of purple velvet.

These sumptuous external robes are of course laid aside during the anointing, and other parts of the coronation service.

The *Armil*, or *Stole*, is the only ecclesiastical symbol now retained in the investiture of our kings. In 'MS. W. Y. in the College of Arms,' quoted by Mr. Taylor, Henry VI. is said to have been 'arrayed at the time of his coronation as a bishop that should sing mass, with a dalmatic like a tunic, and a stole about his neck.' (Glory of Regality, p. 81). This writer insists that the conductors of our English coronations since Henry VII's time (at the least) have very singularly mistaken the stole for the armil of more ancient times, and transferred to the latter the form of delivery originally designed for 'a bracelet or royal ornament of the wrist.' It is singular that the form in question should appear, as it certainly does, to suit either symbol. 'Receive this armil as a token of the divine mercy embracing thee on every side.' The ornament at present in use embraces the neck.

SECT. II.—OF THE ASSISTANT OFFICES.

1. *Of the Prelate who crowns the King*.—As early as the Norman Conquest, this privilege of the see of Canterbury is spoken of as well established; and but two subsequent instances occur of its being overlooked or denied: both remarkably associated with the history of the papal power in this country. In the first, that of the coronation by the archbishop of York of prince Henry, son of Henry II., may be traced the incipient cause of the assassination of archbishop Becket, whose martyrdom became conducive to the highest triumphs of that power: in the second, queen Elizabeth's coronation by Oglethorpe, bishop of Carlisle, and the refusal of all the other prelates to assist in the ceremony, we behold its dying struggles for a dominion never more to be renewed.

2. *The Lord Great Chamberlain's office* commences with carrying the king his shirt on the morning of the coronation, and assisting the chamberlain of the household to dress his majesty. Queens regnant depute this office to some of the ladies of the household: we are told that the celebrated duchess of Marlborough last enjoyed it, at the coronation of queen Anne.

The office gives a claim to all the furniture of the royal chamber, in which its duties begin. The lord chamberlain is official governor of the palace for the time being, and the principal personal attendant of the king.

3. *The Lord High Constable* also attends the royal person, assists at the reception of the regalia from the dean and chapter of Westminster, and, together with the earl marshal, ushers the champion into the hall.

4. *Of the Royal Championship*.—Whether we

consider its uninterrupted exercise, and that by one family, for so many centuries, its feudal import, or its present splendour and imposing effect, the office of champion certainly eclipses all the other services of the coronation.

Since the coronation of Richard II. A. D. 1377 (of which there is in Walsingham a detailed account) this office has been performed by a Dymoke, the head of the family of that name, who have held the manor of Scrivelsby in Lincolnshire, worth about £1200 per annum, by the tenure of this service. During the reigns of Edward II. and III. the right was in dispute: prior to that period, and from the days of the Conqueror it was vested in the far-famed family of Marmion, whose chief, as

— Lord of Fontenay,
Of Lutterworth and Scrivilbaye,
Of Tamworth tower and town,

came from Normandy with William, and is there supposed to have held the first of these possessions, on condition of performing the service of champion to the successive dukes.

The championship is connected also with a remarkable feature of ancient jurisprudence, the wager of battle, recently abolished. This was regarded as an appeal to the judgment of God; and succeeded, at the Conquest, the fires and other ordeals of our ancestors, which the Normans affected to despise. The reader, however, may be disposed to conjecture, that as much of the divine interposition might be expected to decide the healing of a burn or scald, as the issue of a battle.

The wager of battle was certainly of more splendid pretensions, and was introduced at first with these stipulations. If the opposite parties were countrymen, they were to follow their national customs, whatever they were; if the appellee were a foreigner, or of foreign descent, he might offer wager of battle, and on its being declined, purge himself by his own oath and that of his witnesses, according to the Norman law; or, if a native of the country, he might have his choice of the trial by ordeal or by battle.

The solemn feelings and great religious sincerity with which our forefathers regarded combats of this description, cannot be more powerfully or more accurately depicted, than in the memorable combat-scene of Ivanhoe.

An inquisitio post mortem, dated the seventh of Edward III., speaks of the tenure of the manor appertaining to the royal champion as follows: 'That the manor of Scrivelsby is holden by grand sergeanty, to wit, by the service of finding, on the day of coronation, an armed knight, who shall prove by his body, if need be, that the king is true and rightful heir to the kingdom.'

It is remarkable that this important document neither prescribes the absolute appearance of the lord of the manor as knight, but only that he is bound to 'find an armed knight' if required; nor does it describe the office as hereditary. With regard to the latter point, it would seem that possession is the entire law of the case, and we suppose the office would pass with the property by sale; with respect to the former, the honor seems to have called forth the valor of every

successive lord, and princes have seldom imagined that their subjects can in such a cause overstep their duty.

Anciently, the champion rode with the royal procession from the hall to the abbey, and proclaimed the challenge on his way, as well as at the feast: some instances have occurred of its being repeated also in the city, as at the coronation of Henry IV. At his predecessor's coronation it is remarked by Walsingham, that Sir John Dimmock, being armed according to custom, came to the door of the Abbey with his attendants before the service was concluded, and that the earl marshal of the day went out to him and said, he should not have made his appearance so soon.

The fate of our recent and future champions has become of late duly regarded by law. To challenge all who should dispute the pretensions of the king is rightly enough a post of honor; to accept the challenge would always, we know, have been still more bold; but an act of parliament passed during the regency (59 Geo. III. cap. 46.) abolishes altogether the trial and actual battle; so that the champion's lands, after being held with manifest peril for centuries, have at last become a peaceable possession; and all dispute respecting the crown is of course as fully disposed of. It no longer rests on the valor of a single arm—not even on that of a Marmion, or a Dymoke.

5. There was another office, that of the *Lord High Steward* of England, to which in former times much authority was attached. He possessed a kind of vice-regal power on the demise of the crown and until the coronation of the rightful heir, and was a governor of the kingdom immediately under the reigning monarch, so as to be able to control or remove the judicial servants of the crown, at any time. What was once the importance of this office is still indicated by the temporary guardianship of St. Edward's crown being committed to an officer bearing this title on the day of the coronation, and his honorable place of walking immediately before the king in procession. The earls of Leicester once enjoyed this great dignity hereditarily; through them it descended to the De Montford family, until, on the attainder of the last earl, it was granted by Henry III. to his younger son Edmund, by whom it became transmitted to John of Gaunt, and eventually to Henry IV. while duke of Lancaster; since which period it has been prudently suffered to merge in the crown.

6. The hereditary *Grand Almoner* of England is an honor attached to the barony of Bedford. Its duties are to collect and distribute certain monies at the coronation from a silver dish; which the almoner claims for his fee, together with all the cloth on which the king walks in procession from the door of the hall at Westminster to the abbey church.

7. The *Chief Butlership* is traced by authentic records into the hands of William de Albini, who came to England with William the Conqueror, and has been exercised by some of the noblest families in the country since. It is now an hereditary right of the duke of Norfolk as

earl of Arundel, and entitles the possessor to the best gold cup and cover, with all the vessels and wine remaining under the bar, and all the pots and cups, except those of gold and silver, which shall be in the wine cellar after dinner.

8. The *Dapifer* or *Sewer*, who, 'in his surcote, with tabard, sleeves, and a hood about his neck, and his towell above all, served the messes,' or arranged the dishes on the table of the coronation feast of Elizabeth, Henry VII.'s queen, is an ancient worthy of the royal day, whose office has become extinct. If the dishes are not become more tractable, or the royal observation less nice, royal feasting has become, perhaps, less rare in modern times, and this kind of skill, therefore, more common.

9. The *Grand Carver*—*Grand Paniter*, or provider of bread, and the *Royal Napier*, are offices that have also become extinct, while good carving and good living have been still found at the royal table; and while the *Chief Cup-bearer* has retained his office and the possession of the manor of Great Wymondley, in Hertfordshire, as his reward.

10. The *Chief Lardiner* is also still entitled to notice, as having the care and management of the royal larder, and being duly careful of 'the remainder of beef, mutton, venison, kids, lard, and other flesh: as also the fish, salt, &c. remaining in the larder,' which fall to his share of the feast. This office has been attached to the manor of Scoulton, in Norfolk, from the reign of Henry II.

11. Nor should we omit to notice that the Lord Mayor and Citizens of London claim a snug 'seat next the cupboard, on the left side of the hall,' in virtue of their right to assist the chief butler in his duties at the coronation feast; or that his lordship serves the king after dinner with wine in a gold cup, having the cup and its cover for a fee. It is remarkable that the city claims a right to perform the same service, and to receive a similar fee, at the coronation of our queens: but as this escaped her majesty's law officers in the late argument for her coronation, we will not suppose it had any connexion with the strong desire for that event at the Mansion House. The mayor, bailiffs, and commonalty of Oxford also claim to assist in the office of butlery, and receive the humbler reward of three maple cups. With other presents—of grout or gruel, maple cups and napkins, to the king, gentle reader, we will suppose thou hast of late been sufficiently acquainted; but the conspicuous duty of the Barons of the Cinque Ports must not pass unnoticed.

12. These ports claim to furnish sixteen supporters of the royal canopy, in the following proportion, i. e. Hastings 3; Dover 2; Hith 2; Rye 2; Sandwich 3; Romney 2; Winchelsea 2. It is called in an account of the coronation of Richard I. 'a silk umbraculum, borne on four lances:' but is now generally composed of cloth of gold, having a gilt silver bell at each of the four corners, which are supported by four staves of silver. The origin of this claim is involved in such remote antiquity, that a charter of Charles II. speaks of 'the time of the contrary being never remembered to have been.'

CORONE, in ancient geography, a town of Messenia, situated on the sea. Pausanias takes it to be the Apea of Homer; but Strabo, Thuria, and Pliny, Pedasus. It is now called Coron. See CORON.

CORONELLI (Vincent), a famous geographer, born at Venice. His skill in the mathematics brought him to the knowledge of the count d'Estrées, who employed him in making globes for Louis XIV. With this view Coronelli spent some time at Paris; and left a great number of globes there, which are esteemed. In 1685 he was made cosmographer to the state of Venice: and four years after, public professor of geography. He founded an academy of cosmography at Venice, and died in that city in 1718. He published above 400 geographical charts, an abridgment of cosmography, several books on geography, and other works.

CORONER, *n. s.* From Lat. *corona*, an officer whose duty is to enquire, on the part of the king, how any violent death was occasioned; for which purpose a jury is empanelled.

Go thou and seek the coroner, and let him sit o' my uncle; for he's in the third degree of drink; he's drowned.

Shakspeare.

CORONER, an ancient officer in England, so called because he has principally to do with pleas of the crown, or such wherein the king is more immediately concerned. And in this light the lord chief justice of the king's bench is the principal coroner in the kingdom; and may, if he pleases, exercise the jurisdiction of a coroner in any part of the realm. But there are also particular coroners for every county of England; usually four, sometimes six, and sometimes fewer. This officer is of equal authority with the sheriff; and was ordained, together with him, to keep the peace when the earls gave up the wardship of the county. He is chosen by all the freeholders of the county court; and by the statute of Westminster: 1. It was enacted that none but lawful and discreet knights should be chosen; but it seems now sufficient if a man have lands enough to be made a knight, whether he be really knighted or not; for the coroner ought to have an estate sufficient to maintain the dignity of his office, and answer any fines that may be made upon him for his misbehaviour; and, if he has not enough to answer, his fine shall be levied upon the county, as a punishment for electing an insufficient officer. Now, indeed, through the culpable neglect of gentlemen of property, this office has been suffered to fall into disrepute, and get into low and indigent hands; so that although formerly no coroners would be paid for serving their country, and they were by the aforesaid statute of Westminster, 1. Expressly forbidden to take a reward under pain of great forfeiture to the king; yet for many years past they have only desired to be chosen for the sake of their perquisites; being allowed fees for their attendance by the stat. 3 Henry VII. cap. 1. which Sir Edward Coke complains of heavily, though since his time those fees have been much enlarged. The coroner is chosen for life, but may be removed, either by being made sheriff or choser, verderer, which are offices incompatible with the other; and by the stat. 25 Geo. II. cap.

29, extortion, neglect, or misbehaviour, are also with the other; and by the stat. 25 Geo. II. cap. 29, extortion, neglect, or misbehaviour are also made causes of removal.

His powers, like those of the sheriff, are either judicial or ministerial, but principally judicial. This is in a great measure ascertained by statute 4 Edward I. De officio coronatoris; and consist, first, in enquiring when any person is slain, or dies suddenly, or in prison, concerning the manner of his death. And this must be super visum corporis; for if the body is not found, the coroner cannot sit. He must also sit at the very place where the death happened. And his enquiry is made by a jury from four, five, or six, of the neighbouring towns, over whom he is to preside. If any be found guilty, by this inquest, of murder, he is to commit to prison for farther trial, and is also to enquire concerning their lands, goods, and chattels, which are forfeited thereby; but whether it be murder or not, he must enquire whether any deodand has accrued to the king, or the lord of the franchise, by this death; and must certify the whole of this inquisition to the court of king's bench, or the next assizes. Another branch of his office is to enquire concerning shipwrecks; and certify whether wreck or not, and who is in possession of the goods. Concerning treasure trove, he is also to enquire concerning the finders, and where it is, and whether any one be suspected of having found and concealed a treasure; 'and that may well be perceived,' saith the old statute of Edward I., 'where one liveth riotously, haunting taverns, and hath done so of long time; whereupon he might be attached and held to bail upon this suspicion only. The ministerial office of the coroner is only as the sheriff's substitute. For when just exception can be taken to the sheriff, for suspicion of partiality (as that he is interested in the suit, or of kindred to either plaintiff or defendant), the process must then be awarded to the coroner, instead of the sheriff, for execution of the king's writs.

CORONET. An inferior crown worn by the nobility. The coronet of a duke is adorned with strawberry leaves; that of a marquis has leaves with pearls interposed; that of an earl raises the pearls above the leaves; that of a viscount is surrounded with only pearls; that of a baron has only four pearls. See **CROWN**.

CORONILLA, jointed podded colutea, a genus of the decandria order, and didelphia class of plants; natural order thirty-second, papilionaceae: CAL. is bilabiate, with two segments above coalited; the vexillum scarce any longer than the alae; the legumen much contracted between the seeds. To this genus Linnaeus also joins the emerus, or scorpion senna, though Mr. Miller makes it a distinct species. There are twenty-five species, all plants of considerable beauty, with very bright yellow flowers; but rather too tender for this climate, except the *C. emerus*. This species rises with a shrubby stem, branching numerously six or eight feet high, closely garnished with winged leaves of three pair of lobes, terminated by an odd one; and, at the sides of the branches, numerous long flower-stalks, each supporting two or three large

yellow flowers of the papilionaceous kind, succeeded by longish pods; it is easily propagated by seeds, and likewise by layers or cuttings. The leaves of this plant are esteemed laxative, and used as a substitute for common senna in some parts of Europe. A dye is procured by fermentation from the leaves like that of indigo.

CORPORAL. Fr. *caporal*; Ital. *caporale*; Span. *caboral*; probably from Lat. *caput*. A non-commissioned officer of infantry; the lowest in rank, whose office it is to place and remove sentinels.

The cruel *corporal* whispered in my ear,
Five pounds, if rightly tipt, would set me clear.

Gay.

CORPORAL, an inferior officer, under a serjeant, in a company of foot, who has charge over one of the divisions, places and relieves sentinels, and keeps good order in the corps de garde; he also receives the word from the inferior rounds, which passes by his corps de garde; there are generally three corporals in each company.

CORPORAL, **CORPORALE**, is also an ancient church term, signifying the sacred linen spread under the chalice in the eucharist and mass, to receive the fragments of the bread. Some say pope Eusebius first enjoined the use of the corporal; others ascribe it to St. Silvester. It was the custom to carry corporals to fires, and to heave them solemnly against the flames, in order to extinguish them. Philip de Comines says, 'the pope made Louis XI. a present of the corporale, whereon my lord St. Peter sung mass.'

CORPORAL OF A SHIP. An officer that hath the charge of setting the watches and sentries, and relieving them; who sees that all the soldiers and sailors keep their arms neat and clean, and teaches them how to use them. He has a mate under him.

A **CORPORAL OF A SHIP OF WAR** is under the master at arms, and is employed to teach the officers the exercise of small arms, or of musquetry; to attend at the gang-way, on entering ports, and observe that no spirituous liquors are brought into the ship, unless by express leave from the officers. He is also to extinguish the fires and candles at eight o'clock in winter, and nine in summer, when the evening gun is fired; and to walk frequently down in the lower decks in his watch, to see that there are no lights but such as are under the charge of proper sentinels.

CORPORATE, *v. n. & adj.*

CORPORATELY, *adv.*

CORPORATION, *n. s.*

CORPORATURE, *n. s.*

CORPORAL, *n. s. & adj.*

CORPORALITY, *n. s.*

CORPORALLY, *adv.*

CORPORAS, *n. s.*

CORPORAL, *adj.*

CORPORALIST, *n. s.*

CORPORALLY, *adv.*

CORPOROUS, *adj.*

CORPORITY, *n. s.*

Corporations will be found fully described in the quotation from Cowell, and under the separate article which relates to them. The word is vulgarly used to signify great fatness. The corporal, corporale or corporas, is the fine linen

Fr. *corporal*; Ital. *corporale*; Spanish *corporal*; Lat. *corporalis*, from *corpus*, the body. The verb, to incorporate, which means to unite, to incorporate, is obsolete. Corporations will be found fully described in the quotation from Cowell, and under the separate article which relates to them. The word is vulgarly used to signify great fatness. The corporal, corporale or corporas, is the fine linen

cloth in which the eucharist is deposited, and which is looked upon with great reverence by the members of the Romish and Greek churches. Corporeal is relating to the body; belonging to the body; material, as distinguished from spiritual. 'In the present language,' says Johnson, 'when body is used philosophically in opposition to spirit, the word corporeal is used as a corporeal being; but otherwise corporal. Corporeal is having a body; corporal, relating to the body. This distinction seems not ancient.' Corporality and corporeity denote materiality; the quality of being embodied; corporature the state of being embodied; corporally, bodily; corporeous, bodily, having a body; corporeally, in a material or bodily manner; and corporately, in a corporate capacity; unitedly. A corporealist is one who denies the existence of spiritual substances.

A *corporation* is a body politic, authorized by the king's charter to have a common seal, one head or more, and members, able, by their common consent, to grant or receive, in law, any thing within the compass of their charter: even as one man may do by law all things, that by law he is not forbidden; and bindeth the successors, as a single man binds his executor or heir. *Cowell.*

Breaking forth like a sudden tempest, he overran all Munster and Connaught, defacing and utterly subverting all *corporate* towns that were not strongly walled. *Spenser on Ireland.*

Of angels we are not to consider only what they are, and do, in regard of their own being; but that also which concerneth them, as they are linked into a kind of *corporation* amongst themselves, and of society with men. *Hooker.*

They answer in a joint and *corporate* voice,
That now they are at fall. *Shakspeare. Timon.*

Whether are they vanished?
Into the air; and what seemed *corporeal*
Melted, as breath, into the wind. *Id. Macbeth.*

To relief of lazars and weak age,
Of indigent faint souls past *corporeal* toil,
A hundred alms-houses right well supplied.

Id. Henry V.
Render to me some *corporeal* sign about her,
More evident than this. *Id. Cymbeline.*

That God hath been otherwise seen, with *corporeal*
eyes, exceedeth the small proportion of my understanding. *Raleigh.*

If this light be not spiritual, yet it approacheth
nearest unto spirituality; and if it have any *corporality*, then, of all other, the most subtle and pure. *Id.*

Of this we find some footstep in our law,
Which doth our root from God and nature take;
Ten thousand men she doth together draw,
And of them all one *corporation* make. *Davies.*

And from these *corporeal* nutriments, perhaps,
Your bodies may at last turn all to spirit.

Milton's Paradise Lost.
The swiftness of those circles attribute,
Though numberless, to his omnipotence,
That to *corporeal* substances could add
Speed almost spiritual. *Id.*

Since philosophy affirmeth, that we are middle substances between the soul and the body, they must admit of some *corporeity*, which supposeth weight or gravity. *Browne.*

The sun is *corporally* conjoined with basiliscus. *Id.*

Corporeal punishments must necessarily lose that effect, and wear out the sense of shame, where they frequently return. Shame in children has the same place that modesty has in women; which cannot be kept, and often transgressed against. *Locke.*

He would come nearer to the discovery of the texture and motion of the minute parts of *corporeal* things; and in many of them, probably, get ideas of their internal constitutions: but then he would be in a quite different world from other people; nothing would appear the same to him and others: the visible ideas of every thing would be different. *Id.*

It is the saying of divine Plato, that man is nature's horizon, dividing betwixt the upper hemisphere of immaterial intellects, and this lower of *corporeity*.

Glanville's Scep sis.
The one attributed *corporeity* to God, and the other shape and figure. *Stillingfleet.*

God being supposed to be a pure spirit, cannot be the object of any *corporeal* sense. *Tillotson.*

The course is finished which thy fates decreed,
And thou from thy *corporeal* poison freed. *Dryden's Fables.*

Beasts enjoy greater sensual pleasures, and feel fewer *corporeal* pains; and are utter strangers to all those anxious and tormenting thoughts, which perpetually haunt and disquiet mankind. *Atterbury.*

The nobles of Athens being not at this time a *corporate* assembly, therefore the resentment of the commons was usually turned against particular persons. *Swift.*

When men, therefore, break up the original compact or agreement which gives its *corporate* form and capacity to a state, they are no longer a people; they have no longer a *corporate* existence; they have no longer a legal coactive force to bind within, nor a claim to be recognized abroad. They are a number of vague loose individuals, and nothing more. *Burke.*

The *Corporation* worshipful
He valued not an ace,
But swallowed the Mayor, asleep in his chair,
And picked his teeth with the mace. *Huddesford.*

I leave Don Juan, for the present—safe—
Not sound, poor fellow, but severely wounded;
Yet could his *corporeal* pangs amount to half
Of those with which his Haidee's bosom bounded!
Byron. Don Juan.

This noble personage began to look
A little black upon this new flirtation;
But such small licences must lovers brook,
Mere freedoms of the female *corporation*. *Id.*

CORPORATION ACT is that which prevents any person being legally elected into any office relating to the government of any city or corporation, unless he has within a twelvemonth previously received the sacrament of the Lord's Supper, according to the rites of the church of England; and which enjoins him to take the oaths of allegiance and supremacy when he takes the oath of office; otherwise his election is void.

CORPORATIONS. The first general division of corporations is into aggregate and sole. Another division of corporations, either sole or aggregate, is into ecclesiastical and lay.

CORPORATIONS, AGGREGATE, consist of many persons united together into one society, and are kept up by a perpetual succession of members, so as to continue for ever: of which kind are the mayor and commonalty of a city; the head and

llows of a college; the dean and chapter of a cathedral church.

CORPORATIONS ECCLESIASTICAL, are where the members that compose it are entirely spiritual persons; such as bishops; certain deans and prebendaries; all archdeacons, parsons, and vicars; which are sole corporations: deans and chapters at present, and formerly prior and convent, abbot and monks, and the like, were bodies aggregate. These are erected for the furtherance of religion, and perpetuating the rights of the church.

CORPORATIONS, LAY, are of two kinds; civil and eleemosynary.

CORPORATIONS, CIVIL, are such as are erected for a variety of temporal purposes. The king, for instance, is made a corporation to prevent the possibility of an interregnum or vacancy of the throne, and to preserve the possessions of the crown entire; for, immediately upon the demise of one king, his successor is in full possession of the regal rights and dignity. Some corporations are erected for the good government of a town or particular district, as a mayor and commonalty, bailiff and burgesses, or the like; some for the advancement and regulation of manufactures and commerce, as the trading companies of London, Edinburgh, &c. and others for the better carrying on of divers special purposes, as churchwardens for conservation of the goods of the parish; the College of Physicians and Company of Surgeons in London, for the improvement of the medical science; the Royal Society for the advancement of natural knowledge; and the Society of Antiquarians for promoting the study of antiquities.

CORPORATIONS, ELEEMOSYNARY, are such as are constituted for the perpetual distribution of the free alms, or bounty, of the founder, to such persons as he has directed. Of this kind are all hospitals for the maintenance of the poor, sick, and impotent; and all colleges; which last are founded for two purposes: 1. For the promotion of piety and learning by proper regulations and ordinances. 2. For imparting assistance to the members of those bodies, in order to enable them to prosecute their devotion and studies, with greater ease and assiduity. And all these eleemosynary corporations are, strictly speaking, lay, and not ecclesiastical, even though composed of ecclesiastical persons, and although they in some things partake of the nature, privileges, and restrictions of ecclesiastical bodies.

CORPORATIONS, SOLE, consist of one person only and his successors, in some particular station, who are incorporated by law, to give them some legal capacities and advantages, particularly that of perpetuity, which in their natural persons they could not have had. In this sense the king is a sole corporation; so is a bishop; so are some deans and prebendaries, distinct from their several chapters; and so is every parson and vicar. And the use of this institution will be apparent, if we consider the case of a parson of a church. At the original endowment of parish churches, the freehold of the church, the churchyard, the parsonage-house, the glebe, and the tithes of the parish, were vested in the then parson by the bounty of the donor, as a temporal

recompence to him for his spiritual care of the inhabitants, and with intent that the same emoluments should ever afterwards continue as a recompence for the same care. But how was this to be effected? The freehold was vested in the parson; and, if we suppose it vested in his natural capacity, on his death it might descend to his heir, and would be liable to his debts and incumbrances: or at best the heir might be compellable, at some trouble and expense, to convey these rights to the succeeding incumbent. The law, therefore, has wisely ordained that the parson, quatenus parson, shall never die, any more than the king, by making him and his successors a corporation. By which means all the original rights of the parsonage are preserved entire to the successor: for the present incumbent, and his predecessor, who lived seven centuries ago, are in law one and the same person; and what was given to the one, was given to the other also.

The first of these political constitutions were introduced, as Plutarch says, by Numa, who finding, upon his accession, the city torn to pieces by the two rival factions of Sabines and Romans, thought it a prudent and politic measure to subdivide these two into many smaller ones, by instituting separate societies of every manual trade and profession. They were afterwards considered by the civil law (in which they were called universitates), as forming one whole out of many individuals; or collegia, from being gathered together: they were adapted also by the canon law for the maintenance of ecclesiastical discipline; and from them our spiritual corporations are derived. But our laws have considerably refined and improved upon the invention, according to the usual genius of the English nation; particularly with regard to sole corporations, consisting of one person only, of which the Roman lawyers had no notion, their maxim being that tres faciunt collegium: though they held, that if a corporation, originally consisting of three persons, be reduced to one, si universitas ad unum redit, it may still subsist as a corporation, et stet nomen universitatis.

Corporations, by the civil law, seem to have been created by the mere act and voluntary association of their members; provided such convention was not contrary to law, for then it was illicitum collegium. It does not appear that the prince's consent was necessary to be actually given to the foundation of them; but merely that the original founders of these voluntary and friendly societies (for they were little more than such) should not establish any meetings in opposition to the laws of the state. But in England the king's consent, either impliedly or expressly given, is absolutely necessary to the erection of any corporation. The king's implied consent is to be found in incorporations which exist by force of the common law, to which our former kings are supposed to have given their concurrence; common law being nothing else but custom arising from the universal agreement of the whole community. Of this sort are the king himself, all bishops, parsons, vicars, churchwardens, and some others; who by common law have ever been held (as far as our books can

show us) to have been corporations, *virtute officii*: and this incorporation is so inseparably annexed to their offices, that we cannot frame a complete legal idea of any of these persons, but we must also have an idea of a corporation, capable to transmit his rights to his successors, at the same time. Another method of implication, by which the king's consent is presumed, is as to all corporations by prescription, such as the city of London, and many others, which have existed as corporations, time whereof the memory of man runneth not to the contrary; and, therefore, are looked upon in law to be well created. For, though the members of them can show no legal charter of incorporation, yet in cases of such high antiquity the law presumes there once was one; and that, by the variety of accidents which length of time may produce, the charter is lost or destroyed. The methods by which the king's consent is expressly given are either by act of parliament, or by charter. By act of parliament, of which the royal assent is a necessary ingredient, corporations may undoubtedly be created: but it is observable, that most of those statutes, which are usually cited as having created corporations, do either confirm such as have been before created by the king; as in the case of the college of physicians, erected by charter 10 Henry VIII., which charter was afterwards confirmed in parliament; or they permit the king to erect a corporation in futuro, with such and such powers; as is the case of the bank of England, and the society of the British fishery. So that the immediate creative act is usually performed by the king alone. All the other methods, therefore, whereby corporations exist, by common law, by prescription, and by act of parliament, are for the most part reducible to this of the king's letters patent, or charter of incorporation. The king's creation may be performed by the words *creamus, erigimus, fundamus, incorporamus, or the like*. Nay it is held that if the king grants to a set of men to have *gildam mercatoriam*, 'a mercantile meeting or assembly,' this is alone sufficient to incorporate and establish them for ever. The king, it is said, may grant to a subject the power of erecting corporations, though the contrary was formerly held: that is, he may permit the subject to name the persons and powers of the corporation at his pleasure; but it is really the king that erects, and the subject is but the instrument; for though none but the king can make a corporation, yet *qui facit per alium facit per se*. In this manner the chancellor of the university of Oxford has power by charter to erect corporations; and has actually often exerted it in the erection of several matriculated companies, now subsisting, of tradesmen subservient to the students. When a corporation is erected, a name must be given to it; and by that name alone it must sue and be sued, and do all legal acts.

When a corporation is formed and erected, it acquires many powers and rights. Some of these are necessarily and inseparably incident to every corporation; which incidents, as soon as a corporation is duly erected, are tacitly annexed of course. As, 1. To have perpetual succession. This is the very end of its incorporation; for

there cannot be a succession for ever without an incorporation; and, therefore, all aggregate corporations have a power necessarily implied of electing members in the room of such as go off. 2. To sue or be sued, implead or be impleaded, grant or receive, by its corporate name, and do all other acts that natural persons may. 3. To purchase lands, and hold them, for the benefit of themselves and their successors. 4. To have a common seal; for a corporation, being an invisible body, cannot manifest its intentions by any personal act or oral discourse: it therefore acts and speaks only by its common seal. For though the particular members may express their private consents to any act, by words, or signing their names, yet this does not bind the corporation; it is the fixing of the seal, and that only, which unites the several assents of the individuals who compose the community, and makes one joint assent of the whole. 5. To make by-laws or private statutes for the better government of the corporation: which are binding upon themselves unless contrary to the laws of the land, and then they are void. But no trading company is allowed to make by-laws which may affect the king's prerogative, or the common profit of the people, under penalty of £40, unless they be approved by the chancellor, treasurer, and chief justices, or the judges of assize in their circuits: and even though they be so approved, still if contrary to law, they are void. These five powers are inseparably incident to every corporation aggregate. Corporations have a capacity to purchase lands for themselves and successors; but they are excepted out of the statute of wills; so that no devise of lands to a corporation by will is good; except for charitable uses, by statute 43 Eliz. c. 4, which exception is again greatly narrowed by the statute 9 Geo. II. c. 36.; and their privilege even of purchasing from any living grantor is much abridged; so that now a corporation, either ecclesiastical or lay, must have a licence from the king to purchase, before they can exert that capacity which is vested in them by the common law: nor is even this in all cases sufficient. These statutes are generally called the statutes of mortmain. See **MORTMAIN**. The general duties of all bodies politic, considered in their corporate capacity, may, like those of natural persons, be reduced to this single one; that of acting up to the end or design, whatever it be, for which they were created by their founder.

As any members may lose place in the corporation, by acting contrary to its laws or the laws of the land, so the body politic may also itself be dissolved in several ways; which dissolution is the civil death of the corporation: and in this case their lands and tenements revert to the person, or his heirs, who granted them to the corporation; for the law annexes a condition to every such grant, that, if the corporation be dissolved, the grantor shall have the lands again, because the cause of the grant faileth. The grant is indeed only during the life of the corporation, which may endure for ever; but when that life is determined, by the dissolution of the body politic, the grantor takes it back by reversion, as in the case of every other grant for life. The debts of a corporation, either to or from it, are

totally extinguished by its dissolution; so that the members of it cannot recover, or be charged with them, in their natural capacities: agreeably to that maxim of the civil law, *si quid universitati debetur, singulis non debetur; nec, quod debet universitas, singuli debent*. A corporation may be dissolved, 1. By act of parliament. 2. By the natural death of all its members, in cases of an aggregate corporation. 3. By surrender of its franchises into the hands of the king, which is a kind of suicide. 4. By forfeiture of its charter through negligence or abuse of its franchises; in which case the law judges that the body politic has broken the condition upon which it was incorporated, and thereupon the incorporation is void. And the regular course is to bring an information in the nature of a writ of quo warranto, to enquire by what warrant the members now exercise their corporate power, having forfeited it by such and such proceedings. The exertion of this act of law, for the purposes of the state, in the reigns of king Charles and king James II., particularly by seizing the charter of the city of London, gave great and just offence; though perhaps, in strictness of law, the proceedings in most of them were sufficiently regular; but the judgment against that of London was reversed by act of parliament after the Revolution; and by the same statute it was enacted, that the franchises of the city of London shall never more be forfeited for any cause whatsoever. And because by the common law corporations were dissolved, in case the mayor or head officer was not duly elected on the day appointed in the charter or established by prescription, it is now provided, that for the future no corporation shall be dissolved upon that account; and ample directions are given for appointing a new officer, in case there be no election, or a void one, made upon the charter or prescriptive day.

Two modern provisions of the law, with regard to corporations, are worth noticing here. 1. To prevent improper conduct in trading corporations in elections, and in disposing of the joint stock, it is by stat. 7 Geo. III. c. 43, enacted, that no member of such corporations shall be admitted to vote in the general courts, until he shall have been six months in possession of the stock necessary to qualify him: unless it comes to him by bequest, marriage, succession, or settlement; and only one half-yearly dividend is to be made of the profits of stock.

2. To facilitate the proceedings in cases of mandamus and quo warranto, and to prevent any undue advantage on either side, the stat. 12 Geo. III. c. 21, provides that, where any person shall be entitled to be admitted a freeman, &c., of any corporation, &c., and shall apply to the proper officer to be admitted, and shall give notice of his intention to move the court of king's bench for a mandamus, in case of refusal the officer shall pay all the costs of the application. And the same statute enacts, that the proper officer shall, on the demand of two freemen, permit them and their agents to inspect the entries of admission of freemen, and to take copies and extracts, under penalty of £100.

CORPOREITY is the quality of that which is corporeal, or is body; or that which constitutes

or denominates it such. The corporeity of God was the capital error of the Antihropomorphites. Some authors reproach Tertullian with admitting a corporeity in the Deity; but it is manifest that, by body, he means no more than substance. The Mahomedans reproach the Samaritans at this day, with a belief of the corporeity of God.

CORPO'RIFY, *v. a.* } Fr. *corporifier*; Lat. CORPORA'TION. } *corpus*. To embody; to thicken into a body; to attribute body to spiritual beings. The act of embodying.

A certain spirituous substance, extracted out of it, is mistaken for the spirit of the world *corporified*.

Boyle.

CORPOSANT, or CORPO SANTO, *Ital.*, a name given to the volatile meteor, or *ignis fatuus*, often seen in a dark tempestuous night about the decks or rigging of a ship, but particularly at the extremities, as the mast-heads and yard-arms, and is most frequent in heavy rain accompanied with lightning. This appearance, which is nothing more than the electric fluid passing silently from the clouds to the water, or the contrary, by means of the humidity on the masts and rigging, was, in the dark ages of superstition, esteemed by some a good omen and by others an evil one; but modern philosophy has so happily explored its cause, that none but the most ignorant are now intimidated by it. The best ancient opinion is that of Varenius, who says that 'they usually wander, with uncertain motion, from place to place, sometimes appearing to cleave close to the sails and masts: but they frequently leap up and down with intermission, affording an obscure flame, like that of a candle burning faintly. They are produced by some sulphureous and bituminous matter, which being beat down by the motion of the air above, and gathering together, is kindled by the agitation of the air, as butter is gathered together by the agitation of the cream. And from this appearance we may infer, that storms come from sulphureous vapors that rarefy the air and fuel into motion.'

CORPS, *n. s.* } Fr. *corps*; Lat. *corpus*. A CORPSE, *n. s.* } body; a body, in contempt; CORSE, *n. s.* } a dead body. Corps also means a body of troops; a number of persons acting together. In this sense some lexicographers contend that it is derived, through the French, from the Lat. *cohors*.

Spright Emelie, and houletth Palamon,
And Theseus his sister toke anon
Swonning, and bore her from the *corps* away.

Chaucer. Cant. Tales.

But al to late comith the lectuarie
When men the *corse* unto the grave carie.

Id. Troilus and Creseide.

Honour the place that such a jewel tred,
And kisse the ground wheras the *corps* doth rest.

Surrey.

That lewd ribald
Laid first his filthy hands on virgin cleene,
To spoil her dainty *corse*, so fair and sheene,
Of chastity and honour virginal.

Spenser. Faerie Queene.

His *corps* was carried downe along the lee,
Whose waters with his filthy blood it stayned. *Id.*

O how great sorrow my sad soule assaid!
Then forth I went his woeful *corse* to find. *Id.*

Not a friend

Greet my poor *corps*, where my bones shall be thrown.
Shakspeare.

Cold numbness streight bereaves
Her *corps* of sense, and the' air her soul receives.
Denham.

Though plenteous, all too little seems
To stuff this man, this vast unhide-bound *corps*.
Milton.

He looks as man was made, with face erect,
That scorns his brittle *corps*, and seems ashamed
He's not all spirit. *Dryden's Don Sebastian.*

There was the murdered *corps* in covert laid,
And violent death in thousand shapes displayed.
Id. Fables.

See where the *corps* of thy dead son approaches.
Addison.

The *corpse* was laid out upon the floor by the emperor's command: he then bid every one light his flambeau, and stand about the dead body. *Id. Guardian.*

Naturally men so formed and finished are the first gifts of Providence to the world. But when they have once thrown off the fear of God, which was in all ages too often the case, and the fear of man, which is now the case, and when in that state they come to understand one another, and to act in *corps*, a more dreadful calamity cannot arise out of hell to scourge mankind.
Burke.

Yon ruins sable from the wasting flame
But mark the once resplendent dome;
The frequent *corse* obstructs the sullen stream,
And ghosts glare horrid from the sylvan gloom.
Beattie.

O'er his pale *corse* their pearly sea-flowers shed,
And strewed with crimson moss his marble bed;
Struck in their coral towers the pausing bell,
And wide in ocean tolled his funeral knell. *Darwin.*
Not so Haidee: she sadly tossed and tumbled,
And started from her sleep,—and, turning o'er,
Dreamed of a thousand wrecks, o'er which she stumbled,
And handsome *corpses* strewed upon the shore.
Byron. Don Juan.

CORPS, in architecture, a term borrowed from the French, signifying any part that projects or advances beyond the naked wall; and which serves as a ground for some decoration or the like.

CORPS DE GARDE, a post in an army, sometimes under covert, sometimes in the open air, to receive a body of soldiery, who are relieved from time to time, and are to watch in their turns, for the security of a quarter, a camp, station, &c. The word is also used for the men, who watch therein. It is usual to have also a small corps de garde, at a good distance before the lines; to be the more readily advertised of the approach of the enemy.

CORPULENCE, *n. s.* } *Fr. corpulence; It. corpulency, n. s. } corpulenza; Sp. corpulencia; Lat. corpulentia.* Johnson defines corpulence, and corpulency, to be, bulkiness of body; fleshiness; fulness of flesh; spissitude; grossness of matter. Corpulence, however, is now much more commonly used to express increase of size from fat, rather than from muscle.

We say it is a 'fleshy stile, when there is much periphrasis, and circuit of words; and when, with more than enough, it grows fat and *corpulent*.

Ben Jonson's Discoveries.

Excess of nourishment is hurtful; for it maketh the child *corpulent*, and growing in breadth rather than in height.
Bacon.

To what a cumbersome unwieldiness,
And burdenuous *corpulency*, my love had grown.
Donne.

It is but one species of *corpulency*; for there may be bulk without fat, from the great quantity of muscular flesh, the case of robust people.
Arbuthnot on Aliments.

The muscular flesh serves for the vibration of the tail; the heaviness and *corpulency* of the water requiring a great force to divide it.
Ray on the Creation.

CORPULENCE is the occasion of various diseases, and particularly of the apoplexy. It was held infamous among the ancient Lacedæmonians. Sennertus mentions a man that weighed 600 pounds, and a maid, thirty-six years of age, who weighed 450. Bright of Malden, who died at the age of twenty-nine, in 1750, weighed 616 pounds. Chiapiu Vitelli, marquis of Cerona, a noted Spanish general in his time, from an excessive corpulency, is said to have reduced himself, by drinking vinegar, to such a degree of leanness, that he could fold his skin several times round him. Castile soap, in the form of a bolus, an electuary, pills, or dissolved in a gill or more of soft water, from one to four drachms, taken at bed-time, is strongly recommended with a view of reducing corpulency, in a Discourse on its Nature, Causes, and Cure, by Malcolm Flemyng, M. D. London, 1760. See **MEDICINE**.

CORPUS, i. e. a body, Lat. is used in matters of learning, for several works of the same nature collected and bound together. Thus Gratian made a collection of the canons of the church called *corpus canonum*. The *corpus* of the civil law is composed of the digest, code, and institutes. We have also a *corpus* of the Greek poets; and another of the Latin poets.

CORPUS CHRISTI, a festival of the church of England, kept on the Tuesday after Trinity-Sunday, instituted in honor of the eucharist; to which also one of the colleges in Oxford is dedicated.

CORPUSCLE, *n. s.* } Lat. *corp-*
CORPUSCULAR, *adj.* } *pusculum. A*
CORPUSCULARIAN, *n. s. & adj.* } diminutive
body; an atom; a small fragment. *Corpuscularian*, as an adjective, signifies relating to bodies; comprising bodies. 'It is,' says Johnson, 'the distinguishing epithet of that philosophy, which attempts the rational solution of all physical appearances by the action of one body upon another.' A *corpuscularian* is a philosopher of that sect of philosophy.

As to natural philosophy, I do not expect to see any principles proposed, more comprehensive and intelligible than the *corpuscularian* or mechanical.
Boyle.

This may be said, that the modern *corpuscularians* talk, in most things, more intelligibly than the peripatetics.
Bentley.

The mechanical or *corpuscular* philosophy, though peradventure the eldest, as well as the best in the world, had lain dead for many ages in contempt and oblivion.
Id.

It will add much to our satisfaction, if those *corpuscles* can be discovered with microscopes.

Newton's Opticks.

Who knows what are the figures of the little *corpuscles* that compose and distinguish different bodies?

Watts's Logick.

In the apocynum androsæmifolium, the anthers converge over the nectaries, which consist of five glandular oval *corpuscles* surrounding the germ; and at the same time admit air to the nectaries at the interstice between each anther.

Darwin.

CORPUSCULARIAN PHILOSOPHY is that way of philosophising which endeavours to explain things, and to account for the phenomena of nature, by the motion, figure, rest, position, &c. of the corpuscles, or the minute particles of matter. Mr. Boyle sums up the chief principles of the corpuscular hypothesis, which now flourishes under the mechanical philosophy, in these particulars: 1. They suppose that there is but one catholic or universal matter, which is an extended, impenetrable, and divisible substance, common to all bodies, and capable of all forms. 2. That this matter, in order to form the vast variety of natural bodies, must have motion in some or all its assignable parts; and that this motion was given to matter by God, the Creator of all things, and has all manner of directions and tendencies. 3. Matter must also be actually divided into parts, and each of these primitive particles, fragments, or atoms of matter, must have its proper magnitude or size, as also its peculiar figure or shape. 4. They suppose also, these differently fixed and shaped particles may have as different orders and positions, whereof great variety may arise in the composition of bodies.

CORRA LINN, a grand cataract of the Clyde, in Lanarkshire, which is thus described by William Lockhart, Esq. of Baronald: 'The old castle of Corra, with Corra House, and the rocky and woody banks of the Clyde, form of themselves a beautiful and grand coup d'œil; but nothing can equal the striking and stupendous appearance of the fall itself, which, when viewed from any of the different seats placed here and there along the walks, must fill every unaccustomed beholder with awe and astonishment. The tremendous rocks around, the old castle upon the opposite bank, a corn-mill in the rock below, the furious and impatient stream foaming over the rock, the horrid chasm and abyss underneath your feet, heightened by the hollow murmur of the water, and the screams of wild birds, form at once a spectacle, both tremendous and pleasing. A summer-house is situated over a high rocky bank, that overlooks the Linn, built by Sir James Carmichael, of Bonniton, in 1708. From its uppermost room, it affords a very striking prospect of the fall; for, all at once, on throwing your eyes towards a mirror, on the opposite side of the room from the fall, you see the whole tremendous cataract pouring, as it were, upon your head. The Corra Linn, by a late measurement, is found to be eighty-four feet in height. The river does not rush over in one uniform sheet, like the Bonniton Linn, but in three different, though almost imperceptible, precipitate leaps. On the south bank, when the sun shines, a ram-

bow is perpetually seen forming upon the mists and fogs, rising from the violent dashing of the waters.' On a pointed rock, overhanging this stupendous scene, stands a solitary tower. It was lately inhabited, but is now in ruins. In floods, the rock and tower have been observed to shake in such a manner as to spill water in a glass standing on a table. A path leads to the top of the fall, into which projects a high rock, in floods insulated by the water; and from the top is a tremendous view of the furious stream. In the cliffs of this savage retreat the brave Wallace is said to have concealed himself, meditating revenge for his injured country.

TO CORRA'DE, *v. a.* Lat. *corrado*. To rub off; to wear away by frequent rubbing; to scrape together.

CORRADIATION, *n. s.* Lat. *con* and *radius*. A conjunction of rays in one point.

The impression of colour worketh not but by a cone of direct beams, or right lines, whereof the basis is in the object, and the vertical point in the eye; so as there is a *corradation*, and conjunction of beams.

Bacon's Natural History.

CORRADINI DE SEZZA (Peter Marcellinus), a learned civilian and cardinal, born at Sezza in 1658. He acquired the esteem and confidence of Clement XI., and died at Rome in 1743. He was the author of a learned and curious work, entitled, *Verum Latium Profanum et Sacrum*, 2 vols. folio, and a History of Sezza, in 4to.

CORRADO (Sebastian), an Italian grammarian of the sixteenth century, who taught Greek and Latin at Reggio, where he formed an academy of polite literature; and at length removed to Bologna, to be professor of those languages. He wrote several works, the most esteemed of which are, *Quæstura in qua Ciceronis Vita refertur*, an excellent performance; and *De Lingua Latina*. He died in 1556.

CORRECT , <i>v. a. & adj.</i>	} Fr. <i>corriger</i> ; Ital. <i>correggere</i> ; Span. <i>corrigir</i> ; Lat. <i>corrige</i> , from <i>con</i> and <i>re-</i> <i>gere</i> . To punish ; to amend ; to re- move error in writings, life, or things ; to add something which removes some bad quality in another. Correction is punishment ; the act of removing faults ; amendment ; that which is substituted in the place of anything wrong ; reprehension ; abatement of noxious qualities by the addition of something contrary. Corrective, as a noun, means that which has the power of amending ; limitation : as an adjective, it denotes having the power of amending ; the power of producing correctness. Correctioner seems to be used by Shakspeare to express, a jail-bird ; one who has been in the house of correction. So says Johnson ; but, as the speech which he quoted is made to an officer of justice, the word appears rather to denote a corrector ; one who punishes. Corrigible is that which may be amended ; that which deserves punishment. Shakspeare employs it in the sense of having
CORRECTABLE , <i>adj.</i>	
CORRECTION , <i>n. s.</i>	
CORRECTIONER , <i>n. s.</i>	
CORRECTIVE , <i>n. s. & adj.</i>	
CORRECTLY , <i>adv.</i>	
CORRECTNESS , <i>n. s.</i>	
CORRECTOR , <i>n. s.</i>	
CORRIGIBLE , <i>adj.</i>	

power to correct; which, as Johnson observes, is neither proper, nor used.

To slander you is no thing min entent,
But to *correcten* that is mis I ment.

Chaucer. Cant. Tales.

Al so as a wise man sayth, that the judge that *correcteth* not the sinner, commaundeth and biddeth him do sinne.

I do vengeance and pleine *correction*
While I dwell in the signe of the Leon. *Id.*

When this childe sawe the yerde, he sayd to his maister, What thinke you to do? I wol bete thee, sayd the maister, for thy *correction*. Forsoth, sayd the childe, ye ought first *correct* yourself, that have lost all patience for the offence of a childe. *Id.*

O happy mixture! wherein things contrary do so qualify and *correct* the one the danger of the other's excess, that neither boldness can make us presume, as long as we are kept under with the sense of our own wretchedness; nor, while we trust in the mercy of God through Christ Jesus, fear be able to tyrannize over us.

An offensive wife,

That hath enraged him on to offer strokes,
As he is striking, holds his infant up,
And hangs resolved *correction* in the arm
That was upreared to execution.

Shakspeare. Henry IV.

Our bodies are our gardens, to the which our wills are gardeners; so that, if we will either have it sterill with idleness, or manured with industry, the power and *corrigible* authority of this lies in our will.

Id. Othello.

I will have you soundly swinged for this, you blue-bottled rogue! you filthy famished *correcter*!

Id. Henry IV.

To make ambitious, wholesome, do not take
A dram of country's dullness; do not add
Corrections, but as chymists purge the bad.

Donne.

He was taken up very short, and adjudged *corrible* for such presumptuous language.

Howel's Vocal Forest.

Sad accidents, and a state of affliction, is a school of virtue; it *corrects* levity, and interrupts the conscience of sinning.

Taylor.

There seems to be such an instance in the regiment which the human soul exerciseth in relation to the body, that, with certain *correctives* and exceptions, may give some kind of explication or adumbration thereof.

Hale's Origin of Mankind.

They proceed with judgment and ingenuity, establishing their assertions not only with great solidity, but submitting them also unto the *correction* of future discovery.

Broune.

He that thinks absolute power purifies men's blood, and *corrects* the baseness of human nature, need read but the history of this or any other age to be convinced of the contrary.

Locke.

There are ladies, without knowing what tenses and participles, adverbs and prepositions are, speak as properly and as *correctly* as most gentlemen who have been bred up in the ordinary methods of grammar schools.

Id.

Humanly speaking, and according to the method of the world, and the little *correctives* supplied by art and discipline, it seldom fails but an ill principle has its course, and nature makes good its blow.

South's Sermons.

What verse can do, he has performed in this,
Which he presumes the most *correct* of his.

Dryden's Aw. Prol.

Too much labour often takes away the spirit, by adding to the polishing; so that there remains nothing but a dull *correctness*, a piece without any considerable faults, but with few beauties.

Id. Dufresnoy.

Another poet, in another age, may take the same liberty with my writings; if, at least, they live long enough to deserve *correction*.

Id. Fables. Preface.

This is a defect in the first make of some men's minds, which can scarce ever be *corrected* afterwards, either by learning or age.

Burnet's Theory. Preface.

No man's body is as strong as his appetites, but heaven has *corrected* the boundlessness of his voluptuous desires by stinting his strength and contracting his capacities.

Tillotson.

I writ, because it amused me; I *corrected*, because it was as pleasant to me to *correct* as to write.

Pope's Preface.

Such lays as neither ebb nor flow,
Correctly cold, and regularly low.

Id. Essay on Criticism.

Mulberries are pectoral, *corrective* of bilious alkali.

Arbuthnot.

I remember a person, who, by his style and literature, seems to have been the *corrector* of a hedgepress in Little-Britain, proceeding gradually to an author.

Swift.

Those pieces have never before been printed from the true copies, or with any tolerable degree of *correctness*.

Id.

We are all but children here under the great master of the family; and he is pleased, by hopes and fears, by mercies and *corrections*, to instruct us in virtue.

Watts.

In making a medicine, such a thing is called a *corrector*, which destroys or diminishes a quality that could not otherwise be dispensed with; thus turpentine are *correctors* of quicksilver, by destroying its fluxility, and making it capable of mixture.

Quincy.

It is difficult for the most wise and upright government to *correct* the abuses of remote delegated power, productive of unmeasured wealth, and protected by the boldness and strength of the same ill-got riches.

Burke.

Our Indian government is in its best state a grievance. It is necessary that the *correctives* should be uncommonly vigorous; and the work of men sanguine, warm, and even impassioned in the cause.

Id.

To *correct* a child when one is in a passion, gives him an example of two vices at once, rage and revenge; for all *correction* of this kind is likely to be, and to the sufferer will appear to be, excessive; and seem to have, and perhaps really has, something vindictive in it.

Beattie.

Candid, and generous, and just,
Boys care but little whom they trust;

An error soon *corrected*—

For who but learns in riper years

That man, when smoothest he appears,

Is most to be suspected?

Couper.

CORRECTION, in printing, the act of retrenching the faults in a work; or the reading which the corrector gives the proofs; to point out and amend the faults, to be rectified by the compositor. The corrections are placed on the margin of each page, against the line where the faults are found. There are different characters used to express different corrections, as D or δ, de, for any thing to be effaced or struck out. When any thing is to be inserted, the place is marked in the line with a caret (^), and the insertion added in the margin. When a word, syllable, &c. is

to be altered, it is erased out of the proof, and that to be put in its room written in the margin; always observing, if there be several mistakes in the same line, that the corrections in the margin be separated by little bars or strokes, |. If a space be omitted, its place is marked with a caret, and the margin with ††. If a space be wrong placed, as in the middle of a word, the two parts are connected with a curve, and the same character put in the margin. If a letter be inverted, it is expressed in the margin thus, C̄.

If any thing be transposed it is marked thus: the shortest [are the follies] best; for, the shortest follies are the best: and in the margin is added trs. in a circle. If Roman characters are to be changed for Italic, or vice versa, a line is drawn under them, thus, thus, and Roman or Italic added in the margin; if to small capitals, a double line; and if to capitals a treble line. If a word or sentence is entirely omitted, the place is marked with a caret, and in the margin is inserted the word, *out*. If the letters of a word stand too far asunder, a line is drawn under them, and in the margin is put a crooked line or hook, thus, ~.

CORREGIO, a town of Italy, in the principality of the same name, and department of Crostolo, with a castle, eight miles north-west of Modena, nine south-east of Reggio, and twenty-five south of Mantua. Long. 11° 12' E., lat. 44° 46' N.

CORREGIO (Antonio), an eminent historical painter, born in 1494, whose original name, Allegri, was changed to that of his birth-place. Being descended of poor parents, and educated in an obscure village, he enjoyed none of those advantages which contributed to form the other great painters of that illustrious age. He studied none of the statues of ancient Greece or Italy; nor any of the works of the established schools of Rome and Venice. But Nature was his guide; and Corregio was one of her favorite pupils. The agreeable smile, and the profusion of graces which he gave to his madonas, saints, and children, have been said to be sometimes unnatural; but they are still amiable and pleasing. An easy and flowing pencil, a union and harmony of colors, and a perfect intelligence of light and shade, give an astonishing relief to all his pictures, and have been the admiration both of his contemporaries and his successors. Annibal Carracci, who flourished fifty years after him, studied and adopted his manner in preference to that of any other master. From want of curiosity, or of patronage, Corregio never visited Rome, but remained his whole life at Parma, where the art of painting was little esteemed, and poorly rewarded. This concurrence of unfavorable circumstances occasioned, at last, his premature death at the age of forty. He was employed to paint the cupola of the cathedral at Parma, the subject of which is an Assumption of the Virgin; and having executed it in a manner that has long been the admiration of every person of taste, for the grandeur of design, and especially for the boldness of the fore-shortenings, an art which he first and at once brought to the utmost perfection, he went to receive his payment. The

canons of the church, either through ignorance or baseness, found fault with his work; and although the price originally agreed upon had been very moderate, they alleged that it was far above the merit of the artist, and forced him to accept of the paltry sum of 200 livres; which, to add to the inhospitality, they paid him in copper money. To carry home this unworthy load to his indigent wife and children, poor Corregio had to travel six or eight miles from Parma. The weight of his burden, the heat of the weather, and his chagrin at this villanous treatment, immediately threw him into a pleurisy, which, in three days, terminated his life and his misfortunes, in 1534. For the preservation of this magnificent work the world is indebted to Titian. As he passed through Parma, in the suite of Charles V. he went instantly to see the chief d'œuvre of Corregio. While he was attentively viewing it, one of the principal canons of the church told him that such a grotesque performance did not merit his notice, and that they intended soon to have the whole defaced. 'Have a care of what you do,' replied the other; 'if I were not Titian, I would certainly wish to be Corregio.'

CORRELATE, *v. n. & n. s.* } Lat. *con* and
CORRELATIVE, *adj.* } *relatus*. To
CORRELATIVENESS, *n. s.* } stand in a re-
CORRELATIVELY, *adv.* } ciprocual rela-
 tion to each other, as father and son, man and woman, prince and subject. Correlative is, having a reciprocal relation; a relation in which one state cannot exist without the other, they being mutually dependent. A correlate is one who stands in the opposite relation.

It is one thing for a father to cease to be a father, by casting off his son; and another for him to cease to be so, by the death of his son: in this the relation is at an end for want of a *correlate*. *South.*

Father and son, husband and wife, and such other *correlative* terms, seem nearly to belong one to another. *Id.*

Giving is a relative action, and so requires a *correlative* to answer it; giving, on one part, transfers no property, unless there be an accepting on the other. *Id.*

CORREPTION, *n. s.* Lat. *corripio*, *corruptum*. Objurgation; chiding; reprehension; reproof.

If we must be talking of other people's faults, let it not be to de-fame, but to amend them, by converting our detraction into admonition and fraternal *correction*. *Government of the Tongue.*

CORRESPOND, *v. n.* } Fr. *corres-*
CORRESPONDENT, *n. s. & adj.* } *pondre*; Ital.
CORRESPONDENCE, *n. s.* } *correspondere*;
CORRESPONDENCY, *n. s.* } Sp. *correspon-*
CORRESPONDENTLY, *adv.* } *der*; Lat. *con*
CORRESPONDING, *adj.* } *andrespondere*.
CORRESPONSIVE, *adj.* } To fit; to suit;
 to match; to be adapted to; to be adequate to; to keep up an intercourse by letters. Correspondent is, suitable; adapted: a correspondent is one who keeps up a mutual intercourse with another by letters; one who transacts mercantile affairs for or with another residing in a different country. Correspondence and correspondency

the first is the most in use) signify, reciprocal relation of one thing to another; intercourse; friendship; interchange of offices or civilities. Corresponding and responsive mean, answerable; adapted to; proportioned to.

Between the law of their heavenly operations, and the actions of men in this our state of mortality, such *correspondence* there is as maketh it expedient to know in some sort the one, for the other's more perfect direction. *Hooker.*

What good or evil is there under the sun, what action *correspondent* or repugnant unto the law which God hath imposed upon his creatures, but in or upon it God doth work, according to the law which himself hath eternally purposed to keep? *Id.*

Priam's six gates i' the' city, with massy staples,
And *responsive* and fulfilling bolts,
Spere up the sons of Troy.

Shakespeare. Troilus and Cressida.

Let such military persons be assured, and well reputed of, rather than factitious and popular; holding also good *correspondence* with the other great men in the state. *Bacon.*

I had discovered those unlawful *correspondencies* they had used, and engagements they had made to embroil my kingdoms. *King Charles.*

Sure the villains hold a *correspondence*
With the enemy, and thus they would betray us.

Denham.

He was pleased to command me to send to him, and receive from him all his letters from and to all his *correspondents* at home and abroad. *Id.*

Words being but empty sounds, any farther than they are signs of our ideas, we cannot but assent to them, as they *correspond* to those ideas we have, but no farther than that. *Locke.*

Whatever we fancy, things keep their course; and their habitudes, *correspondencies*, and relations keep the same to one another. *Id.*

The days, if one be compared with another successively throughout the year, are found not to be equal, and will not justly *correspond* with any artificial or mechanical equal measures of time.

Holder on Time.

nd as five zones the' etherial regions bind,
Five *correspondent* are to earth assigned.

Dryden. Ovid.

It happens very oddly, that the pope and I should have the same thought much about the same time: my enemies will be apt to say that we hold a *correspondence* together, and act by concert in this matter. *Addison.*

You might, if you pleased, have profited of our example, and have given to your recovered freedom a *correspondent* dignity. Your privileges, though discontinued, were not lost to memory. *Burke.*

Our political system is placed in a just *correspondence* and symmetry with the order of the world, and with the mode of existence decreed to a permanent body composed of transitory parts. *Id.*

returned home very considerably improved. My reading was enlarged with the very important addition of Thomson's and Shenstone's Works; I had seen human nature in a new phasis; and I engaged several of my school-fellows to keep up a literary *correspondence* with me. *Burns.*

Reasoning is that operation of the sensorium by which we excite two or many tribes of ideas, and then re-excite the ideas in which they differ or *correspond*.

Darwin.

These all assume, as circumstances require, the various forms of letter to the editor, occasional anecdote, impartial critique, observation from *correspondent*, or advertisement from the party.

Sheridan. The Critic.

DAN. And not a week but I receive fifty letters, and not a line in them about any business of my own.

SNEER. An amusing *correspondence*. *Id.*

Discussed the fashion which might next prevail,

And settled bonnets by the newest code,

Or crammed twelve sheets into one little letter,

To make each *correspondent* a new debtor.

Byron. Don Juan.

CORREZE, a department of France, bounded by those of Upper Vienne and Cruise on the north, Puy de Dome on the east, Cantal on the south-east, Lot on the south, and Dordogne on the west. It includes the ci-devant province of Limousin, and contains 255,000 inhabitants. It is divided into the arrondissements of Tulle (the capital), Brives, and Ussel. This department is watered by the Correze, the Dordogne, and the Upper and Lower Vezere, but none of them are well fitted for navigation. Northward it is mountainous, but the low grounds produce buckwheat, rye, chestnuts, hemp, wine, and mushrooms. There are extensive heaths of juniper, and meadows which support many thousand sheep and cattle. The minerals are pit-coal, slate, free-stone, lime-stone, iron, lead, copper, and antimony; and the chief towns contain manufactures of wool, cotton, silk, brandy, paper, and oil.

CORREZE, a river of France, which rises about twenty miles north-east of Tulle, and passing by that town, Brives, &c. joins the Vezere, three miles below Brives. It gives name to the above department, through which it passes.

CORRIDOR, *n. s.* French. In fortification, the covert way lying round the whole compass of the fortifications of a place. In architecture, a gallery or long aisle round about a building, leading to several chambers at a distance from each other.

There is something very noble in the amphitheatre, though the high wall and *corridors* that went round it are almost entirely ruined. *Addison on Italy.*

He passed the portal—crossed the *corridore*,

And reached the chamber as the strain gave o'er:

'My own Medora! sure thy song is sad.'

'In Conrad's absence would'st thou have it glad?'

Byron. The Corsair.

CORRIE (James), M. D. a young physician of very promising abilities, born at Ayre, October 20th, 1770. He was educated at Ayre; studied three years at the university of Edinburgh, where he was elected president of the Chirurgo-Physi-cal and Chirurgo-Obstetrical Societies; and took his degrees of A. M. and M. D. at Glasgow, in 1791. He afterwards went to London, where he was admitted a member of the corporation of surgeons; and published his Essay on the Vitality of the Blood; a doctrine for which he was a zealous advocate. This work was dedicated to the late celebrated anatomist, John Hunter, esq. by whose recommendation, Dr. Corrie obtained an appointment in the service of the East India Company, at Condalore; but the climate proving

too severe for his constitution, he died in 1794, while he was collecting materials for several other works on medicine and natural history.

CORRIGIOLA, in botany, a genus of the trigynia order and pentandria class of plants; natural order fifty-fourth miscellanæ: cat. pentaphyllous; the petals five; and one three-cornered seed. Species two; one common, on our own sea-coast; the other a poor Cape plant with green flowers.

CORRIVAL, *v. n. n. s. & adj.* } Lat. *rivalis*
CORRIVALRY, *n. s.* } To vie with;
CORRIVALSHIP, *n. s.* } to emulate; to contend with for any thing. A corvial is a competitor; corvial is contending with.

They had governours commonly out of the two families of the Geraldines and Butlers, both adversaries and *corvials* one against the other.

Spenser on Ireland.

He, that doth redeem her thence, might wear
 Without *corvial* all her dignities.

Shakspeare. Henry IV.

But with the sunne *corvialing* in light.

Fitzgeffry.

CORRIVATE, *v. a.* } Lat. *corrivate*. To
CORRVATION, *n. s.* } draw into one stream.
 The running of waters together into one stream.

Rare devices to *corrivate* waters. *Burton.*

Corrvations of waters to moisten and refresh barren grounds. *Id.*

CORROBORATE, *v. a. & adj.* } Fr. *corro-*
CORROBORANT, *adj.* } *borer*; Ital.
CORROBORATION, *n. s.* } *corroborare*;
CORROBORATIVE, *n. s. & adj.* } Span. *corro-*
borar; Lat. *corroborare*, from *con* and *robur*.
 To confirm; to give support to; to establish; to give strength. A corroborative, or corroborant, is that which increases strength. Corroborative testimony is that which confirms or strengthens other testimony. Corroboration is the act of strengthening or confirming; additional confirmation; additional strength.

To fortify imagination there be three ways; the authority whence the belief is derived, means to quicken and *corroborate* the imagination, and means to repeat it and refresh it. *Bacon.*

Machiavel well noteth, though in an ill-favoured instance, there is no trusting to the force of nature, nor to the bravery of words, except it be *corroborate* by custom. *Id.*

The lady herself procured a bull, for the better *corroboration* of the marriage. *Id.*

There be divers sorts of bracelets fit to comfort the spirits; and they be of three intentions, refrigerant, *corroborant*, and aperient. *Id.*

In the cure of an ulcer, with a moist intemperies, as the heart is weakened by too much humidity, you are to mix *corroboratives* of an astringent faculty; and the ulcer also requireth to be dried. *Wiseman's Surgery.*

It was said that the prince himself had, by the sight of foreign courts, and observations on the different natures of people, and rules of government, much excited and awaked his spirits, and *corroborated* his judgment. *Wotton.*

As any limb well and duly exercised grows stronger, the nerves of the body are *corroborated* thereby. *Watts.*

CORRO'DE, *v. a.*

CORRO'DIATE, *v. a.*

CORRO'DENT, *n. s.*

CORRODIB'ILITY, *adv.*

CORRO'DIBLE, *adj.*

CORRO'SIBLE, *adj.*

CORRO'SIBILITY, *n. s.*

CORRO'SIBLENESS, *n. s.*

CORRO'SION, *n. s.*

CORRO'SIVE, *v. a., n. s. & adj.*

CORRO'SIVELY, *adv.*

CORRO'SIVENESS, *n. s.*

gradually. Corrodiate is obsolete, as is also corrosive, used as a verb. Corrosive, as a noun, denotes that which has the quality of wasting any thing away, or of fretting or giving pain. As an adjective, its meanings are obvious. The kindred words are all closely allied in sense to the root whence they spring.

He meant his *corrosives* to apply,

And with strict diet tame his stubborn malady.

Faerie Queene.

If the maintenance of ceremonies be a *corrosive* to such as oppugn them, undoubtedly to such as maintain them it can be no great pleasure, when they behold that which they reverence is oppugned. *Hooker.*

Such speeches savour not of God in him that useth them, and unto virtuously disposed minds they are grievous *corrosives*. *Id.*

Care is no cure, but rather *corrosive*.

For things that are not to be remedied.

Shakspeare. Henry VI.

Away! though parting be a fretful *corrosive*,

It is applied to a deathful wound. *Id.*

A kind of poison worketh either by *corrosion*, or by a secret malignity and enmity to nature.

Bacon's Natural History.

Statesmen purge vice with vice, and may *corrode*

The bad with bad, a spider with a toad;

For so ill thralls not them, but they tame ill,

And make her do much good against her will.

Donne.

We do infuse, to what he meant for meat,

Corrosiveness, or intense cold or heat. *Id.*

Metals, although *corrodible* by waters, yet will not suffer a liqutation from the powerfulest heat communicable unto that aliment. *Browne's Vulgar Errors.*

The nature of mankind, left to itself, would soon have fallen into dissolution, without the incessant and *corroding* invasions of so long a time.

Hale's Origin of Mankind.

Gold, after it has been divided by *corrosive* liquors into invisible parts, yet may presently be precipitated, so as to appear again in its own form.

Grew's Cosmologia.

Fishes, which neither chew their meat, nor grind it in their stomachs, do by a dissolvent liquor there provided, *corrode* and reduce it into a chylus.

Ray on the Creation.

We know that aqua-fortis *corroding* copper, which is it that gives the colour to verdigrease, is wont to reduce it to a green-blue solution. *Boyle.*

At first it tasted somewhat *corrosively*.

Id.

Saltpetre betrays upon the tongue no heat nor *corrosiveness* at all, but coldness, mixt with a somewhat languid relish retaining to bitterness. *Id.*

Hannibal the Pyreneans past,

And steepy Alps, the mounds that nature cast;

And with *corroding* juices, as he went,

A passage through the living rock he rent.

Dryden's Juvenal.

That *corrosion* and dissolution of bodies, even the most solid and durable, which is vulgarly ascribed to the air, is caused merely by the action of water upon them; the air being so far from injuring and preying upon the bodies it environs, that it contributes to their security and preservation. *Woodward.*

The blood turning acrimonious, *corrodes* the vessels, producing almost all the diseases of the inflammatory kind. *Arbuthnot.*

Should jealousy its venom once diffuse,
Corroding every thought, and blasting all
Love's paradise. *Thomson's Spring.*

The sacred sons of vengeance, on whose course
Corrosive famine waits, and kills the year. *Id.*

The anodyne draught of oblivion, thus drugged, is well calculated to preserve a galling wakefulness, and to feed the living ulcer of a *corroding* memory. *Burke.*

The life-blood streaming through my heart,
Or my more dear immortal part,
Is not more fondly dear!
When heart-*corroding* care and grief
Deprive my soul of rest,
Her dear idea brings relief
And solace to my breast. *Burns.*

Like them, abandoned to ambition's sway,
I sought for glory in the paths of guile;
And fawned and smiled, and to plunder and betray,
Myself betrayed and plundered all the while:
So gnawed the viper the *corroding* file. *Beattie.*

The cankered spoil *corrodes* the pining state,
Starved by that indolence their mines create. *Cowper.*

A fretful temper will divide
The closest knot that may be tied,
By ceaseless sharp *corrosion*;
A temper passionate and fierce,
May suddenly your joys disperse
At one immense explosion. *Id.*

And dost thou ask, what secret woe
I bear, *corroding* joy and youth?
And wilt thou plainly seek to know
A pang, even thou must fail to soothe? *Byron.*

CORROSIVE MURIATE, or CORROSIVE SUBLIMATE. See HYDRARGYRUS MURIATUS.

CORROSIVES, in surgery, are chiefly burnt alum, red and white precipitates of mercury, white vitriol, butter of antimony, lapis infernalis, &c. See ESCHAROTICS.

CORRODY, *n. s.* from Lat. *corrodo*. A defalcation from an allowance or salary, for some other than the original purpose.

Besides these floating burgresses of the ocean, there are certain flying citizens of the air, which prescribe for a *corrody* therein. *Carew.*

In those days ev. n noble persons, and other meaner men, ordered *corrodies* and pensions to their chaplains and servants out of churches. *Ayliffe's Parergon.*

CORRUGATE, *v. a. & adj.* } Fr. *corruga-*
CORRUGATION, *n. s.* } *tion*; Lat. *cor-*
CORRUGANT, *adj.* } *rugare*, from
con and *rugare*. To draw up into wrinkles or furrows; to contract; contraction into wrinkles; having the power of causing to wrinkle.

The cramp cometh of contraction of sinews: it cometh either by cold or dryness; for cold and dryness do both of them contract and *corrugate*.

Bacon's Natural History.

The pain of the solid parts is the *corrugation* or violent agitation of the fibres, when the spirits are irritated by sharp humours. *Floyer on the Humours.*

Extended views a narrow mind extend;
Push out its *corrugate*, expansive make. *Young.*

CORRUPT, *v. a. & adj.* } Fr. *corrom-*
CORRUPTER, *n. s.* } *pre*; Ital. *cor-*
CORRUPTIVE, *adj.* } *rompere*; Sp. *cor-*
CORRUPTIBILITY, *n. s.* } *rompir*; Lat. *cor-*
CORRUPTIBLE, *n. s. & adj.* } *tin*, *corrumpere*,
CORRUPTIBLY, *adv.* } from *con* and
CORRUPTIBLENESS, *n. s.* } *rumpere*. To
CORRUPTING, *n. s.* } mar; to de-
CORRUPTION, *n. s.* } bauch; to de-
CORRUPTIVE, *adj.* } file; to per-
CORRUPTLESS, *adj.* } vert; to de-
CORRUPTLY, *adv.* } prave; to taint;
CORRUPTNESS, *n. s.* } to become pu-
trid; to bribe. These are the meanings of the verb, and they run through all the kindred words. For the legal sense attached to corruption, see CORRUPTION *or* BLOOD.

We have dealt very *corruptibly* against thee, and have not kept the commandments. *Nehemiah i. 7.*

I fear lest by any means, as the serpent beguiled Eve through his subtilty, so your minds should be *corrupted* from the simplicity that is in Christ.

2 Corinthians xi. 3.

Evil communications *corrupt* good manners.

1 Corinthians xv. 33.

So when this *corruptible* shall have put on incorruption, and this mortal shall have put on immortality, &c. *Id. v. 54.*

Let no *corrupt* communication proceed out of your mouth, but that which is good to the use of edifying. *Ephesians iv. 29.*

What they know naturally, as brute beasts, in those things they *corrupt* themselves. *Jude 10.*

The clotered blood for any leche-craft,
Corrupt and is in his touke ylf.

Chaucer. Cant. Tales.

For Nature hath not taken his beginning
Of no partie ne cantel of a thing,
But of a thing that purif is and stable,
Descending so till it be *corruptable*. *Id.*

A maner Latin *corrupt* was hire speche,
But algate therby was she understand. *Id.*

Corrupt was all this world for glotonie. *Id.*

Her breath *corrupt*, her keepers every one
Abhorring her, her sickness past recure. *Sackville.*

After that they againe returned beene,
That in that garden planted be agayne,
And grow afresh, as they had never seen
Fleshy *corruption*, nor mortal payne.

Spenser. Faerie Queene.

Superfluous flesh did rot,
Amendment ready still at hand did wait,
To pluck it out with pincers fiery hot,
That soon in him was left no *corrupt* jot. *Id.*

Throw thyself down, with trembling innocence,
Nor dare look up with *corruptible* eye
On the dread face of that great Deity.

Spenser. Hymn of Heavenly Beauty.

Our *corruptible* bodies could never live the life they snall live, were it not that they are joined with his body which is incorruptible, and that his is in ours as a cause of immortality. *Hooker.*

Corrupt, corrupt, and tainted in desire. *Shakspeare.*

But stay, I smell a man of middle earth ;
With trial fire touch me his finger-end ;
If he be chaste, the flame will back descend,
And turn him to no pain ; but if he start,
It is the flesh of a *corrupted* heart.

Id. Merry Wives of Windsor.

After my death I wish no other herald,
No other speaker of my living actions,
To keep mine honour from *corruption*,
But such an honest chronicler as Griffith.

Id. Henry VIII.

These kind of knaves I know, which in this plain-
ness

Harbour more craft, and more *corrupter* ends,
Than twenty silky ducking observants. *Id. King Lear.*

It is too late ; the life of all his blood
Is touched *corruptibly*. *Id.*

Peace, thou rude bawd !

Thou studied old *corruptress*, tye thy tongue up.
Beaumont and Fletcher.

From the vanity of the Greeks, the *corrupters* of all
truth, who without all ground of certainty vaunt their
antiquity, came the error first of all.

Raleigh's History of the World.

The region hath by conquest, and *corruption* of
other languages, received new and differing names. *Id.*

The aptness or propension of air or water to *corrupt*
or putrefy, no doubt, is to be found before it break
forth into manifest effects of diseases, blasting, or the
like. *Bacon.*

We have *corruption* contracted most names, both of
men and places. *Candem's Remains.*

But though *corruption* cannot touch the mind,
By any cause that from itself may spring,

Some outward cause fate has perhaps designed,
Which to the soul may utter quenching bring.

Darwin.

It is a devouring *corruption* of the essential mix-
ture, which, consisting chiefly of an oily moisture, is
corruptible through dissipation.

Harvey on Consumptions

Language being the conduit whereby men convey
their knowledge, he that makes an ill use of it, though
he does not *corrupt* the fountains of knowledge, which
are in things, yet he stops the pipes. *Locke.*

Be the cause what it will, our Saviour found man-
kind under a *corruption* of manners and principle,
which ages after ages had prevailed, and must be
confessed was not in a way or tendency to be mended.
Id.

It should be endued with an acid ferment, or some
corruptive quality, for so speedy a dissolution of the
meat and preparation of the chyle.

Ray on the Creation.

Some, who have been *corrupt* in their morals, have
yet been infinitely solicitous to have their children
piously brought up. *South's Sermons.*

All around

The borders with *corruptless* myrrh are crowned.

Dryden.

The several parts of which the world consists being
in their nature *corruptible*, it is more than probable,
that, in an infinite duration, this frame of things
would long since have been dissolved. *Tillotson.*

The wise contriver, on his end intent,
Careful this fatal error to prevent,
And keep the waters from *corruption* free,
Mixed them with salt, and seasoned all the sea.

Blackmore.

Those great *corrupters* of Christianity, and indeed
of natural religion, the Jesuits. *Addison.*

Precepts of morality, besides the natural *corruption*
of our tempers, which makes us averse to them, are so
abstracted from ideas of sense, that they seldom get
an opportunity for descriptions and images.

Addison on the Georgicks.

Hear the black trumpet through the world pro-
claim,
That not to be *corrupted* is the shame. *Pope.*

Amidst *corruption*, luxury, and rage,
Still leave some ancient virtues to our age. *Id.*

As Rochefoucault his maxims drew
From nature, I believe them true ;
They argue no *corrupted* mind
In him ; the fault is in mankind. *Swift.*

The *corruptions* of the country are closely allied to
those of the town, with no further difference than
what is made by another turn of thought and method
of living. *Burke.*

No revenue, no, not a royal revenue, can exist
under the accumulated charge of ancient establish-
ment, modern luxury, and parliamentary political
corruption. *Id.*

These charms shall work thy soul's eternal health,
And love, and gentleness, and joy, impart.
But these thou must renounce, if lust of wealth
E'er win its way to thy *corrupted* heart. *Beattie.*

Thou polished and high finished foe to truth,
Gray beard *corrupter* of our listening youth,
To purge and skim away the filth of vice,
That so refined it might the more entice,
Then pour it on the morals of thy son ;
To taint his heart, was worthy of thine own ! *Cowper.*

Would it not be right, then, to pull down this fabric
of *corruption*, to recall the government to its original
principles, and to re-establish the constitution upon
its true basis ? *Sheridan.*

CORRUPTION. See PUTREFACTION.

CORRUPTION OF BLOOD, in law. This is one of
those notions which our laws have adopted from
the feudal constitutions at the time of the Nor-
man conquest. It was unknown in those tenures
which are indisputably Saxon, or Gavel-kind,
wherein, though by treason, according to the an-
cient Saxon laws, the land is forfeited to the king,
yet no corruption of blood, no impediment of de-
scents, ensues ; and on judgment of mere felony,
no escheat accrues to the lord. But, by the law
of England, derived as above, a man's blood is
so universally corrupted by attainder, that his
sons can neither inherit to him nor to any other
ancestor, at least on the part of their attainted
father. See **ATTAINDER**. This corruption of
blood cannot be absolutely removed but by au-
thority of parliament. The king may excuse the
public punishment of an offender ; but cannot
abolish the private right which has accrued, or
may accrue, to individuals as a consequence of
the criminal's attainder. He may remit a for-
feiture in which the interest of the crown is alone
concerned ; but he cannot wipe away the corrup-
tion of blood ; for therein a third person hath an
interest, the lord who claims by escheat. If,
therefore, a man has a son, and is attainted, and
afterwards pardoned by the king ; this son cannot
inherit to his father, or father's ancestors ; be-
cause his paternal blood, being once corrupted
by his father's attainder, must continue so ; but if
the son has been born after the pardon, he may
inherit ; because, by the pardon, the father is
made a new man, and may convey new inherit.

ble blood to his after-born children. This corruption of blood has been long considered as a peculiar hardship; because the oppressive parts of the feudal tenures being now in general abolished, it seems unreasonable to reserve one of their most inequitable consequences. And therefore in most, if not all, of the new felonies treated by parliament since the reign of Henry VIII. it is declared that they shall not extend to any corruption of blood; and by the statute 7 Anne, cap. 21, the operation of which is postponed by the statute 17 Geo. II cap. 39, it is enacted, that after the death of the late Pretender and his sons, no attainder for treason shall extend to the disinheriting any heir, nor the prejudice of any person, other than the offender himself.

CORRUPTICOLE, a sect who rose out of the Monophysites in Egypt, about A. D. 519, under their chief Severus, the pretended patriarch of Alexandria. Their distinguishing doctrine was, that the body of Jesus Christ was corruptible; and that to deny it was to deny the truth of our Saviour's passion. On the other hand, Julian of Ilicarnassus, another Eutychian, a refugee as well as Severus, in Alexandria, maintained that the body of Jesus Christ had been always incorruptible; that to say it was corruptible was to make a distinction between Jesus Christ and the Word, and by consequence to make two natures in Jesus Christ. The people of Alexandria were divided between the two opinions; the partisans of Severus were called *Corrupticole*, q. d. worshippers of something corruptible; and sometimes *Corruptibles*; and the adherents of Julian *Incorruptibles*, or *Phantasiaste*. The clergy and secular powers favored the first; the monks and the people the latter.

CORSAIR, *n. s.* A pirate, or sea-robber; the vessel of a pirate.

He left a *corsair's* name to other times,
Linked with one virtue, and a thousand crimes.

Byron.

CORSAIR. The name is commonly given to the piratical cruisers of Barbary, who had their rise about the beginning of the sixteenth century. A corsair is distinguished from a privateer in this, that the latter has a commission, and only attacks the vessels of those at war with the state whence his commission is derived. The punishment of a corsair is to be hanged, without remission; whereas privateers are to be treated as prisoners of war. All corsair vessels are good prizes.

CORSELET, *v. a. & n. s.* Fr. *corselet*. A light armor for the forepart of the body. To encircle as a corselet does.

Some shirts of maille, some coats of plate put on,
Some doned a cuirace, some a *corselet* bright. *Fairfax.*

Her arms,

Able to knock Jove from a synod, shall

By warranting moonlight *corselet* thee.

Beaumont and Fletcher.

They lash, they foin, they pass, they strive to bore
Their *corselets*, and their thinnest parts explore.

Dryden.

But heroes, who o'ercome or die,

Have their hearts hung extremely high;

The strings of which, in battle's heat,

Against their very *corselets* beat.

Prior.

CORSELETS were light breast-plates made to cover the whole body, anciently worn by the pike-men, who were usually placed in the front and flanks of the battle. *Corselet* also denotes a little cuirass.

CORSE PRESENT, *n. s.* A funeral present; a mortuary.

CORSÉT, *n. s.* French. A pair of boddice for a female.

CORSHAM, or **COSHAM**, a market town of England, in Wiltshire, where king Ethelred had anciently a palace, which the earls of Cornwall afterwards made their chief residence. It is now considerable for its woollen manufacture; and has a weekly market on Wednesday. The town is well built, and consists chiefly of a single street, in which stands a handsome market-house. The church is a fine ancient building. It is five miles south-west of Chippenham, and ninety-six west of London.

CORSICA, one of the largest islands in the Mediterranean, is situate between the territory of Genoa and the island of Sardinia, or between 41° and 42° of N. lat. and 8° and 10° of E. long. Its length is about 110 miles; its breadth very unequal; being in some places only a few French leagues. On account of the numerous gulfs and creeks which indent the coasts of this island, it is extremely difficult to ascertain its precise extent; it cannot, however, be less than 120 leagues round, and its superficies may be computed to contain 527 square leagues.

Corsica abounds in mountains; a vast range of which, in the shape of a cross, completely traverses the island, the summits of many of them glittering with perpetual snow. The two most celebrated for their height are Monte Rotondo (the Mons Aureus of the ancients), and Monte d' Oro, the former 9900 feet above the level of the sea, and the other 8720 feet. Fertile valleys extend on all sides of these mountains, reaching even to the coasts. The principal lakes are the Ino and the Creno, both situated in the interior of the island. The chief river is the Golo, which takes its rise from the lake Ino, and has a course of upwards of seventy miles. The Tarnigano is also a considerable river, rising from the Lake Creno, and extending through the most uncultivated tract of the island. The Restonica may be mentioned, not so much on account of its size, as for the singular property it possesses of whitening every thing over which its waters flow. Besides these, there are many more of minor importance, which at once enrich and beautify the island.

The climate of Corsica is on the whole salubrious, instances of longevity being by no means infrequent. The cold proceeding from the mountains is tempered by the sea-breezes, whilst, on the other hand, the piercing winds which blow over them considerably moderate the intensity of the summer's heat. The winters have been thought severe, and are not unfrequently accompanied by tremendous storms, yet, excepting in the neighbourhood of the stagnant pools, the air is for the most part clear and serene. The soil produces wheat, rye, barley, and millet, excellent wine, oranges, lemons, figs, and a variety of other fruits; but the chief wealth of the island consists

in its oil, chestnuts, and timber. The forests are particularly valuable, and very extensive. At the time this island came into the possession of the French, in the year 1768, it was ascertained that 160 square leagues of its surface were covered with forests. The most considerable at present is that of *Vico*. Among the resinous trees found in the Corsican forests, the pine and larch stand pre-eminent, both as respects the beauty of their form and foliage, and the excellence of their timber. Its agriculture is in a very rude state. The Corsican sheep are in general black or tawny; the mutton, however, is exceedingly delicate, and yields a very rich juice. The horned cattle are of a very inferior quality, and give but very little milk. Oil, as in Italy and all hot countries, supplies the place of butter. The *muffoli*, a kind of wild ram, covered with hair instead of wool, is an inhabitant of the loftier mountains; it is scarcely possible to approach it in a wild state, but, being taken young, it is easily tamed. Vast numbers of goats, deer, and wild boars, are also found in this island. Hunting the wild boar is one of the most favorite sports of the inhabitants; to pursue which they breed a peculiar race of dogs, between the mastiff and the shepherd's dog. Bees abound here, but the honey is somewhat bitter, owing, it is supposed, to the free access which the bees have to the box-wood and yew. Foxes, of a very large size, and extremely ravenous disposition, are also abundant on this island; but there are no wolves, and but very few venomous animals. The fisheries on the coast are very productive.

Among the mineral productions of Corsica may be mentioned silver, copper, lead, iron, antimony, granite, alum, porphyry, and jasper; serpentine stone, talc, saltpetre, rock-crystals, and asbestos. The silver mines are also rich, and the iron is said to equal the prepared ores of Spain in durability. The manufactures are coarse linen and woollen cloths and stuffs (goods of a finer description being imported), leather, lamp oil, wax and tallow candles, guns, and pistols.

The trade of this island is very inconsiderable, although it enjoys great commercial capabilities, both as it respects its natural productions and situation. The coast affords excellent anchorage to shipping; and there are numerous ports, into which the largest vessels can enter, and remain perfectly secure from storms. Its population amounted in 1740 to only 120,389, and in 1815 to 174,702. The intestine wars which have harassed this island for ages, will serve to account for its paucity of inhabitants. Pliny mentions no less than thirty-three large towns of Corsica; at present they are reduced to nine. By an enumeration which took place in the year 1740, this island was found to contain 133 parishes, 427 villages, and 26,854 hearths.

The literature of Corsica is at a very low ebb; since the island came last into the possession of the French, however, the education of their youth has been conducted on a much more liberal principle. In religion the Corsicans are Roman Catholics, and profess great zeal. There are five bishops in the island, who are suffragans of the archbishop of Pisa; about sixty-five convents of mendicant friars, who depend entirely on the

charity of the people for their support; two colleges of Jesuits; two convents of Dominicans; five of Servites; and one of missionaries; all of which have good possessions. There are no nunneries in the island.

Strabo describes the ancient Corsicans as brutal, ferocious, and stupid, but at the time he wrote, they were under the yoke of a tyrant. Pliny speaks of them whilst they enjoyed the protection of a more equitable master, as just, generous, valiant, and humane. In modern times the Genoese have painted them in the blackest colors, but they were at the very time ruling them with a rod of iron. Frederick the Great and Rousseau have praised them for their love of liberty and courage. Corsica has been successively conquered by the Carthaginians, the Romans, the Vandals, the Goths, the Lombards, the Saracens, the Franks, the Pisans, and the Genoese. Till the year 1736 it had groaned under an accumulating weight of misery: the imposition of another tax at this period, however, at once aroused their dormant courage, and the intrepid Stephen Theodore, baron de Neuhoff, arriving on the island at this juncture, they chose him for their leader, and proclaimed him king of Corsica and Capraia. He devoted himself with assiduity to their service, and procured supplies of money, arms, and provisions; and attacked, with great intrepidity, the fortresses held by the Genoese. In the moment of enthusiasm, he succeeded in expelling the enemy from the island. But his triumph was of short duration; for the Genoese, having secured the assistance of France, again compelled the Corsicans to submit to their yoke; the baron was taken and thrown into prison, where he died, in extreme indigence, in 1755.

In 1753 the Corsicans had chosen the celebrated Pascal Paoli for their general. He enrolled all the inhabitants capable of bearing arms, disciplined his troops, caused money to be coined, and made his administration at once feared and respected. He waged a successful war with the Genoese, for the space of four years. They on their side, having become tired of the protracted contest, sold, in 1768, the sovereignty of the island to France. Hereupon the French invaded Corsica, with an army of 5000 men, under the command of the marquis de Chauvelin, supported by a naval force consisting of two ships of the line, two frigates, and six armed brigantines. Paoli defended his country to the last, but on the French receiving a reinforcement, under the command of the count de Vaux in 1769, he was obliged to seek an asylum in England. Paoli returned to Corsica in 1792, after having taken the oath of fidelity to the national assembly of France. He was elected mayor of Bastia, commander in chief of the national guard, and president of the department; but the execution of Louis XVI. at Paris, holding out every prospect of a civil war in France, Paoli embraced this opportunity to revolt, and called in the aid of England. After a violent struggle, the towers of Marsella, Fomelli, and San Fiorenzo were taken by the British troops, commanded by lieutenant-general Dundas, and shortly afterwards Corsica was declared united with Great Britain. On the 19th of

June, 1794, Sir Gilbert Elliot, the present lord Minto, was invested with the dignity of viceroy. Corsica did not, however, remain an appendage to the British crown for a long time; mutual jealousies arose between the English viceroy and Paoli, and the latter embarked for England, but not till he had exhorted his countrymen to maintain their allegiance to Great Britain. The dazzling splendor of the victories of their countryman, Buonaparte, made them forget the exhortations of Paoli, however, and they once more returned to their allegiance to France. The English troops finally evacuated the island in 1796. Corsica is at present a department of the French empire: the revenue drawn from it, however, barely equals the expenses of its administration.

CORSNED, or morsel of excretion, a species of trial, or purgation, anciently in use. It consisted of a piece of cheese or bread, about an ounce in weight, which was consecrated with a form of exorcism; desiring of the Almighty that it might cause convulsions and paleness, and find no passage if the man was really guilty, but might turn to health and nourishment if he was innocent; as the water of jealousy among the Jews was, by God's especial appointment, to cause the belly to swell, and the thigh to rot, if the woman was guilty of adultery. This corned was given to the suspected person, who, at the same time, received the sacrament. Historians assure us, that Godwin, earl of Kent, in the reign of king Edward the Confessor, abjuring the death of the king's brother, at last appealed to his corned, which stuck in his throat and killed him. This custom has been long abolished, but the remembrance of it still subsists in certain phrases of abjuration; as, 'I will take the sacrament upon it;' 'May this morsel be my last,' &c.

CORSOER, a town of Denmark, on the west coast of Zealand, in a small peninsula, which extends into the Great Belt, that separates Zealand from Funen. It has a good harbour fit for light vessels, and is defended by a fort. It lies fifty-two miles south-west of Copenhagen.

CORT (Cornelius), a celebrated engraver, born at Iloorn, in Holland, in 1536. He went to Italy to complete his studies, and at Venice was courteously received by Titian, and engraved several plates from his pictures. He at last settled at Rome, where he died in 1578, aged forty-two. Bafan says, he was 'the best engraver with the burin, or graver only, that Holland ever produced.' Augustine Caracci was his scholar, and imitated his style. His engravings are very numerous; 151 according to Abbe Marolles.

CORTEMIGLIA, a town of Italy, in Piedmont, and late duchy of Montserrat, seated on the Bormida. Part of the town is defended with a wall and ancient towers: the other part, which is built at the foot of a hill, is surrounded by the river. It had anciently a beautiful castle, now fallen to decay. It is four miles north of Gorzegno, and sixteen east of Cherasco.

CORTES (Ferdinand), a Spanish general, born in Estramadura in 1485. He was bred at Salamanca to the law, which he, however, left for a military life, and in 1504 went to St. Domingo.

In 1511 he accompanied Velasquez to Cuba, and was chosen to conduct the troops sent for the conquest of Mexico. He first landed at Tabasco: soon after which, he destroyed his vessels, that his soldiers might have no retreat. After reducing the province of Tlascalala, Cortes marched directly to Mexico, which he conquered, and made the emperor Montezuma prisoner. In the mean time, Velasquez, being jealous of his success, sent a fleet against him, but without any effect; and Cortes completed the reduction of the Mexican empire in 1531, though not without committing the most horrible cruelties on the vanquished, without regard to rank, age, or sex. It probably was on this account he was coolly received on his return to Europe by Charles V. It is even said, that the emperor asked him who he was, to which Cortes replied, 'I am the man who has given you more provinces than your ancestors left you towns.' He died in 1554, aged sixty-three.

CORTÈX, *n. s.* } Lat. *cortex*. The rind
CORTICAL, *adj.* } or bark of planks; a
CORTICATED, *adj.* } cover. Barky; belong-
CORTICOSE, *adj.* } ing to the rind. Resembling the rind of a tree. Full of bark.

This animal is a kind of lizard, a quadruped *corticated* and depilous; that is, without wood, fur, or hair.

Brown.

Their last extremities form a little gland (all these little glands together make the *cortical* part of the brain), terminating in two little vessels.

Cheyne's Philosophical Principles.

CORTLANDT, a township of New York, in the northern part of the county of West Chester, on the east bank of Hudson river.

CORTON, an ancient town of Italy, in Etruria, mentioned by the Roman historians, seated north of the lake Thrasymenus; now called Cortona.

CORTONA, a town of Italy, in Tuscany, with a bishop's see and a celebrated academy. It contains seven churches, built with taste, and adorned with beautiful paintings; and several convents. It is thirty miles south-east of Sienna.

CORTUSA, bear's ear sanicle, a genus of the monogynia order, and pentandria class of plants, natural order twenty-first, præciæ: cor. wheel-shaped, with its throat like an elevated ring: cap. unilocular, oval, quinquevalved at the top. There are two species, both very low, flowery, herbaceous perennials, crowned by umbels of monopetalous wheel-shaped flowers, of a fine red color. Being natives of mountainous rocky parts abroad, they must have a dry lean soil; or they may be kept in pots of dry sandy earth in the shade, and in summer duly watered. Their propagation here is by slipping the roots in October.

CORVEE, from *cura viæ*, Lat. i. e. care of the road; in the ci-devant French customs, a kind of duty similar to that of our statute labor, but much more oppressive. Individuals were called upon to furnish both labor and materials for the construction and reparation of the roads; and, upon this iniquitous system, all the roads in France were made and repaired, as there were no turnpikes. It was abolished in 1774 by the celebrated M. Turgot.

CORVETTE, *n. s.* French. A vessel of war, having fewer than twenty guns.

CORVETTO, *n. s.* The curvet.

You must draw the horse in his career with his manage, and turn, doing the *corvette* and leaping.

Peacham on Drawing.

CORVEY, a small principality of Germany, in the circle of Westphalia, twelve miles long, and twelve broad, with a town so named, and a celebrated abbey, founded A. D. 822. In the treaty of indemnification to those princes who had suffered by the cessions to France at the treaty of Luneville, this principality was transferred to Nassau Dillenburg. It lies on the west bank of the Weser, twenty-four miles east of Paderborn.

CORUNNA, a sea-port town of Spain, in the province of Galicia, of which it is called the capital, from being the seat of a royal residence, of a governor-general, and the intendant of the province. It is divided into the upper and lower towns. The former is seated on the side of a hill, surrounded with walls, and defended by a castle; the latter, called also the *Paxeria*, is situated at the bottom of a hill, on a tongue of land, washed on three sides by the Atlantic Ocean. The town is of a circular form, fortified in the ancient manner, and contains one collegiate, and four parish-churches, and four convents. The harbour is large and safe, and defended by two castles. The objects of interest are the royal arsenal, and an ancient tower, admired for its elevation and solidity. The population is about 4000, exclusive of the military. The harbour is spacious and secure, and provided with a handsome quay. On a high mountain, about three miles from it, is a lighthouse, which is discerned at sea for twenty leagues round Corunna. It is on the whole a commercial place; its principal articles of export being pilchards and cattle. A packet sails hence every month for the Havannah, touching at Porto Rico; another was usually despatched every two months to Buenos Ayres, Chili, Peru, and the Philippine Isles. The intercourse likewise between Spain and England, is chiefly kept up by packets from Corunna to Falmouth.

We must indulge ourselves by transferring to our pages, with some slight alteration, Dr. Southey's spirited narrative of the celebrated modern battle which takes its name from this town:—

A British division, under general Hope, occupied a hill on the left, commanding the road to Betanzos; the height decreased gradually to the village of Elvina, taking a curved direction. At this village general Baird's division commenced, and bent to the right; the whole formed nearly a semicircle. On the right of Sir David Baird, the rifle corps formed a chain across a valley, and communicated with general Fraser's division, which was drawn up about half a mile from Corunna, near the road to Vigo. The reserve, under general Paget, occupied a village on the Betanzos road, about half a mile in the rear of general Hope. Outside of these posts was a magazine of 4000 barrels of gunpowder. It was now necessary to blow it up: the explosion shook the town like an earthquake, and a village near was totally destroyed.

The French made their appearance on the morning of the 12th of January, 1809; but the British preparations for embarking were continued until the morning of the 16th, and the general gave notice that he intended, if the French did not move, to begin embarking the reserve at four in the afternoon.

This was about mid-day. He mounted his horse, and set off to visit the out-posts; before he had proceeded far, a messenger came to tell him that the enemy's line were getting under arms; and a deserter arriving at the same moment, confirmed the intelligence. He spurred forward. Their light troops were pouring rapidly down the hill on the right wing of the British, and the advanced picquets were already beginning to fire. Lord William Bentinck's brigade, consisting of the 4th, 42d, and 50th regiments, maintained this post. The guards were in their rear. General Paget was ordered to advance with the reserve, and support lord William. The enemy opened a cannonade from eleven heavy guns, advantageously planted on the hills. Two strong columns, one advancing from a wood, the other skirting its edge, directed their march towards the right wing. A third column approached the centre; a fourth advanced slowly upon the left; a fifth remained half way down the hill, in the same direction. Both in number and weight of guns they had a decided superiority; and they fired with great effect from their commanding situation. Sir David Baird had his arm shattered with a grape-shot as he was leading on his division. The two lines of infantry advanced against each other; they were separated by stone walls and hedges which intersected the ground; but as they closed, it was perceived that the French line extended beyond the right flank of the British, and a body of the enemy was observed moving up the valley to turn it. Marshal Soult's intention was to force the right of the British, and thus to interpose between Corunna and the army, and cut it off from the place of embarkation. Failing in this attempt, he was now endeavouring to outflank it. Half of the 4th regiment was, therefore, ordered to fall back, forming an obtuse angle with the other half. This manœuvre was excellently performed, and they commenced a heavy flanking fire: Sir John Moore called out to them, that this was exactly what he wanted to be done, and rode on to the 50th, commanded by majors Napier and Stanhope. They charged the enemy most gallantly, and drove them out of the village of Elvina. The general now proceeded to the 42d. 'Highlanders,' said he, 'remember Egypt!' They rushed on, and drove the French before them till they were stopped by a wall; Sir John accompanied them in this charge. He now sent captain Hardinge to order up a battalion of guards to the left flank of the 42d. The officer commanding the light infantry conceived, at this, that they were to be relieved by the guards, because their ammunition was nearly expended, and he began to fall back. The general, discovering the mistake, said to them, 'My brave 42d, join your comrades; ammunition is coming, and you have your bayonets!' Upon this, they

instantly moved forward. Captain Hardinge returned, and pointed out to the general where the guards were advancing. The enemy kept up a hot fire, and their artillery played incessantly on the spot where they were standing. A cannon-shot struck Sir John, and carried away his left shoulder, and part of the collar-bone, leaving the arm hanging by the flesh. He fell from his horse on his back, his countenance did not change, neither did he betray the least sensation of pain. Captain Hardinge, who dismounted, and took him by the hand, observed him anxiously watching the 42d, which was warmly engaged, and told him they were advancing; and upon that intelligence his countenance brightened. Colonel Graham, who now came up to assist him, seeing the composure of his features, began to hope that he was not wounded, till he perceived the dreadful laceration. From the size of the wound, it was in vain to make any attempt at stopping the blood; and Sir John consented to be removed in a blanket to the rear. In raising him up, his sword, hanging on the wounded side, touched his arm, and became entangled between his legs; captain Hardinge began to unbuckle it, but the general said, in his usual tone and manner, and in a distinct voice, 'It is as well as it is; I had rather it should go out of the field with me.' Six soldiers of the 42d and the guards bore him. Hardinge, observing his composure, began to hope that the wound might not be mortal, and said to him, he trusted he might be spared to the army, and recover. Moore turned his head, and looking steadfastly at the wound for a few seconds, replied, 'No, Hardinge, I feel that to be impossible.'

'As the soldiers were carrying him slowly along, he made them frequently turn round, that he might see the field of battle, and listen to the firing, and he was well pleased when the sound grew fainter. A spring-wagon came up, bearing colonel Wynch, who was wounded: the colonel asked who was in the blanket, and being told it was Sir John Moore, wished him to be placed in the wagon. Sir John asked one of the Highlanders whether he thought the wagon or the blanket was best? and the man said the blanket would not shake him so much, as he and the other soldiers would keep the step, and carry him easy. So they proceeded with him to his quarters at Corunna, weeping as they went.

'General Paget, meantime, hastened with the reserve to support the right wing. Colonel Beckwith dashed on with the rifle corps, repelled the enemy, and advanced so far as nearly to carry off one of their cannon; but a corps, greatly superior, moved up the valley, and forced him to retire. Paget, however, attacked this body of the enemy, repulsed it, and pressed on, dispersing every thing before him, till the enemy, perceiving their left wing was now quite exposed, drew it entirely back. The French then advanced upon generals Manningham and Leith, in the centre, and there they were more easily repelled, the ground being more elevated, and favorable for artillery. The position on the left was strong, and their effort there was unavailing; but a body of them took possession of

a village on the road to Betanzos, and continued to fire from it, till lieutenant-colonel Nicholls attacked it, and beat them out. Night was now closing in, and the French had fallen back in all parts of the field. The firing, however, was not discontinued till it was dark. Never was any battle gained under heavier disadvantages. The French force exceeded 20,000 men, the British were not 15,000. The superiority in artillery was equally great. The enemy had met English guns on the way, sent off, thus late, to the patriotic armies, and these they had turned back, and employed against the English. It is twenty-eight miles north of Compostella, and thirty north-west of Lugo.

CORVO, the smallest island of the Azores, being only twelve miles in circumference. It abounds in crows, whence the name.

CORUSCATE, *v. n.* } Lat. *coruscare*. To
CORUSCATION, *n. s.* } glitter; to dart forth
CORUSCANT, *adj.* } flashes or sparkles of light. A flash; a rapid darting forth, or vibration, of light. Glittering by flashes.

We see that lightnings and *coruscations*, which are near at hand, yield no sound. *Bacon's Natural Hist.*

We may learn that sulphureous steams abound in the bowels of the earth, and ferment with minerals, and sometimes take fire with a sudden *coruscation* and explosion. *Newton's Opticks.*

How heat and moisture mingle in a mass,
Or belch in thunder, or in lightning blaze;
Why nimble *coruscations* strike the eye,
And bold tornadoes bluster in the sky,

Garth's Dispeusatory.

As flaming fire was more *coruscating* and enlightening than any other matter, they invented lamps to hang in the sepulchres of the rich, which would burn perpetually. *Greenhill.*

The line of lights, too, up to Charing Cross,
Pall Mall, and so forth, have a *coruscation*
Like gold as in a comparison to dross,

Matched with the continent's illumination,
Whose cities Night by no means deigns to gloss.

Byron. Don Juan.

CORUSCATIONS, ARTIFICIAL. There is a method of producing artificial *coruscations* or sparkling fiery meteors, which will be visible not only in the dark but at noon-day, and that from two liquors actually cold. Fifteen grains of solid phosphorus are to be melted in about a drachm of water; when this is cold, pour upon it about two ounces of oil of vitriol; let these be shaken together, and they will at first heat, and afterwards they will throw up fiery balls in great numbers, which will adhere like so many stars to the sides of the glass, and continue burning for a considerable time; after this, if a small quantity of oil of turpentine is poured in, without shaking the phial, the mixture will of itself take fire, and burn very furiously. The vessel should be large, and open at the top. Artificial *coruscations* may also be produced by means of oil of vitriol and iron, in the following manner: take a glass body capable of holding three quarts; put into it three ounces of oil of vitriol and twelve ounces of water; then warming the mixture a little, throw in, at several times, two ounces, or more, of clean iron filings; upon this an ebullition and white vapors will arise; then present a lighted candle to the mouth of the

vessel, and the vapor will take fire, and will afford a bright fulmination or flash like lightning. Applying the candle in this manner several times, the effect will always be the same; and sometimes the fire will fill the whole body of the glass, and even circulate to the bottom of the liquor; at others, it will only reach a little way down its neck. The great caution to be used in making this experiment is in making the vapor of a proper heat; for, if too cold, few vapors will arise; and, if made too hot, they will arise too fast, and will only take fire in the neck of the glass, without any remarkable coruscation.

CORVUS, in antiquity, a military engine, or rather gallery, moveable at pleasure by means of pulleys; chiefly used by the Romans in boarding the enemy's ships to cover the men. The construction of the corvus was as follows: they erected, on the prow of their vessels, a round piece of timber, about a foot and a-half diameter, and about twelve feet long; on the top of which they had a block or pulley. Round this they laid a platform of boards, four feet broad, and about eighteen long, well framed and fastened with iron. The entrance was long-ways, and it was moved about on the upright piece of timber as on a spindle, and could be hoisted up within six feet of the top; around this was a sort of parapet, knee-high, defended with upright bars of iron, sharpened at the end; and, towards the top there was a ring, by the help of which, and a pulley or tackle, they raised or lowered the engine at pleasure. With this moveable gallery they boarded the enemy's vessels (when they did not oppose side to side), sometimes on their bow and sometimes on their stern. When they had grappled the enemy with these iron spikes, if they happened to swing broadside to broadside, then they entered from all parts; but, in case they attacked them on the bow, they entered two and two by the help of this machine, the foremost defending the fore parts, and those that followed, the flanks, keeping the boss of their bucklers level with the top of the parapet.

CORVUS, in ornithology, the raven or crow, a genus of birds of the order of *picæ*, the distinguishing characteristics of which are these: the beak is convex and cultrated; the nostrils are covered with bristly feathers; the tongue is forked and cartilaginous; and the feet are of the walking kind. There are above forty species. The following are the most remarkable.

1. *C. caryocatactes*, the nut-cracker, is somewhat less than the jack-daw; the bill is strong, straight, and black; the color of the whole head and neck, breast and body, of a rusty brown; the crown of the head and rump are plain; the other parts marked with triangular white spots; the wings black; the coverts spotted like the body; the tail rounded at the end, black tipped with white; the vent feathers are white; the legs dusky. These birds are scattered in many parts of Europe, but nowhere so numerous as in Germany. They are also found in North America, but not near the sea-coasts, and seldom visit England. In manners, this bird resembles the jay, laying up a store of acorns and nuts.

2. *C. corax*, the raven of English authors, weighs three pounds, and is about two feet two

inches in length; the color is black, finely glossed with a rich blue, the belly excepted, which is of a dusky color. They are very docile, and may be trained up to fowling like hawks; to fetch and carry like spaniels; to speak like parrots; and may even be taught to imitate, in a great degree, the human voice, in singing. They have a great propensity to pilfer, often hiding things of value. They frequent the neighbourhood of great towns, where they are useful in devouring the carcasses and filth which would otherwise prove a nuisance. They also destroy many living animals; such as rabbits, ducks, chickens, and even lambs, which have been dropped in a weak state. In clear weather they fly in pairs to a great height, making a deep loud noise, different from the common croaking. Their scent is remarkably good, and they are very long lived. They make their nests early in spring, laying five or six eggs, of a pale, bluish-green color, spotted with brown. With us they build in trees; but in Greenland and Iceland in the holes of rocks, composing their nests of roots, twigs, and bones, and lining them with hair, moss, &c. Their flesh is eaten in Greenland by the natives, who use the skins as a warm under-covering.

3. *C. cornix*, the hooded crow, pretty much resembles the rook, feeding on insects, and flying together in great flocks. In England it is a bird of passage, visiting it in the beginning of winter, and leaving it with the woodcocks. In the maritime parts they feed on crabs and shell-fish. They are very common in Scotland: in many parts of the Highlands, and in all the Hebrides, Orkneys, and Shetland, it is the only species of genuine crow, the carrion and rook being unknown there. They breed and continue in those parts the whole year.

4. *C. corone*, the carrion crow, agrees with the raven, in the form of its body, as well as in its food, whence it was formerly distinguished from the rook, which feeds entirely on grain and insects, by the name of the gor, or gor-crow. Virgil says, that its croaking forebodes rain. It was also thought a bird of bad omen. England breeds more of this species than any other country in Europe. In the 24th of Henry VIII. they were grown so numerous that they were considered as an evil worthy of parliamentary redress; an act was passed for their destruction, in which rooks and choughs were included. Every hamlet was to provide crow-nets for ten years; and all the inhabitants, at certain times, during that space, were obliged to assemble, to consult of the proper means for extirpating them. But, though the crow abounds thus in Britain, it is so rare in Sweden, that Linnæus speaks of it only as a bird that he once knew killed there. It lays the same number of eggs as the raven, and of the same color; immediately after deserting their young they go in pairs. Both these birds are often found white or pied; an accident that befalls black birds more frequently than any others. Pennant says, he has seen one entirely of a pale brown color, not only in its plumage, but even in its bill and feet. The crow weighs about twenty ounces. Its length is eighteen inches; its breadth two feet two inches.

These birds have an instinctive propensity to plant trees in autumn; great numbers of them being seen employed in digging holes in the earth, and then dropping in acorns and other seeds, and covering them with earth and moss.

6. *C. frugilegus*, the rook, is the *corvus* of Virgil; no other species of this genus being gregarious. It differs not greatly in its form from the carrion crow; the most remarkable variation is in the nostrils and root of the bill; which in the crow are well clothed with feathers, but in the rook are bare, or covered only with some bristly hairs. This arises from its thrusting the bill into the earth, after the worms and erucæ of insects, on which it feeds; for it does not live on carrion. It feeds on all sorts of grain, with some loss to the husbandman, but which is doubly repaid by the good done him in extirpating the maggots of the chafer beetle, which in some seasons destroy whole crops of corn. The rook is a gregarious bird, sometimes being seen in immense flocks, so as almost to darken the air. These flights they regularly perform morning and evening, except in breeding time, when the daily attendance of both male and female is required for the use of incubation, or feeding the young; for they do both by turns. As they form themselves into societies, such places as they frequent during the breeding time are called rookeries; and they generally choose a large clump of the tallest trees for this purpose. The eggs are like those of crows, but less, and the spots larger. They begin to build in March, and after the breeding season forsake their nest trees, to roost elsewhere, but return to them in August: in October they repair their nests. In Britain they remain the whole year: yet both in France and Silesia they are birds of passage. Linnaeus says they build in Sweden. The young birds are accounted good eating, especially if put in a pie.

7. *C. glandarius*, the jay, is one of the most beautiful of British birds. The weight is between six and seven ounces: the length thirteen inches. The forehead is white streaked with black; the head covered with long feathers, which it can erect at pleasure into the form of a crest; the whole neck, back, breast, belly, and covert feathers of the wing, are faint purple dashed with gray. The first quill-feather is black; the exterior webs of the nine next are ash-colored; the interior webs dusky; the six next are black, but the lower sides of their exterior webs are white tinged with blue; the two next wholly black; the last a fine bay color tipped with black. The lesser coverts are a light bay: the greater covert feathers most beautifully barred with a lively blue, black, and white: the rest are black: the rump is white. The tail consists of twelve black feathers. The feet are pale brown; the claws large and hooked. Jays build chiefly in woods, making their nest of sticks, fibres of roots, and tender twigs; and lay five or six eggs, of the size of a pigeon's, cinereous olive, marked with pale brown. The young keep with the old ones till the next pairing time in spring; when they choose each his mate to produce their future progeny. In general they feed on acorns, nuts, seeds, and fruits of all kinds; but sometimes destroy young chickens and eggs, and even take

away birds that have been caught in a trap, or entangled with birdlime. They are often kept in cages, and will talk pretty well; but lose all their beauty, so conspicuous in a wild state.

8. *C. graculus*, the red-legged crow, is but thinly scattered over the northern world; no mention is made of it by any of the Faunists: nor do we find it in any other part of Europe except Britain and the Alps. It is produced in the island of Candia, and visits Egypt towards the inundations of the Nile. It affects mountainous and rocky places; builds its nest in high cliffs or ruined towers; and lays four or five eggs, white spotted with a dirty yellow. It feeds on insects, and also on new-sown corn. It commonly flies high, makes a shriller noise than the jackdaw, and may be taught to speak. It is a very tender bird, and unable to bear very severe weather; is of an elegant slender make; active, restless, and thieving. There are instances of houses being set on fire, by its picking up lighted sticks; on which account Camden calls it *incendiaria avis*. It is found in Cornwall, Flintshire, Caernarvonshire, and Anglesey, in the rocky cliffs along the shores; in Scotland as far as Strathnaver, and in some of the Hebrides. Its color is black, beautifully glossed over with blue and purple: the legs and bill are a bright orange inclining to red: the tongue is almost as long as the bill, and a little cloven: the claws are large, hooked, and black.

9. *C. monedula*, the jackdaw, generally weighs about nine ounces; and is thirteen inches long, and twenty-eight broad.

10. *C. pica*, the magpie, in length about eighteen inches, and weighs eight or nine ounces: both too well known to need particular description.

CORYATE (Thomas), a person who made himself famous by his whimsical extravagancies, was the son of a clergyman, and born at Oldcombe in Somersetshire in 1577. He acquired Greek and Latin at Oxford; and, coming to London, was received into the household of Henry prince of Wales, where he became acquainted with the wits of that age. In 1608 he took a long journey on foot; and, on his return, published his travels under the following strange title: *Crudities Hastily Gobbled up in Five Months' Travels, in France, Savoy, Italy, Rhetia, Helvetia, some parts of High Germany, and the Netherlands, London, 1611, 4to.* He wrote several other works. In 1612 he set out again with a resolution to spend ten years in travelling: he went first to Constantinople; and after travelling over a great part of the East, died of a flux at Surat in the East Indies. Some of the accounts of his peregrinations are to be found in Purchas's *Pilgrimages*.

CORYBANTES, in antiquity, priests of Cybele, who danced and capered to the sound of flutes, drums, &c. Catullus, in his poem called *Atys*, gives a beautiful description of them representing them as madmen. Maximus Tyrius says, that those possessed with the spirit of the Corybantes, as soon as they heard the sound of a flute, were seized with an enthusiasm, and lost the use of their reason. And hence the Greeks used the word *κορυβαντεν*, to corybantise, to signify a person's being possessed with a devil. See ENTHUSIASM. Some say that the Cory

bantes were all eunuchs: and that hence Catullus, in his Atys, always uses feminine epithets in speaking of them. Diodorus Siculus says, that Corybas, son of Jason and Cybele, passing into Phrygia with his uncle Dardanus, there instituted the worship of the mother of the gods, and gave his own name to the priests.

CORYBANTICK, *adj.* From *corybantes*. Inflamed with a mad fury, like the priests of Cybele.

The divine zeal is no *corybantick* fury, but a calm and regular heat, guided and managed by light and prudence.

CORYCOMACHIA, among the ancients, was a sort of exercise in which they pushed forwards a ball, suspended from the ceiling, and at its return either caught it with their hands, or suffered it to meet their body.

CORYLUS, the hazel, a genus of the polyandria order, and monœcia class of plants; natural order fiftieth, amentaceæ. Male *CAL.* monophyllous, scale-like, trifid, and unitorous: *COR.* none: *STAM.* eight. Female *CAL.* diphyllous and lacerated: no *COR.* two styles; and an egg-shaped nut. Mr. Miller reckons three species, other botanists only two. They are all of the large shrub kind, hardy and deciduous; and have several varieties valuable for their nuts, as also for their variety in large wildernesses and shrubby works. They prosper in any soil or situation, and turn out to good account in coppices to cut as underwood, and as poles for various uses, as hoops, spars, hurdles, handles to husbandry implements, walking sticks, fishing rods, &c. for which purposes they may be cut every fifth, seventh, or eighth year. The best method of propagating them is by layers, though they may also be raised from the nuts.

CORYMBIUM, in antiquity, an ornament of hair worn by the women.

CORYMBIUM, in botany, a genus of the monogamia order, and syngenesia class of plants; natural order forty-ninth, compositæ: *CAL.* diphyllous, uniflorous, and prismatical: *COR.* monopetalous and regular: there is one woolly seed below each floret. Species, four; natives of Africa.

CORYMBUS, *n. s.* } Lat. 'Amongst tho
CORYMBIATED, *adj.* } ancient botanists,'
CORYMBIFEROUS, *adj.* } says Quincy, 'co-
 rymbus was used to express the bunches or clusters of berries of ivy; amongst modern botanists it is used for a compounded discous flower, whose seeds are not pappous, or do not fly away in down; such are the flowers of daisies, and common marygold.' *Corymbiate*^d signifies garnished with branches of berries. 'Corymbiferous, plants are distinguished into such as have a radiated flower, as the sun-flower; and such as have a naked flower, as the hemp-agrimony, and mugwort: to which are added those a-kin hereto, such as scabious, teasel, thistle, and the like.' See *BOTANY*.

CORYNOCARPUS, in botany, a genus of the monogamia order, and pentandria class of plants: *CAL.* a pentaphyllous perianth: *COR.* five roundish, erect, and hollow petals: *STAM.* five subulated filaments arising from the base of the petals: *ANTH.* erect and oblong: *PERICARP.*

a monospermous, turbinate clavated nut. Species, one only; a native of New Zealand.

CORYPIA, mountain palm, or umbrella tree, in botany, a genus of plants of the order of palmæ: *COR.* tripetalous: *STAM.* six, with one pistil: the fruit a monospermous plum. There are two species; the chief is *C. umbracula*, a native of the West Indies, where it is called coddapana. It rises to a considerable height, and produces at the top many large palmated, plaited leaves, the lobes of which are long, and placed regularly round the end of a long spiny foot-stalk, in a manner representing a large umbrella. The flowers are produced on a branched spadix, from a compound spathe; they are hermaphrodite, and each consists of one petal, divided into three oval parts, and contains six awl-shaped stamina, surrounding a short slender style, crowned with a simple stigma. The germen is nearly round, and becomes a large globular fruit of one cell, including a large round stone. These plums having a pleasant smell are esteemed by the Indians.

CORYPHÆNA, in ichthyology, a genus belonging to the order of thoracici. The head is declined and truncated; the branchiostege membrane has six rays; and the back fin runs the whole length of the back. There are nineteen species, most of them natives of foreign seas. The most remarkable are the blue and parrot fishes.

CORYPHÆUS, from *κορυφή*, the top of the head, in the ancient tragedy, was the chief or leader of the company that composed the chorus. Hence *coryphæus* became a general name for the chief of any company, corporation, sect, opinion, &c. Thus Cicero calls Zeno the *coryphæus* of the stoics; and Eustatius of Antioch is called the *coryphæus* of the council of Nice.

CORYVREKAN, a dangerous whirlpool on the west coast of Scotland, between the isle of Scarba and the north point of Jura. Its vortex extends about a mile in circuit, and at full tide its numerous eddies form watery pyramids, which rise to a great height in the air, and, bursting with the noise of thunder, overwhelm all small vessels that come within the sphere of its attraction.

COS, or Coos, in ancient geography, an island on the coast of Caria, in Asia, fifteen miles west of Halicarnassus, and seventy in compass, called also Meropis; and hence Thucydides joins both names together, Cos Meropis. It was fruitful and produced good wine. It was the birth-place of Hippocrates, Apelles, and Philetas. The vestes Coæ, made of silk, were famous for their fineness and color.

Cos, a town in the above island, mentioned by Homer, and originally called Astypalæa.

COSCINOMANCY, *n. s.* *κοσκινον*, a sieve, and *μαντια*, divination. The art of divination by means of a sieve, &c.

COSCINOMANCY, or divination by a sieve, was used, as appears from Theocritus, to discover the secrets of known persons, as well as to find out the unknown. The sieve being suspended, after rehearsing a formula of words, it was taken between two fingers only; and the names of the parties suspected repeated: he at whose name

the sieve turned, trembled, or shook, was reputed guilty of the evil in question. It was sometimes also practised by suspending the sieve by a thread, or fixing it to the points of a pair of shears, giving it room to turn, and naming the parties suspected.

COSECANT, *n. s.* in geometry, the secant of an arch, which is the complement of another to ninety degrees.

COSEPAGE, in law, a writ that lies where the tresail, that is, the tritavus, the father of the besail, or great-grandfather, being seized in fee at his death of certain lands or tenements, dies; a stranger enters, and abates; then shall his heir have writ of cosepage.

COSEXING, in law, an offence whereby any thing is done deceitfully, in or out of contracts, which cannot be fitly termed by any especial name. In the civil law it is called *stellionatus*.

COSENZA, a town of Naples, the capital of Calabria Citra, and sometimes giving name to that province, is built on seven small hills at the foot of the Apennines. It is the residence of a royal governor, an archbishop's see, and has a fort. The metropolitan is the only church within the walls; but there are three parish churches in the suburbs, and twelve convents in the town. The environs are beautiful, populous, and well cultivated, producing abundance of corn, fruit, oil, wine, and silk. Cosenza has often suffered by earthquakes, particularly in 1638. It is seated on the river Crate, ten miles from the sea coast, and 150 south east of Naples. Population about 12,000.

COSHERING, *n. s.* Irish.

Cosherings were visitations and progresses made by the lord and his followers among his tenants; wherein he did eat them (as the English proverb is) out of house and home. *Darvies*.

COSIER, *n. s.* Old Fr. *cousu*, from *couldre*, to sew. A botcher, says Johnson; but Minsheu defines it a cobbler.

Do you make an alehouse of my lady's house, that ye squeak out your *cosiers'* catches, without any mitigation or remorse of voice? *Shakspeare. Twelfth Night.*

COSIGNIFICATIVE, *adj.* from *con* and *significative*. Having the same meaning.

COSINE, *n. s.* in geometry, the right sine of an arch, which is the complement of another to ninety degrees.

COSMETIC, *n. s.* & *adj.* } Fr. *cosmetique*; **COSMETICAL**, *adj.* } *κοσμητικός*, from *κοσμεω*, to adorn. A preparation to improve beauty. Having the power of improving beauty; beautifying.

No better *cosmeticks* than a severe temperance and purity, modesty and humility, a gracious temper and calmness of spirit; no true beauty without the signatures of these graces in the very countenance.

Ray on the Creation.

First robed in white, the nymph intent adores,
With head uncovered, the *cosmetick* powers. *Pope.*

LIEUT. Oh, hang fortune,—let that take its chance; there is a beauty in Lauretta's simplicity, so pure a bloom upon her charms.

DOCT. So there is, so there is. You are for beauty as nature made her, hey! No artificial graces, no *cosmetic* varnish, no beauty in grain, hey! *Sheridan.*

COSMICAL, *adj.* } *Κοσμος*. Relating to **COSMICALLY**, *adv.* } the world; rising or setting with the sun; not acronycal with the sun; not acronycally.

The *cosmical* ascension of a star we term that, when it ariseth together with the sun, or in the same degree of the ecliptic wherein the sun abideth.

Browne's Vulgar Errors.

From the rising of this star not *cosmically*, that is, with the sun, but heliacally, that is, its emersion from the rays of the sun, the ancients computed their *canicular* days. *Id.*

COSMOGONY, *n. s.* } *Κοσμος* and *γονη*. **COSMOGONIST**, *n. s.* } The birth of the world; the creation. He who gives an account of the creation.

The world is in its dotage, and yet the *cosmogony* or creation of the world has puzzled philosophers of all ages. *Goldsmith.*

The relation seems to have been in some measure approved by the sacred *cosmogonist* himself, *Coventry.*

COSMOGRAPHY, *n. s.* } *Κοσμος* and *γραφη*. **COSMOGRAPHER**, *n. s.* } *φω*. A description **COSMOGRAPHICAL**, } of the visible **COSMOGRAPHICALLY**, *adv.* } world; a science showing the frame of the universe, distinct from geography, which lays down the situation and boundaries of particular countries. A *cosmographer* is one who is skilled in cosmography; one who writes a cosmographical description of the world.

The ancient *cosmographers* do place the division of the east and western hemisphere, that is, the first term of longitude, in the Canary and Fortunate Islands, conceiving these parts the extremest habitations westward. *Browne's Vulgar Errors.*

The terrella, or spherical magnet, *cosmographically* set out with circles of the globe. *Id.*

Here it might see the world without travel; it being a lesser scheme of the creation, nature contracted, a little *cosmography*, or map of the universe. *Smith.*

COSMOLABE, from *κοσμος*, world, and *λαμβάνω*, I take; an ancient mathematical instrument, serving to measure distances, both in the heavens and on the earth. The *cosmolabe* is in great measure the same with the *astrolabe*. It is also called *pentacosm*, or the universal instrument, by L. Morgard, in the treatise upon it, printed in 1612.

COSMOPLASTICK, *adj.* *κοσμος*, and *πλαστικός*. Relative to the formation of the world.

He being no better than a *cosmoplastick* atheist. *Hallywell.*

COSMOPOLITAN, *n. s.* } Gr. *κοσμος* and **COSMOPOLITE**, *n. s.* } *πολιτης*. A citizen of the world; one who is at home in every place.

COSNE, a town of France, in the department of Nievre, and ci-devant province of Nivernois, seated at the confluence of the Loire and Noain, 110 miles south of Paris. Anchors for ships are made here; and its cutlery wares and gloves are much esteemed. Population 4700.

COSSPORE, a town and small district of Hindostan, tributary to the Birmans, bounds the district of Selhat in Bengal on the east. Gold is

found in some of its mines. Great part of the trade between Bengal and Assam formerly passed through this place. The inhabitants are Hindoos, governed by their own rajah.

COSSACKS. See **DON** and **RUSSIA**, **SOUTHERN**.

COSSET, *n. s.* A lamb brought up without the dam.

And if thou wilt bewail my woeful teen,
I shall thee give yon *cosset* for thy paine.

Spenser. Shepherd's Calendar.

COSSIMBAZAR, a considerable manufacturing town of Bengal, adjoining the southern suburbs of Moorshedabad. It is situated on the south-east bank of the Bhagarutty, and has both English, Dutch, and French factories. Silk and cotton stockings are its staple articles. Early in the eighteenth century the East India Company paid 25,000 rupees for the liberty of forming their establishment here; but it was not till 1742, that they obtained permission to fortify it. It was taken and plundered in 1756 by the nuwab Suraje Addouleh. The vicinity abounds with mulberry trees and game, and is watered by the Bhagarutty, Jellingy, and Ganges rivers.

COSSOVA, an extensive plain between Bulgaria and Rascia, memorable for two great battles fought on it, viz. 1st. between Lazarus prince of Servia and Amurath I.; and, 2d. between John Huniades and Mahomet II.; in both of which the Turks were victorious.

COST, *v. n. & n. s.* } *Arm. const*; Welsh,
COSTLESS, *adj.* } *cost*; old Fr. *coesté*;
COSTLINESS, *n. s.* } *Ital. costo*; Ger. & Dut.
COSTLY, *adj.* } *kost*; Swed. *kosta*; Lat.

consto. To be purchased for or with a price. The price of a thing; luxury; expense; detriment. In law, used in the plural, the expense of a suit. Costly is high priced; expensive; sumptuous.

Have we eaten at all of the king's *cost*; or hath he given us any gift?
2 *Samuel* xix. 42.

And of a mirth I am right now bethought,
To don you ase, and it shall *coste* you nought.

Chaucer. Prol. to Cant. Tales.

And thoughte it have *costed* me, yit wol I do my peyn,
For to pike hir purs to nyghte, and win my *cost* ageyn.
Id. Cant. Tales.

For living wit, I weene, cannot display
The roial riches and exceeding *cost*,
Of every pillour and of every post,
Which all of purest bullion framed were.

Spenser. Faerie Queene.

And all the floore was underneath their feet
Bespredd with *costly* scarlett of great name. *Id.*
While he found his daughter maintained without
his *cost*, he was content to be deaf to any noise of infamy. *Sidney.*

Though not with curious *costliness*, yet with cleanly
sufficiency, it entertained me. *Id.*

Why dost thou pine within, and suffer dearth,
Painting the outward walls so *costly* gay?
Why so large *cost*, having so short a lease,
Dost thou upon thy fading mansion spend?

Shakspeare. Sonnet cxlvi.

I shall never hold that man my friend,
Whose tongue shall ask me for one penny *cost*
To ransom home revolted Mortimer.

Id. Henry IV.

What they had fondly wished, proved afterwards to their *costs* over true. *Knolles' History of the Turks.*

And wilt thou, O cruel boast!

Put poor nature to such *cost*?

O! 'twill undo our common mothe

To be at charge of such another. *Crashaw.*

Let foreign princes vainly boast

The rude effects of pride and *cost*

Of vaster fabricks, to which they

Contribute nothing but the pay, *Waller.*

Nor have the frugaller sons of fortune any reason
to object the *costliness*; since they frequently pay
dearer for less advantageous pleasures.

Glanville's Scepsts.

It is strange to see any ecclesiastical *pile*, not by
ecclesiastical *cost* or influence, rising above ground;
especially in an age in which men's mouths are open
against the church, but their hands shut towards it.

South's Sermons.

It is to be remembered, that no man borrows money,
or pays use, out of mere pleasure; it is the want of
money drives men to that trouble and charge of borrowing;
and proportionably to this want, so will every one
have it, whatever price it *cost* him. *Locke.*

The dagger and poison are always in readiness;
but to bring the action to extremity, and then recover
all, will require the art of a writer, and *cost* him many
a pang. *Dryden.*

He whose tale is best, and pleases most,

Should win his supper at our common *cost*. *Id.*

Leave for awhile thy *costly* country-seat;

And, to be great indeed, forget

The nauseous pleasures of the great. *Id.*

Fourteen thousand pounds are paid by Wood for the
purchase of his patent; what were his other visible
costs, I know not; what his latent, is variously
conjectured. *Swift.*

The chapel of St. Laurence will be perhaps the most
costly piece of work on the earth, when completed.

Addison.

He is here speaking of Paradise, which he represents
as a most charming and delightful place; abounding
with things not only useful and convenient, but even
the most rare and valuable, the most *costly* and desirable.
Woodward's Nat. Hist.

There could no *costly* gem ensnare,

No trinket to adorn thy hair;

No Carian slave didst thou request,

No precious chain, no Tyrian vest. *Sheridan.*

An ivory inlaid table spread with state

Before them, and fair slaves on every side;

Gems, gold, and silver, formed the service mostly,
Mother-of-pearl and coral the less *costly*

Byron. Don Juan.

Costs, in law, imply the expenses of a suit
recovered by the plaintiff, together with damages.
Costs were not allowed by the common law, the
amercement of the vanquished party being his
only punishment; but they are given by statute.
Costs are allowed in Chancery for failing to
make answer to a bill exhibited, or making an
insufficient answer; and if a first answer be certified
by a master to be insufficient, the defendant
is to pay 40s.; £3. for a second insufficient answer;
£4 for the third, &c. But if the answer be reported
good, the plaintiff shall pay the defendant 40s. costs.

COST, *n. s.* } Old Fr. *coste*; Lat. *costa*.

COSTAL, *adj.* } A rib or side. Belonging to
the ribs.

Betwixt the *costs* of a ship.

Ben Jonson.

Hereby are excluded all cetaceous and cartilagineous fishes; many pectinal, whose ribs are rectilinear; and many *costal*, which have their ribs embowed.

Brown's Vulgar Errors.

COSTA (Christopher), a celebrated botanist of the sixteenth century, born in Africa. His father was a native of Portugal. Christopher, to perfect himself in the knowledge of simples, went into Asia, where he was taken prisoner, but found means to make his escape, and after several voyages, practised physic at Burgos. He wrote, 1. A Treatise on Indian Drugs and Medicines. 2. His Voyages to the Indies. 3. A book in praise of Women; and other works.

COSTA FURTADO DE MENDOSA (Hippolyto Joseph da), a Portuguese freemason, and latterly chargé d'affaires for Brasil in England, was bachelor of divinity and doctor of laws in the university of Coimbra. He fled to England from the prison of the inquisition, and published in 1811, a work in 2 vols. 8vo, containing A Narrative of the Persecution of the Author, a native of Colonia da Sacramento, on the River La Plata, imprisoned and tried at Lisbon, by the Inquisition, for the pretended crime of Freemasonry. His book comprises the statutes of the holy office; but, though frequent allusions are made to his escape from captivity, the singular mode in which it was effected is omitted. This has been thus supplied:—'The door of the cell in which Da Costa was confined opening into a hall, which was the centre of the prison, he had opportunities for remarking that the daily labors of his jailors terminated with throwing a bundle of keys on a table where a lamp was left burning. By patience and perseverance with abundant exercise for circumspection, in the consciousness of spies, by daylight, through apertures in the walls and ceiling of his cell, he succeeded in forming, out of an old pewter plate, a key which would unlock its door. Upon making his final attempt, the bundle of keys proved to be a proper collection for threading the entire labyrinth, not excepting the outer gate. Besides the keys and lamp, there was a book, containing, among other records, the minutes of his own repeated examinations. This he took with him, and carefully closing and locking every door after him, he made his way, without interruption, to the outside of the prison walls. It was necessary for him to remain six weeks secluded and disguised in the neighbourhood, before he could venture to take shipping, as every bark in the port and on the neighbouring coasts was subjected to the unremitting scrutiny of the officers of the inquisition; and in the course of their victim's rides on horseback, he frequently recognised these his old acquaintance engaged in their search after him. At length he took his departure from Portugal, and reached England in safety, bringing with him the book and keys of the inquisitors, as trophies of his success.' M. da Costa published also in London, the *Correio Braziliense*, a monthly magazine in the Portuguese language, and a small ingenious tract on the Origin of Building. He died in the beginning of 1824, at Kensington.

COSTA RICA, i. e. the rich coast, a province of the new state of Guatemala, in what was formerly

Spanish North America, bounded on the south-east by Veragua, and extending from the Spanish Main to the Pacific Ocean, east and west. It is a very mountainous district, and but little known to Europeans; but is said to contain some considerable mines of the precious metals, and to be very fertile in some parts in cocoa and pasturage. The commerce consists of cattle, hides, wax, and honey. The capital is Carthage, and it has several good ports on the Pacific.

COSTANZO (Angelo di), an Italian historian and poet, lord of Catulupo, was born in 1507, of a noble and ancient family of Naples, and died about 1591. He wrote, 1. A History of Naples, from 1250 to 1480; the best edition of which is that of Aquila, in 1582, in folio, very scarce. 2. Italian Poems, which are esteemed, and have had several editions.

COSTARD, *n. s.*

From *coster*, a } head, says John-
Co'STARD-MONGER, *n. s.* } son, in which he
Co'STER-MONGER, *n. s.* } follows Skinner. The Ency. Met. however, affirms, that there is no authority for the word *coster*. *Costard* is the head; an apple round and bulky, like the head. *Costard-monger*, with which *coster-monger* is synonymous, is a dealer in apples; a fruiterer.

Take him over the *costard* with the hilt of thy sword.
Shakspeare. Richard III.

The wilding, *costard*, then the well-known pomewater.
Drayton.

He'll rail like a rude *coster-monger*.

Beaumont and Fletcher.

Many country vicars are driven to shifts; and if our greedy patrons hold us to such conditions, they will make us turn *costard-mongers*, gasiers, or sell ale.
Burton on Melancholy.

COSTARD (George), a clergyman of the church of England, and author of several learned works, was born about 1710. He was educated at Wadham College, Oxford; and took the degree of M. A. in 1733. He was first appointed curate of Islip, in Oxfordshire, and published, in 1747, some Observations on the Book of Job, 8vo. In 1750, Two Dissertations: 1. On the meaning of Job, chap. xlii. ver. 11. 2. On the Signification of the Word *Hermes*. In 1752 he published, in 8vo, at Oxford, Dissertations II. Critico-Sacrae, quarum prima explicatur, Ezek. xiii. 18. Altera vero, 2 Reg. x. 22. In 1755 he wrote a letter to Dr. Birch, which is preserved in the British Museum, respecting the meaning of the phrase *sphæra barbarica*. Some time after, he published a second edition of Dr. Hyde's *Historia Religionis veterum Persarum, eorumque Magorum*; which was printed under his inspection at the Clarendon Press. Mr. Costard's extensive learning having now recommended him to the notice of lord Chancellor Northington, he obtained in 1764, the vicarage of Twickenham in Middlesex, in which situation he continued till his death. In 1767 he published, in one vol. 4to, The History of Astronomy, with its application to Geography, History, and Chronology; occasionally exemplified by the Globes. In 1778 he published, in 8vo, a Letter to Nathaniel Brassey Halhead, esq. containing some Remarks on his Preface to the Code of Gentoo Laws. This appears to have been the last of his separate pub-

lications; but he wrote several papers in the Philosophical Transactions, on astronomical and chronological subjects. Mr. Costard died January 10th, 1782. He was a man of extensive learning, and eminently skilled in Grecian and oriental literature.

COSTIVE, *adj.* Fr. *constipé*; Lat. *constivus*. Having the intestinal excretions hardened and obstructed; backward in speech or composition; apt to become bound up; stiff; formal. Costiveness is, an obstructed state of the intestinal canal; coldness; formality; tardiness of expression, either oral or written.

When the passage of the gall becomes obstructed, the body grows *costive*, and the excrements of the belly white. *Browné.*

Costiveness has ill effects, and is hard to be dealt with by physick; purging medicines rather increasing than removing the evil. *Locke on Education*

While faster than his *costive* brain indites, Philo's quick hand in flowing letters writes; His case appears to me like honest Teague's, When he was run away with by his legs. *Prior.*

Clay in dry seasons is *costive*, hardening with the sun and wind, till unlocked by industry, so as to admit of the air and heavenly influences.

Mortimer's Husbandry.

You must be frank, but without indiscretion; and close, but without being *costive*. *Chesterfield.*

A reverend dispartant of the same *costiveness* in public elocution with myself. *Wakfield*

COSTMARY. A herb. See **TANACETUM**.

The purple hyacinth, and fresh *costmary*. *Spenser. Virgil's Gnat.*

COSTREL, *n. s.* Supposed to be derived from *coster*. A bottle.

COSTUME, *n. s.* Old Fr. and It. *costume*; low Lat. *costium*. Distinctive dress, habit, or character.

COSTUS, in botany, a genus of the monogynia order, and monandria class of plants; natural order eighth, scitamineæ: cor. interior, inflated and ringent, with the under slip trifid. There is but one species, viz. *C. Arabicus*, a native of the Indies. The root was formerly in some esteem as an attenuant, and serviceable in venereal complaints; but it is now rarely prescribed, or met with in the shops.

CO-SUFFERER, *n. s.* from *con* and sufferer. A companion in suffering.

Should as *co-sufferers* commiserate. *Wycherly.*

CO-SUPREME, *n. s.* from *con* and supreme. One who shares in supremacy.

The phenix and the dove,
Co-supremes and stars of love.

Shakspeare. Pass. Pilgrim.

COT, *n. s.* }
COTE, *n. s.* }
COTLAND, *n. s.* }
COTSWOLD, *n. s.* }
COTTAGE, *n. s.* }

COTTIER, *n. s.* }
 in as far as relates to doves

VOL. VI.

and sheep. A cottager, cotter, or cottier, is one who resides in a cot, or cottage. Cotland is land attached to his dwelling. In law, however, cottager is the technical description of one that lives on the common without paying rent, and without any land of his own. Cotswold, from Ang.-Sax. *cote*, a cottage, and *bold*, a place void of wood, signifies sheepcotes in an open country, and from this the Cotswold hills, in Gloucestershire, have their name.

Hezekiah made himself stalls for all manner of beasts, and *cots* for flocks. *2 Chronicles xxxii. 28.*

The sea coast shall be dwellings and cottages for shepherds, and folds for flocks. *Zeph. ii. 6.*

Wher ther was swiche a congregatioun
Of peple, and eke so strait of herberge,
That they ne founde as moche as a *cottage*
In which they bothe might ylogged be.

Chaucer. Cant. Tales.

Which hardly doen, at length she gon them pray,
That in their *cottage* small that night she rest her may.
Spenser. Faerie Queenc.

To things of riper season self applyd,
And learned of timber lighter *cotes* to frame,
Such as might save my sheep and me from shame.
Id. Shepherd's Calendar.

They were right glad to take some corner of a poor *cottage*, and there to serve God upon their knees.

Hooker.

The self-same sun that shines upon his court
Hides not his visage from our *cottage*, but
Looks on both alike. *Shakspeare. Winter's Tale.*

Besides, his *cot*, his flocks, and bounds of feed
Are now on sale; and at our sheep *cot* now,
By reason of his absence, there is nothing
That you will feed on. *Id. As You Like It.*

The husbandmen and plowmen be but as their work-folks and labourers; or else mere *cottagers*, which are but housed beggars. *Bacon's Henry VII.*

Let the women of noble birth and great fortunes nurse their children, look to the affairs of the house, visit poor *cottages*, and relieve their necessities.

Bishop Taylor.

They envy others whatever they enjoy of estates, houses, or ornaments of life, beyond their tenuity or *cottage* obscurity. *Id.*

Himself goes patched like some bare *cottier*,
Lest he might ought the future stock appeyre.

Hall.

It is difficult for a peasant, bred up in the obscurities of a *cottage*, to fancy in his mind the splendors of a court. *South.*

Is it reasonable, that the eldest brother, because he has the greatest part of his father's estate, should thereby have a right to take away any of his younger brothers' portions? or that a rich man who possessed a whole country, should from thence have a right to seize, when he pleased, the *cottage* and garden of his poor neighbour? *Locke.*

A stately temple shoots within the skies;
The crochets of their *cot* in columns rise;
The pavement, polished marble they behold;
The gates with sculpture graced the spires and tiles
of gold. *Dryden. Baucis and Philemon.*

Beneath our humble *cottage* let us haste,
And here, unenvied, rural dainties taste.

Pope's Odyssey.

The most ignorant Irish *cottager* will not sell his cow for a groat. *Swift's Address to Parliament.*

As Jove vouchsafed on Ida's top, 'tis said,
At poor Philemon's *cot* to take a bed. *Fenton.*

Even humble Harling's *cottage* vale
Shall learn the sad repeated tale,
And bid her shepherds weep. *Collins.*

The *cottage*-curs at early pilgrim bark;
Crowned with her pail the tripping milk-maid sings;
The whistling ploughman stalks afield, and, hark!
Down the rough slop the ponderous waggon rines. *Beattie.*

Our humble *cot*, and homely fare,
Ye freely shall partake it,
That gallant badge, the dear cockade,
Ye're welcome for the sake o't. *Burns.*

The power, incensed, the pageant will desert,
The pompous strain, the sacerdotal stole;
But haply, in some *cottage* far avert,
May hear, well pleased, the language of the soul;
And in his book of life the inmates poor enrol.
Then homeward all take off their several way;
The youngling *cottagers* retire to rest. *Id.*

Yon *cottage*, who weaves at her own door,
Pillar and bobbin all her little store;
Content though mean, and cheerful if not gay,
Shulling her threads about the livelong day,
Just earns a scanty pittance, and at night
Lies down secure, her heart and pocket light. *Cowper.*

The poorest peasant of the poorest soil,
The child of poverty, and heir to toil,
Early from radiant Love's impartial light,
Steals one small spark to cheer his world of night:
Dear spark! that oft through winter's chilling woes,
Is all the warmth his little *cottage* knows. *Sheridan.*

And from the sheep-*cote* in the dell,
Soft tinkling chimes the wether's bell;
According to the cheerful strain
Of milk-maid blithe, and whistling swain. *Huddesford.*

The roofless *cot* decayed and rent,
Will scarce delay the passer by;
The tower by war or tempest bent,
While yet may frown one battlement
Demands and daunts the stranger's eye:
Each ivied arch, and pillar lone,
Pleads haughtily for glories gone. *Byron. The Giaour.*

COT, or COTT, *n. s.* Old Fr. *coete*, *coite*, *κοιτη*.
A small bed; a child's cradle; a hammock.

Their beds are *cots* of two feet height, on four low posts, strengthened with girth-web. *Sir T. Herbert.*

COT, or COTT, *n. s.* Low Lat. *cota*. A little boat.

Divers discourses in their way they spent;
Mongst which Cymoehles of her questioned
Both what she was, and what that usage meant,
Which in her *cott* she daily practiced? *Spenser. Faerie Queene.*

COT, *n. s.* An abridgment of cotquean. See COTQUEAN; also a cade lamb.

COT, } At the end of the names of places,
COTE, } come generally from the Sax. *cot*, a
COAT, } cottage.

COTABAMBA, a province of Peru, bounded on the north by the province of Abancay, south by that of Chilques y Masques, west by that of Chumbivileas, and north-west by that of Aimaraez, being seventy-five miles long east and west, and twenty-five wide from north to south. It is of cold temperature, being largely occupied by mountains covered with snow. In the valleys are

bred numerous herds of cattle; and wheat, maize, and pulse are abundant. A plant is found here, from the tendrils of which are fabricated cords, and very strong ropes. Population 10,000.

COTA'NGENT, *n. s.* in geometry, the tangent of an arch which is the complement of another to ninety degrees.

COTE, *v. a.* Fr. *coté*. It seems to signify, says Johnson, the same as to leave behind; to overpass. And so it does in some instances. But it appears also to have the meaning of going side by side with; for in the Return from Parnassus we find, 'Marry, we presently *coted* and outstript them;' which implies, first, equalling, and then overpassing.

Words her worth had proved with deeds,
Had more ground been allowed the race, and *coted*
for his steeds. *Chapman's Iliad.*

We *coted* them on the way, and hither are they coming. *Shakspeare. Hamlet.*

COTE, *v. a.* The ancient mode of spelling, to quote.

COTE, in coursing, the advantage one greyhound has over another, when he runs by the side of it, and, putting before it, gives the hare a turn.

COTE D'OR, a department of France, bounded by those of Aube on the north, Upper Marne on the north-east, Upper Saone on the east, Jura on the south-east, Saone and Loire on the south, and Nievre and Yonne on the west. It is chiefly formed out of the *ci-devant* province of Burgundy. Its form is an irregular oval, sixty-five miles long from north to south; and from twenty-five to fifty broad from east to west. Dijon is the capital.

COTELERIUS (John Baptist), fellow of the Sorbonne, and Regius Greek professor, was born at Nismes in 1637. He made a collection of the fathers who lived in the apostolic age, which he published at Paris in two volumes folio, in 1672, reviewed and corrected from several MSS. He also published the first volume of Monumenta Ecclesie Græcæ; a collection of Greek tracts out of the libraries of the king and M. Colbert, which had never been published before: to both these works he added a Latin translation and notes. He intended a farther prosecution of this work; but his intense studies broke his constitution, and deprived him of life in 1686.

COTE'MPORARY, *n. s.* & *adj.* Lat. *con* and *tempus*. One who lives at the same period. Living at the same time; coetaneous; contemporary. See CONTEMPORARY.

What would not, to a rational man, *cotemporary* with the first voucher, have appeared probable, is now used as certain, because several have since, from him, said it one after another. *Locke.*

We now find so much artifice among our *cotemporary* who only follow rude and untaught nature. *Spratt.*

COTERELLUS, and COTARIUS, both signify, according to Spelman and Du Fresne, a servile tenant; but in Doomsday and other ancient MSS. there appears a distinction, as well in their tenure and quality as in their name: for the *cotarius* had a free soccage tenure, and paid a stated firm or rent in provisions or money, with some occa-

sional customary services; whereas the coterellus seems to have held in mere villenage, and his pleasure, issue, and goods, were disposable at the pleasure of the lord.

COTERIE. Fr. *coterie*. This word has altered strangely in its meaning. Cotgrave and Sherwood define it to be, 'Companie, societie, association of country people.' It now means a select party, particularly of ladies; a fashionable select assembly; and the word is often used sarcastically.

But for the children of the 'mighty mother's,'

The would-be wits and can't-be gentlemen,

I leave them to their daily 'tea is ready,'

Snug *coterie*, and literary lady. *Byron. Beppo.*

Why then I'll swear, as poet Wordy swore,

(Because the world won't read him, always snarling)

That taste is gone—that fame is but a lottery,

Drawn by the blue-coat misses of a *coterie*.

Id. Don Juan.

COTES (Roger), an excellent mathematician of the eighteenth century. At seventeen years of age he was admitted a pensioner of Trinity College Cambridge. In 1706 he was appointed professor of astronomy in the professorship founded by Dr. Plume, being the first in that chair. In 1713 he published at Cambridge in 4to, a second edition of Newton's *Principia*, with all the author's improvements; to which he prefixed an excellent Preface. He prepared several useful books for the public; and wrote *A Description of the Great Meteor* which appeared on the 6th March 1716, published in the *Philosophical Transactions*. He died in 1716.

CÔTES DU NORD, or the **NORTH COASTS**, a department of France, so named from its situation; being bounded on the north by the British Channel, on the east by the departments of Isle and Vilaine, and on the south and east by those of Morbihan and Finisterre. It contains part of the *ci-devant* Brittany; and extends sixty-five miles from east to west, and between twenty-seven and forty-five from north to south. The superficial extent is about 2800 square miles, and the population 520,000. Its chief productions are hemp, flax, maize, and apples. The breed of cattle is excellent, and the butter much better than in the interior of France, but there are many barren spots. The mineral productions are lead and iron, and the manufactures linen and woollen stuffs, leather, thread, and hardware. St. Brieux is the capital.

COTHURNUS, a species of boot or buskin worn by hunters, and also by actors of tragedy, when they represented the characters of gods and heroes. They differed from the sandal, which was a mere sole tied about the toes and ancles with thongs and straps of leather, while the cothurnus covered the foot and leg as high as the calf, and was ornamented with gold, gems, and ivory. It is said to have been invented by Æschylus.

COTICE, or **CORISE**, in heraldry, is the fourth part of the bend; which with us is seldom or never borne, but in couples, with a bend between them. A bend thus bordered is said to be *co-tised*.

COTILLON. Fr. *cotillon*, a petticoat. A lively dance, usually danced by eight persons.

And, wow! Tam saw an unco sight!

Warlocks and witches in a dance;

Nae *cotillion* brent new frae France,

But hornpipes, jigs, strathspeys, and reels.

Put life and mettle in their heels.

Burns.

COTOPAXI. See **ANDES**.

COTQUEAN, *n. s.* Probably from Fr. *coquin*, says Johnson; but this does not seem a very happy derivation. It is a corruption of *cuchean*, a woman whose husband is unfaithful to her bed, says Mr. Gifford. This guess, however, is more unfortunate than Dr. Johnson's. A *cotquean* is one who meddles too much with what is woman's peculiar business; and it is not easy to see what this has to do with *coqueting*, unless Mr. Gifford means to insinuate that a wife would be tempted to violate her faith to such a husband. Skinner is, perhaps, nearer to the truth, who thinks that it means a *cook-quean*, one who meddles with the cookery. The quotation from Shakspeare lends support to this supposition.

Look to the baked meats, good Angelica;

Spare not for cost.—

— Go, go, you *cotquean*, go;

Get you to bed.

Shakspeare. Romeo and Juliet.

And make a drudge of their uxorious mat

Who, like a *cot-quean*, freezeeth at the rock

While his breechit dame doth man the forren stock.

Hall.

You have given us a lively picture of husbands *hen-pecked*: but you have never touched upon one of the quite different character, and who goes by the name of *cotquean*.

Addison.

COTRONE, a town of Naples, in Calabria Citerior, on the site of the ancient Croton, though not occupying the same extent of ground. It is fortified with walls, and a castle erected by Charles V. The streets are dismal and narrow. Cheese and corn are the principal commodities. The annual export of corn is considerable.

COTT, a sort of bed-frame, suspended from the beams of a ship for the officers to sleep in between the decks. It is much more convenient at sea than either the hammocks or fixed cabins; being a large piece of canvas sewed into the form of a chest, about six feet long, one deep, and from two to three wide. It is extended by a square wooden frame with a canvas bottom, equal to its length and breadth, to retain it in an horizontal position.

COTTAGE, in law, is properly a little house for habitation without lands belonging to it; stat. 4 Edw. I. By a later statute, 31 Eliz. c. 7, no man might build a cottage unless he laid four acres of land thereto; except in market towns or cities, or within a mile of the sea, or for the habitation of laborers in mines, sailors, foresters, shepherds, &c. This remained in force until 15 Geo. III. c. 32, by which it is repealed.

COTTIWAR, or **CATTIVAD**, a district in the province of Gujerat, Hindostan. The inhabitants called *Catties* are *Hindoos*, who adore the sun. They are governed by independent chiefs, frequently at war with each other; but all of whom are tributary to the *Mahrattas*. Their breed of cattle and horses is highly esteemed.

C O T T O N.

COTTON, *v. n.* & *n. s.* } Fr. *coton*. Cotton
 CoTTONY, or } is the down of the
 CoTTONOUS, *adj.* } cotton tree; the
 cloth made from that down. See the following
 article and GOSSIPUM. To cotton means to rise
 with a nap; and, in familiar speech, to agree
 well with. Cottonous and cottony are, like cot-
 ton, full of cotton.

The pin ought to be as thick as a rowling-pin, and
 covered with *cotton*, that its hardness may not be of-
 fensive. *Wiseman.*

A quarrel will end in one of you being turned off,
 in which case it will not be easy to *cotton* with another.

Swift.

Round, and round, and round they go: Mundell-
 sox, that drives his *cotton-mill*, is their exact pro-
 totype—without an idea or wish beyond their circle;
 fat, sleek, stupid, patient, quiet, and contented. *Burns.*

So Arkwright taught from *cotton* pods to call
 And stretch in lines the vegetable wool;
 With teeth of steel its fibre knots unfurled,
 And with its silver tissue clothed the world. *Darwin.*

COTTON. In our examination of this impor-
 tant subject, we shall, in the first instance, briefly
 notice its botanical character, and then proceed
 to a practical examination of its general prop-
 erties and usefulness as an article of commerce.

The plant, or tree, that produces this important
 material, appears to be generally indigenous in
 the tropical regions. In the Linnæan classifica-
 tion of plants it is denominated *gossipium*, a
 genus of the class monadelphica; order polyan-
 dria; CAL. double; and of which there are ten
 species. It seems to have been unknown in Eu-
 rope till a comparatively recent period, none of
 the Latin vocabularies giving any definition of
 its nature or properties. It is adverted to by
 Herodotus, as growing in India. It was found
 in Mexico and in Peru at the time of the Spanish
 invasion, and its manufacture among the Peru-
 vians was carried on to some extent.

The generality of the native West India spe-
 cies of the plant are annuals; whilst those of
 Asia are perennial, both in root and branch,
 rising in a straight line about eight feet high,
 with leaves in five palmate lobes; but the
 plants chiefly propagated are of the herbaceous
 species. The origin and progress of its culture
 in Asia is involved in great obscurity; but it
 was, doubtless, coeval with the origin of those
 ancient dynasties which excited the cupidity of
 Alexander of Macedon, and its manufacture pro-
 gressively extended from the Indus to Cape
 Comorin.

Pliny describes the cotton-shrub as growing
 in the higher parts of Egypt, and 'of which,' he
 says, 'the Egyptian priests were wont to have
 surplices made, in which they took a singular
 delight.' He also tells us, that vestments of
 cotton were worn by the ancient Egyptians, and
 that too, more than a thousand years before the
 commencement of the Christian era. Moses
 speaks of robes of linen, and commands his
 people 'not to wear a garment of divers sorts,

as of woollen and linen together.' The dress of
 the ancient Babylonians consisted of a tunic of
 lawn, which they wore next to their skin. It
 descended, in the eastern mode, to their feet,
 and the Athenians wore long robes of fine
 cotton.

Three species of cotton are cultivated in
 Malta; one natural to the country, another
 from Siam, and the third of a cinnamon color,
 called Antilles cotton. These are all sown in the
 month of April, and the top of the plant is cut
 in the beginning of September, that the fruit
 may increase in size. It is gathered in October,
 when it begins to open, which is a sign that it is
 then sufficiently ripe. It is sown in the follow-
 ing manner: a hole, some inches deep, is made
 in the ground, which is afterwards filled with
 water, and when it is sufficiently soaked, the
 seed is put into it, and covered over, without
 being watered again until it begins to shoot out
 of the ground. The plant, when in perfection,
 grows to the height of from ten to fifteen in-
 ches, and blooms in the month of August.

In the year 1790 the planters, in the southern
 States of America, began to turn their attention
 to the raising of cotton-wool; and, besides car-
 rying the cultivation of the article to a great
 extent, they produced qualities of cotton before
 unknown. In the year 1792 the quantity of
 cotton exported from the United States was only
 138,323 pounds. At present, the annual export
 is supposed to be not less than 60,000,000 of
 pounds, and the amount is yearly increasing.

The American cotton-wool first brought to
 this country was very ill cleaned; and, in con-
 sequence, was for some time indiscriminately
 applied to the manufacture of the coarser spe-
 cies of goods. It was soon, however, perceived,
 that the cotton grown upon the coast, termed
 Sea Island cotton, had a finer and longer staple
 than that grown farther back in the country, and
 known by the name of upland cotton. But it
 was not for several years, and after a succession
 of trials, that this wool was ascertained to be of
 a quality, in every respect, superior to the cotton
 of the Isle of Bourbon. Indeed, it was not be-
 fore the year 1796, that the finest description of
 it was applied to the purposes for which Bourbon
 wool had till then been used, and which it soon
 entirely supplanted; the second quality of it, in
 like manner, supplanting the Brasil wool in
 many kinds of goods for which it had been em-
 ployed.

The upland cotton is a different species from
 the Sea Island, and is separated with such diffi-
 culty from the seed, that the expense of cleaning
 this wool must have put a stop to its farther cul-
 tivation, had not Mr. Whitney, a gentleman of
 the State of Massachusetts, in the year 1795, in-
 vented a machine by which the operation could
 be easily and successfully accomplished. There
 are two qualities of this cotton, the one termed
 upland Georgia, grown in the States of Georgia
 and South Carolina, and the other, a superior

quality, raised upon the banks of the Mississippi, and distinguished in the market by the name of New Orleans cotton. There was at first a strong prejudice against this wool; it was supposed that it was of an inferior quality, and did not receive a good color in dyeing; but being found suitable to different coarse fabrics, its cultivation was so rapidly extended, that, in the year 1807, 55,018,448 lbs. of upland cotton were exported from the United States.

Previous to the extended culture in North America, a very considerable portion of the annual supply was derived from Smyrna—say 6,000,000 to 7,000,000 lbs. The culture in Asia Minor, as well as Macedon and other parts of Turkey in Europe, is still considerable, but consumed chiefly for domestic purposes, and in the eastern parts of Europe; but the little that is now brought to England is used chiefly for candle-wicks. The quality cultivated in Egypt is good, and may be regarded as a new and important feature, should the career of the present enterprising pacha remain uninterrupted for a few years. In addition to the several kinds or growths already enumerated, the Isle of Bourbon, in the Indian Ocean, produces a very superior kind, limited in quantity, but equal in value, though somewhat different, to the American. It is probable also, from the delicacy of some of their fabrics, that a very superior kind is produced in India to any that is imported thence. China also, it is believed, produces a sort peculiar to itself, from which the nankeen cloths are supposed to be made.

But neither the extent of its growth in America, nor of its manufacture in England, is so much an object of surprise, as the very short period in which both have been accomplished. In point of extent, the comparison with the growth and manufacture of India, could it be ascertained, would probably be found trifling; the export of the raw material from Bengal and Bombay, in 1813, exceeded 600,000 bales, chiefly to China, or about 230,000,000 to 240,000,000 of lbs., whilst the internal consumption probably equalled, if not exceeded, that quantity.

It should be noticed, however, that the culture in the West Indies has not decreased in proportion to the apparent decrease of importation. It is true that the culture is very limited there, and the greater portion included under that head is from Demerara; it might also be inferred, from Portugal being included with the Brasils, that some plants are cultivated in Portugal, which is not the case; under the colonial regime the whole of the produce of the Brasils was carried to Portugal, and from thence re-exported: at the present time, however, nearly the whole growth comes direct to England from the Brasils; a comparatively trifling proportion goes direct to France and other parts of Europe. France is, however, the only other part of Europe where the spinning of cotton is carried on to any extent, being in that country about one-third what it is in England, with this difference, however, that whilst England indicates an increase, France indicates a decrease; the number of bags in France, in 1822, having been 190,000,

and only 166,000 in 1823; whilst the quantity in England, in 1822, was 541,000 bags, and 576,000 in 1823; the quantity spun in all the rest of Europe, collectively, not amounting to 60,000 bags.

Till within these few years the finest cotton, that was brought from India and the Isle of Bourbon, was comparatively of no use in England. Owing to its extreme delicacy and peculiarity of fibre, the carding engines then in use could not be brought to work it into a state fit for spinning. But the late improvements in that series of machinery which spinners call 'the preparation,' have obviated this difficulty, and, by enabling us to spin that cotton to the degree of fineness of which it is susceptible, have rendered our manufacture the wonder and envy of our rivals.

We shall now, however, proceed to our examination of the earliest stages of its manufacture.

The cotton, when collected from the pod, contains the seed, and pieces of the husk by which it was enveloped attached to it; it has, therefore, preparatory to being subjected to the operation of spinning, to undergo a process that will divest it of these superfluous parts. The ancient mode of effecting this was by what is termed bowing it; that is, exposing it to the action of a bow, about four feet long, such as is used at the present day by hatters. The process consisted merely in placing the cotton upon a square table, with horizontal crevices cut through it, and submitting it to the repeated action of the bow, until the dust, seeds, and superfluous parts had separated and fallen through the openings. This inconvenient and desultory mode has in modern times been superseded by a far more effectual and expeditious one, by the application of a machine called a *gin*. Gins are of two kinds, the one called the roller-gin, the other the saw-gin.

The *roller-gin* is represented in the annexed diagram. It consists of two shallow fluted rollers, *a* and *b*, placed so near to each other, that when the cotton is thrust against the line where they enter into contact, they immediately seize hold of it and draw it in between them, while the seeds and other particles, not being able to pass through, fall into the box *K*, and are, by the slanting direction of its bottom, delivered on one side. The motion is communicated by means of the treadle and crank, *C D*, and is equalised by the fly-wheel *E*. The cotton is presented to the rollers over the board *f g*, and is drawn between them, and delivered at *I, H*. In South America this kind of gin is much used, and a negro working with one of them can clean from 30 lbs. to 40 lbs. weight of cotton per day, which, however, is considered heavy work.

The *saw-gin* is given in section in the annexed figure. The cotton is thrown into the receptacle A B, on that side marked C D, which is formed of strong wires placed parallel to each other, to admit the circular saws E, fixed on the axis F, behind the

grating, about an eighth of an inch apart, to pass between them. By this means, the teeth of the saws seize hold of the cotton, and draw it through the bars; and the seeds and other superfluous parts being too bulky to pass through, remain behind, and eventually fall through the aperture G. The cotton is brushed from the saws by a circular brush II, made to revolve rapidly on its axis. The motion is communicated by manual, or any other power applied to the axis F, upon one end of which is the wheel K, acting in a pinion, fixed to one end of the axis of the brush. When the cotton arrives in this country, it is again submitted to the action of machinery, for the further separation of the extraneous matter, unless it is to be spun into coarse yarn.

The first process the cotton undergoes in this country, is effected by means of an instrument called a *picker*; as represented in the annexed diagram:—

A and B are two rollers, having an endless cloth C D, stretched over them. This cloth is called the feeding-cloth, and its upper surface is, by the revolution of the rollers, always carried towards D. E and F are two fluted rollers, which nearly touch each other, and revolve, so that their touching surfaces pass towards G H. G H I K are cylinders, covered on their outer surfaces with long blunt pins, making about 250 revolutions, in the direction of the letters, per minute. L L is a grating of wires for the seeds to fall through, when the cotton carried by the feeding-cloth is delivered by the small rollers upon the face of G H. By the rapid revolution of G H, the cotton is thrown against the top O P, and is carried forward and delivered upon the cylinder I K, which in like manner carries it rapidly round, draws it over the grating, and delivers it back upon the lower face of G H, which after having drawn it over the remainder of the grating, and divested it of the remainder of the seeds and particles of dust, deposits it in the box R R.

This machine is liable to injure the staple of the cotton, and is therefore superseded by another called a *batter*, represented in fig. 1, plate I, COTTON MANUFACTURE. In this machine, the feeding-cloth upon the rollers A and B carries

forward the cotton to the rollers c and e, which deliver it upon the curved rack or grating d e, while a scotch g h, revolving rapidly on its axis, strikes the cotton with its two edges g and h, and divides it; at the same time a draught of air, created by the revolution of the fan I, blows the cotton forward over the grating K K, divests it of the superfluous parts, and ultimately deposits it in a box at the end.

Having thus described the process of *batting*, we may now furnish a brief outline of the manipulations through which the material passes, and then examine the engines in detail.

Carding is that operation in which the first rudiments of the thread are formed. It is performed by cylinders covered with wire cards, revolving with considerable swiftness in opposite directions, nearly in contact with each other, or under a kind of dome or covering, the under surface of which is covered with similar cards, whose teeth are inclined in a direction opposite to those of the cylinders. By this means the separation of almost every individual fibre is effected, every little knotty or entangled part disengaged, and the cotton spread lightly and evenly over the whole surface of the last, or finishing cylinder.

For *jenny-spinning*, which is still in use for the coarser kinds of thread, the cardings are stripped off in separate lengths. The finishing cylinder is covered with the ordinary cards, nailed on in stripes across, and the cotton contained between the margins or intervals of each stripe, forms one carding, whose length of course depends on the width of the engine, or cylinder. When stripped off by the crank and comb, it forms a loose and shapeless film, which falling on the surface of a plain wooden cylinder, the lower half of which revolves within a hollow shell or casing, the cotton in its passage is rolled up and delivered at the other side in perfect and cylindrical cardings. For *mule* or *water-spinning*, the finishing cylinder is covered with spiral, or fillet-cards; and the cotton being taken off in one continued fleece, and contracted by passing through the funnel and rollers, forms one endless and perpetual carding, which is interrupted only, or broken, when the tin can that receives it is completely filled. In the *jenny-carding*, the fibres of the cotton are disposed across, or at right angles to the axis of the carding; in the perpetual carding they are disposed longitudinally, or in the direction of its length, and it is this circumstance which renders the carding destined for *mule* or *water-spinning*, inapplicable to the *jenny*, and vice versâ.

Drawing and doubling is one of the preparatory processes for which we are indebted wholly to Sir Richard Arkwright, and belongs exclusively to the *mule*, or *water-spinning*. The doubling, or passing three or four cardings at once through a system of rollers, by which they are made to coalesce, is intended to correct any inequalities in the thickness of the cardings, and also to admit of their being frequently drawn out or extended, by passing through the rollers. The effect of this frequent drawing is to dispose the fibres of the cotton longitudinally, and in the most perfect state of parallelism. The operation of carding effects this in a certain degree; yet the fibres.

though parallel, are not straight, but doubled, as may easily be supposed from the teeth of the cards catching the fibres sometimes in the middle, which become hooked or fastened upon them. Their disposition is also farther disturbed by the taker-off, or comb, which strips them from the finishing cylinder; and though the general arrangement of the fibres of a carding is longitudinal, yet they are doubled, bent, and interlaced in such a way, as to render the operation we are now speaking of absolutely necessary. When the cardings have been passed four or five times through the drawing-frame, every fibre is stretched out at full length, and disposed in the most even and regular direction; and though the average length of a fibre of cotton is not two inches, yet the finished drawing, as these prepared cardings are now termed, has all the appearance of a lock of Jersey wool, whose fibres, six or eight times as long as those of cotton, have been carefully and smoothly combed.

Roving is that operation by which the prepared cotton, as it comes from the carding-engine, or drawing-frame, is twisted into a loose and thick thread, and wound upon a spindle or bobbin. In mule, or twist-spinning, the prepared carding or drawing, as it is termed, is again passed through a system of rollers, and is twisted, either by a rapidly revolving can, into which it is delivered from the rollers, or by a fly and spindle similar to those of the flax-wheel; in the latter case it is wound on the bobbin by the machine; in the former it is received in the conical can in which it acquires the twist, and is afterwards wound upon bobbins by children. Sir Richard Arkwright always employed the revolving can, and it is still employed in many of the first mills in the country. The roving-frame, with fly and spindle, which is in fact nothing more than the twist-frame of Sir Richard, is now however very generally in use, especially since later improvements have removed objections to the machine, which rendered its use previously inconvenient. The operations through which the thread passes after it has received the first twist are various, and depend greatly on the use it is intended for. The finer it is required, the oftener it is drawn out and twisted, till by degrees, as in the process of wire-drawing, it is brought down to the fineness required. The rovings are therefore distinguished into first, second, and third, according to the number of operations they have gone through.

Spinning is the last operation which the thread undergoes in the series of processes employed in converting it into thread, and is that in which it receives the final extension and twisting.

Carding, as we have already stated, is performed by two kinds of engines, one of which is called the breaker, and operates upon the cotton preparatory to its being submitted to the operation of the other, called the finisher. A card is a kind of brush, formed by making wires into the form of staples, as represented in fig. 4. The two legs of the staples are placed through holes in a flexible piece of leather, and present to the side view a form similar to that shown in the figure, where AB is the leather, and CD the wires forced through it. Cards are formed in

two ways; the one called sheet-card is made about four inches wide, and eighteen inches long, or of a length corresponding with the width of the main cylinder, which they have to cover; the other, called fillet-card, is made in one continuous band or fillet, and is used for covering the doffer cylinder. The teeth of the fillet-card are placed pointing in the direction of the length of the fillet, and completely cover the cylinder to which they are applied; whereas in sheet-cards a space is left behind every sheet.

Fig. 5 represents a sectional view of the immediate working parts of a breaker carding-engine. A is the main cylinder, covered with sheet-cards; B the doffer cylinder, covered with fillet-cards; CCC are the tops; *cg* is the feeding cloth supplied with cotton, which has been previously weighed, moving forward over the roller *f*, by means of the roller *g*, and delivering the cotton between the feeding-rollers III, which carry it to the main cylinder. The main cylinder revolves rapidly in the direction of the dart, and carries the cotton upward between itself and the tops, which are covered with sheet-cards, about one inch and three-quarters to two inches wide, so that they may, as nearly as possible, follow the curve of the main cylinder. I is the lapping-cylinder, having wooden rollers *Ii*, lying upon its upper surface; and K is the doffer, or taker-off, having attached to it the steel comb called the doffing-plate.

The main cylinder, by its revolving motion, is soon covered with cotton, and is divested of it by the doffer-cylinder, which is placed so as nearly to touch it, and which moves at a much slower speed, in the direction of the dart. The effect of this engine would therefore be to distribute the cotton equally over the main cylinder, the top cards, and the doffer cylinder; but the doffing-plate, by the action already described, is continually clearing the doffer cylinder, whose points are consequently left bare to receive a fresh supply from the main cylinder. The doffing-plate continually strips the doffer cylinder of the carded cotton, which it delivers upon the lapping cylinder in one continuous web of about eighteen inches wide, which is the usual width of the engines for fine work. When the top cards are covered with cotton, an attendant is appointed to take them off, and to divest them of the loose cotton by means of a card nailed on a board, which he carries in his hand for that purpose. The quantity of work delivered to the engine is ruled by the speed of the cylinders, and quality of the cotton. When it has passed through the engine, and is wound upon the lapping cylinder (which is so adjusted as to contain about twenty laps), the attendant lifts up the large roller, makes a division in the circular web, and takes it off the roller. In this operation we are presented with the first act of plying or doubling, which is introduced in the process of spinning, in order to obtain equality in the strength and thickness of the yarn.

The cotton is in this state called a lap, and is immediately taken to a finisher-engine, which, in general, is disposed back to front, immediately after the breaker-engine, as may be seen in fig. 6. The construction of the finisher-engine is

exactly similar to that of the breaker-engine, except that instead of having a lapping cylinder, the cotton, when it leaves the doffer, is drawn through a mouth-piece R, formed like the end of a trumpet, by means of the rollers *s* and *t*, and is delivered into the can W. The rollers *s* and *t* are seen in section in this figure. Previously, however, to leaving this process, we shall make a few remarks, as it is, with much propriety, considered the very foundation of all good spinning. The breaker-engine for spinning fine cotton is generally covered with cards of a fineness that will admit 225 teeth, or 450 points in a square inch; and the finisher 275, or 550. But spinners are much divided on this subject, and in some mills the same work is performed with cards one-fifth coarser than it is in others. The top cards are in general one-tenth coarser, and those of the doffer cylinder one-tenth finer than those on the main cylinder: and in some manufactures, at the back part of the engines, where the cotton first arrives, coarser top-cards have been introduced, with a view of divesting the cotton of the largest particles of extraneous matter, and in some instances have been again laid aside as superfluous. Cards must be set easy in the leather, which should be thin and strong. The card-engine is driven by a strap passing from a drum over a fast and loose pulley, fixed on the shaft of the main cylinder.

The cotton having been transferred to the can from the card-engines, in the form of a *sliver*, is next submitted to the process of drawing, represented in fig. 7. In this process three or four card-ends are brought in tin cans, and passed between the rollers AB and CD, which revolve with different velocities; that is, the rollers C and D revolve much quicker than AB, and the top rollers A and C are made to press upon B and D, by means of the weight *e*. Now, supposing four slivers to be placed together, and passed through the rollers AB and CD, and that CD revolve so much quicker than AB, that the sliver will become four times its original length, the cotton will, by such elongation, be reduced in thickness three-fourths, that is, to the same thickness as the single sliver when first brought to the rollers. By this process the fibres of the cotton are laid more parallel to each other, in the direction of the length of the sliver, and the operation is repeated by plying the slivers which have passed the rollers, and passing them through a similar set. The sliver, when thus plied and reduced, is drawn through the mouth-piece G, by the rollers E and F, and delivered into another can. After the cotton has been plied and drawn as many times as the spinner, from the quality of the cotton, and the intended quality of the yarn, considers necessary, it is carried to the roving-frame.

This ingenious piece of apparatus, which is much used in mills where mule-spinning is carried on, is represented in fig. 8, and is termed the *can roving-frame*. AB, are two rollers, moving at a slower speed than CD; A and C, are pressed upon the rollers B and D, by the weight E, as may be seen in the accompanying section.

The cans are represented, the one shut and the other open; the latter opens by means of hinges, after raising the ring *g*. The cans are capable of revolving upon their spindles *hh*, and are supported in an upright position by the collars *ii*, and have at their upper extremities funnel-shaped pieces, *kk*. If two slivers of cotton are brought from the drawing-frame, and passed between the rollers AB, and CD, the processes of plying and drawing will again take place; and the rollers CD, will feed the end thus introduced into the can through the mouth-piece at *k*, which, by revolving rapidly upon its axis, will impart to the end, or sliver, a slight degree of twist. When the can is filled, the rollers are thrown out of gear, and the motion ceases; the can is then opened, and the cotton, or as it is now called, the roving, is taken out and wound upon a bobbin, and in that state is carried to a machine called a stretcher. Some objections exist against this species of roving; first, from the necessity of taking the roving out of the can for the purpose of winding it upon a bobbin, during which it is liable to sustain much damage from the fibres being in a very slight state of adhesion; and secondly, from the roving receiving its twist solely from the revolution of the can in which it rests, and by which the twist is not equally diffused over the whole length of the roving. The first objection was attempted to be obviated, by placing the can in a frame, and drawing the roving out through the mouth-piece at which it entered; and a remedy for the second was somewhat unsuccessfully attempted by Mr. Arkwright, who tried to introduce a pair of rollers upon the top of the roving-can, to seize hold of, and feed the roving into the can as fast as it was received from the drawing-rollers. This, undoubtedly, would have perfectly equalised the twist throughout; but the machinery necessary to produce the double rotatory motion was found to be inconvenient, and the plan was in consequence abandoned.

A roving-frame of a different construction, which obviates the preceding objections, and which in consequence, has received more general adoption, is represented at fig. 9. It is called the *bobbin and flier roving-frame*. The rollers for stretching are similar to those before described; and the plied and drawn roving is represented as coming from the rollers at A, whence it passes through an eye at C, over the top of the spindle D, and down one of the legs of the flier B B, which is for that purpose formed tubular. By the revolution of the spindle D, generated by a strap acting upon the pulley F, the fliers are carried swiftly round, and twist and deliver the thread upon the bobbin E, which is moved upwards upon the spindle by raising the board GG, upon which it rests, descending again as the board descends. The roving is, by this means, slightly twisted and wound upon a bobbin, in a fit state to be immediately carried to the stretching-frame, which, being very similar in its construction to the mule, we consider it necessary only to give a side view of one of the spindles of a mule.

It is shown in the annexed figure. A, is the place where the bobbin from the roving-frame

(not shown in this figure), would have been situate; and *c c c*, are three pairs of rollers, for the future drawing of the roving. The roving, when it has been thus drawn, is brought to the spindle *B*, which is formed of polished steel, ground slightly tapering to the end, which is a round blunt point. The spindle receives its motion at the pulley *D*, by means of a band passing round a drum in the box *E E E*; which drum has bands passing in the same manner to several other spindles. When the motion commences, the carriage *E E E*, passes backwards to the position shown by the dotted lines, and carries with it the spindles to the position *B I*, during which the spindle revolves rapidly on its axis, and gives a certain degree of twist to the roving, which already has undergone a reduction in diameter by passing through the rollers *C C C*. The extent to which the frame recedes is about three yards, and when the spindles have given the requisite degree of twist to the yarn, it returns to its former place; while the attendant, by moving the bar *H*, upon its axis, presses the yarn downwards, by means of a piece of wire *K*, which causes it to be wound upon the spindles, so as to form a figure that may be represented by two cones, one having a more acute angle than the other, placed base to base as shown at *A B*, and *B I*. This form is termed a *cop*, and the act of so distributing the yarn, by the movement of *H K*, the *building of the cop*. It may here be observed, that although this is called the stretching-frame, the yarn is not stretched, but merely undergoes a further process of drawing and spinning, and that the stretching is not performed till the next operation, which is performed upon the mule, and termed spinning.

The yarn, delivered from the stretching-frame in the form of a cop, is taken to the mule, which is, though much lighter, both in form and action of the parts, very similar to the stretching-frame. The spindles also are of a smaller size, and are situated nearer to each other. The *mule spinning-frame* differs from that of the stretching-frame inasmuch as the act of stretching is added to the other operations; for when the frame *E E E*, (see diagram) has receded a certain distance, generally about one yard, the rollers *C C C*, cease to move, and the frame still continuing to recede, stretches the yarn. During this process the spindles on the frame *E E E*, move considerably quicker, in order to save time. The stretching is performed with a view to elongate and reduce those places in the yarn which have a greater diameter, and are less twisted than the other parts, so that the size and twist of the yarn may be more uniform throughout. When the cops are full, they are taken from the moving

spindles, and placed on stationary parts of other mules, as at *A*, and the yarn is again submitted to the same process until it is reduced and spun to the proper fineness, both as respects the diameter and the twist; during the whole of which process, the yarn can be continually joined, so that the cops, which are in separate pieces, can be added to each other in parts, or otherwise, as the continual elongation of the yarn in the course of the different operations of each mule may require. The pieces are joined by children, called *piecers*, who are in attendance on each mule, to join any yarn that may be broken in the act of stretching or twisting. The drums, which drive the spindles in those parts of the mule that recede, receive their motions from bands communicating with the moving power; but the advancement and recession of the carriage, for the purposes of receiving and stretching the yarn, as before described, is performed by means of a wheel moved by hand-labor. A spinner is enabled by experience to judge of and regulate both these operations, as also the building of the cop, which is a matter of very great nicety; for if the cop is not well built, the yarn will not run off even when it is to be used. The number of spindles on a mule amounts frequently to 300. The yarn produced by mule-spinning, being by far the most perfect, is employed in the fabrication of the finest articles, such as lace and hosiery; and when it is twisted in two, four, or six plies, is used for sewing-thread.

We may now briefly examine the process called *jenny-spinning*. This is of a much earlier date, and is on the whole a less perfect process than mule-spinning; consequently it is but little used, except in the manufacture of yarn for coarse goods. In this spinning, the cotton, after having been cleaned by some of the processes already described, is, preparatory to being exposed to the action of the jenny, immersed in a solution of soap and water, to divest it of the glutinous matter generally found on the surface of this and other vegetable fibres; it is then, after the soap and water has been pressed from it, put into a warm stove, and when dry is considered to be in a fit state to be exposed to the operation of the carding-engine. The carding-engine used in jenny-spinning is different in its construction to the one before described; for in mule and water spinning there is a breaker and a finisher engine; but the engine used in this process is called the double-engine; the first part, or breaker, is in the same frame with the second part, or finisher, and the doffer from the first part delivers the cotton upon the main cylinder of the second part, which, in like manner, delivers it upon the second doffer. The second doffer, instead of being covered with fillet-cards, as the doffer of the single engines, is covered with sheet-cards, like the main cylinder, but being of smaller dimensions, has generally only twelve cards upon it; therefore the web of cotton combed from such doffer by the doffing-plate is not in one continuous piece, but in several pieces or portions, equal to the quantity attached to each sheet-card upon the doffing cylinder. As the several small portions are delivered by the comb, they fall into the concave part of a smooth

arc that is equal to one-third of a circle. In this arc a cylinder of smooth mahogany slowly revolves in such direction that the lower surface in the arc passes from the engine. This cylinder has small cavities or flutes on its surface, in a parallel direction to its axis; the angles on the projections between the flutes are taken off, so that the several portions of web which fall from the doffer into the arc are seized by the flutes, and carried forward on the concave face of the arc, and formed into a sliver, about half an inch in diameter, and of a length corresponding with the breadth of the carding-engines, which is about from twenty-four to thirty-four inches. The portions thus rolled are called rows, rolls, or rowans.

In this state, the cotton may be considered in the same relative state of progress as a card-end in mule or water spinning; but it is evident that this mode of spinning is very deficient for the purposes of fine yarn, inasmuch as in the rowans the fibres of the cotton are laid across the longitudinal direction in which they are to be spun, so that the advantage derived in the other process of carding, from the fibres being placed in a direction parallel to the intended length of the yarn, is entirely lost. In this process, also, the advantage of plying, which we have noticed as taking place on the lapping cylinder is lost.

When the rowans are perfected by the mahogany cylinder, they are taken up by children, and placed upon the feeding-cloth of a machine called the *billy*, or *roving-billy*, the operation of which is called roving or slubbing; but the latter expression is now but seldom used, except in the manufacture of woollen. This machine is in its construction and action very similar to the mule, as is the feeding-cloth, to that described in the machine called the picker and batter.

The feeding-cloth lies in a slanting position, and the rowans are placed upon it so that they can pass lengthwise in the direction of its action, and be delivered over the upper roller between two pieces of board which possess a capability of clasping and again relieving them. The rowans are then attached to revolving spindles, which have an advancing and recession motion similar to the mule or drawing-frame. By this revolution and recession the spindles perform the operation of spinning and stretching; and at such intervals as the spindles are stretching and twisting, the feeding-cloth stops, and the clasps seize hold of the roving, and detain it till sufficiently spun and twisted, when it is relieved in order to allow a further portion of the rowan to be fed. The roving having by this means received a certain degree of twist, is built on the spindle in the form of a cop, as in mule-spinning, and is then taken to the machine called the jenny. The operation of the jenny is nearly the same as the *roving-billy*; the only material difference is, that the cops of roving to be spun are fixed upon a moving carriage, which has clasps to hold the roving while in the act of being stretched and spun into yarn.

Water-spinning differs both from the mule and jenny spinning; but the carding and drawing machines are the same as those used in the process of mule spinning. When the cotton has passed

through the carding and drawing machines, it is carried to the spinning-frame, which is upon a different principle to the mule, and, indeed, is more closely allied to the bobbin and flier roving frame. One of the spindles is represented in the engraving, fig. 10. A, the bobbin, brought from the roving-frame; B C, and E, guides for the yarn to pass through; G G G, three pairs of rollers to perform the office of drawing; and H, a flier, formed solid, and having at the end of one arm a small twist like a cork-screw, through which the yarn passes. By the revolution of the flier the yarn receives the requisite degree of twist, and is wound upon the bobbin, which, by the movement of the seat I I, on which it rests, has an upward and downward motion, in order that the yarn may be received upon it regularly. The guide C has a slow reciprocating motion in the direction of the axes of the rollers G G G, by which the roving is moved over the surfaces of the rollers, so that the parts wear uniformly.

In water twist-spinning, the operation of stretching is not introduced. The motion is transmitted from the first mover to the drawing and roving frames by means of bevel-wheels, placed on the end of the frame. These wheels communicate motion to the rollers, which have spur-wheels upon their shafts, adapted to give motion to each other by intermediate wheels which give to the lower rollers motion in the proper direction. The spindles receive their motion from bands communicating with the drum K, represented by the dotted lines. This construction of a water spinning-frame is called a *throstle*, and the difference which characterises it from that properly called the water-frame is, that the cylinder K runs through the whole length of the frame, and gives motion to all the spindles at once; whereas in the water-frame the spindles are moved by an upright pulley, communicating motion to only one set of six spindles, which is an advantage, as the motion of one set can be stopped without stopping the motion of the whole. But as the water-frame is far more expensive than the other, it is a matter of doubt which ought to be preferred.

The several sorts of yarn have each their peculiar destination. The yarn from mule and jenny spinning is taken from the frame in the form of a cop; that from water-twist is wound upon a bobbin. The yarn from water-frames possesses much regularity and strength, and is mostly used for the warps of heavy goods, such as fustians and strong calicoes. If the yarn has to be packed for the market, it is reeled upon a frame consisting of six horizontal bars, supported on an axis parallel to each other.

The frame is represented in the accompanying diagram, A A A A A the horizontal bars, B the axis, and C the bobbin from the water-frame. The dotted lines represent the direction of the twist. These reels are of a sufficient breadth to wind off about fifty cops or bobbins, at the same time.

When the reel has made eighty revolutions, a small bell that is connected with the machinery rings, and warns the attendant to stop the motion of the reel. The portion thus wound is called a lay, and seven of these lays wound

upon the same reel constitute a hank, which is taken from the reel by causing one of the horizontal bars, supplied with a hinge, to fall inwards. The circumference of the reel is a yard and a half, consequently the hank measures 840 yards. The size of the twist is expressed by stating how many hanks go to the pound weight: thus, the yarn called No. 100, is that which takes 100 hanks 840 yards each to weigh an avoirdupois pound. Yarn can be spun upon mules as fine as 200 hanks to the pound; but in water-twist and jenny-spinning it seldom exceeds sixty or seventy.

The last operation that we shall have occasion to describe, is that of warping. The machine on which this is performed is an octagonal prism, five or six feet high, and somewhat less in diameter, revolving vertically, and put in motion by a band and pulley placed under the seat of the warper. The bobbins which furnish the thread are suspended horizontally in a frame on one side. Twenty-eight or thirty threads, forming together a system called a half beer, are wound round the prism in a spiral form from top to bottom. The machine is then turned the contrary way, and the thread wound round the prism upwards from bottom to top, and this is repeated backwards and forwards till a sufficient number of half beers have been wound to form a web of the breadth required. When finished, and the ends properly secured, the whole is wound off, and coiled upon the hand into a round ball, called the warp. If the thread has been previously sized in the hank, it is now ready for the loom; but if the warp is made of cop twist, that operation is next performed. The warps are boiled several hours in water till they are thoroughly penetrated and softened; after draining some time they are then uncoiled and worked in the size till fully impregnated, after which the superfluous size is squeezed out, and they are suspended on poles to dry: the warp is then ready for the loom.

Without this operation of sizing, which, as we have before observed, gives strength and tenacity to the thread, it would not support the friction of the loom. Two threads are passed between each dent of the reed, and at each stroke of the treadle one ascends whilst the other descends. There is, therefore, a constant friction of the threads upon each other, as well as against the teeth of the reed. The motion of the reed itself

also backwards and forwards, and of the healds, up and down, is very severe upon the warp, and unless it has been well penetrated by the size, and its fibres well cemented or glued together, this continual rubbing is sufficient to destroy its texture. Good sizing prevents this, but it is still further aided by another operation called dressing, which is performed by the weaver himself after the warp has got into the loom.

This consists first in applying with a brush a kind of paste made of wheat-flour well boiled, to which is often added a small portion of common salt, sometimes of potash, and sometimes even a little tallow. It is in fact a repetition of the operation of sizing, with this difference, that the dressing is applied chiefly to the surface of the thread, which is slightly coated with the paste, and brushed uniformly in one direction from the healds to the beam, by which means the loose fibres are all disposed evenly one way and firmly glued fast to the thread.

In summer the warp is dried simply by fanning it, but in winter, and in damp cold weather, a hot iron is lightly passed over it. It is then dressed again with a brush dipped in tallow or butter, with which it is slightly greased. This gives suppleness and smoothness to the thread, and greatly diminishes the friction of the healds and reed. As such a portion of the warp as is extended between the healds and beam can alone be dressed at one time, this is woven, and the dressing repeated again upon another portion, and so on alternately dressing and weaving, till the whole of the web is finished.

Messrs. Ratcliffe and Ross dress the whole of the warp before it is wound upon the beam; the labor of the weaver is therefore uninterrupted, and his attention directed solely to one object. This alone is a great point gained, but it is attended also by other, not less important, advantages. Great part of the intellectual skill required in weaving, is in the dressing and beaming of the warp; the mere mechanical part of throwing the shuttle, &c. is soon acquired, even by a boy. A more accurate division of labor, by reducing the beaming and dressing to a system by which they are better, more economically, and more expeditiously performed than before, has removed the great difficulty in the art of weaving, and rendered it in a great measure the employment of children. From what we have already said, it will appear that the object in dressing and sizing is nearly the same, and Messrs. Ratcliffe and Ross, by an improved mode of dressing, have succeeded in reducing these operations to one. They have gone still further; they have done away with the necessity of warping, by forming the web at once from the bobbin, and thus reduced the warping, sizing, dressing, and beaming, to one operation. A thousand bobbins and upwards supply the materials for the warp, which in its progress is properly disposed and arranged, sized, dressed, and finally wound upon the beam. See WEAVING.

Messrs. Hall's experiments on the stoving of cotton goods with sulphur, are of a new character, and well worthy of notice. To stove goods in the most advantageous way, they should be

exposed to the vapor of burning sulphur in a moistened state. But they are then rendered less saleable by the appearance of the spots or iron-moulds. The object of the experiments about to be detailed, was at once to combine the good effects, with regard to the appearance and feel of the goods, resulting from stoving, and to obviate the appearance of the spots. The probable conclusion from these experiments is, that small portions of iron are derived from the sulphur, as held in solution in the sulphureous acid gas formed, and are at length deposited in distinct nuclei on the goods exposed to its action, so as to form the spots above mentioned. With the view of preventing this formation of spots, the following experiments were made:—

The clearest and purest sulphur of commerce, called virgin sulphur, &c. was first employed. The spots produced were less numerous than those occasioned by the common kinds of sulphur; but the benefit was partial and inconsiderable only. Flowers of sulphur were then taken and sublimed to the third time; but still the experiment yielded no results of a decisive character. Sulphur precipitated from the alkaline and earthy sulphurets by means of pure acids, still induced the same appearance of spots as before. The same thing may be observed of sulphur purified by means of phosphorus; the phosphorus was first united under water with the sulphur, and then converted into phosphoric acid by continued boiling; much ferruginous matter was separated, and this experiment seemed to promise success; but the result, although the most favorable of all, was far from being perfect. Sulphurous acid gas, produced by the decomposition of sulphuric acid, by means of charcoal and of mercury, still induced the spots, in the same manner as when it resulted from the combustion of sulphur. Sulphurous acid gas expelled from the sulphates of the alkalis or earths, produced the same appearance of spots as before. Sulphurous acid gas passed through acids still retained the same property of spotting.

The usual mode of stoving, consists in burning sulphur in a close chamber, in which the goods to be stoved are hung. Beside this mode of experiments, many trials were made by exposing a little of the material of the goods to the action of the sulphurous acid in a glass jar, containing about six or eight pints of the gas. The cotton, in these experiments, was moistened with a decoction of galls. Rather more than the requisite quantity of sulphur was placed on a bit of tile, brought to a red heat, and placed within the jar. At first the sulphur burnt with its usual blue flame, but at length the flame became extinguished, and the sulphur was seen to sublime, the oxygen of the air being exhausted. After the cotton had remained about an hour exposed to the sulphurous acid gas, it was taken out free from spots; but the spots gradually began to make their appearance during an exposure to the air of about five or ten minutes.

The mode of bleaching cotton in Suabia is worth notice, especially as it is peculiar to that country. This operation is performed in two days, and does not require extensive premises.

An alkaline caustic lee is prepared, by taking two measures of quick-lime, and covering them with ten measures of good ashes; the heap is then to be sprinkled with water, and when the lime is slaked and the mass cooled, it is fit for making the lee, by the addition of cold soft water. The skeins of cotton, being untwisted and tied in parcels, are to be immersed in the lee, in which they are to be left six hours, and to be occasionally turned. They are then to be washed in a river, and afterwards boiled twelve hours in a bath of the same kind of lee, in which, for every sixty-six pounds of cotton thread, six pounds of soap have been dissolved. They are then to be boiled the same length of time in a solution of soap and water only, according to the former proportion; after which, they are to be again washed in the river, and hung up in the air, or laid on the grass to dry as quick as possible. The process for the hosiery is similar. The boiler must be made of copper, and always well cleaned after it has been used.

The manufacture of *Bandanas* has now become a very important branch of our cotton trade; and we cannot do better than furnish our readers with an account of the great Bandana gallery of Messrs. Monteith and Co. at Glasgow. This establishment has been long celebrated in the commercial world for the excellence and beauty of its cotton fabrics. Their madder-reds rival in brilliancy and solidity any ever produced at Adrianople; and the white figures distributed over the cloth, surpass, in purity, elegance, and precision of outline, the original Bandana designs.

Their new arrangement of hydrostatic presses was completed in 1818, under the direction of Mr. George Ridger, sen., manager of the works. It consists of sixteen of these engines beautifully constructed, placed in one range in subdivisions of four; the spaces between each set serving as passages to admit the workmen readily to the back of the press. Each subdivision occupies twenty-five feet; whence the total length of the apparatus is 100 feet. To each press is attached a pair of patterns in lead (or plates, as they are called,) the manner of forming which will be described in the sequel. One of these plates is fixed to the upper block of the press. This block is so contrived that it turns on a kind of universal joint, which enables this plate to apply more exactly to the under plate. The latter rests on the moveable part of the press, commonly called the sill. When this is forced up, the two patterns close on each other very nicely, by means of guide-pins at the corners, fitted with the utmost care. The power which impels this great hydrostatic range, is placed in a separate apartment, called the machinery-room. This machinery consists of two cylinders of a peculiar construction, having cylindric pistons accurately fitted to them. To each of these cylinders three little force-pumps, worked by a steam engine, are connected. The piston of the larger cylinder is eight inches in diameter, and is loaded with a top-weight of five tons. This piston can be made to rise about two feet through a leather stuffing or collar. The other cylinder has a piston of only one inch in diameter, which

is also loaded with a top-weight of five tons. It is capable, like the other, of being raised two feet through its collar. Supposing the pistons to be at their lowest point, four of the six small force-pumps are put in action by the steam engine, two of them to raise the large piston, and two the little one. In a short time, so much water is injected into the cylinders, that the loaded pistons have arrived at their highest points. They are now ready for working the hydrostatic discharge presses, the water pressure being conveyed from the one apartment to the other under ground, through strong copper tubes of small caliber.

Two valves are attached to each press, one opening a communication between the large prime-cylinder and the cylinder of the press, the other between the small prime-cylinder and the press. The function of the first is simply to lift the under-block of the press into contact with the upper-block; that of the second is to give the requisite compression to the cloth. A third valve is attached to the press, for the purpose of discharging the water from its cylinder, when the press is to be relaxed, in order to remove or draw through the cloth. From twelve to fourteen pieces of cloth, previously dyed Turkey red, are stretched over each other, as parallel as possible, by a particular machine. These parallel layers are then rolled round a wooden cylinder, called by the workmen a drum. This cylinder is now placed in its proper situation at the back of the press. A portion of the fourteen layers of cloth, equal to the area of the plates, is next drawn through between them by hooks attached to the two corners of the webs. On opening the valve connected with the eight-inch prime-cylinder, the water enters the cylinder of the press, and instantly lifts its lower block, so as to apply the under plate with its cloth close to the upper one. This valve is then shut, and the other is opened. The pressure of five tons in the one inch prime-cylinder is now brought to bear on the piston of the press, which is eight inches in diameter. The effective force here, will therefore be $5 \text{ tons} \times 8^2 = 320 \text{ tons}$; the areas of cylinders being to each other, as the squares of their respective diameters. The cloth is, therefore, condensed between the leaden pattern-plates, with a pressure of 320 tons.

The next step, is to admit the bleaching or discharging liquor (aqueous chlorine, obtained by adding sulphuric acid to solution of chloride of lime,) to the cloth. This liquor is contained in a large cistern, in an adjoining house, from which it is run at pleasure into small lead cisterns attached to the presses, which cisterns have graduated index tubes, for regulating the quantity of liquor according to the pattern of discharge. The stop-cocks on the pipes and cisterns containing this liquor, are all made of glass. From the measure-cistern, the liquor is allowed to flow into the hollows in the upper lead-plate, whence it descends on the cloth, and percolates through it, extracting in its passage the Turkey red dye. The liquor is finally conveyed into the waste pipe, from a groove in the under block. As soon as the chlorine liquor has passed through, water is admitted in a similar manner, to wash

away the chlorine, otherwise on relaxing the pressure, the outline of the figure discharged would become ragged. The passage of the discharge liquor, as well as of the water through the cloth, is occasionally aided by a pneumatic apparatus or blowing machine; consisting of a large gasometer, from which air, subjected to a moderate pressure, may be allowed to issue, and act in the direction of the liquids, in the folds of the cloth. By an occasional twist of the air stop-cock, the workman also can ensure the equal distribution of the discharging liquor, over the whole excavations in the upper plate. When the demand for goods is pressing, the air apparatus is much employed, as it enables the workman to double his product.

The time requisite for completing the discharging process in the first press, is sufficient to enable the other three workmen to put the remaining fifteen presses in play. The discharger proceeds now from press to press, admits the liquor, the air, and the water; and is followed, at a proper interval, by the assistants, who relax the press, move forwards another square of the cloth, and then restore the pressure. Whenever the sixteenth press has been liquored, &c., it is time to open the first press. In this routine, about ten minutes are employed; that is, 224 handkerchiefs (16×14), are discharged in ten minutes. The whole cloth is drawn successively forward, to be successively treated in the above method. When the cloth escapes from the press, it is passed between two rollers in front, from which it falls into a trough of water placed below. It is finally carried off to the washing and bleaching departments, where the lustre of both the white and the red is considerably brightened. By the above arrangement of presses, 1600 pieces, consisting of 12 yards each = 19,200 yards, are converted into Bandanas in the space of ten hours, by the labor of four workmen.

The patterns, or plates, which are put into the presses to determine the white figures on the cloth, are made of lead, in the following way:—a trellis-frame, of cast-iron, one inch thick, with turned-up edges, forming a trough rather larger than the intended lead pattern, is used as the solid ground-work. Into this trough, a lead plate, about half an inch thick, is firmly put by screw-nails passing up from below. To the edges of this lead plate, the borders of the piece of sheet-lead are soldered, which covers the whole outer surface of the iron frame. Thus, a strong trough is formed, one inch deep. The upright border gives at once great strength to the plate, and serves to confine the liquor. A thin sheet of lead is now laid on the thick lead plate, in the manner of a veneer on toilette-tables, and is soldered to it, round the edges. Both sheets must be made very smooth beforehand, by hammering them on a smooth stone table, and then finishing with a plane; the surface of the thin sheet, now attached, is to be covered with drawing-paper pasted on, and upon this the pattern is drawn. It is now ready for the cutter. The first thing which he does, is to fix down, with brass pins, all the parts of the pattern which are to be left solid. He now proceeds with the little tools generally used by block-cutters, which

are fitted to the different curvatures of the pattern, and he cuts perpendicularly quite through the thin sheet. The pieces thus detached are easily lifted out; and, thus the channels are formed, which design the white figures on the red cloth. At the bottom of the channels, a sufficient number of small perforations are made through the thicker sheet of lead, so that the discharging liquor may have free ingress and egress. Thus, one plate is finished, from which an impression is to be taken by means of printer's ink, on the paper pasted on another plate. The impression is taken in the hydrostatic press. Each pair of plates constitutes a set, which may be put into the presses, and removed at pleasure.

Fig. 1, plate II, is an elevation of one press; A, the top, or entablature; BB, cheeks of ditto, or pillars; C, upper block for fastening upper pattern to; D, lower, or movable block; E, the cylinder; F, the sole, or base; G, the water for the discharged cloth to fall into; H, cistern, or liquor-meter; *dd*, glass tubes for indicating the quantity of liquor in the cistern; *ee*, glass stop-cocks for admitting the liquor into the cistern; *ff*, stop-cocks for admitting water; *gg*, the pattern plates; *nn*, screws for setting the patterns parallel to each other; *mm*, stuffs perforated with a half-inch drill. The lower iron frame has corresponding pins, which suit these perforations; so that the patterns are guided into exact correspondence with each other; *hh*, rollers which receive and pull through the discharged cloth, from which it falls into the water-box; *k*, stop-cock for filling the trough with water; *iii*, waste tubes for water and liquor.

The plan of the buildings in which the cotton spinning machinery is placed, is generally in the form of a parallelogram, of a length proportionate to the extent of the manufacture carried on therein, and about thirty feet wide. In the best constructed mills, the carding and other preparatory machines are placed on the lowest floor; the mules and stretching frames on the next; and so on progressively as the machines improve the fineness of the yarn. The mules, jennies, and water-frames are placed with their line of spindles across the building; and the card engines have the axes of their cylinders parallel to the long wall of the building. Four or six rows, breakers, and finishers, are placed alternately.

The steam engine, or first mover, is placed at one end of the building, and the motion is communicated by a horizontal shaft running the whole length of the building, which transmits the motion to vertical shafts with bevel-wheels, which wheels transmit the motion to horizontal shafts in the upper floors. A better idea, however, may be procured of one of these mills by reference to plate II, COTTON MANUFACTURE, in which we furnish a view of the fire-proof premises erected by Messrs. Strutt.

The most important legislative enactment connected with the cotton manufacture, relates to the regulation of the mills, and is especially intended to preserve the health of the persons employed in those extensive works. The act was passed in the month of June, 1833, and

commenced its operation in August, and the result has been most satisfactory. It commences by enacting that no person, being under the age of sixteen years, shall be employed in any description of work whatsoever, in spinning cotton wool into yarn, or in the previous preparation of such wool, or in the cleaning of any mill, manufactory or building, for more than twelve hours in any one day, exclusive of the necessary time for meals, such twelve hours to be between the hours of five of the clock in the morning, and eight of the clock in the evening. And no person under the age above-mentioned shall be worked more than nine hours on a Saturday; such nine hours to be completed between the hours of five of the clock in the morning, and four of the clock in the afternoon.

There shall be allowed to every person, in the course of every day, not less than half an hour to breakfast, and not less than one full hour for dinner; such half hour for breakfast to be between the hours of eight of the clock, and nine of the clock, in the morning; and such hour for dinner to be between the hours of twelve of the clock in the forenoon, and two of the clock in the afternoon. If at any time, in any such mill, manufactory, or buildings, time shall be lost in consequence of the want of a due supply, or of an excess of water, or any accident happening to the steam engine, water-wheels, or mill-gearing, then it shall be lawful for the proprietors of any such mill to extend the before-mentioned time of daily labor, after the rate of one additional hour in any one day during the week (except on Saturdays), in which it is lost, but no longer. The ceilings and interior walls of every such mill, manufactory, or building, shall be washed with quicklime and water, once in every year.

Every person, whether proprietor, occupier, or foreman, of any such cotton mill, who shall offend against any of the provisions of this act, shall for every such offence forfeit and pay any sum not exceeding £20, nor less than £10, at the discretion of the justices before whom such offender shall be convicted.

We may now turn to the *foreign trade* as regards the manufacture of this important article. In the year 1806, 21,734,000 lbs. of cotton were imported into France, and manufactured into the following articles:—About 1,000,000 lbs. into velveteens; about 925,000 lbs. into nankeens, nankinets, crapes, and other small stuffs; about 1,155,000 into dimities; about 14,880,000 into fustians, calicoes, coverlets, sinnoises, and muslins. In twenty-two of the departments in France, in which this manufacture was carried on, there were, in 1806, 7,450 spinning mules, containing 800,724 spindles, and employing 28,460 persons; and there were in these departments 28,634 looms employed in weaving cotton fabrics, giving occupation to 31,107 persons. The number of machines, and of people engaged in this manufacture in the other parts of the country are not stated.

In the same year France imported (contraband) from England 2,000,000 of pieces of nankeen, 1,000,000 of pieces of cotton cloth for printing, and about 300,000 pieces of other de-

scriptions of cotton goods, such as muslins, cambrics, dimities, &c. valued at £3,000,000 sterling.

The cotton manufacture of Switzerland, whatever may have been the date of its commencement, has not proceeded so rapidly as the French. It was even many years after Sir Richard Arkwright's improvements before it began to make any considerable advance. It was not until the year 1793, that the Swiss had any spinning by machinery, at which time their first mill was erected at St. Gall. Before that period all their yarn was spun upon the one-thread wheel; and even still, about a tenth part of what they produce is spun in this manner. After the introduction of machinery, however, this article of manufacture made rapid advances, and spinning works were erected in all the manufacturing cantons of the republic. In these they now spin water-twist up to No. 40, and mule yarn up to No. 80; but they import from this country all the higher numbers required in their manufacture. A considerable proportion of their machinery is worked in the same manner as a part of the spinning machinery of France; that is, in small systems; and in Switzerland these little establishments are scattered over the country. In the manufacture of the goods, the weaver, in general, provides himself with the yarn, and sells the cloth, when woven, at the nearest weekly market, or exchanges it for a new supply of yarn.

The cotton manufacture is carried on also in Prussia, and there is in the temperament and habits of that people, what leads us to expect that they may become a manufacturing nation. At present, however, like the Austrians, Saxons, and other nations upon the continent who have attempted to carry on this manufacture, they are far behind in the knowledge of the means of economising labor, and in that readiness and precision of execution which the workmen of this country possess. But these they will soon acquire if the business continues to be prosecuted by them. In the mean time they have laborat a cheaper price than that at which we can generally command it; and in manufacturing for markets which lie near to themselves, they can, better than we at a distance, adapt the fashion and fabric of the goods to the changes of taste, and accommodate the supply to the exact measure of the demand. In Russia they have begun to manufacture cotton upon a small scale. At St. Petersburg there is one spinning work, carried on by the emperor, of course at a great expense. They also spin some cotton yarn upon the distaff. In addition to these supplies, they import annually from this country about 3,000,000 lbs. of yarn, of numbers from No. 13 to No. 16. The weaving is carried on in Moscow and its neighbourhood; and, latterly, along that line of country stretching towards the Caspian Sea, particularly about Sarapta, where a colony of Moravians has for some time been established. The goods produced are used chiefly for the garments of the peasantry.

The amazing increase that has taken place in the quantity of cotton goods manufactured in the United States, may be conceived by the follow-

ing facts connected with a district which had not previously a manufacturing character.

In 1810 there existed in New Hampshire, altogether, twelve manufacturing establishments, which produced in a twelve-month, between 4,000,000 and 5,000,000 yards of cotton cloth. Whereas now there are, in the same county, no less than fifty manufactories, making up about 30,000,000 yards! Here there has been a direct increase of more than 500 per cent. It may be added, that the whole surrounding country has now put on a manufacturing aspect; that villages of sixty or seventy habitations have sprung up, where, a short time back, there were but one or two. And that at Lowell a company was incorporated in January 1825, with a capital of 600,000 dollars (£125,000 sterling), for jean, dimity, and twilled goods.

The progress of the Irish in the same line of industry must not be overlooked; and the laudable and spirited exertions of captain Robert Brooke deserve to be particularly noticed. In the year 1780 that gentleman established a cotton manufactory on his lands, situated on the great canal, about eighteen miles west of Dublin. In 1782 the government of Ireland, understanding that some of the manufacturers of Manchester intended to remove to America, and carry their machinery with them, found means to persuade them to go to Ireland, and gave captain Brooke about £3000 for settling them in his houses upon his lands; and they afterwards advanced him £22,000 upon interest and security, that he might give employment to a great number of weavers, who were then starving and riotous for want of employment in Dublin. By means of these, and other acquisitions of inhabitants, the manufacturing village, which was called 'Prosperous,' consisted afterwards of several hundred houses, erected on a spot where, in the year 1780, there stood one single hut; and the manufacture gave employment to about 3000 men, women, and children. Besides captain Brooke's, which was the principal one, there were at this time several other manufactures of cotton established in various parts of Ireland by the spirited exertions of individuals, and the liberal encouragement of parliament.

The quantity of cotton wool exported from Great Britain to Ireland, is very considerably increased during the past five years, as appears from the following parliamentary statement, printed in 1826.

	lbs.
1821	1,386,564
1822	1,716,395
1823	1,950,288
1824	2,177,703
1825	2,598,893.

The lightness, as well as cheapness, of the calico, has rendered it a chief article of dress amongst all classes of people, and annihilated the manufacture of many of the lighter kinds of woollen and worsted stuffs, formerly so much in demand. The trade of Halifax, and the surrounding country, which consisted almost wholly in such stuffs, has gone entirely to decay, and been replaced by the manufacture of calicoes and other

cotton goods : and such are the quantities now manufactured, more especially in the country round Colne, and thence to Bradford, that from 16,000 to 20,000 pieces are brought weekly to the Manchester market; the produce of those districts which adjoin or are included between these towns.

To the same improvements in spinning which gave birth to the manufacture of calicoes, we are indebted for that of muslin, a branch not less important to the country than honorable to our pride and industry as manufacturers. For this elegant article of dress all Europe had long been tributary to India, where the manufacture has, through the long lapse of ages, arrived at the greatest perfection. Muslins were first introduced into this country by the East India Company, about the year 1670, before which time cambries and Silesia lawns were worn, and such fine linens from Flanders and Germany, as were brought back in exchange for our woollen manufactures of various kinds exported thither in considerable quantities. The manufacture was attempted at Paisley as early as the year 1700. A few looms were employed, but this trade was soon annihilated by the introduction of the goods of India. Eighty years afterwards a more successful rivalry commenced. British muslins were first successfully introduced in the year 1781, but were carried to no great extent till 1785, since which period their progress has been rapid beyond all example. In the year 1787 it was computed, that not less than 500,000 pieces of muslin, including shawls and handkerchiefs, were annually made in Great Britain. The manufacture has, from that time to the present, continued progressively to increase and improve, and bids fair to become the most lucrative and extensive of any in this country. The rapidity with which it approaches to perfection, and its surprising extent in the short space of twenty years, are amongst the many important consequences that have resulted from the improvements in the art of spinning. By the cheapness and superior quality of our yarn, we are enabled to employ thousands of looms in the production of this elegant and useful article of dress, to keep in this country millions of specie which was heretofore sent to the east to purchase this commodity, and to clothe ourselves with this fabric at one-third of the expense formerly required.

Some curious data connected with the state of the cotton trade in Manchester are furnished in the MS. notes of a tour made by their imperial highnesses the archdukes John and Lewis of Austria. They say, 'It is calculated, that 1,500,000 lbs. of raw cotton are worked up every week in the manufactories of Manchester; and in the same space of six days, a single house

pays £10,000 for the purchase of raw cotton. One single manufactory pays £1500 a week for wages. From these facts an idea may be formed of the active industry of this place, and of the riches which commerce must bring into it. The manufactories use so great a number of thermometers, that an Italian whom we know, (a Mr. Zanetti), who is settled in Manchester, sells ten or twelve dozen every week. Three hundred steam engines in constant motion produce all these wonders.'

The rapid increase of the cotton trade appears to have been owing, in a great measure, to the more liberal introduction of machinery into every branch of it, than into any other of our staple manufactures. The utility and policy of employing machines to shorten labor, has been a subject which has exercised the pens of several ingenious writers; while their introduction into almost every branch of manufacture has been attended, in the outset, with much riot and disorder. They are, undoubtedly, most wonderful productions of human genius, the progressive exertions of which neither can nor ought to be stopped: they enable the manufacturer to produce a better article than can be made by the hand, in consequence of the uniformity and certainty of their operations; and at a much lower price, in consequence of the vast quantities of goods they are capable of performing. They thus support the credit of our manufactures abroad; and enable us, under the vast load of taxes, and consequent increase in the price of every necessary of life, to meet our foreign competitors with advantage at market. They can even allow the goods to furnish, in their passage, a considerable revenue to the government. And although they do, undoubtedly, on their first introduction, throw some persons out of employ, by changing the nature and course of business, they almost immediately make up for the inconvenience by astonishingly multiplying the absolute quantity of employment. If they take away their work from carders and spinners, they return it them back ten-fold as winders, warpers, weavers, dressers, dyers, bleachers, printers, &c. &c.

We shall conclude our present article by subjoining a summary of the rise and progress of this important branch of British manufacture.

From 1770 to 1780 the importation of cotton wool averaged 5,735,575 lbs. per annum. From 1781 to 1790 about 13,000,000 lbs. weight, and from 1791 to 1801 about 32,000,000 lbs. weight; and the following is a statement of the quantity imported in each of the twenty-two years 1802—1823, distinguishing the several countries from whence imported, and the number of bags and bales from each respective country

COTTON WOOL, IMPORTED FROM

Years.	United States of America.	Brasilis and Portugal.	East Indies.	West Indies, &c.	Total No. of Bags and Bales.	Total in lbs. weight.	Quantity in lbs. weight taken for spinning in each of the nine years 1815—1823.	
1802	107,494	74,720	8,535	90,634	281,383	77,393,600		
1803	106,831	76,297	10,296	43,474	233,898	59,921,990		
1804	104,103	48,588	2,661	86,385	211,637	70,506,355		
1805	124,279	51,242	1,983	73,116	252,620	72,229,537		
1806	124,939	51,034	7,787	77,078	261,738	75,157,530		
1807	171,267	18,931	11,409	31,010	232,667	86,206,870		
1808	37,672	50,442	12,512	67,512	168,138	22,676,740		
1809	135,000	166,107	35,764	103,511	442,382	117,775,530		
1810	240,516	149,535	79,382	92,186	561,173	136,570,735		
1811	123,192	118,514	14,646	61,789	326,141	91,662,535		
1812	95,331	98,714	2,617	64,563	261,215	63,027,570		
1813	37,721	137,168	1,421	73,218	249,503	49,820,530		
1814	48,000	151,500	13,500	74,500	287,500	59,745,373		
1815	201,000	91,200	24,300	54,900	371,400	96,720,370		90,537,350
1816	166,000	124,000	31,000	49,000	370,000	94,140,330	90,350,220	
1817	195,560	114,490	117,955	49,155	477,160	125,132,230	110,532,210	
1818	219,950	160,200	247,300	57,850	660,300	177,257,375	112,235,750	
1819	212,250	125,450	173,300	31,070	545,070	150,735,728	110,235,570	
1820	301,200	179,700	57,300	31,950	577,150	143,637,325	128,735,235	
1821	300,100	121,050	29,700	37,250	488,100	123,573,275	128,527,725	
1822	330,000	143,200	19,300	40,650	533,150	139,797,735	140,795,375	
1823	448,070	118,070	38,650	33,610	668,400	180,233,795	150,325,795	

The following is an account of the official value of the cotton wool imported; the number of bags and bales, and the official value thereof re-exported; and the official and declared real value of the quantity of cotton yarn and of cotton manufactures exported to all parts of the world (except Ireland), in each of the ten years 1814—1823.

The official values imply a fixed value assigned by the government, in 1694; and may or may not have a relation to the real value of the present time; but they are important and interesting as denoting an increase or decrease of quantity.

Years.	Official Value of Raw Imported.	EXPORTED.					
		Raw.		Value of Yarn.		Value of Manufactures.	
		Bags.	Value.	Official.	Real.	Official.	Real.
1814	2,030,862	. . .	366,270	1,119,350	2,791,248	16,600,366	17,393,796
1815	3,335,564	. . .	397,664	808,853	1,674,021	21,699,505	19,124,061
1816	3,160,075	30,000	313,768	1,380,486	2,623,448	16,335,124	13,072,753
1817	4,161,824	22,700	721,430	1,125,257	2,014,181	20,357,147	14,178,021
1818	5,767,547	60,000	1,245,731	1,296,776	2,335,305	21,627,936	16,643,579
1819	4,871,513	65,800	1,085,536	1,535,753	2,516,733	16,876,206	12,388,333
1820	4,957,057	27,500	370,610	2,022,153	2,826,643	20,704,600	13,843,569
1821	4,347,258	51,000	1,062,302	1,398,695	2,307,820	21,639,493	13,786,958
1822	4,731,252	58,700	1,279,263	2,353,217	2,700,437	24,566,920	14,534,253
1823	6,241,561	39,700	707,312	2,425,419	2,625,947	24,117,549	13,751,415

By the first of the above statements it appears that the total quantity of cotton wool imported, in the nine years 1814—1823, has amounted to about 1,235,000,000 of lbs. weight, and the stock on hand at the close of the year 1814, having been about 24,000,000 of lbs. it makes a total quantity of 1,260,000,000 lbs. weight in

the nine years to be accounted for: which has been disposed of in the following manner, viz. 1,062,000,000 of lbs. weight taken for spinning; 105,000,000 lbs. re-exported in a raw state; and 92,000,000 of lbs. remaining on hand at the close of the year 1823.

COTTON GRASS. See ERIOPHORUM.

COTTON, LAVENDER. See SANTOLINA.

COTTON, PHILOSOPHIC, a name given to the flowers of zinc, on account of their resemblance to cotton.

COTTON, SILK. See BOMBAX.

COTTON WEED, a species of filago.

COTTON (Charles), a burlesque poet, was descended from a good family, and lived in the reign of Charles II. and James II. His most celebrated piece is Scarronides, or Travestic of the first and fourth books of the *Aeneid*. He also parodied several of Lucian's dialogues, in the same manner, under the title of the Scoffer Scoff'd; and published another poem of a more serious kind, entitled the Wonders of the Peak. An anecdote is told of him, that in consequence of a single complot in his Virgil Travestic, wherein he made mention of a peculiar kind of ruff worn by a grandmother of his, he lost an estate of £400 per annum, which would otherwise have been left to him by that lady.

COTTON (Sir Robert), an English antiquarian, was descended from an ancient family, and born in 1570. In his eighteenth year he began to collect records, charters, and other MSS. Camden, Selden, and Speed acknowledged their obligations to him in their respective works. He was highly distinguished by queen Elizabeth, and also by James I. who created him a baronet. At his death in 1631 he left his valuable library, consisting of curious MSS. &c. to his family for public use. A large accession was made to it by private benefactions before the death of the founder, and afterwards by the purchases of his heirs, until in 1709 an act of parliament was obtained, at the request of Sir John Cotton, for preserving it to the public after his decease, under the denomination of the Cottonian Library, for public use. It is now in the British Museum.

COTTON (Nathaniel), M.D. also, an ingenious English poet, of the last century, studied medicine under the celebrated Beerhaave, at Leyden, and settled finally at St. Alban's; where for many years he kept an asylum for lunatics. The poet Cowper was under his care, and much attached to him. He died in 1788, aged eighty-one. He wrote, *Visions in Verse*, for the Instruction of Younger Minds.

COTTUS, the bull-head, in ichthyology, a genus of fishes belonging to the order of thoracici. The head is broader than the body, and the gill membrane has six rays. There are ten species, the most remarkable are—1. *C. cataphractus*, the armed bull-head, or *pozzo*, very common on most of the British coasts. 2. *C. gobio*, the river bull-head, also very common in all our clear brooks. 3. *C. scorpius*, the father-lasher, is common on the rocky coasts of this island; it lurks under stones, and will take a bait. It seldom exceeds eight or nine inches in length. The head is large, and has a most formidable appearance, being armed with vast spines, which it can oppose to any enemy that attacks it, by swelling out its cheeks and gill-covers to a large size. This species is also common in the Newfoundland seas, where it is called *sculpin*; and on the coast of Greenland, in deep water near the shore. It is a principal food of the natives, and wholesome soup is said to be made of it.

COTULA, in botany, May-weed; a genus of the polygamia superflua order, and syngenesia class of plants. The receptacle is almost naked; the pappus marginated; the florets of the disc quadrifid; of the radius frequently none. There are twenty-two species, all herbaceous annuals, rising six or eight inches high, and adorned with yellow flowers. None of them are natives of Britain, and most of them require artificial heat.

COTULA, or COTYLA, a liquid measure in use among the ancients. Fannius says, the cotyla was the same thing with the hemina, which was half a sextary. Chorier observes, that the cotyla was used as a dry measure as well as a liquid one; from the authority of Thucydides, who in one place mentions two cotylæ of wine, and in another two cotylæ of bread.

COTYLA, or γ Fr. *coytle*; κοτύλη. The COTYLE, *n. s.* Socket in which the head of a bone moves; a liquid measure used by the ancients.

COTYLEDON, navelwort, a genus of the pentagynia order, and decandria class of plants; natural order thirteenth, succulentæ: CAL. quinquefid: COR. monopetalous: there are five nectariferous scales at the base of the germen, and five capsules. There are twenty-four species, most of them hardy succulent perennials; though some require to be kept in a stove, being natives of warm climates. They rise from half a foot to a yard and a half high, and are adorned with yellow flowers growing in umbels. They are easily propagated either by seeds or cuttings. Two species are found in Britain: 1. *C. umbilicus*, common navelwort. 2. *C. lusea*, yellow navelwort.

COTYLEDONS, *n. s.* Lat. *cotyledon*; κοτύλη. Seed lobes (see BOTANY, Index); glandular bodies which adhere to the chorion of some animals.

Many are of opinion that even the placenta of the human fetus, and *cotyledons* of quadrupeds, are respiratory organs rather than nutritious ones. *Darwin*.

COTYTTO, the goddess of debauchery. Her festivals were celebrated by the Athenians, Corinthians, Thracians, &c. during the night. Her priests were called *baptæ*, and nothing but debauchery and wantonness prevailed at the celebration. See BAPTÆ. A festival was observed in Sicily, where the votaries of the goddess carried about boughs hung with cakes and fruit which it was lawful for any person to pluck off. It was a capital punishment to reveal whatever was seen or done at these sacred festivals. The goddess Cotytto is supposed to be the same as Proserpine.

COUCH, *v. a. v. n., & n. s.* Fr. *coucher*; COUCHANT, *adj.* Dutch, *koets*. COUCHEE, *n. s.* Junius supposes COUCHEE, *n. s.* it to be derived COUCH-FELLOW, *n. s.* à Gall. *couche*; COUCHING, *n. s.* Belg. *koetse*, desumptum ex Ital. *colcare*, pro collocare; nam *colcarsi* in Italis est, *conferre se in cubitum, collocare se in lecto*.' Skinner says, 'à Fr. Gall. *coucher*; Ital. *coricare, colcare, cubare*; à Lat. *culcita*, q. d. *culcitare*, i. e. *in culcitam se condere*.' To couch is, to lie down to rest; to lie down on the knees, as a beast does when it rests;

to lie hidden; to lie in a bed or stratum; to stoop; to repose; to lay any thing in a layer or layers; to bend in; to bend under; to include; to hide; to lay close to another; to fix the spear in the rest, in order to attack; to perform the operation for removing a cataract from the eye. A couch is a seat of repose; a sofa; a bed; a layer or stratum. Couchant signifies, lying down; squatting. Couchee is, bed time; the time of visiting late at night. Coucher is, a bed-fellow; a person who removes a cataract; a register book in monasteries. A couch-fellow is, one who shares the same bed; a familiar companion. Couching, as a noun, is the act of bending or bowing.

Issachar is a strong ass *couching* down between two burdens. *Genesis* xlix. 14.

Blessed of the Lord be his land, for the dew, and for the deep that *coucheth* beneath. *Deut.* xxxiii. 13.

Grand mercy, quod the preest, and was ful glad, And *couched* the coles as the chanon bad.

Chaucer. Cant. Tales.

Let take a cat, and foster hire with milke
And tendre flesh, and make hire *couche* of silke,
And let hire see a mous go by the wall,
Anon she weiveth milke and fleshe and all. *Id.*

The goddesse strayt he knew, and by and by
e peaste and *couched*, while that we passed by.

Suckville.

And over all with brazen scales was armed,
Like plated coat of steel, so *couchd* near,
That nought might pierce. *Spenser. Faerie Queene.*

The knight of the Red Crosse, when him he spide
Spurring so hot with rage dispiteous,
Gan fairly *couch* his speare, and towards ride. *Id.*

And him beside an aged squire there rode,
That seemed to *couch* under his shield three-square,
As if that age hadd him that burden spare. *Id.*

About their lady first they flockt arownd,
Whom having laid in comfortable *couch*,
Shortly they reard out of her frozen swound. *Id.*

His crest was covered with a *couchant* hownd. *Id.*

I have grated upon my good friends for three
reprises for you, and your *couchfellow*, Nim; or else
you had looked through the grate like a geminy of
baboons. *Shakespeare. Merry Wives of Windsor.*

∴ If I court more women, you'll *couch* with more
men. *Id. Othello.*

Doth not the gentleman
Deserve as full, as fortunate a bed,
As ever Beatrice shall *couch* upon?

Id. Much Ado about Nothing.

We'll *couch* i' th' castle-ditch, till we see the light
of our fairies. *Id. Merry Wives of Windsor.*

Let not the royal bed of Denmark be
A *couch* for luxury and damned incest.

Id. Hamlet.

These *couchings*, and these lowly courtesies,
Might stir the blood of ordinary men.

Id. Julius Caesar.

It is at this day in use at Gaza, to *couch* potsherds,
or vessels of earth, in their walls, to gather the wind
from the top, and to pass it down in spouts into
rooms. *Bacon's Natural History.*

A sentence well *couchd* takes both the sense and the
understanding. I love not those cart-ropes speeches
that are longer than the memory of man can fathom.

Feltham.

Before each van

Prick forth the airy knights, and *couch* their spears,
Till taickest legions close. *Milton's Paradise Lost.*

Dire was the tossing, deep the groans! despair
Tended the sick, busiest from *couch* to *couch*. *Id.*

As a tiger, who by chance hath spy'd
In some purlieu, two gentle fawns at play,
Straight *couches* close; then rising, changes oft
His *couchant* watch. *Id.*

None of her sylvan subjects made their court;
Levees and *couches* passed without resort. *Dryden.*

When love's fair goddess
Couchd with her husband in his golden bed.

Id. Æneid.

The former waved in air
His flaming sword; Æneas *couchd* his spear. *Id.*

Trees bent their heads to hear him sing his
wrongs,
Fierce tygers *couchd* around, and lolled their fawn-
ing tongues. *Id.*

The foundation of all parables is some analogy or
similitude between the topical or allusive part of the
parable, and the thing *couchd* under it and intended
by it. *South.*

That great argument for a future state, which St.
Paul hath *couchd* in the words I have read to you.

Atterbury's Sermons.

O ye immortal powers, that guard the just,
Watch round his *couch*, and soften his repose!

Addison's Cato.

———— Subtile wights (so blind are mortal men,
Though satire *couch* them with her keenest pen)

For ever will hang out a solemn face,
To put off nonsense with the better grace;
As pedlars with some hero's head make bold,
Illustrious mark! where pins are to be sold. *Young.*

Whether the cataract be wasted by being sepa-
rated from its vessels, I have never known posi-
tively, by dissecting one that had been *couchd*.

Sharp.

If the weather be warm we immediately *couch*-
malt about an inch thick; but if a hotter season re-
quire it, we spread it on the floor much thinner.

Morimer's Husbandry.

This heap is called by maltsters a *couch*, or bed, of
raw malt. *Id.*

Nor less the alarm that shook the world below,
Where march'd in pomp of war the' embattled foe:
Where mannikins with haughty step advance,
And grasp the shield, and *couch* the quivering lance.

Beattie.

Go, prince, be virtuous, and be blest. The throne
Rears not its state to swell the *couch* of Lust;
Nor dignity Corruption's daring son,
T' o'erwhelm his humbler brethren of the dust. *Id.*

Yes—thou mayst eat thy bread, and lick the hand
That feeds thee; thou mayst frolic on the floor
At evening, and at night retire secure
To thy straw *couch*, and slumber unalarmed. *Comper.*

When all did sleep, whose weary hearts did borrow
One hour from love and care to rest,

Lo! as I pressed my *couch* in silent sorrow,
My lover caught me to his breast. *Sheridan.*

Let him who crawls enamoured of decay.
Cling to his *couch*, and sicken years away,
Heave his thick breath, and shake his palsied head;
Ours—the fresh turf, and not the feverish bed.
While gasp by gasp he falters forth his soul,
Ours with one pang—one bound—escapes control.

Byron. Bride of Abydos.

COUCHANT, in heraldry, is understood of a lion, or other beast, when lying down, but with his head raised, as in the diagram; which distinguishes the posture of couchant from dormant, where-in he is supposed quite stretched out and asleep.

COUCHE' in heraldry, denotes any thing lying side-ways, with the two ends on each side of the shield, which should properly rest on the base as *or*, a chevron couched azure.

COUCHGRASS, *n. s.* A weed.

The *couchgrass*, for the first year, insensibly robs most plants in sandy grounds apt to graze.

Mortimer's Husbandry.

COUCHING, in surgery, is a mode of curing a cataract in the eye. This disease is an affection of the crystalline lens, or of its capsule, by which the rays of light are prevented from falling upon the retina. The cure has been generally performed, either by couching, that is, removing the lens from its capsule, or by extracting it. It was long a matter of doubt which of these methods deserved the preference; but Sir Astley Cooper gives the preference to the former. He says, 'It is applicable to every species of the malady; it produces subsequently symptoms far less severe and dangerous, than those which frequently happen after extraction: it may be successfully repeated, when any accidental circumstance has rendered the primary attempts fruitless; that it is much the most easy operation of the two; that it is not so liable as extraction to be followed by the secondary membranous cataract; and that Pott, Callisen, Lucas, Scarpa, Hey, Latta, and many other eminent and unbiassed surgeons have given it the preference.'

The best needles for couching, according to this great surgeon, are those employed by Scarpa, or Hey, the former in fig. 1, and the latter fig. 2, of the annexed diagram.

'If the curved couching-needle be made use of,' he says, 'it is to be held with the convexity of its curvature forward, its point backward, and its handle parallel to the patient's temple. The surgeon, having directed the patient to turn the eye towards the nose, is to introduce the instrument boldly through the sclerotic coat, at the distance of not less than two lines from the margin of the cornea, in order to avoid the ciliary processes. The exact place, where the point of the needle should next be guided, is between the cataract and ciliary processes, in front of the opaque lens and its capsule; but, as the attempt to hit this delicate invisible mark borders upon impossibility, and might even endanger the iris, it seems safer to direct the extremity of the instrument immediately over the opaque lens, and, in the first instance, to depress it a little downward with the convex flat surface

of the end of the needle. Thus room is made for the safe conveyance of the instrument, between the cataract and ciliary processes, in front of the diseased crystalline and its capsule. Care must be taken, in this latter step of the operation, to keep the marked side of the handle forward, so as to have the point of the instrument turned away from the iris. The needle will now be visible in the pupil, and its point is to be pushed in a transverse direction as far as the inner edge of the lens. Then the operator is to incline the handle of the instrument towards himself, by which means, its point will be directed through the capsule into the substance of the opaque lens; and, on inclining the needle downward and backward, the former will be lacerated, and conveyed, with the latter, deeply into the vitreous humor. It is deemed of great importance to lacerate the front layer of the capsule in the operation; for this plan renders the absorption of the opaque lens more certain and quick afterwards, and the occurrence of a secondary membranous cataract almost impossible. Such is Scarpa's excellent plan of operating for a firm cataract.'

'When the case is a fluid or milky one, the contents of the capsule flow out as soon as the little membranous sac is pierced with the needle, and they sometimes completely conceal the iris, the pupil, and the instrument, from the operator's view. The object is now to lacerate the capsule as much as possible. Both the fragments and the extravasation of the milky fluid in the two chambers of the aqueous humor are gradually absorbed after the operation, so as to leave the eye in a transparent state. When the cataract is soft, the particles of which it is composed will frequently elude all efforts made with the needle to depress them. This, however, is quite unnecessary. The operator may either be content with a free laceration, and disturbance of them, or he may imitate Scarpa in pushing the fragments of the capsule, and the particles of caseous matter, into the anterior chamber. In this cavity, absorption seems to be carried on with more vigor than behind the pupil. When the cataract is a secondary membranous one, the surgeon is to turn the point of the needle cautiously towards the pupil, and pierce the opaque capsule. This is to be broken, as far as it is practicable, at every point of its circumference; and the fragments may either be left in their situation, or pushed forward, through the pupil, into the anterior chamber, in the way which Scarpa practises. When the capsule is adherent to the iris, it may often be separated by skilful and delicate movements of the needle.'

'If the operator should prefer the straight needle, he must be careful to depress the cataract a little in the first instance, before making any attempt to place the instrument in front of the cataract, in order to be able to depress it, downward and backward, in the most convenient manner. As the point of a curved needle is turned backward, it may evidently be brought forward with more safety than a straight one, which has a tendency to run directly against the iris. Whenever an operator prefers lacerating the front layer of the capsule, and pushing the

particles of soft and membranous cataracts forward, he will accomplish his objects with far greater safety by means of Scarpa's needle, than it is possible to effect with a straight one, provided he is well acquainted with the anatomy of the eye, the scientific mode of using the instrument, and has a tolerably steady hand, and a good eye of his own.' *First Lines of the Practice of Surgery.*

Under the article BLINDNESS, we referred our readers, for 'the first effects of sight on those who have been couched,' to the present article. The cases which we there had in view, and which are at once the best attested and the most interesting, are those recorded by Mr. Cheselden and Mr. Ware. The former is stated in the *Philosophical Transactions*, No. CCCIII. p. 477. The youth on whom the operation was performed, seems to have been unusually intelligent. 'When he saw the light for the first time,' says the operator, 'he knew so little how to judge of distances, that he believed the objects which he saw touched his eyes (and this was his expression) as the things which he felt touched his skin. The objects which were most pleasant to him were those whose form was regular and smooth, though he had no idea of their form, nor could he tell why they pleased him better than the others. During the time of his blindness he had such an imperfect idea of colors, that he was then able to distinguish, by a very strong light, that they had not left an impression sufficient by which he could again recognise them. Indeed, when he saw them, he said the colors he then saw were not the same as those he had seen formerly; he did not know the form of any object; nor could he distinguish one object from another, however different their figure or size might be: when objects were shown to him which he had known formerly by the touch, he looked at them with attention, and observed them carefully in order to know them again; but as he had too many objects to retain at once, he forgot the greater part of them, and when he first learned, as he said, to see and to know objects, he forgot a thousand for one that he recollected. It was two months before he discovered that pictures represent solid bodies; until that time he had considered them as planes and surfaces differently colored, and diversified by a variety of shades; but when he began to conceive that these pictures represented solid bodies, in touching the canvas of a picture with his hand he expected to find in reality something solid upon it, and he was much astonished when, upon touching those parts which seemed round and unequal, he found them flat, and smooth like the rest; he asked, which was the sense that deceived him, the sight or the touch? There was shown to him a little portrait of his father, which was in the case of his mother's watch; he said that he knew very well it was the resemblance of his father; but he asked, with great astonishment, how it was possible for so large a visage to be kept in so small a space, as that appeared to him as impossible as that a bushel should be contained in a pint. He could not support much light at first, and every object seemed very large to him; but after he had seen larger things, he considered the

first smaller. He thought there was nothing beyond the limits of his sight. The same operation was performed on the other eye about a year after the first, and it succeeded equally well. At first he saw objects with his second eye much larger than with the other, but not so large, however, as he had seen them with the first eye; and when he looked at the same object with both eyes at once, he said that it appeared twice as large as with the first eye; but he did not see double, at least it could not be ascertained that he saw objects double, after he had got the sight of the second eye.'

The second case also is recorded by Mr. Ware in the *Philosophical Transactions*, and was read to the Society June 11th, 1801. It varies somewhat from Mr. Cheselden's. It was the case of a young gentleman, who, by a surgical operation, recovered his sight when seven years of age; after having been deprived of it by cataracts before he was a year old. Mr. Ware gives the following account of the facts in question: 'I performed the operation on the left eye, on the 29th of December last, in the presence of Mr. Chamberlayne, F. A. S., Dr. Bradley of Baliol College, Oxford, and Mr. Platt, surgeon in London. It is not necessary in this place, to enter into a description of the operation. It will be sufficient to say, that the child, during its performance, neither uttered an exclamation, nor made the smallest motion either with his head or hands. The eye was immediately bound up, and no enquiries made on that day with regard to his sight. On the 30th, I found that he had experienced a slight sickness on the preceding evening, but had made no complaint of pain, either in his head or eye. On the 31st, as soon as I entered his chamber, the mother with much joy informed me that her child could see. About an hour before my visit, he was standing near the fire with a handkerchief tied loosely over his eyes, when he told her that under the handkerchief, which had slipped upward, he could distinguish the table by the side of which she was sitting: it was about a yard and a half from him; and he observed that it was covered with a green cloth (which was really the case), and that it was a little farther off than he was able to reach. No further questions were asked him at that time: as his mother was much alarmed, lest the use thus made of his eye might have been premature and injurious. Upon examination I found that it was not more inflamed than the other eye; and the opacity in the pupil did not appear to be much diminished. Desirous, however, to ascertain whether he was able to distinguish objects, I held a letter before him, at the distance of about twelve inches, when he told me, after a short hesitation, that it was a piece of paper; that it was square, which he knew by its corners; and that it was longer in one direction than it was in the other. On being desired to point to the corners, he did it with great precision, and readily carried his finger in the line of its longest diameter. I then showed him a small oblong band-box covered with red leather, which he said was red and square, and pointed at once to its four corners. After this, I placed before him an oval silver box, which he said had a shining appear-

ance; and, presently afterwards, that it was round, because it had not corners. The observation, however, which appeared to me most remarkable, was that which related to a white stone mug; which he first called a white basin, but, soon after, recollecting himself, said it was a mug, because it had a handle. These experiments did not give him any pain; and they were made in the presence of his mother, and of Mr. Woodford, a clerk in his majesty's treasury. I held the objects at different distances from his eye, and enquired very particularly if he was sensible of any difference in their situation; which he always said he was, informing me, on every change, whether they were brought nearer to, or carried further from him. I again enquired, both of his mother and himself, whether he had ever before this time, distinguished by sight any sort of object; and I was assured by both that he never had on any occasion; and that when he wished to discover colors, which he could only do when they were very strong, he had always been obliged to hold the colored object close to his eye, and a little on one side, to avoid the projection of the nose. No further experiments were made on that day. On the 1st of January I found that his eye continued quite free both from pain and inflammation, and that he felt no un-easiness on the approach of light. I showed him a table knife; which at first he called a spoon, but soon rectified the mistake, giving it the right name, and distinguishing the blade from the handle, by pointing to each as he was desired. He afterwards called a yellow pocket-book by its name, taking notice of the silver lock in the cover. I held my hand before him which he knew, but could not at first tell the number of my fingers, nor distinguish one of them from another. I then held up his own hand, and desired him to remark the difference between his thumb and fingers; after which he readily pointed out the distinctions in mine also. Dark-colored and smooth objects, were more agreeable to him than those which were bright and rough. On the 3rd of January he saw, from the drawing-room window, a dancing bear in the street; and distinguished a number of boys that were standing round him, noticing particularly a bundle of cloths which one of them had on his head. On the same evening I placed him before a looking-glass, and held up his hand: after a little time he smiled, and said he saw the shadow of his hand, as well as that of his head. He could not then distinguish his features; but, on the following day, his mother having again placed him before the glass, he pointed to his eyes, nose, and mouth, and seemed much gratified with the sight.'

COVE, *v. a. & n. s.* Fr. *couver*; Ital. *covare*; Lat. *cubare*; Arm. *cauf*; Isl. *koje*; Ang.-Sax. *cofe*; Teut. *kore*. To cove is used by Holland, in his translation of Plutarch, in the sense of to incubate; but it now means to arch over. Cove is a small creek; a shelter; a cover; but the first of these meanings is the most in use.

The mosques and other buildings of the Arabians are rounded into domes and *coved* roofs. *See* Burne.

Or with fair hope the brightening scenes improve,
And cheer the dreary wastes at Sidney cove. *Darwin.*

And many a summer flower is there,
And many a shade that love might share,
And many a grotto, meant for rest,
That holds the pirate for a guest;
Whose bark in sheltered cove below
Lurks for the passing peaceful prow.

Byron. Bride of Abydos.

As the fleet dove, who, on the mossy breast
Of a *coved* rock, broods fondling o'er her nest,
Scared by some sudden foe, in tumult springs
From her loved home, and loudly claps her wings.

Symonds' Æneis.

COVE, or CORK HARBOUR, the town of Cove, in the parish of Great Island, and in the barony of Barrymore, is about eight English miles south-west of Cork. During the last French war this village, from its local advantages, grew from comparative insignificance into its present importance; having now a population of 6,500 persons in the town alone, besides 3000 in the remaining part of the parish. The cove or harbour of Cork is probably the noblest natural basin in Europe: its entrance is deep, free, and open, and the harbour inside, where the whole British navy might ride at anchor, completely land-locked. There are three fortifications, one on Spike, one on Hawlboline Island, beside Carlisle Fort. Cove Town stands directly opposite to Hawlboline Island, has a southern aspect, enjoys a mild atmosphere, and is much frequented by invalids. The importance of Cove harbour to a nation like England, decidedly commercial, and exposed by her insular situation to foreign invasion, has long been acknowledged. There are at present steam vessels plying from Cork to Bristol, to Liverpool, to Dublin, and to London.

COVENABLE, *adj.* } Fr. *covenable*. Suit-
COVENABLY, *adv.* } able; fit; proper. Suit-
ably; fitly.

As yett unto this time ye han wel and *covenably*
taught me. *Chaucer. Cant. Tales.*

The *covenable* joyning of every of the sayd parties one with another. *Palsgrave.*

COVENANT, *v. a. & n. s.* } Fr. and Span.
COVENANTE'S, *n. s.* } *convenir*; Ital.
COVENAN'TER, *n. s.* } and Lat. *con-*
CO'VENUS, *adj.* } *venire*, from *con*
CO'VENT, *n. s.* } and *venire*. To

agree; to stipulate; to bargain; to contract; to enter into an agreement with. A covenant, in law, is a contract; a stipulation; an agreement; the writing which contains the terms of an agreement. Covenantee signifies one who is a party to a covenant; one who bargains. He who takes a covenant, who makes himself a party to a covenant, is a covenanter. The word is chiefly applied to those who took the covenant in the reign of the misguided Charles I. Covenous is, fraudulent; collusive; trickish. Covent is the old spelling of convent

They *covenanted* with him for thirty pieces of silver.
Matthew.

And by his *covenant* yave he rekenyng,
Sin that his lord was twenty yere of age.

Chaucer. Prolog. to Cant. Tales.

So wele keepinge the *covenant* in Southwork that was made. *Id. Cant. Tales.*

His lord used commonly so to *covenant* with him, which if at any time the tenant disliked, he might freely depart at his pleasure. *Spenser's State of Ireland.*

I shall but lend my diamond till your return; let there be *covenants* drawn between us.

Shakspeare. Cymbeline.

I wish some means devised for the restraint of these inordinate and *covenous* leases of lands, holden in chief, for hundreds or thousands of years.

Bacon's Office of Alienation.

It had been *covenanted* between him and the king of England that neither of them should treat of peace or truce with the French king.

Hayward on Edward VI.

A *covenant* is a mutual compact, as we now consider it, betwixt God and man; consisting of mercies, on God's part, made over to man; and of conditions, on man's part, required by God.

Hammond's Practical Catechism.

He makes a *covenant* never to destroy
The earth again by flood; nor let the sea
Suppass his bounds. *Milton. Par. Lost.*

The *covenanters* shall have no more assurance of mutual assistance each from other, after the taking of the *covenant*, than they had before.

Oxford Reasons against the Covenant.

By words men come to know one another's minds; by these they *covenant* and confederate. *South.*

Jupiter *covenanted* with him, that it should be hot or cold, wet or dry, calm or windy, as the tenant should direct. *L'Estrange.*

Some men live as if they had made a *covenant* with hell: let divines, fathers, friends, say what they will, they stop their ears against them. *Id.*

Pointing to a heap of sand,
For every grain, to live a year demand;
But ah! unmindful of the effect of time,
Forgot to *covenant* for youth and prime.

Garth's Ovid.

Both of them were respective rites of their admission into the several *covenants*, and the *covenantees* become thereby entitled to the respective privileges.

Ayliffe's Parergon.

COVENANT, in ecclesiastical history, denotes particularly a contract or convention agreed to by the Scots in 1638 for maintaining their religion free from innovation. In 1531 the general assembly of Scotland drew up a confession of faith, or national covenant, condemning episcopal government, which was signed by James I., and which he enjoined on all his subjects. It was again subscribed in 1590 and 1596. The subscription was renewed in 1638, engaging the subscribers by oath to maintain religion in the same state as it was in 1580, and to reject all innovations introduced since that time. This oath annexed to the confession of faith received the name of the covenant; as those who subscribed it were called covenanters.

The Solemn League and Covenant was established in the year 1643, and formed a bond of union between Scotland and England. (See ENGLAND.) It was sworn and subscribed by many in both nations, who thereby solemnly abjured popery and prelacy, and combined together for their mutual defence. It was approved by the parliament and assembly at Westminster, and ratified by the general assembly of Scotland in 1645. The Encyclopædia Metropolitana, in its high-church zeal, calls this transaction 'a compound of hypocrisy and fanaticism, to which may be justly charged much of the tragedy of the

succeeding years.' We are not the advocates of religious covenants imposed by the sword; but this writer seems to have no doubt of the sincerity of the prince and his ministers of whom the following facts are recorded.

King Charles II. disapproved of it when he surrendered himself to the Scots' army in 1646; but in 1650 he declared his approbation both of this and the national covenant, by a solemn oath; and in August of the same year made a farther declaration at Dumferline to the same purpose, which was also renewed on occasion of his coronation, at Scone, in 1651. The covenant was ratified by the parliament of Scotland in this year, and the subscription of it required by every member, without which the constitution of the parliament was declared null and void. But it produced a series of distractions in the subsequent history of that country, and was voted illegal by parliament, and provision made against it. Stat. 14, Car. II. cap. 4. Clarendon gives, at length, the document that was subscribed at Westminster in his History, book vii.

COVENANT, in law, is the agreement of two or more persons to do, or not do, some act or thing contracted between them. Also it is the declaration the parties make, that they will stand to such agreement, relating to lands or other things; and is created by deed in writing, sealed and executed by the parties, or otherwise it may be implied in the contract thereto. And if the persons do not perform their covenants, a writ or action of covenant is the remedy to recover damages for the breach of them.

COVENANT, in theology, is much used in connexion with other terms; as, the covenant of grace, of redemption, &c. These phrases generally describe peculiar theological views of the ways of God, rather than any doctrine simply scriptural.

COVENANT. See SOLEMN LEAGUE.

COVENTRY, a city of great antiquity in Warwickshire, whose origin is involved in much obscurity: some suppose its name to have been derived from a convent which was destroyed by Etric the Traitor in 1016. It is more certain that, about the year 1043, Leofric, earl of Mercia, founded and endowed a convent of Benedictine monks here. It is said, however, that Leofric, receiving some provocation from the inhabitants of the town, loaded them with heavy taxes; and being importuned by his lady, Godiva, to remit them, he consented, upon condition that she should ride naked on horseback from one end of the town to the other. This condition, as it was stipulated by her husband, she is said to have complied with; and having enjoined the citizens not to venture out, or become the spectators of her progress on pain of death, proceeded through the city, concealing her person as well as possible with her fine hair. One citizen only, the legends state, a certain tailor, could not refrain from peeping: the lady's horse neighed, and the tailor paid dearly for his curiosity, being instantly struck blind! A figure of 'peeping Tom' is still preserved and to be seen in an opening at the upper part of a house at the corner of Hertford-street, adjoining the King's Head Inn. There was formerly a portrait of the countess and

Loefric exhibited in one of the windows of Trinity Church; the earl being represented as holding out a scroll or charter, inscribed,

‘I, Luoricke, for the love of thee,
Do make Coventry toll-free.’

In commemoration of the circumstance above detailed, a most splendid procession occasionally takes place on the first day of the great fair, Friday in Trinity week, in which a female clad in a close dress of silk or linen of flesh color, and with long and flowing hair, rides through the city, preceded by guards in armor, and followed by the mayor, sheriffs, and corporation, in their robes, together with the masters of various trading companies, their followers, and magnificent streamers: several bands of music are interspersed through the procession. Its popularity is unabated, and thousands are attracted to witness the pageant whenever it takes place. The procession, as now conducted, commenced in the reign of Charles II. South of the town stood anciently the monastery of Gray Friars, celebrated for the mysteries performed in it on the day of Corpus Christi.

After the conquest the lordship of Coventry devolved on the earls of Chester; subsequently it came into the hands of Henry III. and William de Albany, earl of Arundel; then of Robert de Montalt, and was granted, in default of issue, to Isabel, queen mother of Edward III. with remainder, first, to John of Eltham, afterwards earl of Cornwall, and then to king Edward II. and his heirs for ever. Soon after, 1337, Coventry was annexed to the earldom of Cornwall, and had various immunities granted to it. In 1344 the town was incorporated by Edward III. when a mayor and two bailiffs were chosen. In 1355 the building of the wall round the town commenced, which was not completed until forty years afterwards. Richard II., in 1377, confirmed privileges formerly granted, and in 1385 ratified the charter of Edward III. for building the stone walls, and permitted stone to be taken from his quarry at Cheylesmore for that and other purposes. Two parliaments have been held in this city, one in the great chamber of the priory in 1404, the other in 1450 by Henry VI.; the former acquired the name of *parlamentum inductorum*, in consequence of its excluding all lawyers, or persons skilled in the laws: the latter was held in the chapter-house of the priory, and called *parlamentum diabolieum*, the parliament of devils, owing to the numerous attainders passed therein.

Coventry had at one time to boast a splendid cathedral, adorned in the most costly manner, and supposed to have been built on a similar plan to Litchfield cathedral, having two spires at the west end and one in the centre. The city then possessed a matchless group of churches, all standing within one cemetery. St. Michael's church is at this time, and most justly, the boast of Coventry; its fine tower and spire are scarcely to be equalled in Europe, and are choice examples of English ecclesiastical architecture: the tower is 136 feet three inches high, from which ascends the spire 130 feet nine inches in height. Sir Christopher Wren is said to have spoken of it in the highest terms of admiration. The body of the church is worthy of its superb spire, and is

supposed to have been erected in the time of Henry VI.

Trinity Church is both handsome and capacious, but, being situated so near to St. Michael's, its importance and effect are lost in a great degree. St. Mary Hall is a building of singular interest, especially to the antiquary: it is situated in the immediate vicinity of St. Michael's Church, and was erected in the reign of Henry VI. as a place of meeting for the Trinity guild; it is now chiefly used for civic purposes. The Great Hall is a fine old room seventy-six feet six inches long, thirty feet broad, and thirty-four feet high. In consequence of a thorough reparation being necessary, it has very lately been restored, and judiciously altered in some respects, close attention having been paid to preserving its original character.

A handsome and very celebrated cross, considered one of the stateliest in England, stood in Cross-cheaping, and was taken down in 1771. The free-school was founded in the reign of Henry VIII. by John Hales, esq. and liberally endowed by him. Sir William Dugdale and other very eminent men received their education in this place. Coventry contains several hospitals, and many other buildings of considerable interest and antiquity. This city has, besides its churches, a Roman Catholic place of worship, two Independent chapels, a meeting-house for the Society of Friends, a Unitarian, a Baptist, and a Methodist chapel.

The trade of Coventry and the neighbourhood is chiefly confined to the manufacture of ribands and watches; 3000 looms, and 20,000 manufacturers are supposed to be employed in the former. It is governed by a mayor, ten aldermen, and twenty common-council men, and sends two members to parliament. The right of voting is vested exclusively in persons having served seven years apprenticeship to one and the same trade, within the city and county: the number of free men is nearly 4000. The population of Coventry has latterly very much increased, and is supposed to amount to 24,000. It lies eighteen miles south-east of Birmingham, forty-nine north-west of Oxford, and ninety-one north-west of London.

COVENTRY. There are five townships so called in the United States; one in Connecticut, one in Rhode Island with 2447 inhabitants, a third in New Hampshire, a fourth in Vermont, and a fifth in Pennsylvania.

COVER, <i>v. a. & n. s.</i>	} Fr. <i>couvrir</i> ; It. <i>coprire</i> ; Span. <i> cubrir</i> ; Lat. <i>co-operire</i> . So Junius positively affirms it to be. Yet we may, perhaps, be allowed to look to the north for the etymon; and there we shall find, Isl. & Goth. <i>kofa, caverna</i> ; Sueth. <i>kofia, kuffe, latibulum</i> . A thing, then, that is covered is as though it were hidden in a den or cave. To cover is, to spread one

thing over another; to conceal under a covering; to overwhelm with; to shelter, by interposing something above; to incubate; to couple with a female; to wear a hat as a privilege. Cover is any thing laid over another; a concealment; a shelter; a defence; a place where the fox or hare is supposed to be. As a noun, covert signifies a shelter; a thicket, or hiding place: as an adjective, sheltered; secret; insidious; and, in legal parlance, the state of a woman in marriage. The last of these meanings attaches to the word *coverture*; which also denotes shelter; defence. *Covertly* is secretly; underhandedly. *Covercle* is a lid. *Cover-chief*, which is obsolete, is the name of a covering for the head. For *cover-way*, see *FORTIFICATION*; for *covert-baron* and *covert-feme*, see *LAW*. *Cover-shame* and *cover-slut* are contrivances to conceal infamy and slut-tishness.

The women took and spread a *covering* over the well's mouth. 2 *Sam.* xvii. 19.

The pastures are clothed with flocks; the valleys also are *covered* over with corn. *Psal.* lxx. 13.

Let mine outcasts dwell with thee, Moab; be thou a *covert* to them from the face of the spoilers. *Isaiah* xvi. 4.

There shall be a tabernacle for a shadow in the day-time from the heat, and for a place of refuge, and for a *covert* from the storm and rain. *Id.* iv. 6.

Charity shall *cover* the multitude of sins.

1 *Peter* iv. 8.

This false Arcite somewhat must he nede faime
When he was false to *coveren* his traitourie.

Chaucer. Amélie and false Arcite.

A man shuld also think that God seeth and knoweth al his thoughtes, and al his workes, and to him may nothing be hid ne *covered*. *Id. Cant. Tales.*

A large *coverchief* of threde

She wrapped all about her hede.

Id. Romant of the Rose.

Wel woste thou it will make none

A lityl roundil as a circle,

Para'venture as brode as a *covercle*.

Id. The House of Fame.

Some pleasant houres thy wo may wrap, and the de-
fend and *cover*. *Wynt.*

At last he came unto a gloomy glade,
Covered with boughs and shrubs from heaven's high
light. *Spenser. Faerie Queene.*

Enforst to seeke some *covert* nigh at hand,
A shady grove not farr away they spide,
That promist ayde ile tempest to withstand. *Id.*

Loe, loe! how brave she decks her bounteous
boure

With silken curtens and gold *coverletts*. *Id.*

Yet still Aragnol (so his foe was hight)

Lay lurking *covertly* him to surprize.

Id. Muiopotmos.

Go to thy fellows, bid them *cover* the table, serve in
the meat, and we will come in to dinner.

Shakespeare. Merchant of Venice.

Towards him I made; but he was 'ware of me,
And stole into the *covert* of the wood.

Id. Romeo and Juliet.

Bring some *covering* for this naked soul,
Whom I'll intreat to lead me. *Id. King Lear.*

How can'st thou cross this marriage?—Not honest-ly my lord; but so *covertly*, that no dishonesty shall appear in me. *Id. Much Ado about Nothing.*

Without the bed her other fair hand was,
On the green *coverlet*, whose perfect white
Shewed like an April daisy on the grass.

Id. The Rape of Lucrece.

The *secundine* is but a general *cover*, not shaped according to the parts; the skin is shaped according to the parts.

Bacon.

You are of either side the green to plant a *covert* alley, upon carpenter's work, about twelve foot in height, by which you may go in shade into the garden.

Id.

It may be it is rather the shade, or other *cover-ture*, that they take liking in, than the virtue of the herb.

Id.

The infancy of king Edward VI. and the *cover-ture* of queen Mary, did, in fact, disable them to accomplish the conquest of Ireland. *Davis on Ireland.*

His calm and blameless life

Does with substantial blessedness abound,

And the soft wings of peace *cover* him round. *Corley.*

Thence to the *coverts*, and the conscious groves,

The scenes of his past triumphs and his loves.

Denham.

Cover me, ye pines!

Ye cedars with innumerable boughs

Hide me, that I may never see them more. *Milton.*

The flaming mount appeared

In Dothan, *covered* with a camp of fire.

Id.

It was the hour of night, when thus the Son

Communed in silent walk, then laid him down

Under the hospitable *covert* nigh

Of trees thick interwoven.

Id.

By what best way

Whether of open war, or *covert* guile,

We now debate.

Id.

He saw their shame, that sought

Vain *covertures*.

Id.

In the mean time, by being compelled to lodge in the field, which grew now to be very cold whilst his army was under *cover*, they might be forced to retire.

Clarendon.

Sometimes Providence casts things so, that truth and interest lie the same way; and when it is wrapt up in this *covering*, men can be content to follow it.

South.

Or lead me to some solitary place,

And *cover* my retreat from human race.

Dryden.

That king had conferred the honour of grandee upon him, which was of no other advantage or signification to him, than to be *covered* in the presence of that king.

Id.

Orestes' bulky rage,

Unsatisfied with margins closely writ,

Foams o'er the *covers* and not finished yet.

Id.

Amongst the poets, Persius *covertly* strikes at Nero; some of whose verses he recites with scorn and indignation.

Id.

Instead of her being under *covert baron*, to be under *covert feme* myself! to have my body disabled, and my head fortified.

Id.

This done, the host produced the genial bed,

Which with no costly *coverlet* they spread.

Id.

Does he put on holy garments for a *cover-shame* of lewdness?

Id.

Whilst the hen is *covering* her eggs, the male generally takes his stand upon a neighbour bough within her hearing, and by that means amuses and diverts her with his songs during the whole time of her sitting.

Addison's Spectator.

The deer is lodged; I've tracked her to her *covert*.
Be sure ye mind the word; and when I give it,
Rush in at once, and seize upon your prey.

Id. Cato.

Together let us beat this ample field,
Try what the open, what the *covert* yield.

Pope's Essays.

Raillery and wit serve only to *cover* nonsense with
shame, when reason has first proved it to be mere
nonsense.

Watts.

The fox is a beast also very prejudicial to the hus-
bandman, especially in places that are near forest-
woods and *covert* places.

Mortim. Husb.

By mixing with the concerns of state, he (Lanfranc)
did not lose his religion and conscience, or make them
the *covers* or instruments of ambition; but, temper-
ing the fierce policy by the mild lights of religion,
he became a blessing to the country in which he was
promoted.

Burke.

Great Britain was not there. Almost in despair, I
hope she will never, in any rags and *coversluts* of in-
famy, be seen at such an exhibition.

Id.

Reason now

Takes part with Appetite, and pleads the cause
Perversely, which of late she so condemned;
With shallow shifts and old devices, worn
And tattered in the service of debauch,
Covering his shame from his offended sight.

Cowper.

I had been for some days sculping from *covert* to
covert, under all the terrors of a jail; as some ill-ad-
vised people had uncoupled the merciless pack of the
law at my heels.

Burns.

In short, she was a walking calculation,

Miss Edgeworth's novels stepping from their *covers*,
Or Mrs. Trimmer's books on education.

Or 'Cælebs' Wife,' set out in quest of lovers.

Byron. Don Juan.

COVERDALE (Miles), a celebrated English
divine and reformer, was educated at Cambridge,
and became a canon of the order of St. Augus-
tine. On becoming a Protestant he went abroad,
and in 1532 assisted Tindale in his translation
of the Bible. The first complete English transla-
tion of the Scriptures appeared in 1535, with
his name in the title-page. A second version of
the New Testament was published by him in
1538. Queen Catherine Parr made him her
almoner; and in 1551 he was promoted to the
see of Exeter. He went to Denmark on the ac-
cession of queen Mary, and afterwards to Geneva,
where he joined the other English refugees in
their celebrated version of the Bible. He came
home on the accession of queen Elizabeth, but,
instead of resuming his see, accepted the rectory
of St. Magnus, London Bridge. This he resigned
in 1566, and died May 20, 1567, and lies buried
in St. Bartholomew's church, by the Exchange.
Bishop Coverdale was also the author of The
Christen State of Matrymony, wherein Hus-
bands and Wyfes maye lerne to keep House to-
gether with Love; and other tracts.

COVET, *v. a. & n.* } Fr. *convolter*. Skin-
COVETABLE, *adj.* } ner, Junius, and Me-
COVETING, *n. s.* } nage, agree in deriving
COVETINGLY, *adv.* } these words from low
COVETISE, *n. s.* } Lat. *convolare*. Under
COVETOUS, *adj.* } the word *covetous*, Le-
COVETOUSLY, *adv.* } mon, who refers every-
COVETOUSNESS, *n. s.* } thing to the Greek, says,

ὀπιϋω, *coco*, *cupidus*; under Ital. *coridigiu*, *quasi*

cupidigiu; greedy, eager, desirous: unless we
should prefer *avro*, to *covet*; like the avaricious
man.' To *covet* is, to have an inordinate desire
of. *Covetise*, which is obsolete, is synonymous
with *covetousness*, in the sense of avarice; lust
of money; eagerness of gain. Shakspeare uses
covetousness with the meaning of eagerness, de-
sire, as will be seen in the quotation; but in this
application of the word, I believe that he stands
alone. He also uses *covetous* in a good sense,
to express a laudable anxiety for; and he is
not singular in so doing; but this meaning is
nearly, if not quite, disused; the general use of
the word being confined to inordinate, and con-
sequently, improper desire.

But *covet* earnestly the best gifts. I *Cor.* xii. 31.

The love of money is the root of all evil, which
while some *coveted* after, they have erred from the
faith.

I *Tim.* vi.

An heart they have exercised with *covetous* prac-
tices.

2 *Peter* ii. 14.

Coveties is for to *covet* swiche thinges as thou hast not,
and avarice is to withhold and kepe swiche thinges as
thou hast without rightful nede.

Chaucer. Cant. Tales.

And if that she be foul, thou sayst that she

Coveteth every man that she may see.

Id.

His blinde lust was all his *coveting*.

Id. Legende of Lucrece.

The charge thereof unto a *covetous* spright,

Commanded was, who thereby did attend,

And warily awaited day and night,

From other *covetous* fiends it to defend.

Spenser. Faerie Queene.

Most wretched wight, whom nothing might suffice,
Whose greedy lust did lack in greatest store;
Whose need had end, but no end *covetie*.

Id.

All things *coveting* as much as may be to be like
unto God in being ever; that which cannot hereunto
attain personally, doth seek to continue itself another
way, by offspring and propagation.

Hooker.

If it be a sin to *covet* honour,

I am the most offending man alive.

Shakspeare. Henry VI.

I am yet

Unknown to woman; never was forsworn;

Scarcely have *coveted* what was mine own;

At no time broke my faith.

Id. Macbeth.

If he care not for't, he will supply us easily; if he
covetously reserve it, how shall 's get it?

Id. Timon of Athens.

When workmen strive to do better than well,

They do confound their skill in *covetousness*.

Id. King John.

Sheba was never

More *covetous* of wisdom and fair virtue,

Than this fair soul shall be.

Id. Henry VIII.

Then this desire of nature is not vain

She *covets* not impossibilities;

Fond thoughts may fall into some idle brain,

But one assent of all is ever wise.

Davies.

He that is envious or angry at a virtue that is not his
own, at the perfection or excellency of his neighbour,
is not *covetous* of the virtue, but of its reward and re-
putation; and then his intentions are polluted.

Taylor's Rule of Living Holy.

He that takes pains to serve the ends of *covetousness*,
or ministers to another's lust, or keeps a shop of im-
purities or intemperance, is idle in the worst sense.

Id.

Let never so much probability hang on one side of
a *covetous* man's reasoning, and money on the other,
it is easy to foresee which will outweigh. *Locke.*

Covetousness, and the desire of having in our possession, and under our dominion, more than we have need of, being the root of all evil, should be early and carefully weeded out; and the contrary quality, or a readiness to impart to others, implanted. *Id.*

Covetousness debaseth a man's spirit, and sinks it into the earth. *Tillotson.*

O father! can it be, that souls sublime

Return to visit our terrestrial clime?

And that the generous mind, releas'd by death,

Can evert lazy limbs and mortal breath?

Dryden. Æneid.

While cumbered with my dropping clothes I lay,
The cruel na ion, *covetous* of prey,
Stained with my blood the unhospitalable coast. *Id.*

Whence has the world her magic power?

Why deem we death a foe?

Recoil from weary life's best hour,

And *covet* longer woe? *Cooper.*

O evenings worthy of the gods! exclaimed

The Sabine bard. O evenings, I reply,

More to be prized and *coveted* than yours,

As more illumined, and with nobler truths,

That I, and mine, and those we love, enjoy. *Id.*

Whate'er she saw and *coveted* was brought;
Whate'er she did not see, if she supposed
It might be seen, with diligence was sought,
And when 'twas found straightway the bargain
closed. *Byron. Don Juan.*

COVEY, *n. s.* Fr. *couvée*; Ital. *covata*; Span. *covada*; Lat. *cubo*. A hatch; an old bird with her young ones; a number of birds together.

A flight of wasps and a *corey* of partridges went to a farmer, and begged a sup of him, to quench their thirst. *L'Estrange.*

A *corey* of partridges springing in our front, put our infantry in disorder. *Addison's Frecholder.*

There would be no walking in a shady wood, without springing a *corey* of toasts. *Id. Guardian.*

These are expensive joys, fit for the great,

Of large domains possessed; enough for me

To best the gentle spar-hawk on my fist,

Or fly the partridge from the bristly field,

Retrieve the *corey* with my busy train,

Or with my soaring hobby dare the lark. *Somerville.*

The thundering guns are heard on every side,
The wounded *coreys*, reeling, scatter wide;
The feathered field-mates, bound by Nature's tie,
Sires, mothers, children, in one carnage lie. *Burns.*

COUGH, *v. n., v. a. & n. s.* } Arab. *qubhu*;
COUGHER, *n. s.* } Hin. *kuf*; Goth.

huaf, kof; Swed. *quaf*; Dut. *kuch*. It has also been derived from *κωφωω*, *levo, allevo*. To lighten or ease the breast and lungs by expectoration. Minshew and Skinner are of opinion that the word, like some others, is imitative of the sound produced by the act of coughing. Cough is a sonorous concussion of the thorax, produced by the sudden expulsion of the air through the fauces. It is occasioned by a violent and generally involuntary motion of the respiratory muscles. To cough is to have the lungs convulsed; to eject by a cough.

Ye should have *coughed* when ye com. When lern you curtesy? *Chaucer. Cant. Tales.*

And still he stant under the shot window;
Unto his breast it rough, it was so low;
And soft he *cougheth* with a semisoun. *Id.*

The harbinger of death,

To me I see him ride,

The *cough*, the cold, the gasping breath

Doth byd me to provyde. *Songes and Sonettes.*

'Thou didst drink

The stale of horses, and the gilded puddle

Which beasts would *cough* at.

Shakspeare. Antony and Cleopatra.

In consumptions of the lungs, when nature cannot expel the *cough*, men fall into fluxes of the belly, and then they die. *Bacon's Natural History.*

If any humour be discharged upon the lungs, they have a faculty of casting it up by *coughing*.

Ray on the Creation.

If the matter be to be discharged by expectoration, it must first pass into the substance of the lungs; then into the *aspera arteria*, or *weasand*; and from thence be *coughed* up, and spit out by the mouth.

Wiseman's Surgery.

I *cough* like Horace, and tho' lean, am short.

Pope's Epistles.

For his dear sake long restless nights you bore,
While rattling *coughs* his heaving vessels tore. *Smith.*

A frame so steeld

Dreads not the *cough*, nor those ungenial blasts

That breathe the tertian or fell rheumatism.

Armstrong.

Love's a capricious power; I've known it hold

Out through a fever caused by its own heat,

But be much puzzled by a *cough* and cold,

And find a quinsy very hard to treat.

Byron. Don Juan.

COUGH, in medicine, a convulsion of the lungs, generally occasioned, as a disease, by catarrh. As an accident, a drop of cold water, or a crumb of bread, passing to the tender coat of the wind-pipe, is sufficient to throw the muscles into the most violent agitation: but in catarrh it is generally the acrid serum collected in the lungs that is the immediate cause. See CATARRH and MEDICINE.

COVIN, or γ Old Fr. *covm*. A deceitful CO'VINE, *n. s.* } Agreement between two or more, to the hurt of another.

Wickid Tonge, whiche that the *covine*

Of every lovir can devine

Worste. *Chaucer. Romaunt of the Rose.*

One *covyn* followeth another, and deceit is met with the lyke. *Knight.*

COVING, *n. s.* from *cove*. A term in building, used of houses that project the ground-plot, and the turned projecture arched with timber, lathed and plastered.

COULD. The imperfect preterite of *can*. See CAN. Was able to; had power to.

And if I have done well, and as is fitting the story, it is that which I desired; but if slenderly and meanly, it is that which I *could* attain unto.

2 Mac. xv. 38.

Wel *coude* he sitte on hors, and fayre ride;

He *coude* songes make, and wel endite.

Chaucer. Prolog. to Cant. Tales.

Well mote ye wonder how that noble knight,

After he had so often wounded beene,

Could stand on foot now to renew the fight.

Spenser. Faerie Queene.

What if he did not all the ill he *could*?
Am I obliged by that t' assist his rapines,
And to maintain his murders?

Dryden's Spanish Friar.

COULOMB (Charles Augustus), an eminent French philosopher, was born at Angouleme in 1736. He was sent to Paris at an early age for his education, and, acquiring a partiality for the mathematical sciences, made great proficiency in his favorite study. The profession which his friends or his taste pointed out to him as the most eligible was that of the army; and the branch of the military service in which his previous acquirements could be employed to the greatest advantage, and could lead to the greatest distinction, was that of the engineers. He therefore entered that corps, and was sent out to the West Indies. After an absence of nine years, the unhealthiness of the climate compelled him to return to France, where he soon began to acquire celebrity by his philosophical labors. Before he was admitted into the Academy he submitted a memoir entitled *Sur les Moyens d'executer sous l'eau toutes sortes de Travaux Hydrauliques, sans employer aucun Epuisement*, which procured for him the title of corresponding member. His next memoir was on the theory of simple machines. Coulomb had divided with Sivinden the prize for the best construction of the magnetic needle; and, in the discussions to which some questions connected with the subject led him, his attention had been directed to the effects of torsion, or the resistance which is opposed to the force of magnetism, by the stiffness of the suspended wire. He applied himself, therefore, to the examination of this point, and invented an ingenious machine for measuring with precision the force of torsion. In 1781 he arrived at Paris; and the value of his works being already appreciated by the Academy, he was immediately elected a member. Before the era of the revolution Coulomb was appointed commissary to the king in Brittany, and was employed in examining all the canals and public works in that province. When the regal government was overthrown, and the civil troubles commenced in France, our author retired to an estate which he possessed near Blois. In 1798 he read to the national institute, which succeeded to the Academy, a paper containing the result of many experiments he had made, to determine the different quantities of work which the labor of a man can execute, according to the different modes in which his force is employed. In 1800 he contributed to the Transactions of the institute a valuable paper, entitled *Determination Theorique et Experimentale des Forces qui ramentent Differentes Aiguilles Aimantées a Saturation, a leur Meridien Magnetique*. His next, and his last paper of any importance, had for its object to determine the cohesion of fluids: it was published in the same volume of the memoirs of the institute with the preceding, and is reckoned among the most ingenious of his numerous speculations. After the elevation of Buonaparte to the head of the French government, Coulomb was recalled to Paris, and appointed one of the inspectors-general of studies; an office which, though undertaken with

reluctance, he filled with credit and usefulness. He died on the 23rd of August 1806.

COULTER, or } Fr. *coultrre*; Ital. *cultro*;
COULTER, n. s. } Ang.-Sax. *cultor*; Dutch,
kultor; Lat. *cultter*. The sharp iron of the plough, which cuts the earth perpendicular to the share.

The Israelites went down to sharpen every man his share, and his *coulter*, and his ax, and his mattock.
1 Samuel xiii. 20.

He shoke of shere, and *coulter* off drove,
And hanged his harness on a pinne.

Chaucer. Cant. Tales

A smith man called Dan Gerveis,
That in his forge smithed plow harnais;
He sharpeth share and *cultre* besily. *Id.*

Like damask roses' bud
Cast from the stalk, or like
In field to purple flowre,
Which languisheth, being shred
By *cultter* as it past.

Spenser. The Mourning Muse.

Literature is the grindstone to sharpen the *coulters*,
to whet their natural faculties.

Hammond on Fundamentals.

The plough for stiff clays is long and broad; and the *coulter* long, and very little banding, with a very large wing. *Mortimer.*

With *coulters* bright the rushy sward bisect,
And in new veins the gushing rills direct. *Darwin.*

COUNCIL, n. s. } Fr. *conseil*; It.
COUNCILIST, n. s. } and Sp. *concilio*;
COUNCIL-BOARD, n. s. } Latin, *concilium*.
COUNCIL-BOOK, n. s. } Council signifies,
COUNCIL-CHAMBER, n. s. } a body of persons
COUNCIL-HOUSE, n. s. } met together to
COUNCIL-MAN, n. s. } consult and deli-
COUNCIL-TABLE, n. s. } berate; the act of

public deliberation; the body of privy counsellors. The council-board and council-table are synonymous, and mean the board, or table, in the council-chamber, or house, at which sit the persons in council, whose proceedings and resolves are entered in the council-book. Council-man is a member of a council. Milton uses the word councilist to denote a person well read in the acts of the councils. Our older writers used council and counsel indiscriminately; but the latter is now applied only to the advice given.

The chief priests, and all the *council*, sought false witness. *Matthew xxvi. 59.*

Thus art thou of my *conseil* out of doute,
And now thou woldest falsly ben aboute
To love my lady whom I love and serve.

Chaucer. Cant. Tales.

Without the knowledge
Either of king or *council*, you made bold
To carry into Flanders the great seal.

Shakspeare. Henry VIII.

He hath commanded,
To-morrow morning to the *council-board*,
He be convened. *Id.*

They being thus assembled, are more properly a *council* to the king, the great *council* of the kingdom, to advise his majesty in those things of weight and difficulty, which concern both the king and the people, than a court. *Bacon's Advice to Villiers.*

The scepter'd heralds call

To council in the city gates : anon
Grey-headed men and grave, with warriors mixed,
Assemble, and harangues are heard. *Milton.*

Wherewith he went at heaven's high council-table
To sit the midst of Trinal Unity. *Id.*

When slip-money was transacted at the council-board,
they looked upon it as a work of that power they were obliged to trust. *Clarendon.*

Soon after, by my advice, he was put to the banker in Lombard Street ; is now a common-council-man, will shortly be deputy of the ward, and may in time bid fair for the chair. *Tatler.*

In histories composed by politicians, they are for drawing up a perpetual scheme of causes and events, and preserving a constant correspondence between the camp and the council-table. *Addison's Spectator.*

And Pallas, if she broke the laws,
Must yield her for the stronger cause ;
A shame to one so much adored
For wisdom at Jove's council-board. *Swift.*

Some borrow all their religion from the fathers of the Christian church, or from their synods or councils. *Watts.*

We see the dame, in rustic pride,
A bunch of keys to grace her side,
Stalking across the well-swept entry,
To hold her council in the pantry. *Sheridan.*

COUNCIL AND SESSION, LORDS OF, the supreme judges of the highest court in Scotland. See SCOTLAND.

COUNCIL, AULIC. See AULIC.

COUNCIL, COMMON, in the city of London, is a court wherein are made all by-laws which bind the citizens. It consists, like the parliament, of two houses ; an upper one composed of the lord mayor and aldermen, and a lower of a number of common-council-men, chosen by the several wards, as representatives of the body of the citizens. See LONDON.

COUNCIL, OECUMENICAL, or GENERAL, is an assembly supposed to represent the universal church. The Romanists reckon eighteen of them ; Bullinger, in his treatise De Conciliis, six ; Dr. Prideaux, and Bp. Beveridge, eight, which he says are all the general councils which have ever been held since the time of the first Christian emperor. They are as follows :—1. The council of Nice, held in the reign of Constantine the Great, on account of the heresy of Arius. 2. The council of Constantinople, called under the reign and by the command of Theodosius the Great, for much the same end that the former council was summoned. 3. The council of Ephesus, convened by Theodosius the younger, at the suit of Nestorius. 4. The council of Chalcedon, held in the reign of Martianus, which approved of the Eutychian heresy. 5. The second council of Constantinople, which was assembled by the emperor Justinian, and condemned the three chapters taken out of the book of Theodorus of Mopsuestia, having first decided that it was lawful to anathematise the dead. Some authors tell us, that they likewise condemned the several errors of Origen about the Trinity, the plurality of worlds, and the pre-existence of souls. 6. The third council of Constantinople, held by the command of Constantius Pogonatus, in which they received the definitions of the first five

general councils, and particularly that against Origen and Theodorus of Mopsuestia. 7. The second Nicene council. 8. The fourth council of Constantinople, assembled when Louis II. was emperor of the West. Their regulations are contained in twenty-seven canons, the heads of which are set down by M. Dupin, to whom the reader is referred.

COUNCIL OF WAR, an assembly of principal officers of an army or fleet, occasionally called by the general or admiral to concert measures for their conduct, with regard to sieges, retreats, engagements, &c.

COUNCIL, PRIVY. See PRIVY-COUNCIL.

CO-UNDERSTANDING, *n. s.* from *con* and *understanding*. Mutual understanding.

Provided there be a reciprocal knowledge and co-understanding between the parties. *Hoell.*

CO-U'NE, *v. a.* } From *con* and
CO-UNI'TE, *v. a. & adj.* } unite. To unite.
United.

CO'UNSEL, *v. a. & n. s.* } Fr. *conseiller* ;
CO'UNSELLABLE, *adj.* } Lat. *consilior*. To
CO'UNSELLING, *n. s.* } counsel is to give
CO'UNSELLOR, *n. s.* } advice. Counsel
CO'UNSELLORSHIP, *n. s.* } is, advice ; consul-
CO'UNSEL-KEEPER, *n. s.* } tation ; delibera-
CO'UNSEL-KEEPING, *n. s.* } tion ; prudence ;
secrecy ; formerly, purpose, design ; a person who pleads a cause in court for another. A counsellor signifies, an adviser ; confidant ; one of the king's privy council ; one who gives advice and pleads in law cases. Counsellorship denotes the office of a privy counsellor. He who is willing to receive advice, or counselling, is counsellable ; and he who keeps a secret that is confided to him is a counsel-keeper. Persons of these two classes are less numerous than could be wished. That which preserves secrecy is counsel-keeping.

His mother was his counsellor to do wickedly.
2 Chron. xxii. 3.

The counsel of the Lord standeth for ever, the thoughts of his heart to all generations.
Psaln xxxiii. 11.

O how comely is the wisdom of old men, and understanding and counsel to men of honour.
Eccles. xxv. 5.

There is no wisdom, nor understanding, nor counsel, against the Lord.
Prov. xxi. 30.

She would be a counsellor of good things, and a comfort in cares.
Wisdom viii. 9.

Men may *conseille* a woman to be on,
But *conselling* is no commandment.
Chaucer. Cant. Tales.

For troste wel that comunly these *consellours* ben flaterers, namely the *consillours* of grete lordes, for they enforen hem alway rather to speken pleasant wordes, enclining to the lordes lust, than wordes that ben trewe or profitable.
Id.

They all confess, therefore, in the working of that first cause, that *counsel* is used, reason followed, and a way observed.
Hooker.

Truth shall nurse her ;
Holy and heavenly thoughts still *counsel* her.
Shakespeare. Henry VIII.

I hold as little *counsel* with weak fear
As you, or any Scot that lives. *Id. Henry IV.*

The players cannot keep *counsel*; they'll tell all.

Id. Hamlet.

Your hand, a covenant; we will have these things set down by lawful *counsel*. *Id. Cymbeline.*

Death of thy soul! Those linen cheeks of thine Are *counsellors* to fear. *Id. Macbeth.*

And, look, whether the fiery Trigon, his man, be not lisping to his master's old tables; his note-book, his *counsel-keeper*. *Id. 2 Henry IV.*

Curtained with a *counsel-keeping* care.

Id. Titus Andronicus.

There is danger of being unfaithfully *counselled*, and more for the good of them that *counsel* than for him that is *counselled*. *Bacon.*

There is as much difference between the *counsel* that a friend giveth, and that a man giveth himself, as there is between the *counsel* of a friend and of a flatterer. *Id.*

For the advocates and *counsel* that plead, patience and gravity of learning is an essential part of justice; and an overspeaking judge is no well-tuned cymbal. *Id.*

Of the great offices and officers of the kingdom, the most part are such as cannot well be severed from the *counsellorship*. *Id.*

He supports my poverty with his wealth, and I *counsel* and instruct him with my learning and experience. *Taylor.*

In such green palaces the first kings reigned,
Slept in their shades, and angels entertained;
With such old *counsellors* they did advise,
And by frequenting sacred groves grew wise.

Waller.

Bereave me not,
Whereon I live, thy gentle looks, thy aid,
Thy *counsel*, in this uttermost distress. *Milton.*

Very few men of so great parts were more *counsel-able* than he; so that he would seldom be in danger of great errors, if he would communicate his own thoughts to disquisition. *Clarendon.*

The less had been our shame,
The less his *counselled* crime which brands the Grecian name. *Dryden's Fables.*

A *counsellor* bred up in the knowledge of the municipal and statute laws, may honestly inform a stout prince how far his prerogative extends.

Dryden's Juvenal, Dedication.

If in a multitude of *counsellors* there is safety, we ought to think ourselves the securest nation in the world. Most of our garrets are inhabited by statesmen, who watch over the liberties of their country, and make a shift to keep themselves from starving, by taking into their care the properties of their fellow-subjects. *Addison. Spectator.*

What says my *counsel* learned in the law? *Pope.*

There waiter Dick, with Bacchanalian lays,
Shall win his heart, and have his drunken praise,
His *counsellor* and bosom friend shall prove,
And some street-pacing harlot his first love.

Cowper.

Unknown to me the object of her grief—
I dare not *counsel*, did she ask relief;
Yet may the wish no vain intrusion prove,
To share her grief, for all who shared her love.

Sheridan.

He died: and most unluckily, because
According to all hints I could collect
From *counsel* learned in those kind of laws,
(Although their talk's obscure and circumspect)
His death contrived to spoil a charming cause.

Byron. Don Juan.

COUNSEL, or ADVOCATES, in English courts of law, are of two degrees, BARRISTERS, and SERJEANTS. See those articles. From both these degrees some are usually selected to be his majesty's counsel, learned in the law; the two principal of whom are called his attorney-general, and solicitor-general. It is now customary to grant letters patent of precedence to such barristers as the crown thinks proper to honor with that mark of distinction: whereby they are entitled to such rank and pre-audience as are assigned in their respective patents; sometimes next after the king's attorney-general, but usually next after his majesty's counsel next being. These, as well as the queen's attorney and solicitor-general, rank promiscuously with the king's counsel; and, together with them, sit within the bar of their respective courts. The first king's counsel, under the degree of serjeant, was Sir Francis Bacon, who was made so, honoris causa, without either patent or fee. And all other serjeants and barristers, indiscriminately (except in the court of common pleas, where only serjeants are admitted,) may take upon them the protection and defence of any suitors, whether plaintiff or defendant, who are therefore called their clients,—like the dependents on the ancient Roman orators. These, indeed, practised gratis, for honor merely, or at most for the sake of gaining influence; and so likewise it is established that a counsel can maintain no action for his fees, which are given not as *locatio vel conductio*, but as *quiddam honorarium*; not as a salary, or hire, but as a mere gratuity, which a counsellor cannot demand without doing wrong to his reputation,—as is also laid down with regard to advocates in the civil law, whose honorarium was directed, by a decree of the senate, not to exceed in any case 10,000 sesterces, or about £80 of English money. And in order to encourage due freedom of speech in the lawful defence of their clients, and at the same time to check the unseemly licentiousness of prostitute and illiberal men, it has been holden that a counsel is not answerable for any matter by him spoken relative to the cause in hand, and suggested in the clients instructions, although it should reflect upon the reputation of another, and even prove absolutely groundless; but if he mentions an untruth of his own invention, or even upon instructions, if it be impertinent to the cause in hand, he is then liable to an action from the party injured. And counsel guilty of deceit and collusion are punishable by the statute Westm. 13 Edw. 1. cap. 28, with imprisonment for a year and a day, and perpetual silence in the courts; a punishment still sometimes inflicted for gross misdemeanors in practice.

COUNSELLOR AT LAW, a person retained by a client to plead his cause in a public court of judicature. See ADVOCATE, BARRISTER, COUNSEL, and SERJEANT

COUNSELLOR, PRIVY. See PRIVY-COUNSELLOR.

COUNT, <i>v. a., v. n., & n. s.</i>	} Fr. <i>compter</i> ; It. <i>contare</i> ; Sp. <i>contar</i> ; Latin <i>computare</i> , from <i>con</i> and <i>putare</i> .
CO'UNTABLE, <i>adj.</i>	
CO'UNFLESS, <i>adj.</i>	
CO'UNTFER, <i>n. s.</i>	
CO'UNTING-HOUSE, <i>n. s.</i>	

To number up ; to preserve a reckoning ; to calculate ; to compute ; to place to an account ; to estimate ; to found an account or scheme, in which case it takes *upon* after it. Count is, number ; the number summed up ; estimation ; in law, a charge in an indictment, or a declaration in pleading. As a noun, counter signifies an imitative piece of money, used in reckoning ; contemptuously, money ; the long table on which goods are sold in a shop ; the part of a horse's fore hand that lies between the shoulder and under the neck ; the name of some prisons in London ; an auditor ; an abbreviation of encounter. For the adverb, see COUNTER. Counting-house is a room appropriated by merchants and traders to their books and accounts, and to the transaction of their business when they are at home.

He believed in the Lord, and he *counted* it to him for righteousness. *Genesis* xv. 6.

Count not thine handmaid for a daughter of Belial. *1 Sam.* i.

And let no wylt thy woe seeke to withholde : But *count* thee worthy (wretche !) of sorrows store. *Sackville.*

For from the day that he thus did it leave, Amongst all knights he blotted was with blame, And *counted* but a recreant knight with endless shame. *Spenser. Faerie Queene.*

he to his closet went, where all his wealth Lay hid ; thereof she *countlesse* summes did reare, The which she meant away with her to beare. *Id.*

And fully setteth his felicity, *Counting* it fairer than it is indeed, And yet indeed her fairness doth exceed. *Id. Hymn in honor of Beauty.*

That we up to your palaces may mount, Of blessed saints for to increase the *count*. *Id. Epithal.*

The evils which you desire to be recounted are very many, and almost *countable* with those which were hidden in the basket of Pandora. *Id. Ireland.*

When once it comprehendeth any thing above this, as the differences of time, affirmations, negations, and contradictions in speech, we then *count* it to have some use of natural reason. *Hooker.*

Here thro' this grate I can *count* every one, And view the Frenchmen. *Shakspeare. Henry VI.*

By my *count*, I was your mother much upon these years. *Id. Romeo and Juliet.*

When Marcus Brutus grows so covetous, To lock such rascal *counters* from his friends, Be ready, gods ! with all your thunder-bolts Dash him to pieces. *Id. Julius Cæsar.*

Ay, tear for tear, and loving kiss for kiss, Thy brother Marcus tenders on thy lips : O were the sum of these that I should pay *Countless* and infinite, yet would I pay them. *Id. Titus Andronicus.*

Bear the sea's sand in memory, Earth's grass, and the stars in sky, The little moats which mounted Hang in the beams of Phæbus' eye, And never can be *counted*. *Davies.*

Nor shall I *count* it heinous to enjoy The publick marks of honour and reward Conferred upon me. *Milton's Agonistes.*

Some modern zealots appear to have no better knowledge of truth, nor better manner of judging it, than by *counting* noses. *Shaftesbury.*

Not barely the plowman's pains is to be *counted* into the bread we eat ; the labour of those who broke the oxen, must all be charged on the account of labour. *Locke.*

Men in trade seldom think of laying out money upon land, till their profit has brought them in more than their trade can well employ ; and their idle bags, cumbering their *counting-houses*, put them upon emptying them. *Id.*

All the virtues that have been ever in mankind are to be *counted* upon a few fingers ; but his follies and vices are innumerable, and time adds hourly to the heap. *Swift.*

I think it a great error to *count* upon the genius of a nation, as a standing argument in all ages. *Id.*

You would not wish to *count* this man a foe ! In friendship, and in hatred, obstinate *Philips's Briton.*

In half-whipt muslin needles useless lie, And shuttlecocks across the *counter* fly. *Gay's Trivia.*

And man, whose heaven-erected face The smiles of love adorn, Man's inhumanity to man Makes *countless* thousands mourn ! *Burns.*

Nor deems he wiser him, who gives his noon To miss, the mercer's plague, from shop to shop Wandering and littering with unfolded silks The polished *counter*, and approving none, Or promising with smiles to call again. *Id.*

A king sate on the rocky brow Which looks o'er sea-born Salamis ; And ships, by thousands, lay below, And men in nations ;—all were his ! He *counted* them at break of day— And when the sun set where were the *Byron. Juan.*

COUNT, *n. s.* } Fr. *comte* ; Ital. ;
 CO'UNTESS, *n. s.* } Sp. *conde* ; Lat. *comes*. A
 CO'UNTY, *n. s.* } foreign title of nobility, equivalent to that of earl. County was the old designation of a nobleman, as may be seen in our old writers ; but the term has long been obsolete. Countess is the feminine of count.

Wost thou (quod he) wher this be wife or maide, Or queene or *countesse*, or of what degree ? *Chaucer. Legend of Good Women.*

Princes and *counties* ! surely a princely testimony, a goodly *count* comfekt ! *Shakspeare. Much Ado about Nothing.*

The gallant, young, and noble gentleman, The *county* Paris. *Id. Romeo and Juliet.*

I take it, she that carries up the train, Is that old noble lady, the duchess of Norfolk.— It is, and all the rest are *countesses*. *Id. Henry VIII.*

He made Hugh Lupus *county* palatine of Chester, and gave that earldom to him ; and his heirs, to hold the same, ita liberè ad gladium, sicut rex tenebat Angliam ad coronam. *Davies.*

It is the peculiar happiness of the *countess* of Abingdon to have been so truly loved by you while she was living, and so gratefully honoured after she was dead. *Dryden.*

Shire is a Saxon word, signifying a division ; but a *county*, *comitatus*, is plainly derived from *comes*, the *count* of the Franks. *Blackstone.*

COUNT, as a title, properly signifies a nobleman who possesses a domain erected into a county. See VISCOUNT. English and Scottish counts we distinguish by the title of earls ; foreign ones still retain their proper name. The dignity of a count is a medium between that

of a duke and a baron. At one period, most plenipotentiaries and ambassadors assumed the title of counts; and anciently, all generals, counsellors, judges, and secretaries of cities under Charlemagne were called so; the distinguishing character of a duke and count being this, that the latter had but one town under him, but the former several. A count has a right to bear on his arms a coronet, adorned with three precious stones, and surmounted with three large pearls, whereof those in the middle and extremities of the coronet advance above the rest.

Counts were originally lords of the court, or of the emperor's retinue, and had their name comites, à comitando, or à comiendo: hence those who were always in the palace, or at the emperor's side, were called counts palatine, or comites à latere. See PALATINE. In the times of the commonwealth, comites, among the Romans, was a general name for all those who accompanied the proconsuls and proprators into the provinces, there to serve the commonwealth; as the tribunes, prefects, scribes, &c. Under the emperors comites were the officers of the palace. The origin of what we now call counts seems owing to Augustus, who took several senators to be his comites, as Dion observes, i. e. to accompany him in his voyages and travels, to assist him in the hearing of causes, which were to be judged with the same authority as in full senate: but this title was rather a mark of office than of dignity; and Constantine was the first who converted it into an honorary name. The Franks, Germans, &c. passing into Gaul and Germany, did not abolish the form of the Roman government; and as the governors of cities and provinces were called comites, (counts), and dukes, (dukes), they continued to be called so. Under the last or the second race of French kings, their dignity was made hereditary, and when Hugh Capet came to the crown his authority was not sufficient to oppose their encroachments. By degrees most of the counties were re-united to the crown. William the Conqueror, as Camden observes, gave the dignity of counts in fee to his nobles, annexing it to this or that county or province, and allotting for their maintenance a certain proportion of money, arising from the prince's profits in the pleadings and forfeitures of the provinces. In France at first, there was no clause in the patent of erection, intimating the reversion of the county to the crown in default of heirs male; but Charles IX., to prevent their becoming too numerous, ordained that duchies and counties, in default of heirs male, should return to the crown. The point of precedence between counts and marquises has been formerly much controverted: the reason was, that there were counts who were peers of France, but no marquises. But the point is now given up, and marquises take precedence; though anciently, when counts were governors of provinces, they were on a level even with dukes.

COUNT, in law, denotes the original declaration in a real action; as the declaration is in a personal one: the libellus of the civilians answers to both.—Yet count and declaration are sometimes confounded, and used for each other; as count in debt, count in appeal, &c.

COUNT-WHEEL, in the striking part of a clock, a wheel which moves round once in twelve or twenty-four hours. It is sometimes called the locking-wheel. See CLOCK.

CO'UNTE'NANCE, v. a. & n. s. } Fr. *contenance*; Ital. *continenza*;
CO'UNTE'NANCER, n. s. }
CO'UNTE'NANCING, n. s. }

Span. *continenca*; Lat. *continere*. To encourage; to support; to patronise. The cast of the features; the look; composure of face; in which case it is preceded by the verb to *keep*; confidence of mien, generally with *in* or *out of* before it, as, in countenance, out of countenance; expression of the feelings, as visible on the face; support; patronage; superficial appearance; resemblance. Countenancer is one who affords countenance to; countenancing is the act of affording countenance to.

Neither shalt thou countenance a poor man in his cause. *Ecclesiastes* xxiii. 3.

A man came unto me, and his countenance was like the countenance of an angel of God, very terrible. *Judges* xiii. 6.

As I may best I wol my wo endure :
Ne make no countenance of hevinesse,
That folk of you may demen harme or gesse. *Chaucer. Cant. Tales.*

But yet her countenance was so gled,
And she so fewe yris bed,
As any ladie that was there. *Id. Dream.*

Each to these ladies love did countenance,
And to his mistress each himself strove to advance. *Spenser. Faerie Queene.*

Yet the stout fairy, 'mongst the midstest crowd,
Thought all their glory vain in knightly view,
And that great princess too, exceeding proud,
That to strange knight no better countenance allowed. *Id.*

The salvage nation feele her secret smart,
And read her sorrow in her countenance sad. *Id.*

The election being done, he made countenance of great discontent thereat. *Ascham's Schoolmaster.*

The church of Christ, which held that profession which had not the publick allowance and countenance of authority, could not use the exercise of the Christian religion but in private. *Hooker.*

The night beginning to persuade some retiring place, the gentlewoman, even out of countenance before she began her speech, invited me to lodge that night with her father. *Sidney.*

Malcolm! Banquo!
As from your graves rise up, and walk like sprites,
To countenance this horreur. *Shakespeare. Macbeth.*

Well, Suffolk, yet thou shalt not see me blush,
Nor change my countenance for this arrest :
A heart unspotted is not easily daunted. *Id. Henry VI.*

Bianca's love
Made me exchange my state with Tranio,
While he did bear my countenance in the town. *Id. Taming of the Shrew.*

Now then we'll use
His countenance for the battle; which being done,
Let her who would be rid of him devise
His speedily taking off. *Id. King Lear.*

We will not make your countenance to fall by the answer ye shall receive. *Bacon's New Atlantis.*

So spake our sire, and by his countenance seemed
Entering on studious thoughts abstruse. *Milton.*

This conceit, though *countenanced* by learned men, is not made out either by experience or reason.

Browne.

Their best friends were out of *countenance*, because they found that the imputations which their enemies had laid upon them, were well grounded. *Clarendon.*

It is plain, that shaking off a power, which force, and not right, hath set over any one, though it hath the name of rebellion, yet is no offence before God, but is that which he allows and *countenances*, though even promises and covenants, when obtained by force, have intervened. *Locke.*

I do not remember that, in all my conversation with him, I ever saw him once angry, or to be so far provoked as to change colour or *countenance*, or tone of voice. *Id.*

To whom, with *countenance* calm, and soul sedate, Thus Turnus. *Dryden's Æneid.*

She smiled severe; nor with a troubled look,
Or trembling hand, the funeral present took;
Even kept her *countenance*, when the lid removed
Disclosed the heart unfortunately loved. *Id. Fables.*

If the outward profession of religion and virtue were once in practice and *countenance* at court, a good treatment of the clergy would be the necessary consequence. *Swift.*

If those preachers would look about, they would find one part of their congregation out of *countenance*, and the other asleep. *Id.*

The two great maxims of any great man at court are, always to keep his *countenance*, and never to keep his word. *Id.*

This national fault, of being so very talkative, looks natural and graceful in one that has grey hairs to *countenance* it. *Addison.*

This is the magistrate's peculiar province, to give *countenance* to piety and virtue, and to rebuke vice and profaneness. *Atterbury.*

Oppressed by thee (Poverty), the son of genius, whose ill-starred ambition plants him at the tables of the fashionable and polite, must see, in suffering silence, his remark neglected, and his person despised, while shallow greatness, in his idiot attempts at wit, shall meet with *countenance* and applause. *Burns.*

A father, whose authority, in show
When most severe, and mustering all its force,
Was but the graver *countenance* of love. *Cowper.*

The allies of ministry (those I mean who supported some of their measures, but refused responsibility for any) endeavoured to undermine their credit, and to take ground that must be fatal to the success of the very cause which they would be thought to *countenance*. *Scridan.*

CRAET. O to be sure! she has herself the oddest *countenance* that ever was seen; 'tis a collection of features from all the different countries of the globe. *Id.*

COUNTER, *adv.* Fr. *contre*; Lat. *contra*. Contrary to, in which case it generally has the verb *run* before it; the wrong way; contrariwise; the face, but this sense is obsolete. Counter is much used, both before nouns and verbs, to signify opposite to, as counter-plea, counter-petition.

How cheerfully on the false trail they cry,
Oh, this is *counter*, you false Danish dogs!

Shakespeare. Hamlet.

They hit one another with darts, as the other do with their hands, which they never throw *counter*, but at the back of the flyer. *Sandys' Journal.*

A man, whom I cannot deny, may oblige me to use persuasions to another, which, at the same time I am

speaking, I may wish may not prevail on him: in this case, it is plain, the will and the desire run *counter*. *Locke.*

That design was no sooner known, but others of an opposite party were appointed to set a *counter*-petition on foot. *Clarendon.*

Shall we erect two wills in God's, and make the will of his purpose and intention *run counter* to the will of his approbation? *South.*

The profit of the merchant, and the gain of the kingdom, are so far from being always parallels, that frequently they *run counter* one to the other. *Child on Trade.*

COUNTERACT, *v. a.* } From counter and
COUNTERACTION, *n. s.* } act. To hinder any thing from its effect by contrary agency.

In this case we can find no principle within him strong enough to *counteract* that principle, and to relieve him. *South.*

The *counteraction* of a false principle, or a stubborn partiality. *Johnson.*

Liberal, not lavish, is kind Nature's hand;
Nor was perfection made for man below.

Yet all her schemes with nicest art are planned,
Good *counteracting* ill, and gladness woe. *Beattie.*

Hence in respect to moving to the right or left these percussions *counteract* each other, but they coincide in respect to the progression of the fish. *Darwin.*

COUNTER-ATTRACTION, *n. s.* From counter and attraction. Opposite attraction.

Attractions of either kind are less perspicuous and less perceptible, through a variety of *counter-attractions* that diminish their effect. *Shenstone.*

COUNTERBALANCE, *v. a.* & *n. s.* To weigh against; to act against with an opposite weight; to reduce to an equilibrium. Opposite weight; equivalent power; that which holds another thing in equilibrium.

There was so much air drawn out of the vessel, that the remaining air was not able to *counterbalance* the mercurial cylinder. *Boyle.*

Few of Adam's children are not born with some bias, which it is the business of education either to take off or *counterbalance*. *Locke.*

Money is the *counterbalance* to all other things purchasable by it, and lying, as it were, in the opposite scale of commerce. *Id.*

But peaceful kings, o'er martial people set,
Each other's poise and *counterbalance* are.

Dryden's An. Mirab.

It may be asked,—whether the inconveniences and ill effects which the world feels, from the licentiousness of this practice, are not sufficiently *counterbalanced* by the real influence it has upon men's lives and conduct? that if there was no evil-speaking in the world, thousands would be encouraged to do ill, and would rush into many indecorums, like a horse into the battle, were they sure to escape the tongues of men. *Sterne.*

The English owed to the virtue of this stranger (Lanfranc), and the influence he had on the king, the little remains of liberty they continued to enjoy; and at last such a degree of his confidence, as in some sort *counterbalanced* the severities of the former part of his reign. *Burke.*

COUNTER-BOND, *n. s.* From counter and bond. A counter security.

COUNTER-BUFF, *v. a.* & *n. s.* From counter and buff. To impel a direction contrary to that which was given by the original impulse; to

strike back. A blow in an opposite direction ; a stroke which makes an object recoil.

He at the second gave him such a *counterbuff*, that, because Phalantus was not to be driven from the saddle, the saddle with broken girths was driven from the horse. *Sidney.*

Go, captain Stub, lead on, and show
What house you come of, by the blow
You give Sir Quintin, and the cuff
You scape o' the sandbags *counterbuff*. *Ben Jonson.*

The giddy ship, betwixt the winds and tides
Forced back and forwards, in a circle rides,
Stunned with the different blows ; then shoots amain,
Till *counterbuffed* she stops, and sleeps again. *Dryden.*

CO'UNCERCAST, *n. s.* } From counter, a
CO'UNCERCASTER, *n. s.* } sham piece of mone-
y, and cast, to devise. Countercast is a con-
temptuous designation of an arithmetician ; a
book-keeper ; a keeper of accounts ; a reckoner.

So as they past together on their way,
He gan devise this *countercast* of slight.
Spenser. Faerie Queene.

I, of whom his eyes had seen the proof
At Rhodes, at Cyprus, must be led and calmed
By debtor and creditor, this *countercaster*.
Shakspeare. Othello.

CO'UNCERCHANGE, *v. a. & n. s.* From
counter and change. To give reciprocally. Ex-
change ; reciprocation.

She, like harmless lightning, throws her eye
On him, her brothers, me, her master, hitting
Each object with a joy. The *counterchange*
Is severally in all. *Id. Cymbeline.*

That hearts can easily *counterchanged* be. *T. Hall.*

CO'UNCERCHARM, *v. a. & n. s.* From
counter and charm. To disenchant ; to destroy
the effect of a charm. That which has the power
of dissolving a charm.

Like a spell it was to keep us invulnerable, and
so *countercharm* all our crimes, that they should only
be active to please, not hurt us. *Decay of Piety.*

Now touched by *countercharms* they change again,
And stand majestic, and recalled to men.
Pope's Odyssey.

CO'UNCERCHECK, *v. a. & n. s.* From
counter and check. To oppose ; to stop with
sudden opposition. Stop ; rebuke.

To *countercheck* that sword, else like to conquer all.
Drayton.

If again I said his beard was not well cut, he would
say I lye : this is called the *countercheck* quarrelsome.
Shakspeare.

CO'UNCERDISTINCTION, *n. s.* From
counter and distinction. Contradistinction.

I call it moral in *counterdistinction* to philosophi-
cal or physical. *H. More.*

COUNTERDRAW, *v. a.* From counter and
draw. With painters, to copy a design or
painting by means of a fine linen cloth, an oiled
paper, or other transparent matter, whereon the
strokes, appearing through, are traced with a
pencil.

COUNTER-ERMINE, in heraldry, is the
contrary of ermine, being a black field with
white spots.

COUNTEREVIDENCE, *n. s.* From counter
and evidence. Testimony by which the de-
position of some former witness is opposed.

Sense itself detects its more palpable deceptions by
a *counter-evidence*, and the more ordinary impostures
seldom outlive the first experiments. *Glanv. Seeps.*

We have little reason to question his testimony
in this point, seeing it is backed by others of good
credit ; and all because there is no *counter-evidence*,
nor any witness, that appears against it.

Burnet's Theory of the Earth.

CO'UNCERFEIT, *v. a., n., n. s.* Fr. *contre-*
CO'UNCERFEITER, *n. s.* [*& adj.*] } *faivre* ; Ital.
CO'UNCERFEITLY, *adv.* } *contraffarre* ;
CO'UNCERFA'ISANCE, or } *barb. Lat.*
CO'UNCERFESANCE, *n. s.* } *contrafactus*.

To copy with an intent to pass off the
copy as an original ; to forge ; to imitate ; to re-
semble ; to feign. A counterfeit is a person or
thing which, with intent to deceive, takes the
semblance of another ; a forgery ; formerly a
likeness ; a picture ; a copy. The meanings of
counterfeiter and counterfeited are obvious.
Counterfaience and counterfesance signify the
act of counterfeiting ; forgery ; but they are both
obsolete.

And peined her to *contrefetan* chere
Of court and ben estatlich of manere,
And to ben holden digne of reverence.

Chaucer. Cant. Tales.

And *contrefeted* was ful subtilly
Another lettre, wrought ful siufully. *Id.*

And all soche other *counter faitours*,
Chanons, canons, and soche disigised,
Ben Goddis enemies and traitours. *Id.*

Yet was not that same her owne native hewe,
But wrought by art and *counterfitted* shew.
Spenser. Faerie Queene.

Such is the face of Falshood, such the sight
Of fowle Duessa, when her borrowed light
Is laid away, and *counterfeasaunce* knowne. *Id.*

What art thou,
That *counterfeits* the person of a king ?
Shakspeare. Henry IV.

And, oh, you mortal engines ! whose rude throats
The' immortal Jove's dread clamours *counterfeit*,
Farewel ! *Id. Othello.*

I am no *counterfeit* ; to die is to be a *counterfeit* ;
for he is but the *counterfeit* of a man, who hath not
the life of a man. *Shakspeare. Henry IV.*

Since the wisdom of their choice is rather to have
my cap than my heart, I will practise the insinuating
nod, and be off to them most *counterfeitly*.

Id. Coriolanus.

A man of easy profession never *counterfeits*, till he
lays hold upon a debtor, and says he rests him ; for
then he brings him to all manner of unrest.

Ben Jonson. Every Man in his Humour.

Henry the Second altered the coin, which was cor-
rupted by *counterfeiters*, to the great good of the com-
monwealth. *Camden.*

There have been some that could *counterfeit* the
distance of voices, which is a secondary object of
hearing, in such sort, as, when they stand fast by you,
you would think the speech came from afar off in a
fearful manner. *Bacon.*

This priest, being utterly unacquainted with the
true person, according to whose pattern he should
shape his *counterfeit*, yet could think it possible for
him to instruct his player, either in gesture or fashions.

or in fit answers to questions, to come near the resemblance. *Id.*

O Eve! in evil hour thou didst give ear
To that false worm, of whomsoever taught
To counterfeit man's voice *Milton.*

I learn

Now of my own experience, not by talk,
How counterfeit a coin they are, who friends
Bear in their superscription; in prosperous days
They swarm, but in adverse withdraw their head. *Id.*

I think every one ought to contribute to the common stock, and to have no other scruple, or slyness, about the receiving of truth, but that he be not imposed on, and take counterfeit, and what will not bear the touch, for genuine and real truth. *Locke.*

There would be no counterfeits but for the sake of something real; though pretenders seem to be what they really are not, yet they pretend to be something that really is. *Id.*

But trust me, child, I'm much inclined to fear
Some counterfeit in this your Jupiter. *Adison's Ovid.*

It happens, that not one single line or thought is contained in this imposture, although it appears that they who counterfeit me had heard of the true one. *Swift.*

The counterfeited smile of pleasure in disagreeable company soon brings along with it a portion of the reality, as is well illustrated by Mr. Burke. *Darwin.*

True modesty is a discerning grace,
And only blushes in the proper place;
But counterfeit is blind, and skulks through fear,
Where 'tis a shame to be ashamed to appear;
Humility the parent of the first,
The last by vanity produced and nursed. *Cowper.*

COUNTERFERMENT, n. s. From counter and ferment. Ferment opposed to ferment.

What unnatural motions and counterferments must a medley of intemperance produce in the body! When I beheld a fashionable table, I fancy I see innumerable distempers lurking in ambuscade among the dishes. *Adison's Spectator.*

COUNTER-FLORY, in heraldry, is said of a tressure whose fleurs-de-lis are opposite to others.

COUNTER-FOIL, or COUNTER-STOOK, in the exchequer, that part of a tally which is kept by an officer of the court.

COUNTERFORT, n. s. From counter and fort.

Counterforts, buttresses, or spurs, are pillars serving to support walls or terrasses subject to bulge. *Chambers.*

COUNTERGA'GE, n. s. From counter and gage. In carpentry, a method used to measure the joints, by transferring the breadth of a mortise to the place where the tenon is to be, in order to make them fit each other.

COUNTERGUARD, n. s. From counter and guard. A small rampart, with a parapet and ditch, to cover some part of the body of the place.

COUNTER-INFLUENCE, v. a. From counter and influence. To prevent any thing by means of a counteracting influence.

COUNTER-LIBRATION, n. s. In astronomy, opposite libration.

COUNTERLIGHT, n. s. From counter and light. A window or light opposite to any thing, which makes it appear to a disadvantage.

COUNTERMAND, v. a. & n. s. Fr. *contramander*. To order the contrary of that which has been ordered; to revoke a command; to contradict orders given by another; to prohibit. Countermand is a contrary order.

For us to alter any thing, is to lift up ourselves against God, and, as it were, to countermand him. *Hooker.*

Have you no countermand for Claudio yet,
But must he die to-morrow? *Shakspeare. Measure for Measure.*

Avicen countermands letting blood in choleric bodies, because he esteems the blood a bridle of the gall. *Harvey.*

In states notoriously irreligious, a secret and irresistible power countermands their deepest projects, and smites their policies with frustration and a curse. *South.*

COUNTERMARCH, v. n. & n. s. from counter and march. To march back; to march in indirect ways. Retrograde march; march in a new direction; change of measures.

How are such an infinite number of things placed with such order in the memory, notwithstanding the tumults, marches, and countermarches of the animal spirits? *Collier on Thought.*

They make him do and undo, go forward and backwards by such countermarches and retractions, as we do not willingly impute to wisdom. *Barnet's Theory of the Earth.*

His host of wooden warriors to and fro
Marching and countermarching, with an eye
As fixed as marble, with a forehead ridged
And furrowed into storms, and with a hand
Trembling as if eternity were hung
In balance on his conduct of a pin. *Cowper.*

COUNTER-MARCH, in military affairs, a change of the face or wings of a battalion, by which means those that were in the front come to be in the rear.

COUNTERMARK, v. a. & n. s. From counter and mark. For a definition of the verb, see the quotation from the Farriers' Dictionary. The noun has the following meanings. A second or third mark put on a bale of goods belonging to several merchants, that it may not be opened but in the presence of them all. The mark of the goldsmiths' company, to show the metal is standard, added to that of the artificer. An artificial cavity made in the teeth of horses that have outgrown their natural mark, to disguise their age. A mark added to a medal a long time after it is struck, by which the curious know the several changes in value which it has undergone.

A horse is said to be countermarked, when his corner teeth are artificially made hollow, a false mark being made in the hollow place, in imitation of the eye of a bean, to conceal the horse's age. *Farrier's Dictionary.*

COUNTERMINE, v. a. & n. s. From counter and mine. To form a mine for the purpose of destroying that of the enemy; to counteract; to defeat by secret measures. A mine made to destroy an enemy; any thing that is calculated to defeat a hostile project.

He thinking himself contemned, knowing no countermines against contempt but terror, began to let nothing pass, which might bear the colour of a fault, without sharp punishment. *Sidney.*

After this they mined the walls, laid the powder, and rammed the mounds; but the citizens made a *countermine*, and therein they poured such a plenty of water, that the wet powder could not be fired.

Hayward.

The matter being brought to a trial of skill, the *countermine* was only an act of self-preservation.

L'Estrange.

Thus infallibly it must be, if God do not miraculously *countermine* us, and do more for us than we can do against ourselves.

Decay of Piety.

COUNTERMOTION, n. s. } From counter
COUNTERMOVEMENT, n. s. } and motion.
Opposition of motion; motion in a contrary direction. The second of these words is principally used with reference to military manœuvres.

That resistance is a *countermotion*, or equivalent to one, is plain by this, that any body which is pressed, must needs press again on the body that presses it.

Digby on the Soul.

If any of the returning spirits should happen to fall foul upon others which are outward bound, these *countermotions* would overset them, or occasion a later arrival.

Collier.

COUNTERMURE, v. a. & n. s. Fr. *contremur*. To fortify with a second wall. Countermure is a wall erected behind a breach or weak place.

Countermured with walls of diamond. *Kyd.*

The great shot flying through the breach, did beat down houses; but the *countermure*, new built against the breach, standing upon a lower ground, it seldom touched.

Knolles.

COUNTERNATURAL, adj. From counter and natural. Contrary to nature.

A consumption is a *counternatural* hectic extenuation of the body.

Harvey on Consumptions.

COUNTERNOISE, n. s. From counter and noise. A sound by which any other noise is overpowered.

They endeavoured, either by a constant succession of sensual delights, to charm and lull asleep, or else by a *counternoise* of revellings and riotous excesses to drown, the softer whispers of their conscience.

Culamy's Sermons.

COUNTEROPENING, n. s. From counter and opening. An aperture or vent on the contrary side.

A tent, plugging up the orifice, would make the matter recur to the part disposed to receive it, and mark the place for a *counteropening*.

Sharp's Surgery.

COUNTERPACE, n. s. From counter and pace. Contrary measure; attempts in opposition to any scheme.

When the least *counterpaces* are made to these resolutions, it will then be time enough for our malecontents.

Swift.

COUNTERPALED, in heraldry, is when the escutcheon is divided into twelve pales parted per fesse, the two colors being counter-changed; so that the upper are of one color and the lower of another.

COUNTERPANE, n. s. Fr. *contrepoint*. A coverlet for a bed, or any thing else woven in squares. It is sometimes written, according to etymology, counterpoint. It also formerly meant

one part of a pair of deeds, but this sense is become obsolete, and is replaced by counterpart.

Read, scribe; give me the *counterpane*.

Ben Jonson.

COUNTERPART, n. s. From counter and part. The correspondent part; the part which answers to another, as the two papers of a contract; the part which fits another, as the key of a cypher.

In some things the laws of Normandy agreed with the laws of England; so that they seem to be, as it were, copies or *counterparts* one of another.

Hale's Law of England.

An old fellow with a young wench, may pass for a *counterpart* of this fable.

L'Estrange.

Oh *counterpart*

Of our soft sex; well are you made our lords:
So bold, so great, so god-like are you formed,
How can you love so silly things as women?

Dryden.

He is to consider the thought of his author, and his words, and to find out the *counterpart* to each in another language.

Id.

In the discovery, the two different plots look like *counterparts* and copies of one another.

Addison's Spectator.

COUNTER-PART, in music, denotes one part to be applied to another. Thus the base is said to be a counter-part to the treble.

COUNTER-PASSANT, in heraldry, is when two lions are in a coat of arms, and the one seems to go the contrary way from the other.

COUNTER-PETITION, v. n. & n. s. To petition against another petition, or against that which is prayed for by another petition. A petition in opposition to another.

The gentlemen and others of Yorkshire, who had *counter-petitioned*.

Raresby.

That design was no sooner known, but others of an opposite party were appointed to set a *counter-petition* on foot.

Clarendon.

COUNTERPLEAD, v. a. } From counter
COUNTERPLEA, n. s. } and plead. To put in a counter-plea; to oppose. A counter-plea, says Cowell, in law, is a replication: as, if a stranger to the action begun desire to be admitted to say what he can for the safeguard of his estate, that which the demandant allegeth against this request is called a counterplea.

That as to *counterplede* them, though ye wer my brother,

I wolde gve yew no counsaill.

Chaucer. Cant. Tales.

And she answerde, Let be thine arguing,

For Love ne will not *counterplede*id be

In right ne wrong. *Id. Legende of Good Women.*

COUNTERPLOT, v. a. & n. s. } From coun-
COUNTERPLOTTING, n. s. } ter and plot.

To oppose plot by plot. One artifice opposed to another.

The wolf that had a plot upon the kid, was confounded by a *counterplot* of the kid's upon the wolf;

and such a *counterplot* as the wolf, with all his sagacity, was not able to smell out. *L'Estrange.*

Prudentia had *counterplotted* us, and had bespoken the same evening, the puppet show of The Creation of the World. *Tatler.*

COUNTERPOINT, *n. s.* A coverlet woven in squares, now called a counterpane; an opposite point or course; a trick; a contrivance; the art of composing harmony.

No *counterpoint* of cunning policy. *Spenser. Mother Hubbard's Tale.*

In cypress chests, my arras *counterpoints*. *Shakespeare. Taming of the Shrew.*

Fell suddenly into the very *counterpoint* of justifying bestiality. *Sir E. Sandys.*

COUNTER-POINT, in music, from Lat. *contra* against, and *pungere*, to point, is so named because the musical characters by which the notes in each part are signified are placed in such a manner, each with respect to each, as to show how the parts answer one another. See **COMPOSITION**.

COUNTER-POINTED, *contre-pointé*, in heraldry, is when two chevrons in one escutcheon meet in the points, the one rising, as usual, from the base, and the other inverted, falling from the chief; so that they are counter to one another in the points, as in the diagram. They may also be counterpointed when they are founded upon the sides of the shield, and the points meet that way, called counterpointed in fesse.

COUNTERPOISE, *v. a. & n. s.* From counter and poise. To keep in equilibrium; to act against with equal weight; to manifest an equal degree of power. Equiponderance; equivalence; the state of being placed to counterbalance something else; a counterbalance to.

It shall do us mochil gode,
And to our herte as moche availle
The *countirpoise*, ese and travaile. *Chaucer. The House of Fame.*

An huge great pair of ballance in his hand,
With which he boasted, in his surquedrie,
That all the world he would weigh equallie,
If ought he had the same to *counterpoise*. *Spenser. Faerie Queene.*

So many freeholders of English will be able to beard
and to *counterpoise* the rest. *Spenser on Ireland.*

Our spoils we have brought home
Do more than *counterpoise* a full third part
The charges of the action. *Shakespeare. Coriolanus.*

Take her by the hand,
And tell her she is thine; to whom I promise
A *counterpoise*, if not in thy estate,
A balance more replete. *Id. All's Well that Ends Well.*

The second nobles are a *counterpoise* to the higher
ability, that they grow not too potent. *Bacon.*

The Eternal hung forth his golden scales,
Wherein all things created first he weighed,
The pendulous round earth, with balanced air
In *counterpoise*. *Milton. Par. Lost.*

The force and the distance of weights *counterpoising*
one another, ought to be reciprocal.

Digby. On the Soul.

The heaviness of bodies must be *counterpoised* by a
plummet fastened about the pulley to the axis.

Wilkins.

Fastening that to our exact balance, we put a metal-
line *counterpoise* into the opposite scale.

Boyle's Spring of the Air.

Their generals, by their credit in the army, were,
with the magistrates and other civil officers, a sort of
counterpoise to the power of the people. *Swift.*

But royalty, nobility, and state,
Are such a dead preponderating weight,
That endless bliss (how strange soe'er it seem),
In *counterpoise*, flies up and kicks the beam. *Cowper.*

COUNTERPOISON, *n. s.* From counter and
poison. Antidote; medicine by which the effects
of poison are obviated.

Counterpoisons must be adapted to the cause; for ex-
ample, in poison from sublimate corrosive, and arsenic-
nick. *Arbuthnot.*

COUNTER-POTENT, *contre potence*, in heraldry,
is reckoned a fur as well as vair and ermine;
but composed of such pieces as represent the
tops of crutches, called in French potences, and
in old English potents.

COUNTERPRACTICE, *n. s.* From counter
and practice. Practice in opposition to.

COUNTERPRESSURE, *n. s.* From counter
and pressure. Opposite force; power acting in
contrary directions.

Does it not all meehanic heads confound,
That troops of atoms from all parts around,
Of equal number, and of equal force,
Should to this single point direct their course;
That so the *counterpressure* every way,
Of equal vigour, might their motions stay,
And by a steady pause the whole in quiet lay?
Blackmore.

COUNTERPROJECT, *n. s.* From counter
and project. Correspondent part of a scheme.

A clear reason why they never sent any forces to
Spain, and why the obligation not to enter into a
treaty of peace with France, until that entire monarchy
was yielded as a preliminary, was struck out of the
counterproject by the Dutch. *Swift.*

To **COUNTERPROVE**, *v. a.* From counter
and prove. To take off a design in black lead, or
red chalk, by passing it through the rolling-press
with another piece of paper, both being moistened
with a sponge.

COUNTER-QUARTERED, *contre ecartelé*, in heraldry,
denotes the escutcheon, after being quartered,
to have each quarter again divided into
two.

COUNTER-REVOLUTION, *n. s. & j* From
" **COUNTER-REVOLUTIONARY**, *adj.* } counter
and revolution. A revolution which reverses the
effects of a preceding revolution. That which
tends to bring about a counter-revolution.

COUNTERROLL, *v. a.* } From counter and
COUNTERROLLMENT, *n. s.* } roll. To preserve
the power of detecting frauds by another account.
This spelling is obsolete, and control is substituted
instead. A counter account; controlment.

This manner of exercising of this office, hath many
testimonies, interchangeable warrants, and *counterrol-
ments*, whereof each, running through the hands, and

resting in the power of many several persons, is sufficient to argue and convince all manner of falsehood.

Bacon.

COUNTER-SALIENT, in heraldry, is when two beasts are borne in a coat leaping from each other directly the contrary way.

COUNTERSCARP, *n. s.* Sometimes written counterscarf by our old authors, from counter and scarp. That side of the ditch which is next the camp, or properly the talus that supports the earth of the covert-way; although by this term is often understood the whole covert-way, with its parapet and glacis; and so it is to be understood when it is said the enemy lodged themselves on the counterscarp.

COUNTER-SCUFFLE, *n. s.* From counter and scuffle. Mutual opposition.

A terrible counter-scuffle between them and their lusts.

Hewyt.

COUNTERSEAL, *v. a.* From counter and seal. To seal with others.

You shall bear

A better witness back than words, which we,
On like conditions, will have countersealed.

Shakspeare. Coriolanus.

COUNTERSECURE, *v. a.* To give additional security to any thing.

What have the regicides promised you in return, in case you should show what they call dispositions to conciliation and equity, whilst you are giving that pledge from the throne, and engaging parliament to countersecure it.

Burke.

COUNTERSENSE, *n. s.* Contrary meaning.

There are some words now in French which are turned to a countersense.

Howell.

COUNTERSIGN, *v. a. & n. s.* From counter and sign. To sign an order or patent of a superior in quality of secretary, to render it more authentic. Thus charters are signed by the king, and countersigned by a secretary of state, or lord chancellor. In military affairs, the countersign signifies, the watch word of the day.

COOUNTERSIGNAL, *n. s.* From counter and signal. A signal which answers to, or corresponds with, another.

COOUNTERSNARL, *n. s.* From counter and snarl. A snarl in return.

If he bristle himself up and stand to it, give but a countersnarle, there is not a dog that dares meddle with him.

Burton.

COUNTERSTATUTE, *n. s.* From counter and statute. A contradictory statute.

His own antinomy or counterstatute.

Milton.

COUNTERSWAY, *n. s.* From counter and sway. Influence or power exercised in opposition to.

By a countersway of restraint curbing their wild exorbitance.

Milton.

COUNTERSTROKE, *n. s.* A stroke given in return.

He met him with a counterstroke so swift,
That quite smit off his arme as he it up did lift.

Spenser. Faerie Queene.

COUNTERSURETY, *n. s.* From counter and surety. A counter bond to a surety.

CO'UNTERTALLY, *n. s.* From counter and tally. One of two tallies, on which any thing is scored; a check-tally.

COUNTERTASTE, *n. s.* From counter and taste. Vicious taste.

There is a kind of *countertaste*, founded on surprise and curiosity, which maintains a rivalry with the true.

Shenstone.

COUNTERTENOR, *n. s.* From counter and tenor. One of the mean or middle parts of music; so called, as it were, opposite to the tenor.

I am deaf: this deafness unqualifies me for all company, except a few friends with *countertenor* voices.

Swift.

COUNTERTIDE, *n. s.* From counter and tide. Contrary tide; fluctuations of the water.

Such were our *countertides* at land, and so

Presaging of the fatal blow,

In your prodigious ebb and flow.

Dryden.

COUNTERTIME, *n. s.* From counter and time; Fr. *contretemps*. The defence or resistance of a horse, that intercepts his cadence, and the measure of his manage. Defence; opposition.

Let cheerfulness on happy fortune wait,
And give not thus the *countertime* to fate.

Dryden's Awengzebe.

COUNTERTURN, *n. s.* From counter and turn.

The catastasis, called by the Romans *status*, the height and full growth of the play, we may call properly the *counterturn*, which destroys that expectation, embroils the action in new difficulties, and leaves you far distant from that hope in which it found you.

Dryden on Dramatic Poesy.

CO'UNTERVAIL, *v. a. & n. s.* To be equal to; to have equal influence. Equipoise; equal weight or value with something else.

Yet he (poor soule!) with patience all did beare,
For nought against their wills might *countervaille*.

Spenser. Faerie Queene.

In some men there may be found such qualities as are able to *countervail* those exceptions which might be taken against them, and such men's authority is not likely to be shaken off.

Hooker.

The outward streams, which descend, must be of so much force as to *countervail* all that weight whereby the ascending side does exceed the other.

Wilkins's Dædalus.

We are to compute that, upon balancing the account, the profit at last will hardly *countervail* the inconveniences that go along with it.

L'Estrange.

Surely, the present pleasure of a sinful act is a poor *countervail* for the bitterness of the review, which begins where the action ends, and lasts for ever.

South's Sermons.

CO'UNTERVIEW, *n. s.* From counter and view. Opposition; confronting; contrast.

Mean while, ere thus was sinned and judged on earth,

Within the gates of hell sat Sin and Death,

In *counterview*.

Milton's Paradise Lost.

I have drawn some lines of Linger's character, on purpose to place it in *counterview* or contrast with that of the other company.

Swift.

COUNTERVOTE, *v. a.* From counter and vote. To vote against; to outvote.

The law in our minds being *countervoted* by the law in our members. *Scott.*

COUNTERWEIGH, *v. n.* From counter and weigh. To weigh equal with; to weigh against.

If Wright had ten fellowships of St. John's, it would not *counterweigh* with the loss of this occasion. *Ascham.*

COUNTERWHEEL, *v. a. & n. s.* From counter and wheel. To wheel in an opposite direction; to wheel so as to oppose other movements. The movement made for that purpose.

Whose shoots the wary Heron beat
With a well *counterwheeled* retreat. *Lovelace.*

COUNTERWIND, *n. s.* A contrary wind.
Is met of many a *counterwinde* and tyde. *Spenser.*

To COUNTERWORK, *v. a.* From counter and work. To counteract; to hinder any effect by contrary operations.

But heaven's great view is one, and that the whole :
That *counterworks* each folly and caprice ;
That disappoints th' effect of every vice. *Pope.*

They were then only passengers in a common vehicle. They were then carried along with the general motion of religion in the community, and, without being aware of it, partook of its influence. In that situation, at worst, their nature was left free to *counterwork* their principles. *Burke.*

COUNTRY, *n. s. & adj.* } Fr. *contrée* ; It.
CO'UNTRYMAN, *n. s.* } *contrada* ; Dutch,
CO'UNTRIFIED, *adj.* } *kontreye* ; low Lat. *contrata*. A region; the parts of a region distant from cities and courts; the place of a man's residence or birth; the inhabitants of any region. As an adjective, country signifies rustic; rural; peculiar to a region or people; rude; untaught. Countryman denotes, one born in the same country; a rustic; a husbandman. See **COUNTRY-DANCE**. Countified, which means rustic, country-like, is a word of recent introduction into our language, and is not yet used in elegant composition or conversation.

She laughing the cruel tyrant to scorn, spake in her *country* language. *2 Maccabees vii. 27.*

And wedded the freshe queene Ipolita,
And brought hire home with him to his *contree*
With mechel glorie and great solemnitee. *Chaucer. Cant. Tales.*

Full many *countreyes* they did overrunne,
From the uprising to the setting sun. *Spenser. Faerie Queene.*

Yet was she certes but a *country* lasse,
Yet she all other *country* lasses farre did passe. *Id.*
Send out more horses, skirre the country round,
Hang those that talk of fear. *Shakspeare. Macbeth.*
See, who comes here?

My *countryman* ; but yet I know him not *Id.*
All the *country*, in a general voice,
Cried hate upon him ; all their prayers and love
Were set on Hereford. *Id. Henry IV.*

'Tis the trial of a man to see if he will change his side ; and if he be so weak as to change once, he will change again. Your *country* fellows have a way to

try a man if he be weak in the hams, by coming behind him and giving him a blow unawares ; if he bend once, he will bend again. *Selden.*

They require to be examined concerning the descriptions of those *countreys* of which they would be informed. *Spratt.*

A *countryman* took a boar in his eorn. *L'Estrange.*

Homer, great bard ! so fate ordained, arose ;
And, bold as were his *countrymen* in fight,
Snatched their fair actions from degrading prose,
And set their battles in eternal light. *Prior.*

I see them hurry from *country* to town, and then from the town back again into the *country*. *Spectator.*

I never meant any other, than that Mr. Trot should confine himself to *country-dances*. *Id.*

To live deprived of one's *country* is intolerable. Is it so ? how comes it then to pass that such numbers of men live out of their *countreys* by choice. *Bolingbroke.*

I fancy the proper means of increasing the love we bear our native *country*, is to reside some time in a foreign one. *Shenstone.*

We may have the same geographical situation, but another *country* ; as we may have the same *country* in another soil. The place that determines our duty to our *country* is a social, civil relation. *Burke.*

In a free *country*, every violation of law is an attack upon the public liberty. The laws of God and our *country* are our best and only security against oppression ; and therefore liberty can exist amongst us no longer than while those laws are obeyed. *Beattie.*

There lived in Gothic days, as legends tell,
A shepherd-swain, a man of low degree ;
Whose sires, perchance, in Fairyland might dwell,
Between groves, or vales of Arcady ;
But he, I ween, was of the north *countree*. *Id.*

Can he love the whole,
Who loves no part ? He be a nation's friend,¹
Who is in truth the friend of no man there ?
Can he be strenuous in his *country's* cause,
Who slights the charities, for whose dear sake
That *country*, if at all, must be beloved ? *Cowper.*
Or should the vulgar grumble now and then,
The Prompter might translate for *country* gentlemen. *Sheridan.*

Did not the Italian Musico Cazzani
Sing at my heart six months at least in vain ?
Did not his *countryman*, Count Corniani,
Call me the only virtuous wife in Spain ?
Byron. Don Juan.

COUNTRY DANCE, Fr. from *contre*, against, or opposite, a dance of English origin, though now transplanted into almost all the countries and courts of Europe. There is no established rule for the composition of tunes to this dance, because there is in music no kind of time whatever which may not be measured by the motions common in dancing ; and there are few song tunes of any note within the last century, that have not been applied to country dances.

COUNTY, *n. s.* Old Fr. *counté* ; mod. Fr. *comté* ; Lat. *comitatus*. A shire, says Cowell, is a circuit or portion of the realm, into which the whole land is divided, for the administration of justice ; so that there is no part of the kingdom but what lieth within some county. See **COUNT**.

Discharge your powers unto their several *counties*,
As we will ours. *Shakspeare. Henry IV.*
He caught his death the last *county* sessions, where he would go to see justice done to a poor widow-woman, and her fatherless children. *Addison's Spectator.*

Leaving far behind him even Lord Camelford's generous design of bestowing Old Sarum on the bank of England, Mr. Benfield has thrown in the borough of Cricklade to reinforce the county representation.

Burke.

As petty-foggers' dirty wiles
Set John a Nokes on Tom a Stiles,
To prove, by desperate course of law,
His title to a barley straw;
Reckless of a whole county's curses,
So they can drain the loobies' purses.

Huddesford.

COUNTY, in geography, originally signified the territory of a count or earl, but now it is used in the same sense with shire. For the execution of the laws in the several counties, excepting Cumberland, Westmoreland, and Durham, sheriffs are appointed every Michaelmas. Other officers of counties are, a lord lieutenant, who has the command of the militia; custodes rotulorum, justices of peace, bailiffs, high constable, and coroner. See SHERIFF.

COUNTY CORPORATE is a title given to several cities, or ancient boroughs, on which our monarchs have thought fit to bestow extraordinary privileges; annexing to them a particular territory, land, or jurisdiction; and making them counties of themselves, to be governed by their own sheriffs and magistrates.

COUNTY COURT, in English law, is a court incident to the jurisdiction of the sheriff. It is not a court of record, but may hold pleas of debt or damages under the value of 40s. Over some of which causes these inferior courts have, by the express words of the statute of Gloucester, a jurisdiction totally exclusive of the king's superior courts. For in order to be entitled to sue an action of trespass for goods before the king's justices, the plaintiff is directed to make affidavit, that the cause of action does really and bona fide amount to 40s. which affidavit is now, however, disused, except in the court of exchequer. The statute also of 43 Eliz. c. 6. which gives the judges in many personal actions, where the jury assess less damages than 40s. a power to certify the same, and abridge the plaintiff of his full costs, was also meant to prevent vexation by litigious plaintiffs; who, for purposes of mere oppression, might be inclinable to institute such suits in the superior courts for injuries of a trifling value. The county court may also hold plea of many real actions, and of all personal actions to any amount, by virtue of a special writ called justices; which is a writ empowering the sheriff for the sake of despatch to do the same justice in his county court, as might otherwise be had at Westminster. The freeholders of the county are the real judges in this court, and the sheriff is the ministerial officer. The great conflux of freeholders, which are supposed always to attend at the county court (which Spelman calls *forum plebeia justitie et theatrum comitiva potestatis*), is the reason why all acts of parliament at the end of every session were wont to be there published by the sheriff; why all outlawries of absconding offenders are there proclaimed; and why all popular elections, which the freeholders are to make, as formerly of sheriffs and conservators of the peace, and still of coroners, verderers,

and knights of the shire, must ever be made in pleno comitatu, or in full county court. By the statute 2 Edw. VI. c. 25, no county court shall be adjourned longer than for one month, consisting of twenty-eight days. And this was also the ancient usage, as appears from the laws of king Edward the elder: *prepositus* (that is the sheriff) *ad quartam circiter septimanam frequentem populi concionem celebrato; cuique jus dicit; litesque singulas dirimito*. In those times the county court was a court of great dignity and splendor, the bishop and the ealdorman, or earl, with the principal men of the shire, sitting there to administer justice both in lay and ecclesiastical causes. But its dignity was much impaired, when the bishop was prohibited, and the earl neglected to attend it. And, in modern times, as proceedings are removeable from hence into the king's superior courts, by writ of *pone* or *recordare*, in the same manner as from hundred courts and courts baron; and as the same writ of false judgment may be had, in nature of a writ of error; actions are rarely brought there.

COUNTY PALATINE. Of all the counties palatine Durham alone remains in the hands of a subject; for the earldom of Chester was united to the crown by Henry III. and has ever since given title to the king's eldest son. And the county-palatine or duchy of Lancaster, in the reign of Henry IV. was, by act of parliament, vested in the king and his heirs, kings of England, for ever. 1. Blackst. 118. There is a court of chancery in the counties palatine of Durham and Lancaster, over which there are chancellors; that of the latter is called chancellor of the duchy; and there is a court of exchequer at Chester, of a mixed nature, for law and equity, of which the chamberlain of Chester is judge. There is also a chief justice of Chester, and the other counties palatine have their justices, to determine civil actions and pleas of the crown. In none of these are the king's ordinary writs of any force; and the judges of assize, who sit within these franchises, sit by virtue of a special commission under the great seal of England. 3 Blackst. 79.

COUNTY-RATE. By the 12th Geo. II. c. 29, the justices at their general or quarter sessions, or the greater part of them (and by the 13th Geo. II. c. 18, justices of liberties and franchises not subject to county commissioners) shall have power to make one general county-rate, to answer all former distinct rates, which shall be assessed on every parish, &c. and collected and paid by the high constables of hundreds to treasurers appointed by the justices, which money shall be deemed the public stock, &c.; but appeal lies by the church-wardens and overseers against the rate of any particular parish, 22 Geo. III. c. 17. This rate is to be applied for the repairing of bridges and highways thereto adjoining, and to salaries for the surveyors of bridges; for building and repairing county gaols; for repairing shire-halls; for the salary of the master of the house of correction, and relieving the weak and sick in his custody; for the relief of the prisoners in the king's bench and marshalsea prisons, and of poor hospitals in the county, and of those who shall sustain losses by fire, water, the sea, or other casualties, and other charitable purposes for the

Relief of the poor, as the justices in sessions shall think fit; for the relief of the prisoners in the county gaol; for the preservation of the health of the prisoners; for the salary of the chaplain of the county gaol; for setting prisoners to work; for salaries of persons making returns of the prices of corn; for charges attending the removal of any of the said general county-rates by certiorari; for money for purchasing lands at the ends of county bridges; for charges of rebuilding or repairing houses of correction, and for fitting up and furnishing the same, and employing the persons sent thither; for charges of apprehending, conveying, and maintaining, rogues and vagabonds; for charges of soldiers' carriages over and above the officer's pay for the same, by the several yearly acts against mutiny and desertion, and by the militia act; for the coroner's fee of 9d. per mile for travelling to take an inquisition, and 20s. for taking it; for charges of carrying persons to the gaol or house of correction; for the gaoler's fees for persons acquitted of felony or discharged by proclamation; for charges of prosecuting and convicting felons; for charges of prosecuting and convicting persons plundering shipwrecked goods; for charges of maintaining the militia-men's families by the several militia acts; for the charges of bringing insolvent debtors to the assizes, in order to their discharge, if themselves are not able to pay; for the charges of transporting felons, or conveying them to the places of labor and confinement; for charges of carrying parish apprentices, bound to the sea service, to the port to which the master belongeth.

By the 12th Geo. II. c. 29, the church wardens and overseers shall, in thirty days after demand made, out of the money collected for the poor, pay the sums so assessed on each parish and place; and if they shall neglect or refuse so to pay, the high constable shall levy the same by distress and sale of their goods, by warrant of two or more justices residing in or near such parish or place. Where there is no poor-rate, the justices, in their general or quarter sessions, shall by their order, direct the sum assessed on such parish, township, or place, to be rated and levied by the petty-constable, or other peace-officer, as money for the relief of the poor is by law to be rated or levied. The high constables, at or before the next session respectively after they have received the money, shall pay the same to the treasurer; and the money so paid shall be deemed the public stock: and the said high constables shall deliver in a true account on oath, if required, of the money by them received, before the said justices at their general or quarter sessions. The treasurer shall pay so much of the money in his hands to such persons, as the justices in session shall from time to time appoint, for any uses and purposes to which the public stock of any county, city, division, or liberty, is or shall be applicable; and shall deliver in a true account on oath, if required, of his receipts and disbursements to the justices at every general or quarter session, and also of the proper vouchers for the same, to be kept amongst the records of the sessions: and the discharge of the said justices, by their order at the general or quarter session, shall be a sufficient discharge to the

treasurer: and no new rate shall be made until it appears by the treasurer's accounts or otherwise, that three-fourths of the money collected have been expended for the purposes aforesaid. If the church-wardens and overseers of any parish or place shall think such parish or place is over-rated, they may appeal to the next general or quarter sessions. A subsequent statute, 52 Geo. III. c. 110, amends 12 Geo. II. c. 29, and remedies defects in the laws relating to the repairing of county bridges, &c. By this the quarter sessions are empowered to appoint, annually at Easter, &c. two or more justices to superintend the repairs of bridges; who may incur any expenditure not exceeding £20 for such repairs, which shall be paid by the sessions on certificate of the justices. Justices at sessions may also contract with commissioners of turnpike roads for repair of bridges, &c. for any term not exceeding seven years.

Justices are also empowered, by 43 Geo. III. c. 59, amended by 54 Geo. III. c. 90, and 55 Geo. III. c. 143, to purchase land, houses, &c. for the widening, altering, and improving of county bridges; and also of bridges repaired by hundreds or general divisions of counties.

By 55 Geo. III. c. 51, additional provisions are made for the more equally and effectually making and levying the county rates. By this act, justices in general or quarter sessions are empowered to make a fair and equal county-rate in any county, whenever circumstances appear to require it. For this purpose they may require church-wardens and overseers of the several parishes to make returns to the justices of the respective divisions in petty sessions, of the annual value of all rateable property, which such justices must certify to the quarter sessions, who may make the county-rate thereon. By this act the treasurers of counties are required to publish an abstract of their receipts and expenditure yearly, as audited by the justices. And the high-constable employed in levying the rates, may be required by the quarter sessions to give security; and if he fails, the rates shall be paid directly to the treasurer. By 56 Geo. III. c. 49, extra parochial places are made rateable, and the sessions are empowered to ascertain boundaries, &c; 57 Geo. III. c. 94, regulates the mode of appeal against rates, which are to remain in force until quashed on such appeal, &c.

COVOLO, a fortress and village of the Tyrol, formerly an important pass in the road from Germany to Italy. Here Buonaparte defeated the Austrians under general Wurmser, September 8th, 1796. It lies near the Brenta, on the borders of the Veronese, twenty miles north of Vicenza, and twenty-three east of Trent.

COVORDEN. See COEVORDEN.

COUP-DE-MAIN, Fr. In military affairs, a sudden and violent attack, for the purpose of carrying a post. The phrase is applied to any prompt measure.

COUP-D'ŒIL, *n. s.* The first view; the first glance. In military affairs, a general who can instantly see in what manner the peculiarities of the ground may be turned to advantage is said to have a good coup-d'œil. Napoleon possessed this quality in perfection.

COUPED, in heraldry, is used to express the head, or limb, of an animal, cut out from the trunk, smooth, as in the diagram: distinguishing it from that which is called erased, that is, forcibly torn off, and therefore is ragged and uneven, it is also applied to such crosses, bars, bends, chevrons, &c. as do not touch the sides of the escutcheon, but are, as it were, cut off from them.

I'll keep my stable-stand where
I lodge my wife; I'll go in *couplets* with her,
Than when I feel and see no further trust her.
Id. Winter's Tale.
Oh! alas!
I lost a *couple*, that 'twixt heaven and earth
Might thus have stood, begetting wonder, as
You gracious *couple* do. *Id.*
Anon, as patient as the female dove,
Ere that her golden *couplets* are disclosed,
His silence will sit drooping. *Id. Hamlet.*

COUPE'E, n. s. Fr. A motion in dancing, when one leg is a little bent and suspended from the ground, and with the other a motion is made forwards.

COUPLE, v. a., v. n., & n. s. } Fr. *coupler*,
COUPLEMENT, n. s. } *accoupler*; Ital. *accoppiare*; Lat.
COUPLABLE, adj. } *copulare*. To
COUPLING, n. s. } link together;
COUPLE-BEGGAR, n. s. } to conjoin; to
COUplet, n. s. } join in wedlock; to unite sexually. Couple signifies a chain by which dogs are held together; a pair; male and his female. Couplable is fit to be coupled with. Couplement is union; but both these words are disused; junction, sexual union, are the meanings of coupling. A couple-beggar is one who marries beggars. A couplet denotes a pair of rhymes; a pair, as of doves.

Put the taches into the loops, and *couple* the tent together that it may be one. *Exodus xxvi. 11.*
To the artificers and builders gave they it, to buy hewn stone, and timber for *couplings*.
2 Chron. xxxiv. 11.
They behold your chaste conversation *coupled* with fear. *1 Peter iii. 2.*
Love that yhuittith lawe and companie,
And *couplis* doth in vertue for to dwel.
Chaucer. Troilus and Creseide.

There myght I see how ver hed every blossome kent,
And eke the new betrothed byrdes y *coupled* how they went. *Surrey.*
A schoolmaster, who shall teach my son and your, I will provide; yea, though the three do cost me a *couple* of hundred pounds. *Ascham.*

One day, as he forepassed by the plaine
With weary pace he far away espied
A *couple* seeming well to he his twayne.
Spenser. Faerie Queene.

After all which up to their steedes they went,
And forth together rode, a comely *couplement*. *Id.*
I shall rejoice to see you so *coupled* as may be fit both for your honour and your satisfaction. *Sidney.*

He was taken up by a *couple* of shepherds, and by them brought to life again. *Id.*
Then would they cast away their pipes, and holding hand in hand, dance by the only cadence of their voices which they would use in singing some short *couplets*, whereto the one-half beginning, the other half should answer. *Id.*

Huntsman, I charge thee, tender well my hounds;
And *couple* Clowder with the deep-mouthed Brach.
Shakspeare. Introduction to Taming of the Shrew.

The orator, to deck his oratory,
Will *couple* my reproach to Tarquin's shame.
Id. The Rape of Lucrece.

Waters in Africa being rare, divers sorts of beasts come from several parts to drink; and so being refreshed, fall to *couple*, and many times with several kinds. *Bacon.*

I have read of a feigned commonwealth, where the married *couple* are permitted, before they contract, to see one another naked. *Id. New Atlantis.*

That great variety of brutes in Africa, is by reason of the meeting together of brutes of several species at water, and the promiscuous *couplings* of males and females of several species. *Hale's Origin of Mankind.*
By adding one to one, we have the complex idea of a *couple*. *Locke.*

It is in some sort with friends as it is with dogs in *couples*; they should be of the same size and humour. *L'Esrange.*
After this alliance,
Let tigers match with hinds, and wolves with sheep,
And every creature *couple* with his foe. *Dryden's Spanish Friar.*

He said: the careful *couple* join their tears,
And then invoke the gods with pious prayers. *Id.*
That man makes a mean figure in the eyes of reason, who is measuring syllables and *coupling* rhimes, when he should be mending his own soul, and securing his own immortality. *Pope.*

I am just going to assist with the archbishop, in degrading a parson who *couples* all our beggars, by which I shall make one happy man. *Swift.*

No *couple-beggar* in the land
E'er joined such numbers hand in hand. *Id.*
In Pope I cannot read a line,
But with a sigh I wish it mine;
When he can in one *couplet* fix
More sense than I can do in six,
It gives me such a jealous fit,
I cry, Pox take him and his wit. *Id.*

Round her strewed room a frippery chaos lies,
A chequered wreck of notable and wise;
Bills, books, caps, *couplets*, combs, a varied mass,
Oppress the toilet, and obscure the glass. *Sheridan.*
While seated after dinner at his ease,
Beside his mistress in some soft abode,
Palace, or garden, paradise, or cavern,
Which serves the happy *couple* for a tavern. *Byron. Don Juan.*

COURAGE, v. a. & n. s. } Old Fr. *corage*;
COURAGEOUS, adj. } mod. Fr. *courage*;
COURAGEOUSLY, adv. } It. *coraggio*; Sp.
COURAGEOUSNESS, n. s. } *corage*; low Lat. *coragium*, from *cor*, the heart. The verb, which has the same meaning with to encourage, is, as Mr. Todd truly observes, unjustly slighted and forgotten. The noun signifies, bravery; active fortitude; spirit of enterprise; and formerly it was used in the sense of heart or mind. Shakspeare ludicrously uses the word courageous in the sense of outrageous.

And he that is *courageous* among the mighty, shall flee away naked in that day. *Amos*, ii. 16.

Nicanor, hearing of the manliness and the *courageousness* that they had to fight for their country, durst not try the matter by the sword.

2 *Maccabees*, xiv. 18.

In Southwerk at the Tabard as I lay,
Redy to wendon on my pilgrimage
To Canterbury with devoute *courage*.

Chaucer. Prol. to Cant. Tales.

No length of time or deth may this deface,
Ne change my *courage* to an other place.

Id. Cant. Tales.

This Diomede, as bokis us declare,
Was in his nedis prest and *courageous*.

Id. Troilus and Creside.

And kind with *courage* so my corps had blent,
That lae on whom but me dyd she most smyle ?

Sackville.

Whose warlike provesse and manly *courage*,
Tempred with reason and advizement sage,
Hath fild sad Belgieke with victorious spoile.

Spenser.

Did counterfeit hynd pittie where was none,
For where's no *courage* there's no ruth nor none.

Id. Faerie Queene.

The king-becoming graces,
Devotion, patience, *courage*, fortitude,
I have no relish of them. *Shakspeare. Macbeth.*

Their discipline

Now mingled with their *courage*. *Id. Cymbeline.*

He is very *courageous* mad about his throwing into the water. *Id.*

The king the next day presented him battle upon the plain, the fields there being open and champaign : the earl *courageously* came down, and joined battle with him. *Bacon's Henry VII.*

Courage, that makes us bear up against dangers that we fear, and evils that we feel, is of great use in an estate as ours is in this life, exposed to assaults on all hands : and, therefore, it is very advisable to get children into this armour as early as we can. *Locke.*

All *courageous* animals are carnivorous, and greater *courage* is to be expected in a people, such as the English, whose food is strong and hearty, than in the half-starved commonalty of other countries.

Sir W. Temple.

True *courage* has so little to do with anger that there lies always the strongest suspicion against it, where this passion is highest. The true *courage* is cool and calm. The bravest of men have the least of a brutal bullying insolence ; and in the very time of danger are found the most serene, pleasant, and free.

Shaftesbury.

Hope arms their *courage* ; from their towers they throw

Their darts with double force, and drive the foe.

Dryden.

Courage, that grows from constitution, very often forsakes a man when he has occasion for it ; and, when it is only a kind of instinct in the soul, it breaks out on all occasions, without judgment or discretion. That *courage* which arises from the sense of our duty, and from the fear of offending him that made us, acts always in an uniform manner, and according to the dictates of right reason. *Addison's Guardian.*

Nothing but the want of common *courage* was the cause of their misfortunes. *Swift.*

There is a *courageous* wisdom : there is also a false reptile prudence, the result not of caution but of fear. *Burke.*

But, more distinguished than the rest,
Was seen a wether ready drest,
That smoking, recent from the flame,
Diffused a stomach-rousing steam.
Our wolf could not endure the sight,
Courageous grew his appetite :
His entrails groaned with tenfold pain,
He licked his lips, and licked again. *Beattie.*

Now from the dust of ancient days bring forth
The sober zeal, integrity, and worth ;
Courage, ungraced by these, affronts the skies,
Is but the fire without the sacrifice. *Cowper.*

But now with pleasant pace a cleaner road
I mean to tread. I feel myself at large,
Courageous and refreshed for future toil,
If toil await me, or if dangers new. *Id.*

Let your *courage* be as keen, but at the same time
as polished, as your sword. *Sheridan.*

COURANT, in music, is a piece in triple time : the air of the courant is ordinarily noted in triples of minims ; the parts to be repeated twice. It begins and ends when he who beats the measure falls his hand ; in contradistinction from the saraband, which ordinarily ends when the hand is raised.

COURANT, in heraldry, an epithet for any beast represented in a running attitude, as in the diagram :—

COURAYER (Peter Francis), a Roman Catholic clergyman, born at Vernon, in Normandy, 1601. While canon regular and librarian of the abbey of St. Genevieve, at Paris, he addressed a letter to archbishop Wake in defence of the episcopal succession in England, and the validity of the English ordinations. This was afterwards published in Holland in 1727, and drew upon him the formal censures of the French church. Taking refuge in England, he was well received, and presented by the university of Oxford with the degree of D. D. In 1736 he translated into French, and published, Father Paul's History of the Council of Trent, in 2 vols. fol. dedicated to queen Caroline ; who augmented to £200 a pension of £100 a year, which he had obtained before from the court. His works are numerous, and all in French ; into which language he also translated Sleidan's History of the Reformation. He attended the service both of his own church and that of the church of England regularly. He died in 1776, after two days illness, at the age of ninety-five ; and was buried in the cloister of Westminster Abbey.

COURB, *v. n.* & *adj.* To bend ; to bow to ; stoop in supplication ; crooked.

Her neck is short, her shoulders *courb*. *Gower.*

In the fatness of these pury times,
Virtue itself of vice must pardon beg,
Yea, *courb* and woo, for leave to do it good.

Shakspeare. Hamlet.

COURIER, *n. s.* Fr. *courier* ; Ital. *corriere* ; Sp. *correo* ; from Lat. *currere*, to run. A messenger sent in haste ; an express ; a runner, generally ; a messenger.

I met a *courier*, one mine ancient friend.

Shakspeare. Timon.

This thing the wary Bassa well perceivng, by speedy couriers advertised Solyman of the enemy's purpose, requesting him with all speed to repair with his army to Tauris. *Knolles' History.*

COURIER PIGEON. See COLUMBA.

COURIERS, ANCIENT. The ancients had two kinds of couriers, viz. 1. Those who ran on foot, called by the Greeks, Hemerodoromi, q. d. couriers of day. Pliny, Corn. Nepos, and Casar, mention some of these who would run twenty, thirty, thirty-six, and in the circus even forty leagues per day. 2. Cursores equitantes, who changed horses, as modern couriers do. Xenophon attributes the first couriers to Cyrus. Herodotus says they were very common among the Persians, and that there was nothing more swift than these kind of messengers. 'That prince,' says Xenophon, 'examined how far a horse would go in a day, and built stables at such distances from each other, where he lodged horses, and persons to take care of them; and at each place kept a person always ready to take the packet, mount a fresh horse, and forward it to the next stage: and thus throughout his empire.' But it does not appear that either the Greeks or Romans had any regular fixed couriers till the time of Augustus: under that prince they travelled in cars; though it appears from Socrates they afterwards went on horseback. Under the western empire they were called viatores; and under that of Constantinople, cursores: whence the modern name. See POST-OFFICE.

COURLAND, a duchy of Poland, situated between 21° and 60° E. long., and between 56° 30' and 57° 30' N. lat. It is bounded by the gulf of Riga and the river Dwina, which divide it from Livonia on the north; by Lithuania on the east; by Samogitia on the south; and by the Baltic Sea on the west: being 250 miles long and forty broad. It was formerly independent, but incorporated with the Russian empire in 1795. This country rises in gentle hills, and is fertile in corn, hemp, and flax. It also abounds in pine, fir, oak, and other timber, and has many neat villages and good inns. It is divided into Courland Proper and Semigallia. The chief towns are Mittau the capital, Goldengen, Groben, Libau, Winday, and Tacibstadt. It is said to contain 11,200 square miles, and 480,000 inhabitants.

COURSE, *v. a., v. n. & n. s.* } Fr. *course* ;
 CO'URSER, *n. s.* } Latin, *cursus*,
 CO'URSING, *n. s.* } from *currere*.

The shades of meaning in the verb and noun, particularly in the latter, are numerous. The verb signifies to hunt; to pursue; to chase with dogs that keep the game in sight; to compel to run; to run; to rove about. The noun denotes race; career; race ground; progressive motion; running in the lists; a ship's track; certain sails of a ship; process; order of succession; regular method, manner, or series of; conduct; manner of proceeding; method of life; train of actions; natural bent; catamenia; orderly structure; a continued layer of bricks or stones in a building; series of consequences; number of dishes set at once upon the table; settled rule; empty form. Of course, implies something that follows as a natural consequence from some other thing.

Courser is, a swift horse; a war horse; one who courses hares. Coursing is hunting with greyhounds. See COURSING.

And when we had finished our *course* from Tyre, we came to Ptolemais. *Acts xxi. 7.*

If any man speak in an unknown tongue, let it be by two, or at the most by three, and that by *course*, and let one interpret. *I Cor. xiv. 27.*

The tongue defileth the whole body, and setteth on fire the *course* of nature. *James iii. 6.*

When Zephirus eke with his sote bretho
 Enspired hath in every holt and hetho
 The tender croppes, and the yonge sonne
 Hath in the Ram his halfe *course* yronne.

Chaucer. Prolog. to Cant. Tales.

Ther was the hart ywont to heve his flight,
 And over a brooke, and so forth on his wey,
 This duk wol have a *course* at him or twey
 With houndes, swiche as him lust to commaunde.

Id.

Wher as she many a ship and barge sie
 Sailing hir *course* wher as hem list to go.

Id.

This gentil duk down from his *courser* sterte
 With herte piteous when he herd hem speke.

Id.

So fareth love when he hath tane a *course*,
 Rage is his rayne, resistance vayleth none.

Wyat.

So as they *coursed* here and there, it chaunst
 That in her wheeling round, behind her crest
 So sorely he her strooke, that thence it glaunst
 Adowne her backe.

Spenser. Faerie Queene.

He proudly pricketh on his *courser* strong,
 And Atin ay him pricks with spurs of shame and wrong.

Id.

But this hot knight was cooled with a fall, which,
 at the third *course*, he received of Phalantus.

Sidney.

A woman of so working a mind, and so vehement
 spirits, as it was happy she took a good *course*; or
 otherwise it would have been terrible.

Id.

The big round tears

Coursed one another down his innocent nose
 In piteous chase. *Shakespeare. As You Like it.*

The king is hunting the deer; I am *coursing* myself.

Id. Love's Labour Lost.

The blood, before cold and settled, left the liver
 white and pale, which is the badge of pusillanimity
 and cowardice; but the sherris warms it, and makes
 it *course* from the inwards to the parts extreme.

Id. Henry IV.

The duke cannot deny the *course* of law.

Id.

Worthy Sir, thou bleedest,

Thy exercise hath been too violent

For a second *course* of fight. *Id. Coriolanus.*

He that is disrespectful in his *course*,
 Oft sells his reputation at cheap market.

Ben Jonson.

To the *courses* we have devised studding-sails, sprit-
 sails, and top-sails.

Raleigh's Essays.

It would be tried also in flying of hawks, or in *coursing*
 of a deer, or hart, with greyhounds.

Bacon's Natural History.

That worthy deputy, finding nothing but a common
 misery, took the best *course* he possibly could to estab-
 lish a commonwealth in Ireland.

Davies on Ireland.

And some she arms with sinewy force,
 And some with swiftness in the *course*.

Cowley.

When they have an appetite
 To ventry, let them not drink nor eat,
 And *course* them oft, and tire them in the heat.

May's Virgil.

— Rhyme the ruler is of verses,
With which, like ships, they steer their *courses*.

Butler.

But if a right *course* be taken with children, there will not be so much need of common rewards and punishments.

Locke.

With a mind unprepossessed by doctors and commentators of any sect, whose reasonings, interpretation, and language, which I have been used to, will of *course* make all chime that way; and make another, and perhaps the genuine meaning of the author, seem harsh, strained, and uncouth to me.

Id.

It is best to leave nature to her *course*, who is the sovereign physician in most diseases.

Temple.

Men talk as if they believed in God, but they live as if they thought there was none; their vows and promises are no more than words of *course*.

L'Estrange.

The stoppage of women's *courses*, if not suddenly looked to, sets them undoubtedly into a consumption, dropsy, or some other dangerous disease.

Harvey on Consumptions.

Give willingly what I can take by force;
And know, obedience is your safest *course*.

Dryden's Aurengzebe,

Then with a second *course* the tables load,
And with full chargers offer to the god.

Dryden's Æneid.

Then to his absent guest the king decreed
A pair of *courses*, born of heavenly breed;
Whom from their nostrils breathed æthereal fire,
Whom Circe stole from her celestial sire.

Id.

Ten brace and more of greyhounds, snowy fair,
And tall as stags, ran loose, and *coursed* around his chair.

Dryden.

I am continually starting hares for you to *course*;
we were certainly cut out for one another; for my temper quits an amour just where thine takes it up.

Congreve's Old Bachelor.

Men will say,
Thatauteous Emma vagrant *courses* took,
Her father's house and civil life forsook.

Prior.

Sense is of *course* annexed to wealth and power;
No muse is proof against a golden shower.

Garth.

The senate observing how, in all contentions, they were forced to yield to the tribunes and people, thought it their wisest *course* to give way also to time.

Swift.

When the state of the controversy is plainly determined, it must not be altered by another disputant in the *course* of the disputation.

Watts.

A leash is a leathern thong, by which a falconer holds his hawk, or a *course* leads his greyhound.

Hanmer.

All at once
Relapsing quickly, as quickly re-ascend
And mix, and thwart, extinguish, and renew,
All ether *course*ing in a maze of light.

Thomson's Autumn.

Though vain the Muse, and every melting lay,
To touch thy heart, unconscious of remorse!
Know, monster, know, thy hour is on the way,
I see, I see the years begin their mighty *course*.

Beattie.

Is there a man, whose judgment clear
Can others teach the *course* to steer,
Yet runs himself life's mad career,
Wild as the wave;
Here pause—and through the starting tear,
Survey this grave.

Burns.

History, not wanted yet,
Leaned on her elbow, watching Time, whose *course*,
Eventful, should supply her with a theme.

Cowper.

O Love!—tormentor!—fiend!—whose influence,
like the moon's acting on men of dull souls, makes
idiots of them, but meeting subtler spirits, betrays
their *course*, and urges sensibility to madness!

Sheridan.

The morning watch was come; the vessel lay
Her *course*, and gently made her liquid way;
The cloven billow flashed from off her prow
In furrows formed by that majestic plough;
The waters with their world were all before;
Behind the South Sea's many an islet shore.

Byron. The Island.

COURSES, a name applied to the principal sails of a ship, viz. the main-sail, the fore-sail, and the mizen; the mizen-stay sail and fore-sail are also sometimes comprehended in this denomination; as are the main-stay sails of all brigs and schooners. When a ship sails under the main-sail and fore-sail only, without lacing on any bonnets, she is then said to go under a pair of courses.

COURSING, among sportsmen. There are three several sorts of courses with grey-hounds: 1. At the hare; 2. At the fox; and 3. At the deer. The best method of coursing the hare, is to go out and find a hare sitting; which is easily done in summer, by walking across the lands, either stubble, fallow, or corn grounds, and casting the eye up and down; for in summer they frequent those places for fear of the ticks, which are common in the woods at that season; and in autumn they dislike the shade of trees on account of the drops falling in time of rain. At other seasons it will be necessary to beat the bushes and thickets to rouse them, and oftentimes they will lie so close that they will not stir till the pole almost touches them; the sportsmen are always pleased with this, as it promises a good course. If a hare lie near any close or covert, and with her head that way, it is always to be expected that she will take to that immediately on being put up; all the company are therefore to ride up and put themselves between her and the covert before she is put up, that she may take the other way, and run upon open ground. When a hare is put up it is always proper to give her ground, or law as it is called, that is to let her run twelve score yards, or thereabouts, before the greyhounds are slipped at her, otherwise she is killed too soon, the greater part of the sport is thrown away, and the pleasure of observing the several turnings and windings that the creature will make to get away is lost. A good sportsman had rather see a hare save herself after a fair course, than see her murdered by the greyhounds as soon as she is up. In coursing the fox no other art is required than standing close, in a clear wind, on the outside of some grove where it is expected he will come out; and when he comes out he must have head enough allowed him, otherwise he will return back to the covert. The slowest greyhound will be able to overtake him, after all the odds of distance necessary; and the only danger is the spoiling the dog by the fox, which too frequently happens. For this reason no greyhound of any value should be run at this course, but the strong,

hard, bitter, dogs, that will seize any thing. For the deer, there are two sorts of courses; the one in the paddock, the other either in the forest, or the purlieu. For the paddock course there must be the greyhound and the terrier, and mongrel greyhound, whose business is to drive away the deer before the greyhounds are slipped; a brace or a leash are the usual number slipped at a time, seldom more than two brace. In-coursing the deer in the forest or purlieu, there are two ways in use; the one is coursing them from wood to wood; and the other upon the lawns close by the keeper's lodge. In the coursing from wood to wood, the way is to throw in some young hounds into the wood to bring out the deer; and if any deer come out that is not weighty, or a deer or antler which is buck, sore, or sorrel, then you are not to slip your greyhounds, which are held at the end of the wood, where the keepers, who can guess very well on these occasions, expect that the deer will come out. If a proper deer come out, and it is suspected that the brace or leash of greyhounds slipped after him will not be able to kill him, it is proper to waylay him with a couple of fresh greyhounds. The coursing upon the lawn is more agreeable than any of the other ways. When the keeper is warned before hand, he will lodge a deer for the course; and then, by coming under the wind, the greyhounds may be brought near enough to be slipped for a fair course.

The laws of coursing established by the duke of Norfolk in the reign of queen Elizabeth are still held binding. 1. He that is chosen fawterer, or letter loose of the dogs, shall receive the greyhounds matched to run together into his leash as soon as he comes into the field; he is to march next to the hare-finder, or him who is to start the hare, until he come to the form: and no horse-man or footman is to go before or sideways, but all straight behind, for the space of about forty yards. 2. A hare ought never to be coursed with more than a brace of greyhounds. 3. The hare-finder is to give the hare three sohoes before he puts her up from her form or seat, to the end that the dogs may be prepared and attend her starting. 4. If there be not a particular danger of losing the hare, she should have about twelve score yards law. 5. The dog that gives the first turn, if after that there be neither cote, slip, or wrench, wins the wager. 6. A go-by, or bearing the hare, is counted equivalent to two turns. 7. If neither dog turn the hare, he that leads to the last covert wins. 8. If any dog turn the hare, serve himself, and turn her again, it is as much as a cote, and a cote is esteemed as much as two turns. 9. If all the course be equal, he that bears the hare shall win; and if he be not borne, the course shall then be judged dead. 10. If a dog take a fall in his course and yet perform his part, he may challenge the advantage of a turn more than he gave. 11. If a dog turn the hare, serve himself, and give divers cotes, and yet in the end stand still in the field, the other dog, if he turn home to the covert, although he gives no other, shall be adjudged to win the wager. 12. If by misfortune a dog be ridden over in the course, that course shall be adjudged void, and he that did the mischief is to make reparation to the owner. 13. If a dog give

the first and last turn, and there be no advantage betwixt them, he that gives the odd turn wins. 14. A cote is when a greyhound goes end ways by the side of his fellow, and gives the hare a turn. 15. A cote serves for two turns, and two trippings or jerkings for a cote; and if the hare turns not quite about, she only wrencheth in the sportsman's phrase. 16. If there be no cotes given by the greyhounds, but one serve the other at turning, then he that gives the most turns wins the wager. 17. Sometimes a hare does not turn, but wrenches, for she does not turn except she turns as it were round; in these cases two wrenches stand for one turn. 18. He that comes in first at the death of the hare takes her up, and saves her from breaking; he cherishes the dogs, and cleanses their mouths from the wool; he is adjudged to have the hare for his pains. 19. Finally, those who are judges of the leash, must give their judgment before they depart out of the field, or else it is not to stand as valid.

COURT, <i>v. n. & n. s.</i>	} Old French, <i>court</i> ; mod. Fr. <i>cour</i> ; Goth. <i>kurt</i> , civility of manners. Ang.-Sax. <i>cupre</i> ; Dut. <i>koort</i> ; Lat. <i>curtis</i> . To solicit; to flatter; to woo a woman. Court signifies a prince's residence; the retinue of a prince; the place where justice is administered; any jurisdiction, military, civil, or ecclesiastical; the art of insinuation; flattery; an open space before a house; a small opening enclosed with houses and paved with broad stones, through which, in general, carriages cannot pass. Courtier is one who follows the court; one who solicits a favor from another; but the latter meaning is disused. Courty and courtliness mean, having the manner of a court; being of gracious manners. Courtling is a contemptuous synonyme of courtier. Courtezan was formerly used in an inoffensive sense, but it is now confined to prostitutes. Courtesy denotes elegance of manners; an act of civility; the reverence made by women; a tenure, not of right, but by the favor of others. Courteous is elegantly mannered; polite; well bred. Courtlike is, refined; polite. Courting and courtship are the act of soliciting favor, chiefly that of a woman in order to obtain her hand. Donne uses the latter word in the sense of elegance of manners.

It shall be an habitation of dragons, and a court for owls. *Isaiah xxvi. 13.*

Friendship is more than is catell,
For friende in *courte* aie better is
Than peny is in purse certis.

Chaucer. Romaunt of the Rose.

His stede, which that shonne as sunne bright,
Stant in the court as stille as any ston.

Chaucer. Cant. Tales.

For, brother min, take of me this motif,
I have now ben a court-man all my lif. *l. l.*

Deus hic, quod he; O Thomas, friend, good day,
Sayde this frere all *courtisly* and soft. *l. l.*

Curteis he was, lowly and servisable,
And carf before his father at the table.

Id. Prol. to Cant. Tales.

A knight there was, and that a worthy man,
That fro the time that he firste began
To riden out, he loved chivalrie;
Trouthe and honour, fredom and *curtesie*. *Id.*

Creseide fro it awoke
And all that *court* and conuocacioun
Vanished awaie.

Henderson. On Test. of Creseide.

A tong, that served in forein realmes his king,
Whose *courteous* talk to virtue did inflame
Each noble hart. *Surrey,*

Myne owne John Poynes, sins ye delight to know
The causes why that homeward I me draw,
And flee the prease of *courts*. *Wyat.*

The neat *courtier*
So serves for lesse, than do these fatted swine. *Id.*
Him the prince with gentle *court* did board.

Spenser. Faerie Queene.

Forthwith to *court* of Gloriane I sped,
Of Gloriane, great queene of glory bright. *Id.*

What needes of dainty dishes to devize,
Of comely services, or *courtly* trayne? *Id.*

That nyght they pass in ioy and lollity,
Feasting and *courting* both in bowre and hall. *Id.*

And in the midst thereof, upon the floure,
A lovely bevy of faire ladies sate,
Court of many a jolly paramour. *Id.*

'The first which then refused me,' said hee,
'Certes was but a common *courtisane*.' *Id.*

But to Duess' each one himself did payne,
All kindnesse and faire *courtesie* to shew,

For in that *court* whylome her well they knew. *Id.*

Here do you keep a hundred knights and squires,
Men so disorderly, so debauched and bold,

'That this our *court*, infected with their manners,
Shews like a riotous inn; epicurism and lust

Make it more like a tavern or a brothel,
Than a graced palace. *Shakspeare. King Lear.*

The archbishop

Of Canterbury, accompanied with other
Learned and reverend fathers of his order,
Held a late *court* at Dunstable.

Shakspeare. Henry VIII.

He hath been a *courtier*, he swears.
If any man doubts that, let him put me to my purgation.

I have trod a measure; I have flattered a lady;
I have been politick with my friend, smooth with
mine enemy; I have undone three taylors; I have
had four quarrels, and like to have fought one.

Id. As You Like It.

You spurned me such a day; another time
You called me dog; and, for these *courtesies*,

I'll lend you thus much money.

Id. Merchant of Venice.

Be merry, and employ your chiefest thoughts
To *courtship*, and such fair ostents of love,

As shall conveniently become you there. *Id.*
He hath deserved worthily of his country; and his
assent is not by such easy degrees, as those who have
seen supple and *courteous* to the people.

Id. Coriolanus.

Sweet Cytherea, sitting by a brook,
With young Adonis, lively, fresh, and green,
Courted the lad with many a lovely look,

Such looks as none could look but beauty's queen.

Id. The Passionate Pilgrim.

Courtling, I rather thou shouldst utterly
Dispraise my work, than praise it frostily.

Ben Jonson.

Follow a shadow, it flies you;
Seem to fly it, it will pursue:
So *court* a mistress, she denies you;
Let her alone, she will *court* you. *Id. Forest.*

But when the cause itself must be decreed,
Himself in person in his proper *court*,
To grave and solemn hearing doth proceed
Of every proof, and every bye report. *Davies.*

You must have, before you come to the front, three
courts: a green *court* plain, with a wall about it; a
second *court* of the same, but more garnished, with
little turrets, or other embellishments, upon the wall;
and a third *court*, to square with the front, not to be
built but inclosed with a naked wall. *Bacon.*

With them there are no stews, no dissolute houses,
no *courtesans*, nor any thing of that kind; nay, they
wonder, with detestation, at you in Europe, which
permit such things. *Id. New Atlantis.*

Our English tongue is, I will not say as sacred as
the Hebrew, or as learned as the Greek, but as *court*,
as the Latin, as *courteous* as the Spanish, as *courtlike*
as the French, and as amorous as the Italian.

Camden's Remains.

There was not among all our princes a greater *cour-*
tier of the people than Richard III.; not out of fear,
but wisdom. *Suckling.*

The slightest part that you excel in, is *courtlines*.
Lord Digby to Sir Kenelm Digby.

Their wisdom was so highly esteemed, that some of
them were always employed to follow the *courts*
of their kings, to advise them. *Temple.*

Whilst Christ was upon earth, he was not only easy
of access, he did not only *courteously* receive all that
addressed themselves to him, but also did not disdain
himself to travel up and down the country.

Calamy's Sermons.

Hast thou been never base? Did love ne'er bend
Thy frailer virtue to betray thy friend?
Flatter me, make thy *court*, and say it did;
Kings in a crowd would have their vices hid.

Dryden's Aurengzebe.

They can produce nothing so *courtly* writ, or which
expresses so much the conversation of a gentleman, as
Sir John Suckling. *Id. on Dramatick Poetry.*

In short, a mere *courtier*, a mere soldier, a mere
scholar, a mere any thing, is an insipid, pedantic
character, and equally ridiculous. *Spectator.*

Every man, in the time of *courtship*, and in the first
entrance of marriage, puts on a behaviour like my
correspondent's holiday suit. *Addison's Guardian.*

If I should meet her in my way,
We hardly *court'sy* to each other. *Prior.*

Ev'n now, when silent scorn is all they gain,
A thousand *court* you, though they *court* in vain.

Pope.

It is but to venture your lungs, and you may preach
against pride and dissimulation and bribery at White-
hall: you may expose rapine and injustice in the inns
of *court*; and in a city pulpit be as fierce as you please
against avarice, hypocrisy, and extortion 'Tis but
a ball banded to and fro, and every man carries a
racket about him to strike it from himself among the
rest of the company. *Swift.*

A *courtier's* dependant is a beggar's dog. *Shenstone.*

Vanity bids all her sons to be generous and brave—
and her daughters to be chaste and *courteous*.—But
why do we want her instructions? Ask the comedian
who is taught a part he feels not. *Sternac.*

When was it that a king of England wanted where-
withal to make him respected, *courted*, or perhaps
even feared, in every state in Europe? *Burke.*

Though blest with wisdom and with wit refined,
She *courts* not homage, nor desires to shine;
In her each sentiment sublime is joined
To female sweetness, and a form divine. *Beattie.*

Admiring multitudes shall trace
Each patrimonial charm combined—
The *courteous* yet majestic mien,
The liberal smile, the look serene,
The great and gentle mind. *Id.*

Nymphs were Dianas then, and swains had hearts,
That felt their virtues; innocence, it seems,
From *courts* dismissed, found shelter in the groves. *Cowper.*

Courtier and patron cannot mix
There heterogeneous politics,
Without an effervescence,—
Like that of salts with lemon juice
Which does not yet like that produce
A friendly coalescence. *Id.*

There shall no vain pretender be,
To *court* thy smiles and torture me;
No proud superior there be seen;
But nature's voice shall hail thee queen. *Sheridan.*

YOUNG F. Hey-day! What the devil have we
here!—Sure my gentleman's gown a favorite at
court, he has got so many people at his levee! *Id.*

SNEER. Yes; and our prudery in this respect is
just on a par with the artificial bashfulness of a
courtesan, who increases the blush upon her cheek
in an exact proportion to the diminution of her mo-
desty. *Id.*

And now, Hidalgo! now that you have thrown
Doubt upon me, confusion over all,
Pray have the *courtesy* to make it known—
Who is the man you search for? how d'ye call
Him? What's his lineage? let him but be shown.
Byron. Don Juan.

However, present remedy was none,
And no great good seemed answered if she staid;
Regarding both with slow and sidelong view,
She snuffed the candle, *curtsied*, and withdrew. *Id.*

COURT, in law. As by our excellent constitution, the sole executive power of the laws is vested in the person of the king, it follows that all courts of justice, which are the medium by which he administers the laws, are derived from the power of the crown. For, whether created by act of parliament or letters patent, or subsisting by prescription, the only methods by which any court of judicature can exist, the king's consent in the two former is expressly, and in the latter impliedly, given. In all these courts the king is supposed, in contemplation of law, to be always present; but, as that is in fact impossible, he is there represented by his judges, whose power is only an emanation of the royal prerogative. For the more speedy, universal, and impartial administration of justice between subject and subject, the law has appointed a great variety of courts, some with a more limited, others with a more extensive jurisdiction: some constituted to enquire only, others to hear and determine: some to determine in the first instance, others upon appeal and by way of review. See **LAW**, and the respective articles in the order of the alphabet. One distinction runs throughout them all; viz. that some of them are courts of record, others not of record.

A court of record is that where the acts and judicial proceedings are enrolled in parchment for a perpetual memorial and testimony; which rolls are called the records of the court, and are of such high and supereminent authority, that their truth is not to be called in question. For it is a settled rule and maxim, that nothing shall be averred against a record, nor shall any plea or even proof be admitted to the contrary. And if the existence of a record be denied, it shall be tried by nothing but itself; that is, upon bare inspection whether there be such record or not; else there would be no end of disputes. But if there appear any mistake of the clerk in making up such record, the court will direct him to amend it. All courts of record are the king's courts, in right of his crown and royal dignity, and therefore no other court hath authority to fine or imprison; so that the very erection of a new jurisdiction with power of fine or imprisonment, makes it instantly a court of record. A court not of record is the court of a private man, whom the law will not intrust with any discretionary power over the fortune or liberty of his fellow-subjects. Such are the courts baron, and other inferior jurisdictions; where the proceedings are not enrolled or recorded, but as well their existence as the truth of the matters therein contained, shall, if disputed, be tried and determined by a jury. These courts can hold no plea of matters cognizable by the common law, unless under the value of 40s, nor of any forcible injury whatsoever, not having any process to arrest the person of the defendant. In every court there must be at least three constituent parts, the actor, reus, and judex; the actor, or plaintiff, who complains of an injury done; the reus, or defendant, who is called upon to make satisfaction for it; and the judex, or judicial power, which is to examine the truth of the fact, to determine the law arising upon that fact, and as if any injury appears to have been done, to ascertain, and by its officers to apply the remedy. It is also usual in the superior courts to have attorneys and advocates, or counsel, as assistants. See **ATTORNEY**, and **COUNSEL**.

COURT, ARCHES. See **ARCHES COURT**.

COURT BARON, in English law, a court incident to every manor in the kingdom, to be holden by the steward within the said manor. This court baron is of two natures: the one is a customary court, appertaining entirely to the copyholders, in which their estates are transferred by surrender and admittance, and other matters transacted relative to their tenures only. The other is a court of common law, and it is the court of the barons, by which name the freeholders were called: for that it is held before the freeholders who owe suit and service to the manor, the steward being rather the registrar than the judge. These courts, though in their nature distinct, are confounded together. The freeholders' court was composed of the lord's tenants, who were the pares of each other, and were bound by their feudal tenure to assist their lord in the dispensation of domestic justice. This was formerly held every three weeks; and its most important business is to determine, by writ of right, all controversies relating to the right of lands within the manor. It may also hold plea

of any personal actions, of debt, trespass on the case, or the like, where the debt or damages do not amount to forty shillings. Which is the same sum, or three marks, that bounded the jurisdiction of the ancient Gothic courts in their lowest instance, or fierding courts, so called because four were instituted within every superior district or hundred. But the proceedings on a writ of right may be removed into the county court by a precept from the sheriff, called a *tolt*, quia tollit atque eximit causam e curia baronum. And the proceedings in all other actions may be removed into the superior courts by the king's writs of *pone*, or *accedas ad curiam*, according to the nature of the suit. After judgment given, a writ also of false judgment lies to the courts at Westminster, to rehear and review the cause, and not a writ of error; for this is not a court of record; and therefore, in some of these writs of removal, the first direction given is to cause the plaint to be recorded, *recordari facias loquelam*.

COURT OF KING'S BENCH. See BENCH.

COURT MARTIAL, a court appointed for the punishing offences in officers, soldiers, and sailors, the powers of which are regulated by the mutiny-bill.

COURT-CHAPLAIN, *n. s.* From court and chaplain. One who attends the king to celebrate the holy offices.

The maids of honour have been fully convinced by a famous *court-chaplain*. *Swift*.

COURT-DAY, *n. s.* From court and day. Day on which justice is solemnly administered.

The judge took time to deliberate, and the next *court-day* he spoke. *Arbutnot and Pope*.

COURT-DRESSER, *n. s.* From court and dresser. One that dresses the court, or persons of rank; a flatterer.

There are many ways of fallacy; such arts of giving colours, appearances, and resemblances, by this *court-dresser*, fancy. *Locke*.

COURTENAY (John), an Irish gentleman, descended from the Devonshire family of this name; was originally in the army, and first appeared in public life as secretary to the marquis Townsend, lord-lieutenant of Ireland. He was returned at the general election in 1780, M. P. for Tamworth, and re-elected for that borough in 1784 and 1790. He came into administration with the whig party in 1783, as surveyor of the ordnance, and secretary to the master-general. During their administration in 1806 he was appointed one of the commissioners of the treasury. He sat in parliament for Appleby from 1796 to 1812. His speeches and conversation were always admired for their wit. His works are, 1. A Tract on the Duke of Richmond's Plan of Fortifications, 8vo. 2. A Poetical Review of Dr. Johnson's Character, 8vo. 3. Reflections on the French Revolution. 4. Poetical Epistles on the Manners of France, Italy, &c. 8vo. He died in 1816, aged seventy-five.

COURTESY OF ENGLAND. A tenure (says Cowell) by which, if a man marry an inheritrix, that is, a woman seized of land, and getteth a child of her that comes alive into the world, though both the child and his wife die forthwith, yet, if she were in possession, shall he keep the

land during his life, and is called *tenant per legem Angliæ*, or by the courtesy of England.

COURT-FAVOR, *n. s.* From court and favor. Favors or benefits bestowed by princes.

We part with the blessings of both worlds for pleasures, *court-favours*, and commissions; and at last, when we have sold ourselves to our lusts, we grow sick of our bargain. *L'Estrange*.

COURT-HAND, *n. s.* From court and hand. The hand or manner of writing used in records and judicial proceedings.

He can make obligations, and write *court-hand*. *Shakspeare*.

COURT-LADY, *n. s.* From court and lady. A lady conversant or employed in court.

The same study, long continued, is as intolerable to them, as the appearing long in the same clothes or fashion is to a *court-lady*. *Locke*.

COURTRAI, or COURTRAY, a town of the Netherlands, with a castle; seated on the I.ys. It is famed for its manufactures of woollen cloths, lace, diaper, and damask linens, &c. It was taken by the French under general Jarry, in the spring of 1792, but was soon after evacuated, and the suburbs burnt. It was retaken by them in 1792, and again evacuated in the spring of 1793; but surrendered a third time on the 28th of April, 1794, to general Pichegru; and was retained by France until the peace of 1814. Population 14,000. It lies fourteen miles east of Ypres, twenty-three south-west of Ghent, and twenty-four south of Bruges.

COUSIN, *n. s. & adj.* } Fr. *cousin*; Ital. *Cousinage*, *n. s.* } *cugino*; Lat. *consanguineus*. Any one collaterally related—more remotely than a brother or sister. It is also a title of honor given by the king to noblemen, particularly to those of the council. Cousinage is an old word for kin.

Who was so welcome as my Lord Dan John,
Our dire *cousin*, full of curtesie? *Chaucer. Cant. Tales*.

Eke Plato sayeth, who so can him rede,
The wordes most ben *cosin* to the dede.

Id. Prol. to Cant. Tales.

By him lay heavy slepe, the *cosin* of death,
Flat on the ground, and still as any stone. *Shakville*.

Macbeth unscamed him.

Oh valiant *cosin*! worthy gentleman!
Shakspeare.

Tyhalt, my *cosin*! O my brother's child!
Unhappy sight! alas, the blood is spilled
Of my dear kinsman. *Id. Romeo and Juliet*.

Thou art, great lord, my father's sister's son,
And *cosin*-german to great Priam's seed.

Id. Troilus and Cressida.

Your friends all wearie, and your spirits spent,
Ye may your fortunes seek, and be forwent,
Of your kind *cosins* and your churlish sires,
Left there alone, midst the fast folding briers. *Hall*.

Well, I never will join in ridiculing a friend; and so I constantly tell my *cosin* Ogle, and you all know what pretensions she has to be critical on beauty.

Sheridan.

They formed a very nymph-like looking crew
Which might have called Diana's chorus '*cosin*,'
As far as outward show may correspond;
I won't be bail for anything beyond.

Byron. Don Juan.

Cousin is a term of relation between the children of brothers and sisters, who in the first generation are called cousins-german, in the second generation second cousins, &c. Theodosius the Great prohibited cousins from marrying under pain of death; on pretence that they were, in some sort, brothers and sisters to each other. Also a title often given to the nobility, particularly to those of the privy council, by the king.

Cousin (John), a celebrated French painter, who excelled in painting on glass. His picture of the Last Judgment, in the vestry of the minims of the Wood of Vincennes, is much admired. He was also a good sculptor. He wrote several works on geometry and perspective; and died about 1639.

Cousu, in heraldry, signifies a piece of another color or metal, placed in the ordinary, as if it were sewed on, as the word imports.

Coutances, an old town of France, in Lower Normandy, having a population of 10,000. It is situated on the west coast of the department of La Manche, on the river Soule, five miles from its influx into the English channel, and contains several fine churches. Its manufactures are linen and lace; and its other articles of trade corn, flax, and wool. It is fifty miles west of Caen.

Coutantin, **Cotantin**, or **Cotentin**, a ci-devant territory of France, in Lower Normandy, containing the towns of Coutances, Carantan, Cherbourg, Barfleur, Granville, St. Sauveur, Valogne, Ville-Dieu, &c. It is now included in the department of the Channe!

Couth, *adj.* Ang.-Sax. *cuð*. Known.

Couth, **Cotn**, or **Could**. This is the past participle of *conn*, to know; to be able; but has long been obsolete in the original sense. *Could* is new used as a grammatical auxiliary.

Nor need he guide; the way right well he *could*.
Which leads to shady plains of Gaza old.

Fairfax. Tasso.

Couthon (George), a French revolutionist of the wildest character, was born in 1756 at Orsai, in the department of Puy de Dome. Brought up to the law, he practised as an advocate, and became president of the court of justice at Clermont. In September, 1791, he was chosen deputy from his native department to the Legislative Assembly; and in 1792 became a member of the National Convention. He spoke violently in the convention against the measure of granting the king a negative on public measures, and was one of the first to propose the trial of Louis XVI., for whose execution he voted. He wavered awhile between the parties of Brissot and Robespierre, but perceiving the latter to be the more powerful, closely connected himself with it, and all its atrocities. Being sent as commissioner from the convention to Lyons, and the deformity of his lower limbs rendering him incapable of walking, he ordered himself to be carried in a chair to the square of Belle-cour, where he gave a blow with a silver hammer to one of the buildings, exclaiming, "I strike in the name of the law." This was the signal for commencing the work of destruction; and the noblest edifices of the city were reduced to heaps of ruins. Couthon was most justly involved in the

fate of his party. When arrested, he is said to have exhibited the greatest pusillanimity; and his execution, which took place July 28th, 1794, was attended with great suffering, the distortion of his frame rendering it impossible to place him under the guillotine in the usual posture.

Coutts (Thomas), a London banker, who, from a small commencement, raised himself to high rank in the mercantile class, was the fourth and youngest son of John Coutts, a merchant of Edinburgh; and in early life a junior partner in a house in St. Mary Axe, in correspondence with the firm to which his father belonged. He afterwards joined his brother's banking-house in the Strand, of which he became sole proprietor. He is remarkable principally for his matrimonial speculations, having married, first, Susan Starkie, a female servant of his brother's, by whom he had three daughters—Susan, married in 1796 to lord Guilford; Frances, who married in 1800 John, marquis of Bute; and Sophia, married in 1793 to sir Francis Burdett, bart. He entered a second time into the marriage state in 1815, about three months after his first wife's decease, with Miss Mellon, an actress of some celebrity, whom he constituted at his death the sole legatee of his large fortune, sworn to be *under* £600,000 personals 'in the diocese of Canterbury,' besides real estates. He died February, 1821, aged eighty-seven.

Couvert, in heraldry, a piece of hanging, or a pavilion falling over the top of a chief or other ordinary, so as not to hide, but only to be a covering to it.

Cow, *v. a.* } Dr. Johnson unhesitatingly
Cowish, *adj.* } derives this verb from coward,
of which he declares it to be a contraction. Mr. Tooke, with perhaps more plausibility, refers its origin to *cower*. Other lexicographers, however, trace it to the Swed. *kufica*, to check, to curb, to suppress, to subjugate; meanings which also belong to the Isl. *kuga*. To *cow* signifies, to depress with fear; to break the spirits so as to render habitually timid. *Cowish* is timorous; mean; pusillanimous.

Macduff was from his mother's womb

Untimely ripped.—

—Accused be that tongue that tells me so,
For it hath *cowed* my better part of man.

Shakspeare. Macbeth.

It is the *cowish* terror of his spirit,
That dares not undertake: he'll not feel wrongs
Which tie him to an answer. *Id. King Lear.*

By reason of their frequent revolts, they have drawn upon themselves the pressures of war so often, that it seems to have somewhat *cowed* their spirits.

Howel's Vocal Forest.

For when men by their wives are *cowed*,
Their horns of course are understood. *Hudibras.*

Cow, <i>n. s.</i>	} Per. <i>gau</i> ; Sans. <i>gau</i> ; Goth. <i>ku</i> ; Ang.-Sax. Lu; Dut. <i>koe</i> ; Ger. <i>kuhe</i> ; Swed. <i>ko</i> . Junius supposes, 'knew vel <i>kuw</i> ' to be the parent word. The female of the bull. A cow-leech is one who professes to cure cows. Cowslips, says Dr. John-
Co'w-boy, <i>n. s.</i>	
Co'w-herd, <i>n. s.</i>	
Co'w-house, <i>n. s.</i>	
Co'w-keeper, <i>n. s.</i>	
Co'w-leech, <i>v. n.</i> & <i>n. s.</i>	
Co'w-like, <i>adj.</i>	
Co'w-slip, <i>n. s.</i>	

son, are so called, 'as some think, from the resemblance of scent to the breath of a cow; perhaps, from growing much in pasture grounds, and often meeting the cow's lips.' Others suppose they derive their name from cows delighting in them, or from their similitude to the lips of a cow.

If that this bone be washe in any well,
If cow, or calf, or shepe, or oxe, swell
That any worm hath ete, or worm ystonge,
Take water of that well and washe his tongue
And it is hole anon. *Chaucer. Cant. Tales.*

How often would she flowers twine,
How often garlands make
Of cowslips and of columbine,
And all for Corin's sake. *Songes and Sonnettes.*
Streight downe she ranne, like an enraged cow
That is berobbed of her youngling dere.

Spenser. Faerie Queene.
And for her sake a cowheard vile became,
The servant of Admetus, cowhard vile,
Whiles that from heaven he suffered exile. *Id.*
Show me the ground with daffadowdillies,
And cowslips, and king cups, and loved lillies.
Id. Shepherd's Calendar.

Where the bee sucks, there suck I;
In a cowslip's bell I lie. *Shakespeare. Tempest.*

We see that the horns of oxen and cows, for the most part, are larger than the bull's; which is caused by abundance of moisture, which in the horns of the bull faileth. *Bacon.*

Then, leaving in the fields his grazing cows,
He sought himself some hospitable house,
Good Creton entertained his godlike guest.
Dryden's Fables.

The terms cowkeeper and hogherd are not to be used in our poetry; but there are no finer words in the Greek language. *Broome.*

Thy little sons
Permit to range the pastures: gladly they
Will mow the cowslip posies, faintly sweet. *Philips.*
You must house your milch-cows, that you give
hay to, in your cow-house all night. *Mortimer.*

Though there are many pretenders to the art of farriering and cow-leeching, yet many of them are very ignorant, especially in the country. *Id.*

Cowslip is also called pagil, grows wild in the meadows, and is a species of primrose. *Miller.*

Mourn, Spring, thou darling of the year!
Hk cowslip cup shall kep a tear:
Thou, Simmer, while each corny spear
Shoots up its head,
Thy gay, green, flowery tresses shear,
For him that's dead. *Burns.*

Who glide unseen, on printless slippers borne,
Beneath the waving grass, and nodding corn;
Or lay your tiny limbs, when noon-tide warms,
Where shadowy cowslips lay their golden arms.
Darwin.

In the Adventurer, a periodical paper, published by the ingenious Dr. Hawkesworth, I remember, indeed, a sort of humorous account of a dog that bit a hog in the streets; the hog bit a farmer, and the farmer bit a cow; and, what is very extraordinary, each conveyed his peculiar quality to the other; for the hog barked like a dog, the farmer grunted like a hog, and the cow did its best to talk like the farmer. *Sheridan.*

Cow, in zoology. See Bos.

Cow, *n. s.* A moveable top to a chimney, to prevent it from smoking. The word is supposed to be corrupted from cowl.

COW, SEA. See TRICHECUS.

CO'WARD, *v. a., n. s. & adj.* } Fr. *coward*;
CO'WARDICE, *n. s.* } Ital. *codardo*;

refer it to cowherd; though why a man who watches cows should necessarily be a dastard, it is not easy to divine. Yet the manner in which some of our old writers speak the word, seems to afford some ground for this conjecture. Twisden, Somner, and Tyrwhitt consider it to be a corruption of *culum vertere*, to turn tail. Horne Tooke maintains, that coward is the past participle of the verb to cower; and with him agrees the Encyclopædia Metropolitana. Cowheart or cow-hearted have also been supposed to be the parent stock. Mr. Todd, however, reasons forcibly in favor of the derivation from the old Fr. *coward*, which itself springs from *coûe*, Lat. *cauda*, a tail; allusively to animals depressing the tail between the legs when they are frightened. A coward is, a poltroon; a dastard; one who is habitually under the dominion of fear. The verb to cowardize, to make cowardly, is obsolete. The meaning of the subordinate words is obvious.

I cannot love a coward by my faith.
Chaucer. Cant. Tales.

Alas! she saith, that ever I was yshape
To wed a milksop or a coward ape,
That wol ben overlede with every wight. *Id.*

———— This compass we'll marke
Not aye with full sailes the hie seas to beate,
Ne by coward dred, in shonning stormes darke,
On shallow shores thy keel in perill fret. *Surrey.*
But loe my souldiers cowardly shrank away.
For such is fortune when she lyst to frowne. *Sackville.*

That I alas in this calamitie
Alone was left, and to myself mought playne
This treason, and this wretched cowardlye. *Id.*

———— Why lovest thou thy strokes
Cowardes among, turn thee to me, in case
Manhood there be so much left in thy heart.
Uncertain Auctors.

Vile cowheard Dogge! now do I much repent
That ever I this life unto thee lent,
Whereof thou, Caytive! so unworthy art!
Spenser. Faerie Queene.

For all he taught the tender yonge was but
To banish cowardize and bastard feare. *Id.*

Pyrocles did such wonders, beyond belief, as was
able to lead Misidorus to courage, though he had
been born a coward. *Sidney.*

Having more man than wit about me, I drew;
He raised the house with loud and coward cries.
Shakespeare. King Lear.

I do find it cowardly and vile,
For fear of what might fall, so to prevent
The time of life. *Id. Julius Caesar.*

A very paltry boy, and more a coward than a hare:
his dishonesty appears in leaving his friend here in
necessity, and denying him; and for his cowardship,
ask Fabian. *Id. Twelfth Night.*

He sharply reproved them as men of no courage, who had most cowardly turned their backs upon their enemies. *Knolles.*

There was a soldier that vaunted, before Julius Cæsar, of the hurts he had received in his face. Cæsar, knowing him to be but a coward, told him, You were best take heed, next time you run away, how you look back. *Bacon.*

An Egyptian soothsayer made Antonius believe that his genius, otherwise brave and confident, was in the presence of Octavius poor and cowardly. *Bacon's Natural History.*

Gallant and fearless courage will turn into a native and heroic valour, and make them hate the cowardice of doing wrong. *Milton on Education.*

Some are brave one day, and cowards another, as great captains have often told me, from their own experience and observation. *Temple.*

Let all such as can enlarge their consciences like hell, and style a cowardly silence in Christ's cause discretion, know, that Christ will one day scorn them. *South.*

None was disgraced ; for falling is no shame,
And cowardice alone is loss of fame.
The vent'rous knight is from the saddle thrown,
But 'tis the fault of fortune, not his own.

Dryden's Fables.

Invading fears repel my coward joy,
And ills foreseen the present bliss destroy.

Prior.

Tremble ye not, oh friends ! and cowards fly,
Doomed by the stern Telemachus to die !

Pope's Odyssey.

Rage, we know, can make a coward forget himself and fight. But what is done in fury or anger, can never be placed to the account of courage. Were it otherwise, womankind might claim to be the stoutest sex ; for their hatred and anger have ever been allowed the strongest and most lasting. *Shaftesbury.*

To tell a man he lies, though but in jest, is an affront that nothing but blood can expiate. The reason, perhaps, may be because no other vice implies a want of courage so much as the making of a lie ; and therefore telling a man he lies, is touching him in the most sensible part of honour, and indirectly calling him a coward. *Addison.*

It might, methinks, somewhat abate the insolence of human pride to consider, that it is but increasing or diminishing the velocity of certain fluids in the animal machine, to clate the soul with the gayest hopes, or sink her into the deepest despair ; to depress the hero into a coward, or advance the coward into a hero. *Melmoth.*

The loose improvidence, the cowardly rashness of those who dare not look danger in the face, so as to provide against it in time, and therefore throw themselves headlong into the midst of it. *Burke.*

O shun th' annoyance of the bustling throng,
That haunt with zealous turbulence the great ;
There coward Office boasts th' unpunished wrong,
And sneaks secure in insolence of state. *Beattie.*

Wha will be a traitor knave ?
Wha can fill a coward's grave ?
Wha sae base as be a slave ?

Traitor ! coward ! turn and flee. *Burns.*

—When

Thy sons are in the lowest scale of being,
Slaves turned o'er to the vanquished by the victors ;
Despised by cowards for greater cowardice,
And scorned even by the vicious for such vice

As in the monstrous grasp of their conception
Defy all codes to image or to name them.

Byron. The Doge of Venice.

COWARD, in heraldry, a term given to a lion borne in an escutcheon with his tail doubled, or turned in between his legs, as in the annexed diagram :—

COWEL (Dr. John), a learned and eminent civilian, born about 1554. In 1607 he compiled a Law Dictionary, which gave great offence to Sir Edward Coke and the common lawyers : so that they first accused him to James I. as asserting that the king's prerogative was in some cases limited ; and when they failed in that attempt, they complained of him to the house of commons, as a betrayer of the rights of the people, by asserting that the king was not bound by the laws ; for which he was committed to custody, and his book publicly burnt. He also published *Institutiones Juris Anglicani*, in the manner of Justinian's Institutes ; and died of the operation for the stone, in 1611.

COWBER, *v. a. & n.* Fr. *cowber* ; Ital. *covare* ; Lat. *cabare* ; Goth. *kura* ; Welsh, *cwrrian*. To sink by bending the knees ; to stoop ; to shrink from ; to cherish carefully : the latter meaning is obsolete.

Kingis mete to him knele and coure.
To the apostles that Christ frebode.

Chaucer. Cant. Tales.

Where finding life not yet dislodged night,
He much rejoyest, and *cowrd* it tenderly,
As chicken newly hatcht, from dreaded destiny.

Spenser. Faerie Queene.

The splitting rocks *covered* in the sinking sands,
And would not dash me with their ragged sides.

Shakspeare. 2 Henry VI.

Let the pail be put over the man's head above water, then he *cover* down, and the pail be pressed down with him.

Bacon.

As thus he spake, each bird and beast beheld,
Approaching two and two ; these *covering* low
With blandishment, each bird stooped on his wing,
Milton.

Our dame sits *covering* o'er a kitchen fire,
I draw fresh air, and nature's works admire.

Dryden.

Lo ! where the Giant on the mountain stands,
His blood-red tresses deepening in the sun,
With death-shot glowing in his fiery hands,
And eye that scorseth all it glares upon ;
Restless it rolls, now fixed, and now anon
Flashing afar,—and at his iron feet
Destruction *covers* to mark what deeds are done.

Byron. Childe Harold.

A band of children, round a snow-white ram,
There wreath his venerable horns with flowers ;
While peaceful as if still an unweaned lamb,
The patriarch of the flock all gently *covers*
His sober head, majestically tame. *Id. Don Juan.*

COWES, a sea-port town on the north coast of the Isle of Wight ; situated on the river Meden, which divides it into East and West Cowes each of which has a castle built by Henry VIII. It is a place of considerable trade, and much resorted to as a bathing place. The buildings,

rising one above another on the brow of the hill, command delightful views. The harbour is one of the safest and most commodious in the British Channel. During war large fleets of merchant ships are to be found waiting here for convoy or favorable winds. Genteel private lodgings abound, and there are two excellent inns. Passage boats ply regularly between Cowes and Southampton, a distance of sixteen miles, and afford, in favorable weather, a most charming sail. Distance from London eighty-four miles south-west, and from Portsmouth twelve W. S. W.

COWL, *n. s.* } Old Fr. *coule*; Ital. *cu-*
Co'wled, *adj.* } *culla*; Sp. *cagulla*; Wel.
 COWL-STAFF, *n. s.* } *cul*; Ang.-Sax. *cul*, *cugle*;
 Sw. *kujl*; Per. *koolah*; Lat. *cutculus*. A monk's hood; a vessel in which water is carried on a pole between two persons. Cowl-staff, usually written cole-staff, is the pole on which the vessel is suspended.

You may imagine that Francis Cornfield did scratch his elbow, when he had sweetly invented, to signify his name, saint Francis, with his friery *cowl* in a cornfield. *Camden.*

Mounting him upon a *cowl-staff*,

Which (tossing him something high)

He apprehended to be Pegasus. *Suckling.*

What differ more, you cry, than crown and *cowl*?

I'll tell you, friend, a wise man and a fool. *Pope.*

Hear the *cowled* zealots with united cries,

Urged the crusade. *Shenstone.*

They will tell you that they see no difference between the idler with a hat and a national cockade, and an idler in a *cowl* or in a rocket. *Burke.*

Dark and unearthly is the scowl

That glares beneath his dusky *cowl*.

Byron. The Giaour.

COWLS, worn by the Bernardines and Benedictines, are of two kinds; the one white, very large, worn in ceremony, and when they assist at the office; the other black, worn on ordinary occasions, in the streets, &c. F. Mabilion maintains the cowl to be originally the same thing in its origin with the scapular. The author of the Apology of the Emperor Henry IV. distinguishes two forms of cowls: the one a gown reaching to the feet, having sleeves, and a capuchin, used in ceremonies; the other a kind of hood to work in, called also a scapular, because it only covers the head and shoulders.

COWLEY (Abraham), an eminent poet, born at London in 1618. His father, who was a grocer, dying before he was born, his mother procured him to be admitted a king's scholar, at Westminster. His first inclination to poetry arose from his perusal of Spenser's Fairy Queen, when but just able to read: and he began at the age of thirteen to write poems; a collection of which was published in 1633. In 1636 he was elected a scholar of Trinity College, Cambridge, and removed to that University. He had taken his degree of M. A. before 1643, when, in consequence of the turbulence of the times, he, among others, was ejected from the college; and retiring to St. John's Oxford, published a satire, called the Puritan and the Papist. But he did not remain long at Oxford: his zeal for the royal cause engaging him in the king's service, whom he attended in many of his expeditions. During

one part of the civil war, he was settled in the earl of St. Albans' family; and when the queen mother retired into France, he accompanied her; labored strenuously in the affairs of the royal family, undertook several very dangerous journeys on their account, and was the principal instrument in maintaining an epistolary correspondence between the king and queen, whose letters he decyphered. His poems were published at London in 1647; and his comedy called the Guardian, (afterwards altered under the title of Cutter of Coleman-street), in 1650. In 1656 he came over to England, and, under pretence of retirement, gave information to lord Ormond of the posture of the public affairs. During his stay in England he wrote his Two Books of Plants, published first in 1662; to which he afterwards added four books more; all of which, with his other Latin poems, were printed in London, in 1678. He was created M. D. at Oxford, Dec. 2nd, 1637. Soon after the Restoration he became possessed of a very competent estate, through the favor of the duke of Buckingham and the earl of St. Albans; and, being now above forty years of age, he resolved to pass the remainder of life in studious retirement. His first rural residence was at Barn Elms; but he afterwards removed to Chertsey, where he died on the 28th of July, 1667, in the forty-ninth year of his age. He was interred in Westminster Abbey, near the ashes of Chaucer and Spenser. He was a man who united a very amiable character, with admirable genius. Charles II. on the news of his death, declared 'that Cowley had not left a better man behind him in England.' A monument was erected to his memory by George Villiers, duke of Buckingham, in 1675. Cowley's other works were, A Proposition for the Advancement of Experimental Philosophy; A Discourse by way of Vision concerning the Government of Oliver Cromwell; and several Discourses by way of Essays in prose and verse. A spurious piece, entitled The Iron Age, was published under his name during his absence from England, and, in Mr. Dryden's Miscellany Poems, we find a Poem on the Civil War, said to be written by him, but not extant among his works. An edition of his works was published by Dr. Spratt, afterwards bishop of Rochester, who prefixed to it an account of the author's life. Cowley's character as a poet has been variously estimated. Lord Clarendon has said he made a flight above all men; Addison, in his account of the English poets, that he improved upon the Theban bard. Dr. Johnson observes of his poetry, that 'he wrote with abundant fertility, but negligent or unskilful selection; with much thought, but with little imagery; that he is never pathetic, and rarely sublime, but always either ingenious or learned, either acute or profound.' Of his prose he says, 'no author ever kept his verse and his prose at a greater distance from each other. His thoughts are natural, and his style has a smooth and placid equability, which has never yet obtained its due commendation. Nothing is far-sought or hard labored; but all is easy without feebleness, and familiar without grossness.' He adds, 'that he was the first who imparted to English numbers the

enthusiasm of the greater ode and the gaiety of the less; that he was among those who freed translation from servility; and that, if he left versification yet improveable, he left likewise from time to time such specimens of excellence, as enabled succeeding poets to improve it.

COWLEY (Hannah), a dramatic writer, was born at Tiverton in Devonshire in 1743. At the age of twenty-five she married Mr. Cowley, an officer in the East India Company's service, who died in 1797. She produced as her first play the comedy of the Runaway in 1776, which was followed the year after by the Belle's Stratagem, and some other popular pieces. Her best poems are the Maid of Arragon and the Siege of Acre. She died at Tiverton in 1809, and her works were published in 1813 in 3 vols. 8vo. with a memoir of her life.

CO-WO'RK, *v. n.* } From *con* and worker.
CO-WO'RKER, *n. s.* } A fellow-workman.

The power of God *co-working* within us. *Goodwin.*

And therefore in all acquired gifts and habits, such as are those of philosophy, oratory, or divinity, we are properly *συνεργοι*, *co-workers* with God. *South.*

COWPER (William), one of the most distinguished of modern English poets, was the son of Dr. Cowper, rector of Berkhamstead, Herts, where he was born November 26th, 1731. His grandfather, Spencer Cowper, was a judge of the court of Common Pleas, and brother to lord Chancellor Cowper. From infancy his constitution was remarkably delicate, and his mind of a tender and timid cast. At six years of age he lost his excellent and 'most indulgent' mother, and was sent immediately to a large school in Bedfordshire. 'Here,' he says, 'I had hardships of different kinds to conflict with, which I felt more sensibly, in proportion to the tenderness with which I had been treated at home. But my chief affliction consisted in my being singled out from all the other boys, by a lad about fifteen years of age, as a proper object upon whom he might let loose the cruelty of his temper. I choose to forbear a particular recital of the many acts of barbarity, with which he made it his business continually to persecute me: it will be sufficient to say, that he had, by his savage treatment of me, impressed such a dread of his figure upon my mind, that I well remember being afraid to lift up my eyes upon him, higher than his knees; and that I knew him by his shoe-buckles, better than any other part of his dress. The cruelty of this boy, which he had long practised in so secret a manner that no creature suspected it, was at length discovered. He was expelled from the school, and I was taken from it.'

He was now placed for a year in the family of a surgeon and oculist, being in danger of losing one of his eyes, and from thence transferred to Westminster school. He praises its religious discipline at this time, and particularly the manner in which the boys were 'prepared for confirmation': but here he imbibed that strong aversion to public education, which he afterwards expressed so forcibly in one of his best poems, the 'Tirocinium.'

At the age of eighteen he was removed from

Westminster, 'being tolerably furnished,' as he informs us, 'with grammatical knowledge, but as ignorant of all points of religion as the satchel at my back;' a curious result of the aforesaid discipline. Having spent about nine months at home, he was articled to an attorney of the metropolis, until he came of age, passing his leisure time ('pretty near all his time' he says) at an uncle's in Southampton-row. At twenty-one years of age he took possession of a set of chambers in the temple, with a view to the future practice of the law, as a barrister, but was soon afterwards attacked seriously with that wretched 'dejection of spirits,' which was the bane of his life. Its causes were evidently constitutional, and he mentions an early but short attack of the kind at Westminster school. Among the predisposing circumstances of this calamity, however, particularly at this period, we cannot but reckon the long continued *idleness* of his youth and early manhood. Had he been either by authority, by necessity, or by a sense of duty impelled to a real and steady exertion of his considerable powers for business, during the important years he trifled away at Southampton-row, the result we must believe would have been most salutary.

We shall not be expected to trace the ebbs and flowings of this unhappy complaint. He at first looked into Herbert's Poems, and books of devotion; was then advised to try a change of scene, and finding it relieve him, threw all his religious books aside, and renewed his school acquaintance with the profligate Churchill, with Lloyd, Thornton, and Colman; for the latter of whom he wrote two papers in the *Connoisseur*. His little patrimony being now well nigh spent, and a marriage being projected for him with a sister of Lady Hesketh's, he gladly accepted the offer of the places of reading clerk, and clerk of the committees to the house of lords. This satisfaction, however, was but momentary. In the course of a week his apprehensions of his own incompetence, and of his being publicly exposed before the assembled peerage, were overwhelming to his mind, and he wrote to the friend who had given him the choice of three places of this kind, relinquishing the two that were most profitable. His powers completely failed him, even in preparing for the less arduous post of clerk of the Journals. His agitation produced a nervous fever. 'The feelings of a man when he arrives at the place of execution,' he says, 'are probably much like mine, every time I set my foot in the office, which was every day for more than half a year together.' He in vain left London for a short refreshment of his health and spirits: on his return, the scene of preparation, and the idea of his public appearance before the house, became intolerable. 'To this dilemma was I reduced,' says he, 'either to keep possession of the office to the last extremity, and by so doing, expose myself to a public rejection for insufficiency; (for the little knowledge I had acquired, would have quite forsaken me at the bar of the house;) or else to fling it up at once, and by this means run the hazard of ruining my benefactor's right of appointment, by bringing his discretion into question. In

this situation, such a fit of passion has sometimes seized me, when alone in my chambers, that I have cried out aloud, and cursed the hour of my birth; lifting up my eyes to heaven, at the same time, not as a suppliant, but in the hellish spirit of rancorous reproach and blasphemy against my Maker. A thought would sometimes come across my mind, that my sins had perhaps brought this distress upon me, that the hand of divine vengeance was in it; but in the pride of my heart I presently acquitted myself, and thereby implicitly charged God with injustice, saying, 'What sins have I committed to deserve this?'

He hoped for madness, he tells us afterwards, and resolved on suicide; not, as some of his biographers have stated, in consequence of any distortion of some peculiar religious sentiments which he had now imbibed; but in a state of evident scepticism as to all religion. 'Perhaps, thought I, *there is no God*; or if there be, the Scriptures may be false; if so, then God has no where forbidden suicide.' His Calvinistic sentiments were clearly not imbibed until the latter part of his residence with Dr. Cotton. We will not transcribe the dismal narrative of his various wretched efforts to rid himself of life; he bought laudanum, took a coach resolving to throw himself into the Thames, and at last, on the morning on which he was to appear at the bar of the house of lords, hung himself over his bed-chamber door until he was totally insensible; but his garter providentially breaking, he was restored to the world at the very point of strangulation. His kinsman arriving was 'pointed to the broken garter in the middle of the room, and apprised of the attempts which he had been making.' Certainly, he observed, the office could not be held at that rate, asked for the deputation, and took it away with him; and thus ended all our poet's connexion with the house of lords.

His intellects completely sunk under the subsequent pressure of remorse and the fear of death, and in 1763 he was placed under the care of Dr. Cotton, with whom he remained eighteen months. His despair, according to Mr. Greathead, was at the latter part of this period 'effectually removed by reading in the sacred Scriptures that God hath set forth Jesus Christ to be a propitiation through faith in his blood, to declare his righteousness for the remission of sins that are past, through the forbearance of God. While meditating on this passage, he obtained a clear view of the gospel, which was attended with unspeakable joy. His subsequent days were (for awhile) chiefly occupied with praise and prayer, and his heart overflowed with love to his crucified Redeemer. The transports of his joy, which at first interrupted his necessary sleep, having subsided, were followed by a sweet serenity of spirit, which he was enabled to retain, notwithstanding reviving struggles of natural and habitual corruption.'

Cowper's own Memoirs of his Early Life prepare us in part for what may be called this sudden conversion, by a narrative of some conversation which he had with the Rev. Martin Madan prior to his illness. He also dwells on

the transports of joy with which it was accompanied. Its best effects were the serenity which seems to have followed, and which lasted for a period of upwards of eight years. A writer in the Quarterly Review (No. 59) presumes to pronounce without 'doubt', that the whole was 'the mere natural consequence' of high wrought feelings; and speaks of the 'flood of light which burst upon his mind as the false fire of insanity.' But Dr. Cotton was surely somewhat of a judge of this question, and his brother who concurred in his removal from that gentleman's care, was of different religious sentiments to those which Cowper now imbibed. What these were he thus informs us in a letter to a relative, dated October 20th, 1766:—'That Jesus is a present Saviour from the guilt of sin by his most precious blood, and from the power of it by his Spirit; that corrupt and wretched in ourselves, in Him, and in Him only, we are complete; that being united to Jesus by a lively faith, we have a solid and eternal interest in his obedience and sufferings, to justify us before the face of our heavenly Father, and that all this inestimable treasure, the earnest of which is in grace, and its consummation in glory, is given, freely given to us of God; in short, that he hath opened the kingdom of heaven to all believers;—These are the truths, which, by the grace of God, shall ever be dearer to me than life itself; shall ever be placed next my heart as the throne whereon the Saviour himself shall sit, to sway all its motions, and reduce that world of iniquity and rebellion to a state of filial and affectionate obedience to the will of the Most Holy.'

He declined to return to London, he says, as the scene of his former dissipation, and resigned from the conscientious motive of being thus unable to fulfil its duties, the office of a commissioner of bankruptcy, worth about £60 per annum. His brother procured for him a retreat at Huntingdon, where in November, 1765, he became an inmate in the family of the Rev. Mr. Unwin. On that gentleman's decease, in 1767, he continued to reside with his widow.

Some of the best fruits of the nine happy years of his life that followed, are preserved in his Private Correspondence, published in 1824, by his cousin, Dr. Johnson of Yaxley. We extract a playful letter of his, written at this period; and another containing one of the best gentle admonitions on a common, but serious topic, which we have ever seen.

TO THE REV. JOHN NEWTON

March 19th, 1725.

'My dear Friend,

'You will wonder no doubt when I tell you that I write upon a card table; and will be still more surprised when I add, that we breakfast, dine, and sup, upon a card table. In short, it serves all purposes except the only one for which it was originally designed. The solution of this mystery shall follow, lest it should run in your head at a wrong time, and should puzzle you, perhaps, when you are on the point of ascending your pulpit.

The round table, which we formerly had in use, was unequal to the pressure of my superincumbent breast and elbows. When I wrote upon it, it creaked and tilted, and by a variety of inconvenient tricks disturbed the process. The fly-table was too slight and too small; the square dining table too square and too large, occupying, when its leaves were spread, almost the whole parlour; and the side-board table, having its station at too great a distance from the fire, and not easily shifted out of its place and into it again, by reason of its size, was equally unfit for my purpose. The card table, therefore, which had for sixteen years been banished as mere lumber; the card table which is covered with green baize, and is therefore, preferable to any other that has a slippery surface; the card table, that stands firm and never totters, is advanced to the honor of assisting me upon my scribbling occasions; and because we choose to avoid the trouble of making frequent changes in our household furniture, proves equally serviceable upon all others. It has cost us, now and then, the downfall of a glass; for when covered with a table cloth, the fish ponds are not easily discerned; and, not being seen, are sometimes as little thought of. But having numerous good qualities which abundantly compensate that single inconvenience, we spill upon it our coffee, our wine, and our ale, without murmuring, and resolve that it shall be our table still, to the exclusion of all others. Not to be tedious, I will add but one circumstance more upon the subject, and that only because it will impress upon you as much as anything that I have said, a sense of the value we set upon its escriptorial capacity. Parched and penetrated on one side by the heat of the fire, it has opened into a large fissure, which pervades not the moulding of it only, but the very substance of the plank. At the mouth of this aperture, a sharp splinter presents itself, which, as surely as it comes in contact with a gown or apron, tears it. It happens, unfortunately, to be on that side of this excellent and never-to-be-forgotten table, which Mrs. Unwin sweeps with her apparel almost as often as she rises from her chair. The consequences need not, to use the fashionable phrase, be given in detail; but the needle sets all to rights, and the card table still holds possession of its functions without a rival,' &c. vol. 1. p. 349.

TO JOSEPH HILL, ESQ

'Jan. 21st, 1769.

'Dear Joe,

'I rejoice with you in your recovery, and that you have escaped from the hands of one from whose hands you will not always escape. Death is either the most formidable, or the most comfortable thing, we have in prospect, on this side of eternity. To be brought near to him, and to discern neither of these features in his face, would argue a degree of insensibility, of which I will not suspect my friend, whom I know to be a thinking man. You have been brought down to the sides of the grave, and you have been raised again by Him who has the keys of the invisible world: who opens, and none can shut,

who shuts, and none can open. I do not forget to return thanks to Him on your behalf, and to pray that your life, which He has spared, may be devoted to his service. 'Behold! I stand at the door and knock,' is the word of Him, on whom both our mortal and immortal life depend; and, blessed be his name, it is the word of one who wounds only that he may heal, and who waits to be gracious. The language of every such dispensation is, 'Prepare to meet thy God.' It speaks with the voice of mercy and goodness, for, without such notices, whatever preparation we might make for other events, we should make none for this. My dear friend, I desire and pray, that when this last enemy shall come to execute an unlimited commission upon us, we may be found ready, being established and rooted in a well-grounded faith in His name, who conquered and triumphed over him upon his cross.

Yours ever,

W. C.'

But we deeply lament, with the Christian Observer, the injudicious application of his time at this important period. It seems to have been wholly occupied with devotional exercises, and writing a few hymns and letters. It partook too much of the religion of the cloister to preserve a sound mind in a healthy state; but with his unhappy tendency to derangement it was most injudiciously associated. In 1773, the death of his brother brought on another paroxysm of his complaint, which rendered the following five or six years of his life an absolute blank. During its continuance he became highly indebted to the affectionate attention of Mrs. Unwin. On his recovery his friends engaged him as much as possible in literary composition. At the suggestion of the Rev. Mr. Bull, a dissenting minister of Newport-Pagnell, he produced his beautiful translation of Madame Guion's poems; and prepared for press in the same year (1780), his first volume of poems, containing Error, Truth, Expectation, Hope, Charity, Retirement, and Conversation. The latter, published by Johnson, 1782, was declared by the sages of the Critical Review to be devoid of all poetry, and attracted little general attention.

In 1781 lady Austen came to reside at Olney. Her sprightly conversation and general accomplishments made her a most suitable and salutary companion at the vicarage; and, as Hayley, we believe, has said,

Sent the freed eagle in the sun to bask,
And from the mind of Cowper drew the Task.

The poet consulted her respecting a subject for his muse; 'You can write upon any thing,' she replied, 'write upon this sofa.' He adopted the suggestion, beginning, as it would seem, a species of mock heroic description of the origin of that useful and elegant seat, and led on by his genius into the most exquisite natural and moral associations. This piece appeared, accompanying the Tirocinium, as a second volume of his poems in 1783. His character as a genuine and highly favored son of the muses was now established. Dr. Johnson spoke highly of his poetic powers, and Mr. Fox quoted him in the house of com-

mons. Unhappily for his future life and occupations, his gratitude to Mrs. Unwin, to whom, though much his senior in years, he had promised marriage, induced him to resign in the following year the friendship of lady Austen.

At about this period he commenced his translation of Homer, which appeared in 1791, in 2 vols. 4to; and, immediately on its completion, accepted an engagement with Mr. Johnson to translate the Italian poetry of Milton, and write a commentary on all his works. He also projected a new original poem, called *The Four Ages*, a fragment of which appeared in Mr. Hayley's biographical volumes. But in 1792 a paralytic seizure, which Mrs. Unwin experienced, gave a fatal shock to his mind, and all his literary undertakings were relinquished the year following. In 1794, by the good offices of earl Spencer, a pension of £300 per annum was settled upon him by the crown; he manifested, however, no visible satisfaction at the communication of this fact. At this period, in the feeble state of Mrs. Unwin's health, his cousin lady Hesketh kindly undertook the management of his domestic concerns.

He was removed from Olney in 1795, together with Mrs. Unwin, to the house of his relative the Rev. Mr. Johnson, of Tuddenham, Norfolk. On the journey he walked with his young kinsman in the church-yard of Eaton, near St. Neot's, by moon-light, and talked of the poet Thomson with some composure. Soon after he visited another relation at Mattishall, where, seeing his own portrait by Abbot, he clasped his hands in an agony of grief, wishing that his present sensations could be what they were at the period when he sat to the artist.

He had short lucid intervals in the summer of 1796, and in the course of 1799; but the death of Mrs. Unwin once more threw him back into gloom at the close of the former year; and in the latter, he only made a few insignificant translations, and composed his *Castaway*. Symptoms of dropsy appeared in the beginning of 1800, and brought him to the grave the 25th of April in that year, at Dereham.

Few authors have had the facts of their history more amply detailed than Cowper. Mr. Hayley announces and spins them out to absolute tediousness; but he performed the great service to the public of establishing the claims of our poet to be also one of our ablest English letter-writers. In the choice selection of words he has been held to equal Pope; in wit and humour, Gray, and even Swift; while he is as free from all vulgarity as from all affectation, and utters the language of the heart in the most spirited and easy style. Of the influence of his peculiar religious sentiments on the latter part of his life, our readers will arrive at very different conclusions, perhaps, according to their own respective sentiments. As a poet he will rank to the latest posterity, we cannot doubt, with the first of our painters after nature; and, as eminently, the bard of social life. As a translator of Homer he is rugged, cold, and often repulsive; but faithful and correct. As compared with Pope, he has been well said to have all in this respect that his predecessor wants, and to want all that grace and spirit which he possesses.

COWRIES, the name of a species of cyprea, whose shell is of a fine white color and crimped, bearing a high polish. It is extensively used as money in India and Africa.

COWRY. The small shell commonly known by the name of blackamoor's tooth. See *CYPRÆA*.

It is curious that some of the most common fossil shells are not now known in their recent state as the *cornua ammonis*; and on the contrary, many shells which are very plentiful in their recent state, as limpets, sea-ears, volutes, *cowries*, are very rarely found fossil. Darwin.

COWSLIP. See *PRIMULA*.

COW-WHEAT. See *MELAMPYRUM*.

COX (Richard), a learned prelate, was born at Whaddon in Buckinghamshire, in 1499. He obtained a scholarship at King's College, Cambridge, of which he became a fellow in 1519: he was thence invited to Oxford by cardinal Wolsey, and made one of the junior canons of Cardinal College. In 1525 he was incorporated B. D. and in 1526 took the degree of M. A. But his attachment to the opinions of Luther soon rendered him hateful to his superiors, who threw him into prison on a suspicion of heresy. Being, however, soon released, he was chosen master of Eton school, which flourished under his care. In 1537 he took his degree of D. D. at Cambridge; in 1540 was made archdeacon, and in 1541 prebendary of Ely. In 1546 he was made dean of Christ Church, Oxford. By the recommendation of archbishop Cranmer, he was chosen preceptor to prince Edward: on whose accession to the throne he was sworn of the privy council, and made king's almoner. In 1547 he was elected chancellor of Oxford; in 1548 canon of Windsor; and 1549 dean of Westminster. Being appointed one of the commissioners to visit the University of Oxford, his zeal for reformation was so little under the guidance of knowledge, that he destroyed a number of curious and valuable books, because they were written by Roman Catholics. On the accession of queen Mary, he was stripped of all his preferments and committed to the Marshalsea. Being released, he immediately left the kingdom, and resided at Strasburg with his intimate friend Peter Martyr. On the death of queen Mary he returned to England, was appointed, with other divines, to revise the liturgy. In 1559 was preferred to the see of Ely, which he enjoyed upwards of twenty-one years. He died 22d of July 1581, aged eighty-one. His works are, 1. Two Latin Orations on the Dispute between Dr. Tresham and Peter Martyr, London 1549, 4to. 2. Liturgy of the Church of England; in compiling, and afterwards correcting which, he was principally concerned. 3. The Lord's Prayer in verse, commonly printed at the end of David's Psalms by Sternhold and Hopkins. 4. Translation of the four Gospels, the Acts of the Apostles, and the Epistle to the Romans, in the new translation of the Bible in the reign of Elizabeth. 5. Resolutions of some Questions concerning the Sacrament, in the Collection of Records at the end of Burnet's History of the Reformation. 6. Several Letters to the

queen and others, published in Strype's Annals of the Reformation.

COXCOMB,
CO'XCOMBLY, *adj.*
CO'XCOMICAL, *adj.*
CO'XCOMICALLY, *adv.*
COXCUMBRY, *n. s.*

From cock and comb. The top of the head; the distinctive ornament which licensed fools formerly wore in their cap; a fop; a superficial pretender to knowledge or accomplishments; a kind of red flower. Coxcomblly is foolish; vain; in the manner of a coxcomb. Coxcomical is, foppish; conceited. A low word, unworthy of use, says Johnson; but in spite of his censure, the word is still in use, as well as its relation, coxcocomically.

As the cockney did to the eels, when she put them i' the pasty alive; she rapt them o' th' *coxcombs* with a stick, and cried, Down, wantons, down!

Shakspeare. King Lear.

There, take my *coxcomb*; why, this fellow has banished two of his daughters, and did the third a blessing against his will: if thou follow him, thou must needs wear my *coxcomb*. *Id.*

I sent to her,
 By this same *coxcomb* that we have i' th' wind,
 Tokens and letters which she did resend. *Shakspeare.*

I scorn, quoth she, thou *coxcomb* sil'y,
 Quarrel or council from a foe. *Hudibras.*

It is a vanity for every pretending *coxcomb* to make himself one of the party still with his betters.

L'Estrange.

They overflowed with smart repartees, and were only distinguished from the intended wits by being called *coxcombs*, though they deserved not so scandalous a name. *Dryden.*

She is a most engaging creature, if she were not so fond of that damned *coxcombly* lord of hers.

Congreve.

Some are bewildered in the maze of schools,
 And some made *coxcombs*, nature meant but fools.

Pope.

Because, as he was a very natural writer, and they were without prejudice, without prepossession, without affectation, and without the influence of *coxcomic*, senseless cabal, they were at liberty to receive the impressions which things naturally made on their minds. *Dennis.*

We should not deem a man a *coxcomb* for his dress, till, by frequent conversation, we discover a flaw in his title. If he was incapable of uttering a bon mot, the gold upon his coat would seem foreign to his circumstances. A man should not wear a French dress, till he could give an account of the best French authors; and should be versed in all the oriental languages before he should presume to wear a diamond.

Shenstone.

LORD F. Now, by all that's good and powerful, thou art an incomprehensive *coxcomb*—but thou makest good shoes, and so I'll bear with thee. *Sheridan.*

You haven't been here, I believe, since I fitted up this room. Books, you know, are the only things in which I am a *coxcomb*. *Id.*

One hates an author that's all author, fellows

In foolscap uniforms, turned up with ink,

So very anxious, clever, fine, and jealous,

One don't know what to say to them, or think,

Unless to puff them with a pair of bellows;

Of *coxcombry's* worst *coxcombs* e'en the pink,

Are preferable to these shreds of paper,

These unquenched snuffings of the midnight taper.

Byron. Beppo.

COY, *v. a. & adj.*
CO'YISH, *adj.*
CO'YING, *n. s.*
CO'YLY, *adv.*
CO'YNESS, *n. s.*

Old Fr. *coy* or *quoy*, a corruption of Lat. *quietus*. The verb, which is now little, if at all in use, signifies, to behave reservedly; to make difficulty; to allure; to caress; to pat or stroke. The adjective *coy* means, modest; reserved; shrinking from notice; receding from familiarities. *Coying*, as a noun, is fondling, petting. The rest of the secondary words do not require elucidation.

There was also a Nonne, a prioresse,
 That of hire smiling was full simple and *coy*,
 Hire gretest othe n'as but by Seint Eloy.

Chaucer. Prol. to Cant. Tales.

Sire clerk of Oxenforde, our hoste said,
 Ye sire as stille and *coy* as doth a maid,
 Were newe spoused, sitting at the bord.

Id. Cant. Tales.

Of Bialacoil she toke aie hede,
 That er he liveth in wo and drede,
 He kept him *coye* and eke privé.

Id. Romaunt of the Rose.

A fairer beaste, of fresher hue, beheld I never none,
 Save that her lookes were *coy*, and froward eke her grace. *Surrey.*

Wherefore I woulde you wiste, that for your *coyed* lookes,
 I am no man that will be trapt, nor tangled with such hookes. *Id.*

So forth they rode, he feining seemly merth,
 And she *coy* lookes. *Spenser. Faerie Queene.*

—For my sake hith learned to sport and dance,
 To *coy*, to wanton, dally, smile, and jest.
Shakspeare. Venus and Adonis.

Oh pity, gan she cry, flint-hearted boy!
 'Tis but a kiss I beg, why art thou *coy*? *Id.*

I'll mouncebank their loves,
Coy their hearts from them, and come home beloved
 Of all the trades in Rome. *Id. Coriolanus.*

If he *coyed*
 To hear Cominius speak, I'll keep at home, *Id.*

—In love, scorn is bought with groans; *coy* looks,
 With heart-sore sighs; one fading moment's mirth,
 With twenty watchful, weary, tedious nights:
Id. Two Gentlemen of Verona.

This said, his hand he *coyly* snatched away
 From forth Antinous' hand. *Chapman's Odyssey.*

When the sun hath warmed the earth and water,
 three or four male carps will follow a female; and she putting on a seeming *coyness*, they force her through weeds and flags. *Walton.*

Like Phœbus sung the no less am'rous boy:
 Like Daphne she as lovely, and as *coy*. *Waller.*

When the kind nymph would *coyness* feign,
 And hides but to be found again. *Dryden.*

What, *coying* it again!
 No more; but make me happy to my gust,
 That is, without your struggling. *Id. King Arthur.*

Retire! I beg you, leave me.—

—Thus to *coy* it!

With one who knows you too!

Roue's Jane Shore.

At this season every smile of the sun, like the smile of a *coy* lady, is as dear as it is uncommon.

Pope

The Nile's *coy* source.

Grainger

So pure, so soft, with sweet attraction shone
Fair Psyche, kneeling at the ethereal throne ;
Wen with *coy* smiles the admiring court of Jove,
And warmed the bosom of unconquered love,

Darwin.

In vain delighted memory tries to raise
My doubtful song, and aid my will to praise!
In vain ! nor fancy strike, nor memory knows
Those little springs from whence those joys arose.
Yet come, *coy* fancy,—sympathetic maid !
Yes—I will ask, I will employ thy aid :—

Sheridan.

COYPEL (Anthony), an excellent French painter, born at Paris in 1661. Noel Coypel, his father, being chosen by M. Colbert to be the director of the academy at Rome, he took Anthony with him into Italy, where he formed his style on the works of the greatest masters, and on his return to France was made first painter to the duke of Orleans; who employed him in painting the grand gallery of the royal palace, and allowed him a pension. In 1714 he was director of the academy of painting and sculpture. In 1715 he was made first painter to the French king, and was ennobled. He died in 1722. M. Coypel, his son, also excelled in the same art.

COYSTREL, *n. s.* A species of degenerate hawk.

One they might trust, their common wrongs to wreak :

The musket and the *coystrel* were too weak,
Too fierce the falcon. *Dryden's Hind and Panther.*

COZ, *n. s.* A cant or familiar word, contracted from cousin.

Be merry, *coz* ; since sudden sorrow
Serves to say thus, some good thing comes tomorrow.
Shakspeare.

CO'ZEN, *v. n.* } Minsheu says, 'to de-
CO'ZENAGE, *n. s.* } ceive or beguile under the
CO'ZENER, *n. s.* } name or show of kin-
CO'ZENING, *n. s.* } dred.' This derivation seems to be more ingenious than solid. It is rather too Swifitean. Junius refers to the Dutch *koosen*, to fawn upon, to soothe, or flatter. The Encyclopædia Metropolitana says, 'the primitive is probably Ang.-Sax. *costnian*, to try, to tempt. Perhaps we may be allowed to go farther north, for the authority of Serenius, who says Goth. and Sueti. *kjusa*, fascinari; *kosen*, fascinatur.' It will hardly be denied, that many of those who have been cozened, seem to have been fascinated, bewitched, by the cozeners. To cozen is, to cheat; to trick; to defraud; to impose upon. Cozenage and cozening signify, fraud; trick; cheat; fallacy; the practice of cheating; the profession of a cozeners.

For he was scholed by kind in all the skill
Of close conveyance, and each practice ill
Of *cozenage*, and cleanly knavery,
Which oft maintained his master's bravery.
Besides he used another slippery sleight,
In taking on himself in common sight
False personages, fit for every sted,
With which he thunders cleanly *cozined*.
Spenser. Mother Hubbard's Tale.

Let the queen pay never so fully, let the muster-
master view them never so diligently, let the deputy

or general look to them never so exactly, yet they can
cozen them all. *Id.*

Her lilly hand her rosy cheek lies under,
Cozening the pillow of a lawful kiss.

Shakspeare. The Rape of Lucrece.
Indeed, Sir, there are *cozeners* abroad, and there-
fore it behoves men to be wary. *Id. Winter's Tale.*
They say this town is full of *cozenage*,
As nimble jugglers that deceive the eye,
Disguised cheaters. *Id. Comedy of Errors.*

Wisdom without honesty is mere craft and *cozenage* ;
and therefore the reputation of honesty must first be
gotten, which cannot be but by living well : a good
life is a main argument. *Ben Jonson's Discoveries.*

There's no such thing as that we beauty call,
It is mere *cozenage* all ;

For though some long ag
Liked certain colours mingled so and so,
That doth not tie me now from chusing new.

Suckling.

Imaginary appearances offer themselves to our im-
patient minds, which entertain these counterfeiters,
without the least suspicion of their *cozenage*.

Glanville's Scepiss.

Goring loved no man so well but that he would
cozen him, and expose him to publick mirth for having
been *cozened*.

Clarendon.

He that suffers a government to be abused by care-
lessness or neglect, does the same thing with him that
maliciously and corruptly sets himself to *cozen* it.

L'Estrange.

Children may be *cozened* into a knowledge of the
letters, and be taught to read, without perceiving it to
be any thing but a sport. *Locke on Education.*

What if I please to lengthen out his date
A day, and take a pride to *cozen* fate.

Dryden's Aurengzebe.

Strange *cozenage* ! none would live past years again,
Yet all hope pleasure in what yet remain!
And from the dregs of life think to receive
What the first sprightly running could not give. *Id.*

But all these are trifles, if we consider the fraud
And *cozenage* of trading men and shopkeepers. *Swift.*

COZUMEL, a fertile island of North America,
forty miles long and from three to ten wide,
near the east coast of Yucatan. It is inhabited
by native Indians; and abundant in fowl and
cattle. Cortes touched here in 1519 on his ex-
pedition to Mexico, and was the means of li-
berating Aguilar, a Spanish dean, who, in going
from Darien to Hispaniola, had been taken pris-
oner a few years before by the Indians. He
became the interpreter of this chief.

COZY, or COSY, *adj.* Snug; comfortable.
The word is common in the Scotch dialect; and
is sometimes used in the English, in familiar
speech.

Thou saw the fields laid bare an' waste,
An' weary winter coming fast
An' *cozie* here, beneath the blast,
Thou thought to dwell,
Till crash! the cruel coulters part,
Out-thro' thy cell. *Burns.*

CRAB, *v. a., n. s., & adj.* } Fr. *crabe* ; Arm.
CRABBED, *adj.* } *crab* ; Ang-Sax.
CRABBEDLY, *adv.* } *crabba* ; Dut. and
CRABBEDNESS, *n. s.* } Germ. *krabbe* ;
CRABBY, *adj.* } Swed. *krabba* ;
CRABBS'-EYES, *n. s.* } Lat. *carabus* ;
CRABER, *n. s.* } *καρὰβος*. The
verb signifies to sour; to render peevish or ma-

rose. Crab is, a well-known crustaceous fish; a wild apple; a peevish morose person; an engine for lifting heavy weights; a sign of the zodiac. As an adjective it is expressive of something worthless or degenerate. Crabbed and crabby are, peevish; unpleasing; difficult; perplexing. Crabbedness is, sourness of taste, of countenance, of manners; difficulty. For CRABS' EYES and CRABS' CLAWS see the following articles.

For thin husband armed be in maille,
The armes of thy *crabbed* eloquence
Shal pierce his brest and eke his aventaille.

Chaucer. Cant. Tales.

And first of al Saturne gave his sentence,
Which gave to Cupide litle reverence,
But as a boistous chorle in his manere
Came *crabbidly* with austrine loke and chere.

Henderson. Testament of Cresseide.

Therin a *cancered* carle does dwell,
Thot has no skill of cour nor courtesie,
Ne cares what men say of him, ill or well.

Spenser. Faerie Queene.

A man of years, yet fresh as mote appear,
Of swarth complexion, and of *crabbed* hue,
That him full of melancholy did shew.

Id.

Noble stock
Was graft with *crab* tree slip, whose fruit thou art.

Shakespeare.

When roasted *crabs* hiss in the bowl,
Then nightly sings the staring owl. *Id.*
Fetch me a dozen *crab* tree staves, and strong
ones; these are but switches. *Id. Henry VIII.*

O, she is
Ten times more gentle than her father's *crabbed*;
And he's composed of harshness. *Id. Tempest.*

That was when
Three *crabbed* months had soured themselves to death,
Ere I could make thee open thy white hand,
And clepe thyself my love. *Id. Winter's Tale.*

Crabbed age and youth
Cannot live together;
Youth is full of pleasure,
Age is full of care. *Id. The Passionate Pilgrim.*

Thus have I writ, in smoother cedar tree,
So gentle satires, penned so easily.
Henceforth I write in *crabbed* oak tree rynde,
Search they that mean the secret meaning find. *Hall.*

Those that cast their shell are, the lobster, the *crab*,
the crawfish, the hodmandod or dodman, and the tortoise.
The old shells are never found; so as it is
like they seale off and crumble away by degrees.

Bacon's Natural History.

How charming is divine philosophy!
Not harsh and *crabbed*, as dull fools suppose,
But musical as is Apollo's lute,
And a perpetual feast of nectared sweets,
Where no crude surfeit reigns. *Milton.*

Beside, he was a shrewd philosopher,
And had read every text and gloss over;
Whate'er the *crabbedest* author hath,
He understood b' implicit faith. *Hudibras.*

The poor fish have enemies enough, beside such
unnatural fishermen as otters, the cormorant, and the
craber, which some call the water-rat.

Walton's Angler.

Several persons had, in vain, endeavoured to store
themselves with *crabs'-eyes*. *Boyle.*

Then parts the Twins and *Crab*, the Dog divides,
And Argo's keel, that broke the frothy tides. *Creech.*

Better gleanings their worn soil can boast
Than the *crab* vintage of the neighbouring coast.
Dryden.

Lucretius had chosen a subject naturally *crabbed*. *Id.*

Your *crabbed* rogues that read Lucretius
Are against gods, you know. *Prior.*

The Heaven-taught Bards of whom I speak
When time was young, in *crabbed* Greek,
Th' achievements of celestial legions
Detailed among these lower regions. *Huddesford.*

But if more deep the quarrel,
Why sooner drain the barrel
Than be the hateful fellow
That's *crabbed* when he's mellow. *Sheridan.*

CRAB, of the genus Cancer, Linnæus, is thus described. Mouth usually furnished with six feelers; mandibles thick and horny; eyes two, distant, elongated, moveable, and commonly placed on peduncles; antennæ four, short, and filiform, or setaceous, the inner pair (or sometimes both) bifid at the last joint; legs eight or six, and two chelate claws; body somewhat ovate; tail short. The species are very numerous, and have been subdivided into three sections.

SECT. I.—Thorax smooth, sides very entire. These species are, 1. *Grapsus*.—Front retuse, deflected, and armed with four lobes; body variegated. (Fabricius, &c.) A native of the West India Islands, where it is not very common. The color whitish, most elegantly varied with red. The hand-claws are comparatively small and rough. 2. *Mutus*.—Thorax chestnut-brown transversely on the anterior margin. (Fabricius.) A native of the Mediterranean Sea. The posterior part of the body truncated; hand-claws smooth; arms denticulated beneath. 3. *Quadratus*.—Thorax square; sides crenated; hand-claws scabrous; Banksian Cabinet. (Fabricius.) A native of Jamaica. Size large. 4. *Ruricola*.—First joint of the legs spinous; second and third with tufts of hair.

This great land-crab of the Bahama Islands, the history of which has been largely detailed by Sloane, Catesby, and others, may be thus abridged. These animals regularly march from the mountains, their usual abode, to the sea-side in the months of April and May. At that time the whole ground is covered with this band of adventurers; and they direct their march with the utmost precision, never turning to the right or left for any obstacles they can possibly pass over. They are said to be commonly divided into three battalions, of which the first consists of the strongest and boldest males; but the main body of the army is composed of females, which never leave the mountains till the rain is set in, and then descend in regular order, being formed into columns of fifty paces broad, and three miles deep. Three or four days after this, the rear guard follows, a straggling, undisciplined tribe, consisting of males and females, but neither so robust nor so vigorous as the former. The night is the chief time of proceeding, and if it rains by day they do not fail to profit by the occasion; but when the sun shines they halt. When they are terrified, they march back in a confused disorderly manner, holding up, and

clattering their nippers together, as if to threaten those that disturb them. They most commonly subsist on vegetables; but if any of them by accident are maimed in such a manner as to be incapable of proceeding, the rest fall upon and devour them upon the spot, and then pursue their journey.

After a march of sometimes two, or perhaps three months in this manner, they arrive at their destined spot on the sea-coast, on which they rush eagerly to the edge of the water, and let the waves wash over their bodies two or three times. This has been thought necessary by some to ripen the spawn in the ovaria, as the crab, appearing satisfied with this slight bathing, immediately retires, and seeks a lodging on the land. Before the last time the spawn may be seen under the tail in bunches the size of a hen's egg, which they shake off into the water, leaving them to the chance of fortune and accident to bring them to maturity. The eggs that escape the shoals of fishes gathered round the shore are hatched under the sand; and soon after the little crabs are seen slowly travelling up to the mountains. The old ones, however, have become so feeble and lean that they can hardly crawl along, and are obliged to continue in the flat parts of the country till they recover, making holes in the earth, which they cover at the mouth with leaves and dirt. They there throw off their old shells, and remain almost without motion, for six days together, when they become so fat as to be delicious food. It is said they have then under their stomachs four large white stones, which gradually decrease in proportion as the shell hardens, and when they come to perfection are not to be found. This animal, when in the mountains, subsisting only on vegetables, seldom ventures out; and its habitation being in the most inaccessible places, it remains for a great part of the season in perfect security. But when they descend into the flat country, the natives destroy thousands; disregarding their bodies, they only seek for the small spawn which lies on each side of the stomach, within the shell, of about the thickness of a man's thumb. They are much more valuable on their return, after they have cast their shells, for, being covered with a skin resembling soft parchment, almost every part except the stomach may be eaten. They are taken in the holes, by feeling for them with an instrument, and are sought after by night, when on their journey, by flambeaux light. Sometimes also they are caught when they take refuge in the bottoms of holes in rocks by the sea-side, by stopping up the mouth of the hole, and then the tide coming enters the hole, and the animal is drowned in its retreat. These crabs are of various colors; but those of a light color are esteemed most, and when full in flesh are well tasted. In some of the sugar islands they form no inconsiderable part of the food of the poor negroes. 5. *Paderus*.—Thorax oblong, with three teeth in front; eyes large and kidney-shaped. (Herbst.) Body size of a horse-bean, yellowish, with a ferruginous spot in the middle of the thorax. 6. *Residuum*.—Thorax subrotund; front on both sides emarginate. (Herbst.) *Mus. Casar Viennens, &c. &c.*

SECT. II.—Thorax smooth and cut at the

sides. The principal species are, 1. *Corallinus*.—Thorax obovate, one toothed; front divided into three lobes. A native of India, and the largest known, being considerably bigger than *C. pagurus*, the great English crab. 2. *Xaiva*.—Thorax tridentate, front truncated, body hemispherical and about two inches and a half in breadth. A native of Chili. 3. *Strigosus*.—Thorax smooth, and streaked transversely on the sides; behind the eye a single tooth; snout deflected, with four tubercles before the tip. 4. *Pagurus*.—Thorax with nine plaits on each side, pincers of the claws black at the tip. Found on most of the rocky shores of Europe, and is in perfection at Christmas. The flesh is more palatable and wholesome than that of any other crab.

SECT. III.—Thorax spinous at the back. The chief species worthy of notice are, 1. *Germanus*.—Thorax rough, with a spine in the front and on the tail. Found in the German sea, and is very minute. 2. *Auritus*.—Thorax one spine in front, the back soft. Found in Iceland.

CRAB, in ship building, a sort of wooden pillar, whose lower end A, being let down through a ship's decks, rests upon a socket B, like the capstern; and having in its upper end three or four holes, at different heights, through the middle of it, into which long bars are thrust, whose length is nearly equal to the breadth of the deck. It is employed to wind in the cable, or to raise any other weighty matter which requires a great mechanical power. This differs from a capstern, as not being furnished with a drum head, and by having the bars to go entirely through it, reaching from one side of the deck to the other; whereas those of the capstern, which are superior in number, reach only about eight or twelve inches into the drum head, according to the size thereof.

CRABS' CLAWS, in the materia medica, are the tips of the claws of the common crab broken off at the verge of the black part, so much of the extremity of the claws only being allowed to be used in medicine as is tinged with this color. The blackness, however, is only superficial; they are of a grayish-white within, and when levigated furnish a tolerably white powder. Crabs' claws are of the number of the alkaline absorbents; but they are superior to the generality of them in some degree, as they are found on a chemical analysis to contain a volatile urinous salt.

CRAB TREE, in botany. See PYRUS.

CRACATOA, the most southern of a cluster of islands lying in the entrance of the straits of Sunda in the East Indies. Its whole circumference does not exceed nine miles; and off its north-east extremity is a small island forming a road, in which Captain Cook anchored, when

visiting this island on his last voyage. The road where the Resolution anchored is in lat. 8° 6' south, and by observation, in 105° 36' long. east, by the time-keeper in 104° 48'. The variation of the compass 1° west. On the full and change days it is high water at seven o'clock A. M. and the tide rises three feet two inches perpendicular.

CRACK, or
 CRAKE, *v. a.* & *n. s.*
 CRA'CKER, *n. s.*
 CRA'KER, *n. s.*
 CRA'CKLE, *v. n.*
 CRA'CKLING, *n. s.*
 CRA'CKNEL, *n. s.*
 CR'ACK-BRAINED, *adj.*
 CRACK-HEMP, *n. s.*
 CRACK-ROPE, *n. s.*

Fr. *craquer*; Ital. *crocchiare*; Sp. *crurir*; Dut. *kracken*; Ger. *kracken*; Goth. *krackia*; Ir. *crac*. To break into chinks; to split; to flaw; to do anything quickly; to destroy; to craze; to fall to ruin; to emit a loud sound suddenly; to boast of; to brag; in the last two senses it was formerly written *crak*. Crack is, an abrupt disruption, in which the parts recede but a little; the chink so produced; the sound made by a falling, or bursting body; any sudden and quick sound; the change of the voice on entering into the state of puberty; breach of chastity; craziness; a crazy man; a boast, vulgarly a boaster and a prostitute; out of hand, quickly, as, I will do it in a crack; a lad. Crackle signifies to make slight cracks; to decrepitate. Cracker, a noisy boaster; a kind of firework; that which makes any thing crack. Cracknel is a hard brittle cake, so called from the sound which it makes in being broken. Crack-brained denotes crazy; and crack-hemp and crack-rope, deserving of the gallows.

What say we of hem that belevon on divinales, as by flight or by noise of briddes or of bestes, or by sorte of geomanié, by dremes, by chirking of dores, or cracking of houses, by gnawing of rattes, and swiche maner wretchednesse?
Chaucer. Cant. Tales.

The furious gonne, in his most raging yre,
 When that the boule is rammed in to sore,
 And that the flame cannot part from the fier,
Crackes in sunder. *Wyat.*
 'He lives,' quoth he, 'and boasteth of the fact,
 Ne yet hath any knight his courage crackt.'
Spenser. Faerie Queene.

Leasings, backbyttings, and vain glorious *crakes*. *Id.*
 So well she couth the shepherds entertain
 With cakes and *cracknels*, and such country cheer.
Id. Shepherd's Calender.

Of folded schedules had she many a one,
 Which she perused, sighed, tore, and gave the flood;
 Cracked many a ring of posied gold and bone,
 Bidding them find their sepulchres in mud.
Shakspeare. A Lover's Complaint.

If I say sooth, I must report they were

As cannons overcharged with double cracks.

Id. Macbeth.

And let us, Polydore! though now our voices,
 Have got the mannish crack, sing him to th' ground.

Id. Cymbeline.

Love cools, friendship falls off, brothers divide; in cities, mutinies; in countries, discord; in palaces, treason; and the bond cracked 'twixt son and father.

Id. King Lear.

Thou wilt quarrel with a man for cracking nuts, having no other reason but because thou hast hazel eyes.

Shakspeare. Romeo and Juliet.

And since her time are colliers counted bright,
 And Ethiops of their sweet complexion crack.

Id. Love's Labour Lost.

What cracker is this same that deafs our ears
 With this abundance of superfluous breath?

Id. King John.

Come hither, crack-hemp.

—I hope I may chuse, Sir.

Come hither, you rogue:

What, have you forgot me?

Id. Taming of the Shrew.

I was ever of opinion, that the philosopher's stone, and an holy war, were but the rendezvous of cracked brains, that wore their feather in their heads.

Bacon's Holy War.

Honour is like that glassy bubble,
 That finds philosophers such trouble
 Whose least part cracked, the whole does fly,
 And wits are cracked to find out why. *Hudibras.*

The bladder, at its breaking, gave a great report, almost like a cracker. *Boyle.*

The credit not only of banks, but of exchequers, cracks when little comes in, and much goes out.

Dryden.

Caught her dishevelled hair and rich attire;
 Her crown and jewels cracked in the fire. *Id. Æneid.*
 Pay tributary cracknels, which he sells;
 And with our offerings help to raise his vails.

Id. Juvenal.

At length it would crack in many places; and those cracks, as they dilated, would appear of a pretty good, but yet obscure and dark, sky-colour.

Newton's Opticks.

Vulcan was employed in hammering out thunderbolts, that every now and then flew up from the anvil with dreadful cracks and flashes. *Addison.*

I have invented projects for raising millions, without burthening the subject; but cannot get the parliament to listen to me, who look upon me as a crack and a projector. *Id.*

Marrow is a specific in that scurvy which occasions a crackling of the bones; in which case marrow performs its natural function of moistening them.

Arbuthnot on Aliments.

We have sent you an answer to the ill-grounded sophisms of those crack-brained fellows. *Id. and Pope.*
 Sir Balaam now, he lives like other folks;
 He takes his chirping pint, he cracks his jokes. *Pope.*

Then furious he begins his march,
 Drives rautling o'er a brazen arch,
 With squibs and crackers armed to throw
 Among the trembling crowd below. *Swift.*

Since pulpits fail, and sounding boards reflect
 Most part an empty ineffectual sound,
 What chance that I, to fame so little known,
 Nor conversant with men or manners much,
 Should speak to purpose, or with better hope
 Crack the satiric thong? *Cowper.*

Thus the slight wound engraved on glass unnealed
 Runs in white lines along the lucid field;
 Crack follows crack, to laws elastic just,
 And the frail fabric shivers into dust. *Darwin.*

Piles the dry cedar round her silver urn,
 Bright climbs the blaze, the crackling faggots burn. *Id.*

She's just like the French fruit one cracks for motes—made up of paint and proverb. *Sheridan.*

And giving up all notions of resistance,
 They followed close behind their sable guide,
 Who little thought that his own cracked existence
 Was on the point of being set aside.

Byron. Don Juan.

CRACOW, a city and republic of Poland, situated at the confluence of the Vistula and Rudowa. Its castle, and the wide space covered by its buildings, convey to a stranger the impression of an extensive city; but the place is thinly inhabited, the streets crooked, and the pavements wretched. It has three suburbs, one of which lies on the opposite bank of the Vistula. It is the see of a bishop, who formerly bore the title of duke of Sivaria. The cathedral once contained the crown and regalia of Poland, and still possesses the tombs of the ancient Polish kings. This city was founded in the thirteenth century, and is said to have had in former times no less than 70,000 inhabitants: in 1810 only 25,736. The richer classes are principally German Jews. It is well situated for trade, the principal objects of which at this time are, wood, fish, Hungarian wine, honey, wax, and linen cloth. It is 128 miles S. S. W. of Warsaw, and 264 south of Koningsberg.

The latest British traveller who has given us any account of this neighbourhood is Mr. Jacob. He arrived in this part of Poland, in the latter part of 1825, with a view to ascertaining its resources as a corn-country. See our article **CORN LAWS**.

Around the city of Cracow, he found an independent republic of this name, very fertile, and extending on the Vistula about twenty miles. The whole territory contains above 500 square miles, or 320,000 English acres, with 100,000 inhabitants. The land is a clayey loam, requiring three or four horses to plough it, and yielding when well managed crops of excellent wheat and oats. Where they have adopted the practice of sowing clover between the corn crops, the produce is very abundant. Cracow is its capital.

CRA'DLE, *v. a., n., & n. s.* } Ang.-Saxon,
CRA'DLE-CLOTHES, *n. s.* } cradel. To lay
CRA'DLE-TIME, *n. s.* } in a cradle; to
 rock in a cradle; to lodge as in a cradle. A moveable bed for children; infancy; a case for a broken bone; a frame to assist in launching a ship; an instrument used by mezzotinto engravers; a part added to a scythe for the purpose of gathering the corn into swathes. Cradle-clothes are, the bed clothes of a cradle; cradle-time, infancy.

The sow fretting the child right in the *cradel* ;
 The croke yscalled for all his long ladel.

Chaucer. Cant. Tales.

— Or that the earth had rent in twaye,
 And swallowed thee in *cradle* as thou laye. *Sackville.*

There she beholds, with high aspiring thought,
 The *cradle* of her own creation,
 Emongst the seats of angels heavenly wrought.

Spenser's Colin Clout.

He knew them to be inclined altogether to war, and therefore wholly trained them up, even from their *cradles* in arms and military exercises.

Spenser's Ireland.

Heracles; whose famous acts

We orderly shall tell,

Whereof the first, but not the least,

In *cradle-time* befel.

Warner.

She had indeed, Sir, a son for her cradle, ere she had a husband for her bed. *Shakspeare. King Lear.*

O could it be proved

That some night-tripping fairy had exchanged,
 In *cradle-cloaths*, our children, where they lay,
 And call mine Percy, his Plantagenet;
 Then would I have his Harry, and he mine. *Id.*

His birth, perhaps, some paltry village hides,
 And sets his *cradle* out of fortune's way. *Dryden.*

The tears steal from our eyes, when in the street
 With some betrothed virgin's hearse we meet;
 Or infant's funeral, from the cheated womb
 Conveyed to earth, and *cradled* in a tomb. *Id.*

If they are suffered from their *cradles* to treat men ill and rudely, because, by their father's title, they think they have a little power over them; at best it is ill-bred, and, if care be not taken, will, by degrees, nurse up their natural pride into an habitual contempt of those beneath them: and where will that probably end, but in oppression and *cradly*? *Locke.*

The *cradle* and the tomb, alas, so nigh!

To live is scarce distinguished from to die. *Prior.*

Me let the tender office long engage,
 To rock the *cradle* of reposing age;
 With lenient arts extend a mother's breath,
 Make languor smile, and smooth the bed of death. *Pope.*

He shall be *cradled* in my ancient shield, so famous
 through the universities. *Arbutnot and Pope.*

No gaudy wreath of flowers she weaves,
 But twines with oak the laurel leaves,

Thy *cradle* to adorn. *Beattie.*

Ah! what avails the *cradle's* damask roof,
 The cider bolster, and embroidered woof!—
 Oft hears the gilded couch unpitied plains,
 And many a tear the tasselled cushion stains!

Darwin.

Her brood delighted stretch their callow wings,
 As poised aloft their pendent *cradle* swings, *Id.*

Fast by his hand one lisping boy she led;
 And one fair girl amid the loud alarm
 Slept on her kerchief, *cradled* by her arm. *Id.*

I pity kings, whom worship waits upon
 Obsequious from the *cradle* to the throne;
 Before whose infant eyes the flatterer bows,
 And binds a wreath about their baby brows;
 Whom education stiffens into state,
 And death awakens from that dream too late.

Cowper.

Alas! my babe, if thou wouldst peaceful rest,
 Thy *cradle* must not be thy mother's breast.

Sheridan.

CRA'DLE, in engraving, is the name of an instrument used in scraping mezzotintos and preparing the plate. It is formed of steel, resembling a chissey, with one sloping side, upon which are cut hollow lines very near each other and at equal distances. The acting part of this tool is made circular, and the corners are rounded. After being properly tempered, it must be sharpened on the whetstone. There are various sizes of this instrument.

CRA'DLE, in ship-building, is a frame of timber, as in the diagram, raised along the outside of a ship by the bulge, and is used to support the ship's weight, while she slides down the descent or sloping passage called the ways, which are for this purpose covered with soap and tallow.

CRAFT, *v. n. & n. s.* } Ang.-Sax. *craft* ;
 CR'AFFTILY, *adv.* } Ger. and Swed. *kraft*.
 CR'AFFTINESS, *n. s.* } The idea conveyed by
 CR'AFFLESS, *adj.* } the root of all these
 CR'AFFY, *adj.* } words is that of power,
 CR'AFFSMAN, *n. s.* } strength, excellence,
 CR'AFFSMASTER, *n. s.* } and, formerly, craft
 and its congeners were used in a good as well
 as in a bad sense; they signified strength, skill.
 The verb, which is obsolete, means to play
 tricks; to practise artifice. Craft is, manual art,
 trade; ability; fraud; cunning; deception;
 cheating; small vessels employed in trade.
 Craftily and craftiness have now invariably a
 sinister meaning; they imply cunning; a want
 of fairness. Craftsman is, an artificer; a me-
 chanic; craftsman one who is skilful in his
 trade.

He taketh the wise in his own *craftiness*. *Job.*

For *craft* is all, who so that don it can.
Chaucer. Cant. Tales.

Though he can but lewdely
 On metres and on riming *craftily*. *Id.*
 A prentis whilom dwelt in our citie,
 And of a *craft* of vitailleurs was he. *Id.*

How could ye wepin so by *craft*? (quod she)
 Maie there soch teris evir fained be?
Id. Legende of Phyllis.

o dearly had I boughte my grene and youthful
 yeres,

If in myne age I coulde not fynde, when *craft* for
 love appeares. *Surrey.*

What man so wise, what earthly witt so were,
 As to descry the *crafty* cunning traine
 By which deceipt doth maske in visour faire?
Spenser. Faerie Queene.

The bashfull blood her snowy cheekes did dye,
 That her became, as polisht yvory,
 Which cunning *craftsman* hand hath overlayd,
 With fayre vermilion or pure castory. *Id.*

You've made fair hands,
 You and your *crafts*! You've *crafted* fair.
Shakspeare. Coriolanus.

The offence is holy that she hath committed;
 And this deceit loses the name of *craft*,
 Of disobedience, or unduteous title. *Id.*

Nay, you may think my love was *crafty* love,
 And call it cunning. *Id. King John.*

What reverence he did throw away on slaves,
 Wooing poor *craftsmen* with the *craft* of smiles. *Id.*
 He is not his *craftsman*, he doth not do it right. *Id.*

A poem is the work of the poet; poesy is his skill
 or *craft* of making the very fiction itself of the work.
Ben Jonson.

Long as the *crafty* cuttle lieth sure,
 In the blacke cloude of his thicke vomiture,
 Who list complaine of wronged faith or fame,
 When he may shift it to another's name. *Hall.*

One would think that all mankind had bound
 themselves by an oath to do all the wickedness they can;
 that they had all (as the scripture speaks) "sold
 themselves to sin:" the difference only is, that some
 are a little more *crafty* (and but a little, God knows)
 in making of the bargain. *Cowley.*

Before he came in sight, the *crafty* god
 His wings dismissed, but still retained his rod.
Dryden.

No body was ever so cunning as to conceal their be-
 ing so; and every body is shy and distrustful of *crafty*
 men *Locke.*

There is art in pride: a man might as soon learn a
 trade. Those who were not brought up to it, seldom
 prove their *craftsmaster*. *Collier on Pride.*

What a resemblance this advice carries to the ora-
 tion of Demetrius to his fellow *craftsmen*.

Decay of Piety.

May he not *craftily* infer
 The rule of friendship too severe,
 Which chain him to a hated trust;
 Which make him wretched to be just? *Prior.*

This gives us a full view of wonderful art and *craft*
 in raising such a structure of power and iniquity.

Ayliffe.

But say, in country life can *craft* be learned,
 Where knowledge opens, and exalts the soul?
Beattie.

There sit, involved and lost in curling clouds,
 Of Indian fume, and guzzling deep, the boor,
 The lackey, and the groom: the *craftsman* there
 Takes a Lethæan leave of all his toil. *Couper.*

CRA'G, *n. s.* } Wel. & Celt. *crraig* ;
 CRA'GGED, *adj.* } Ang.-Sax. *cræg*; which
 CRA'GGEDNESS, *n. s.* } mean a rock; Swed.
 CRA'GGINESS, *n. s.* } *kroge*, a collar. Crags
 CRA'GGY, *adj.* } are, in the first place,

rough, steep, rocks; the rugged protuberances
 of rocks, in which case, the Welsh seems to be
 the parent word. Crag, in the second place,
 denotes the neck, and here we may derive it from
 the Swedish and the kindred dialects. In the
 latter sense, however, it is now applied only to a
 neck of mutton, which is familiarly known by
 the name of a crag or scrag. All the derivatives
 from crag imply steepness; ruggedness; being
 filled with prominences.

Upon the whiche also stode
 Of squard stone a sturdy wall,
 Which on a *cragge* was found in all.

Chaucer. The Romaunt of the Rose.

Under *craggy* rocks they have barren plaines.
Wyat.

Ere long they come where that same wicked wight
 His dwelling has, low in an hollow cave,
 Far undeneath a *craggy* cleff ypignt.

Spenser. Faerie Queene.

They looken bigge as bulls that been eate,
 And bearen the *crag* so stiff on so state.

Id. Shepherd's Calender.

And as mount Etna vomits sulphur out,
 With cliffs of burning *crags* and fire and smoke.
Fairfax.

It was impossible to pass up the woody and *craggy*
 hills, without the loss of these commanders.

Raleigh's Essays.

On a huge hill,
Cragged and steep, truth stands. *Crashaw.*

Who hath disposed but thou, the winding way,
 Where springs down from the steepy *crags* do beat.
Wotton.

The *craggedness* or steepness of that mountain,
 maketh many parts of it in a manner inaccessible.
Brerewood.

A lion spied a goat upon the *crag* of a high rock.
L'Estrange.

Mountaineers that from Severus came,
 And from the *craggy* cliffs of Tetica. *Dryden.*

The town and republic of St. Marino stands on the
 top of a very high and *craggy* mountain.

Addison on Italy.

Of did the cliffs reverberate the sound
Of parted fragments tumbling from on high;
And from the summit of that *craggy* mound
The perching eagle oft was heard to cry,
Or on resounding wings to shoot athwart the sky.

Beattie.

Round the dark *crags* the murmuring whirlwinds
blow,
Woods groan above, and waters roar below. *Darwin.*

And thus a moon rolled on, and fair Haidee
Paid daily visits to her boy, and took
Such plentiful precautions, that still he

Remained unknown within his *craggy* nook.

Byron. Don Juan.

CRAIG (John), a Scotch mathematician who settled at Cambridge about 1680, and about 1685 held a dispute with the celebrated Bernoulli on the method of the quadrature of curved lines, and curvilinear figures. He had afterwards another contest with that great mathematician on a question in algebra, but discovering that he was wrong, he candidly acknowledged it in the Philosophical Transactions. He wrote several able pieces on mathematical subjects; but the most extraordinary one is entitled, *Theologicæ Christianæ Principia Mathematica*, first printed in 1699, at London, and at Leipsic, with a learned preface, in 1756, 4to. The design of this singular tract is to apply mathematical calculation to the gospel history; and he maintains, on this principle, that the Christian religion must end, according to the doctrine of chances A. D. 3150, when our Lord will make his second appearance to judgment. The abbé Houteville answered this tract, in a work entitled, *The Christian Religion proved by Facts*. The time of Craig's death is not known.

CRAIL, or CARYLE, an ancient royal borough in the parish of the same name, situated on the Frith of Forth, near Fifeness, with a small harbour. This town is mentioned by historians so early as the middle of the ninth century; and a battle was fought here between the Danes and the Scots. It received a charter from king Robert I. which was confirmed by new grants from Robert II., queen Mary, James VI., and Charles I. In the beginning of the eighth century, it was the great rendezvous for the herring fishery, but for fifty years past has gradually declined. It consists of two parallel streets extending east and west along the shore; which is here steep and high. The houses are fallen into decay, and the whole town bears evident marks of having seen better days. It lies seven miles south-east of St. Andrews.

CRAM, *v. a. & n.* Goth. and Swed. *krama*; Dan. *kramme*; Ang-Sax. *cranman*. To stuff; to force in too large a quantity; to thrust in by force; to eat to excess.

With boxes *crammed* full of lyes,
As evir vessel was with lies.

Chaucer. The House of Fame.

As much love in rhyme,
As would be *crammed* up in a sheet of paper,
Writ on both sides the leaf, margent and all.

Shakspeare.

Thou hast spoke as if thy eldest son should be a
fool, whose skull Jove *cram* with brains.

Id. Twelfth Night.

You *cran*: these words into mine ears, against the
stomach of my sense.

Id. Tempest.

Cran. not in people by sending too fast company
after company; but so as the number may live well
in the plantation, and not by surcharge be in penury.

Bacon.

Yet must he haunt his greedy landlord's hall
With often presents at each festival;

With *crammed* capons every new year's morn. *Hall.*

Huffer, quoth Hudibras, this sword
Shall down thy false throat *cran* that word. *Hudibras.*

Reading furnishes the mind only with materials of
knowledge: it is thinking makes what we read ours.
We are of the ruminating kind, and it is not enough to
cran ourselves with a great load of collections; unless
we chew them over again, they will not give us
strength and nourishment. *Locke.*

Fate has *crammed* us all into one lease,
And that even now expiring. *Dryden's Cleomenes.*

You'd mollify a judge, would *cran* a squire;
Or else some smiles from court you may desire.

King.

But Annius, crafty seer,
Came *crammed* with capon from where Pollio dines.

Pope.

As a man may be eating all day, and, for want of
digestion, is never nourished; so these endless readers
may *cran* themselves in vain with intellectual food.

Watts on the Mind.

When the whole trading interest of this empire,
crammed into your lobbies, with a trembling and anxious
expectation, waited, almost to a winter's return of
light, their fate from your resolutions. *Burke.*

Where it [emulation] is wanting, in vain shall we
preach up to children the dignity and utility of know-
ledge: the true appetite for knowledge is wanting;
and, when that is the case, whatever is *crammed* into
the memory will rather surfeit and enfeeble, than im-
prove the understanding. *Beattie.*

CRAMBE, or CRAMBO, *n. s.* A cant word,
probably without etymology. A play at which
one gives a word, to which another finds a rhyme;
a rhyme.

So Mevius, when he drained his skull

To celebrate some suburb trull,

His similes in order set,

And every *cranbo* he could get.

Swift.

CRAMBI, sea cabbage, sea-beach kale, or
sea colewort, in botany: a genus of the siliquosa
order, and tetradynamia class of plants; natural
order thirty-ninth, siliquosa. The four longer
filaments are forked at top, with an anthera only
on one point of each; the fruit a dry, globose,
and deciduous berry. There are eight species,
all herbaceous esculents with perennial roots,
producing annually large leaves resembling those
of cabbage, spreading on the ground, with strong
flower-stalks and yellowish flowers. Only one of
these is a native of Britain. It grows wild on
the shores of many of the maritime counties of
England, but is cultivated in many gardens as a
choice esculent. Its principal season for use is
in April and May.

CRAMER (John Andrew), a celebrated me-
tallurgist, born at Quedlinburgh, in 1710. He is
said to have been the first who formed the art of
assaying into a system; and he composed an in-
genious work on the subject, entitled *Elementa
Artis Docimasticæ*, published in 1739, 8vo. He
also wrote an introduction to the care and ma-

agement of Forests, with a particular description of the method of Burning Charcoal, 1766, fol. and the Elements of Metallurgy, in two parts fol. He died near Dresden, in 1777.

CRAMER (John Andrew), a German divine of some celebrity, was born in 1713. He studied at Leipsic, where he became a lecturer, and published a weekly paper, entitled *The Guardian Spirit*. He commenced preacher in 1748, and was removed to Copenhagen, as chaplain to the court, in 1754, where he was appointed professor of theology in 1765; but was deprived of his places upon the disgrace of Struensee, after which he retired to Lubec. In 1774 he was re-established in Denmark, and received the appointment of divinity professor at Keil: at which place he died in 1788. He translated into German several of Chrysostom's works; also Bossuet's *Universal History*, with Dissertations. He likewise published an animated poetic version of the Psalms; besides sermons, odes, the life of Gillert, and various miscellaneous pieces. His poems are held in great estimation.

CRAMERIA, in botany, a genus of the monogynia order, and tetrandria class of plants: CAL. none: COR. four petals; the superior nectary is trifid, the inferior biphylloous: SEED. is a dry, monospermous, and echinated berry. Species one, a native of Japan.

CRAMP, *v. a., n. s. & adj.* } Fr. *crampe* ;
 CRAMP-FISH, *n. s.* } Goth. *kram* ;
 CRAMP-IRON, *n. s.* } Dan. *krampe* ;
 CRAMP-RINGS, *n. s.* } Swed. & Ger.

kramp. To pain with cramps or twitches; to restrain; to obstruct; to compress into uncomfortably narrow bounds; to fasten with cramp-irons. Cramp is, a spasm or sudden contraction of the muscles of the limbs; a restriction; a hindrance; a piece of iron bent at each end, for holding together two bodies, called also a cramp-iron: as an adjective, it signifies, difficult; hard to be understood. Cramp-fish is the torpedo. Cramp-ring is a ring worn as a remedy for the cramp. The kings of England were formerly believed to have the power of blessing these rings on Good Friday, so as to give to them medicinal virtue!

But wel he felte about his hertè crepe,
 For every tere which that Creseide asterte,
 The *cramp* of deeth to straine him by the herte.
Chaucer. Troilus and Creseide.

Or beem thy bagpipes ren far out of frame?
 Or hath the *cramp* thy joints benumbed with ache?
Spenser. Shepherd's Calender.

The aged man that coffers up his gold,
 Is plagued with *cramps*, and gouts, and painful fits;
 And scarce hath eyes his treasure to behold.
Shakspeare. The Rape of Lucrece.

The *cramp* cometh of contraction of sinews; which is manifest, in that it cometh either by cold or dryness.
Bacon's Natural History.

It is impossible to conceive the number of inconveniencies that will ensue, if borrowing be *cramped*.
Bacon.

To the uppermost of these there should be fastened a sharp grapple, or *cramp* of iron, which may be apt to take hold of any place where it lights. *Wilkins.*

And *Crane* few but find that some companies benumb and *cramp* them, so that in them they can neither speak nor do any thing that is handsome.

Glawville's Scepsis.
 A narrow fortune is a *cramp* to a great mind, and lays a man under incapacities of serving his friend.
L'Esrange.

When the contracted limbs were *cramped*, even then
 A waterish humour swelled, and oozed again.

The antiquaries are for *cramping* their subjects into as narrow a space as they can, and for reducing the whole extent of a science into a few general maxims.
Addison on Italy.

No more
 The expansive atmosphere is *cramped* with cold,
 But full of life, and vivifying soul. *Thomson's Spring.*

The diversified but connected fabric of universal justice is well *cramped* and bolted together in all its parts.
Burke.

O that unwelcome voice of heavenly love,
 Sad messenger of mercy from above!
 How does it grate upon his thankless ear,
 Crippling his pleasures with the *cramp* of fear!

Cowper.
 SERJ. What's here!—a vile *cramp* hand! I cannot see
 Without my spectacles.

ATT. He means his fee.
 Nay, Mr. Serjeant, good sir, try again. [*Gives money.*
Sheridan.

CRAMPONEE, in heraldry, an epithet given to a cross which has at each end a *cramp* or square piece coming from it; that from the arm in chief towards the sinister angle, that from the arm on that side downwards, that from the arm in base towards the dexter side, and from the dexter arm upwards.

CRANE, *v. a. & n. s.* } Anglo-Sax. *cræn* ;
 CRA'NAGE, } Dut. *kraan* ; Sw. *kran* ;
 A bird. See ARDEA. An instrument made with ropes and pulleys, for raising great weights; a syphon for drawing liquor out of a cask. Cranage, from low Lat. *crangium*, signifies a liberty to use a crane for drawing up wares from the vessels, at any creek of the sea or wharf, unto the land, and to make profit of it. It signifies also the money paid and taken for the same.

Like a *crane*, or a swallow, so did I chatter. *Isaiah.*
 The *crane*, the geant, with his trompis' soune.
Chaucer. The Assemble of Fowles.
 And stalking stately like a *crane* did stryde
 At every step upon the tiptoes heie.
Spenser. Faerie Queene.

That small infantry warred on by *cranes*. *Milton.*
 In case the mould about it be so ponderous as not to be removed by any ordinary force, you may then raise it with a *crane*.
Mortimer.

Then commerce brought into the public walk
 The busy merchant, the big warehouse built,
 Raised the strong *crane*. *Thomson's Autumn.*

Meanwhile they trim their plumes for length of flight,
 Whet their keen beaks, and twisting claws, for fight;
 Each *crane* the pigmy power in thought o'erturns,
 And every bosom for the battle burns. *Beattie.*

CRANE, in ornithology, see ARDEA.
 CRANES, in practical mechanics, are connected with their entire history. What other name can we give to those early triumphs of scientific mechanism, the engines of Archimedes? To him

has been attributed the theory of the inclined plane, the pulley, and the screw: while the machines alluded to, by which he annoyed the Roman army, astonish modern mechanics with regard to their power. Polybius represents them as composed of a balance and powerful levers, but we have no detailed description of them. In the ancient theatres the gods descended in clouds by means of some contrivances of this kind. Vitruvius is the earliest explicit writer on the subject. He mentions a species of crane used for the lading and unlading of vessels, as well as for raising the heavier stones of a building, which was moved by men walking within a wheel, to which were attached pulleys, and on some occasions the aid of the capstan was employed; but the jib, or arm of the modern crane, seems to have been wanting.

Until a comparatively recent date all the cranes in ordinary use in this country were constructed nearly as follows:—The principal member was a strong upright beam or arbor, firmly fixed in the ground, and sustained by eight arms, coming from the extremities of four pieces of wood laid across, through the middle of which passes the foot of the beam. About the middle of the arbor the arms met, and were mortised into it; its top ending in an iron pivot, which bore a transverse piece, advancing out to a good distance, something after the manner of a crane's neck, whence indeed the machine had its name. This projecting piece was commonly called the jib or gibbet. The middle and extremities of this were again sustained by arms from the middle of the arbor: and over it came a rope or cable, to one end of which the weight was fixed; the other was wound about the spindle of a wheel, which when turned (commonly by means of men walking upon the inside of the rim of the wheel) drew the rope, and *that* heaved up the weight; which might afterwards be applied to any side or quarter by the mobility of the transverse piece on the pivot.

These cranes were usually of two kinds: in the first, called the *rat-tailed crane*, the whole machine with the load, turned upon a strong axis; in the second kind, the gibbet alone moved on its axis. In both kinds, when the machinery was put in motion by men walking within the wheel, as was the almost universal practice, the laborers employed were exposed to extreme danger, and frequently met with the most shocking and fatal accidents. From this principle of their first movement, these machines have been generally called *walking cranes*.

The late Mr. Ferguson invented a crane, which has three trundles, with different numbers of staves, that may be applied to the cogs of a horizontal wheel with an upright axle; round which is coiled the rope that draws up the weight. This wheel has ninety-six cogs; the largest trundle twenty-four staves, the next twelve, and the smallest six; so that the largest revolves four times for one revolution of the wheel, the next eight, and the smallest sixteen. A winch is occasionally fixed on the axis of either of these trundles for turning it; and is applied to the one or the other, according as the weight to be raised is smaller or larger. While

this is drawing up, the ratch-teeth of a wheel slip round below a catch that falls into them, prevents the crane from turning backwards, and detains the weight in any part of its ascent, if the man who works at the winch should accidentally quit his hold, or wish to rest himself before the weight is completely raised. Making a due allowance for friction, a man may raise by such a crane, from three times to twelve times as much in weight as would balance his effort at the winch, viz. from ninety to 360 lbs., taking the average labor.

All cranes in which chains are used should be provided with barrels with a spiral groove cut in them, and the lower half of the chain run in the groove. This was applied in 1789 by Mr. John Smeaton, to a crane designed by him, and executed at the Wool-quay, Custom-house, and found to be a great advantage.

In 1792 Mr. James White, of Chevening, Kent, invented a crane for wharfs, for which he received the premium of the Society of Arts, and which was a decided improvement upon the walking crane. See plate CRANES, fig. 1. Its properties are these:—1. It is simple, consisting of a mere wheel and axle. 2. Its only friction, exclusive of the pulleys, is that on the two gudgeons of the shaft; and one of these supports the weight of the wheel, and of the man who works it, nearly in the direction of its point. 3. It is durable. 4. It is safe, for it cannot work but during the pleasure of the man, and while he is actually pressing on the gripe lever. 5. It admits of an almost infinite variety of different powers; and this variation is obtained without the least alteration of any part of the machine. If in unloading a vessel, there should be found goods of every weight, from a few hundreds to a ton and upwards, the man who does the work will be able so to adapt his strength to each, as to raise it in a time inversely proportionate to its weight; he walking always with the same velocity, as nature and his greatest ease may teach him. It is a great disadvantage in some cranes, that the smallest weight must be as long in raising as the largest, unless the man turn or walk on with a greater velocity, which tires him in proportion. In other cranes two or three different powers may be procured, to obtain which, some pinion must be shifted, or fresh handle applied. But in this crane, if the laborer find his load so heavy as not to permit him to ascend without turning, let him only move a step or two towards the circumference, and he will be fully equal to the task. Again, if the load be so light as scarcely to resist the action of his feet, and thus oblige him to run through so much space, as to tire him beyond necessity, let him move laterally towards the centre, and he will soon feel the place, where his strength will suffer the least fatigue, by raising the load in question. If left alone, this crane will reduce itself to a state of rest, even though a weight were suspended to it. The means are, the gripe or brake at the top, and its lever, which stretches across the diameter of the wheel, at the height of a man's breast, when in an attitude of treading the wheel. The frame of the crane may be considered as part of the house in which it is placed,

and is almost unnecessary where such a crane is to be erected in a house already built. In warehouses this crane would be extremely simple and cheap; as the wheel, though of considerable diameter, occupies but little room, from its thinness and inclination. A slit in a floor about two feet wide, with a support above and below for the axis, is all that is necessary to constitute and contain the crane: for goods may be stowed both under the whole wheel, and above nearly half of it; and there would be ample room to stow a large quantity of goods properly sheltered from the weather. Hence, the house would diminish the wharf room much less than many others. One man's weight alone, applied at the extremity of the wheel, would raise upwards of a ton; and a single-sheaved block would double that power; and this wheel will give as great advantage, at any point of its plane, as a common walking wheel of equal diameter; as the inclination can be varied at pleasure. A represents a circular inclined plane, moving on a pivot underneath it, and carrying round with it the axis E. A person walking on this plane, and pressing against the lever B, throws off the gripe D, by means of an iron rod C, and thus admits the plane and its axis to move freely, and raise the weight G, by the coiling of the rope F round the axis E. To show more clearly the construction and action of the lever and gripe, a plan of the circular inclined plane is added, fig. 2; where B represents the lever, D the spring or gripe. In this plan, when the lever B is in the situation it now appears in, the spring or gripe D presses against the periphery of the plane, as shown by the double line; and the machine cannot move but when the lever B is pressed out to the dotted line II. The gripe is also thrown off to the dotted line I, and the whole machine left at liberty to move. One end of a rope of a proper length is fixed near the end of the lever B, and the other end made fast to one of the uprights, serving to prevent the lever from moving too far, when pressed by the man.

In 1805 Mr. Gilbert Gilpin received the silver medal of the Society of Arts for the invention, in fact, of Mr. Smeaton, above alluded to; the society appearing ignorant that it had been used before. The pulleys were in this machine grooved to receive the lower half of the alternate links of the chain in the same manner as in Mr. Smeaton's. But Mr. Gilpin farther proposes, that the lower pivot on which the vertical arbor of the crane turns, instead of being fixed to that shaft, and turning in a bush or socket fastened in the nether block, shall be fixed in that block, while a socket in the lower part of the shaft shall be made to fit it and turn about it.

Many practical and scientific men have thought highly of Mr. D. Hardie's crane, of St. James's Street. It will be seen to be on the very principle of the modern tread-mill.

This crane is in fact the same kind of walking-wheel as is used in China for working at the chain-pump, in raising water to the higher grounds employed in the culture of rice. The wheel is six feet in diameter, and may vary in length from six to twelve or more feet, according to the number of men intended to be employed

in working it; on the outside of the wheel are placed twenty-four equidistant steps, after the manner of float-boards in a mill water-wheel; these are for the men to tread upon, where the steps are found at a height rather exceeding that of the axis, or just above the position where the plane of the steps becomes horizontal. At one end of the wheel, and upon its axle, is the crane-ropes barrel, of a diameter suited to the draft of goods, and the number of men generally allowed. The men ascend by a flight of steps to a platform on the same horizontal plane as the axle of the wheel, and which reaches to within a few inches of its rim; on this platform is a seat, on which the men may rest themselves at the intervals between the operations. On the general framework which supports the wheel, there are placed above it, at suitable distances and convenient heights, both vertical and horizontal handles for the men to take hold of with both hands, when treading on the steps; sometimes both hands are applied to the vertical handles; at others, one hand to a vertical, and the other to a horizontal handle; at others, both hands to the horizontal handles; thus producing by either pushing or lifting, or both, a variety in the action, and, when necessary, a considerable augmentation to the force. There is a pawl which drops in at every step to prevent the wheel and its incumbent weight from overpowering the men at any time; it has at its lower part a cord with a loop to pass over one of the horizontal handles, near the extremity of which there is a notch sufficiently deep to retain the loop when drawn into it, for the purpose of raising the pawl to disengage it from the wheel preparatory to any operation of lowering. It is obvious, that by treading on the steps as they arrive at the position just above the horizontal plane passing through the axis, the men both ascend and descend nearly in the same vertical direction, of consequence the greatest possible velocity is produced without any unproductive labor; and the men are enabled to maintain the action by means of a hold of an upright handle in each hand, or occasionally to augment the action by pushing at these handles. Further, by taking hold of the horizontal handles, each man can, by an act similar to that of lifting, augment the force arising from his weight through all the degrees from about 150 to 300 lbs.: so that the same number of men can perform many operations of raising greater drafts than usual: such as with the common walking wheel or most other cranes could not be accomplished without additional men; and the pawl which drops in each step provides in the most effectual manner for the safety of the men; besides, that the distance between the edge of the platform and the revolving wheel is by no means large enough for a man to fall through.

Mr. Hardie has likewise contrived a method of operating without a gibbet, in which he places the crane at the top of the warehouse so as to allow the crane-rope to drop directly down from the barrel of the crane in front of the loop-holes; and at the upper floors, where the shortness of the rope diminishes the swing of the goods in or out of the loop-hole, he has provided a sliding floor immediately under the floor of the ware-

house, which one man draws out or in, by pulling a cord, with the greatest ease, to receive or deliver the goods by a truck at the loop-hole. The part of the warehouse floor which is immediately above the sliding-floor, consists of a thin plate of cast iron, which allows the truck to run off the one on the other, without any sensible obstruction. Thus more than one man's labor in five or six is saved by getting quit of the friction of the pulley of a pulley; and a still greater saving of labor is effected by accelerating all the movements at the loop-holes.

Mr. Hardie's lowering regulator is invented for the special purpose of removing the evils and dangers attendant upon the usual practice of lowering goods by the brake and brake-wheel. The part essential to this invention is a cast-iron box, fixed firmly to a floor, and divided into two cylindrical compartments; each ten inches long, one of four inches diameter, and the other of two inches diameter: these are both filled with oil, a liquid not subject to any material change by frost; or they may be filled with water in summer and mild weather, and some spirituous liquor, gin for instance, in frosty weather. These two cylinders communicate by apertures in their upper bottoms: the smaller compartment having a cock with its valve pressing down on the side of the iron box, guarded by a stuffing-box, and a quadrant with equilibrium nut fixed at its end, to receive an iron claw which retains the cock in any or several positions, and shows the extent of its apertures when opened. The larger compartment has a piston with its rod passing through the top of the iron box (guarded here also by a stuffing-box) and passing through a guide: this rod is connected with a joint moved by a crank, which is turned by a pinion of about six teeth, and this pinion is moved by a wheel of a size suited to the diameter of the barrel of the crane, and the weight of the goods commonly lowered: this latter wheel is fixed to the axle of the crane by a simple mode of connexion, which admits of its being disengaged during the operation of raising: it is also provided with the barrel-rope and counter-weight, which are commonly used for the purpose of winding up the slack crane-rope on the barrel of the crane, to be ready to repeat the operation of lowering.

Now if the cock were quite shut, the oil or other liquid confined between it and the piston, would prevent the piston from moving, and of course hinder the goods hanging from the wheel, &c. connected with the pinion from descending; but, if the cock were opened a very little, the oil would pass slowly through it, and would therefore allow the piston to move up and down slowly, and the goods to descend slowly also: and in like manner a further opening of the cock, will permit the load to descend with a greater velocity: thus the cock, by being more or less opened, gives the precise velocity desired to the descent of the goods, whatever their weight may be.

The advantages resulting from these inventions are too obvious to require our dwelling upon them. Although the crane is a walking-machine, yet it is free from the dangers and inconveniences of the common walking-wheel: for as it is not

walk on the outside of the wheel instead of inside of the rim, they are, in consequence of the adjoining platform, and the use of the pawl, free from danger; while, during the whole time of their labor, they can walk in an upright posture, well suited to free respiration; and further, as they act at the extremities of horizontal levers, their weight, and occasional muscular force act with all the advantages they can have; while the modifications they can make at pleasure in their activity, will frequently supersede the necessity of calling in any more men, even when a double load is to be raised. Indeed, there can be no doubt that with a crane of this construction, any given number of men will raise at least twice as much a day, as they could do with the ordinary wheel, or working at a distance, or at a wheel and pulley. And as to the lowering apparatus, it possesses a much higher degree of perfection in lowering, than any of the other cranes. The means afforded of regulating it to lower either small or great weights with facility, expedition, and safety, and without depending during the operation on the operator's attention and management of a manual tender, in our opinion, is preferable to the hazardous and limited mode of lowering goods by the brake wheel, with respect both to safety and great saving of labor. It not only supersedes the modes of lowering by the capstan, and the wheel-and-pawl, which require nearly the same number of men to lower that they take to raise any weight.

It appears that the late ingenious and popular lecturer on mechanics, first suggested the application of the vertical screw above the axis or upper guide of the pulley. These might not be plainly admitted as a practical improvement, by their extreme solidity, and the necessity of the rope being kept perfectly over the upper guide of the pulley, and the length of the rope between the pulley and the axle of the great wheel of the machine, will be always the same, in all positions of the pulley, and the pulley consequently remain in any position to which it may be turned; and they thus let the rope bend upon them, as the pulley is turned, on either side. Almost all the jibs of the London water-lift cranes are constructed in this manner, the wheel-work being in the interior of the premises.

A useful crane, constructed with the action of a crystal is in much use; and has been thus described. At the extremity of a beam, supported horizontally ten or twelve feet from the ground, is the upper pivot of a jib supported, the lower pivot resting on a post fixed in the ground. The jib is formed of a triangular frame and perpendicular sides, moving upon pivots on a vertical axis of motion. At an angle of about 90° or upwards, a beam is projected from near the upper end of the perpendicular part of the jib, and forming the upper side of the triangle. The third side is formed by a strong brace projected from near the foot of the perpendicular part towards the extremity of the upper beam. From this extremity the weight is suspended by a rope passing over a pulley: the other end of the rope is wound round a vertical pulley, the piston turning on pivots, one of which

is supported by the horizontal beam first mentioned; the other on a post. Horizontal levers move this capstan capable of receiving as many men or horses as may be thought proper. The power is sometimes increased by the application at the jib of additional pulleys or blocks. For Mr. Heriot, of the Thames police office, has been claimed the original suggestion of applying the hydrostatic principle to cranes. Mr. Bramah, however, it is clear, first carried it into practice. The hydrostatic paradox, in fact, on which his machine is constructed, has been known for ages.

The simplest form of it is a machine to raise a heavy weight to a small height. A metallic cylinder, sufficiently strong, and bored cylindrical within, has a solid piston fixed into it, which is made perfectly watertight, by a leather or other packing, round its edge. In the bottom of the cylinder is inserted the end of a small tube, by means of which water, or any other fluid, may be introduced from a forcing pump. This pump is of course provided with valves to prevent the return of the water. If we suppose the diameter of the cylinder to be six inches, and the diameter of the piston of the small pump or injector only one quarter of an inch; the proportions between the two surfaces or ends of the pistons will be as the squares of their diameters, which are as 1 to 24; therefore the areas will be as 1 to 576; and supposing the intermediate space between them to be filled with water, or any other dense and incompressible fluid, any force applied to the small piston will operate on the other in the proportion of 1 to 576. Suppose the small piston, or injector, to be forced down with a weight of 20 cwt., which can easily be done by means of a long lever, the piston of the great cylinder would then be moved up with a force equal to 1 ton multiplied by 576.

Figure 2, plate *CRANES*, represents a crane constructed upon the hydrostatic principle; that is by the injection of water from a small pump into a large cylinder, which is fitted with a piston, having a rack attached to it for the purpose of turning a pinion upon the axis of a large drum-wheel or barrel, round which the rope is coiled, and from thence passes to the jib. A represents the jib, made of iron, and supported upon two brackets *a, a*, projecting from the wall of the warehouse in which the crane is supposed to be erected. The rope passes over the pulley *S*, and down through holes in the brackets *a, a*, then turns under the pulley *b*, and comes to the lower side of the great drum-wheel *B*. The pinion *C* is fixed on the same axis with this, and its gudgeons turn in small iron frames *d*, bolted down to the floor of the warehouse. The pinion *C* is actuated by the teeth of the rack *D*; and a small roller, whose pivot is shown at *e*, presses against the back of the rack, to keep its teeth up to the pinion. The rack is attached to the piston *D*, of the cylinder *E*, in which the power for working the crane is obtained. The piston passes through a tight collar of leather on the top of the cylinder *E*, which does not admit of any leakage by the side of it; and, therefore, if any water is forced into the cylinder, it must protrude the piston from it. The cylinder is supported in a wooden frame *F, F*, and has a small copper pipe *g, g*, proceeding from the lower end of it,

communicating with a small forcing pump at *h*; this stands in an iron cistern, *H*, which contains the water, and sustains the standard *i*, for the centre of the handle *G*, with which the pump is worked by one or two men. The upper extremity of the standard, *i*, guides the piston rod of the pump to confine it to a vertical motion; *l* is a weight to balance the handle, *G*, of the pump. From what we have said before, the operation of this machine is evident; the power of the cylinder *D*, is in proportion to its size, compared with the size of the pump; but, as it only acts through short limits, the pinion and drum *B* are necessary to raise the weight a sufficient height. The operation of lowering goods by this crane is extremely simple, as it is only necessary to open a cock at *m*, which suffers the water to escape from the cylinder into the cistern *H*, and the weight descends, but under the most perfect command of the person who regulates the opening of the cock; for, by diminishing the aperture, he can increase the resistance at pleasure, or stop it altogether.

CRANES-BILL, n. s. From crane and bill. An herb. See *GERANIUM*. A pair of pincers terminating in a point, used by surgeons.

CRANGANORE, a town and district of India, in the country of Cochin, situated on the coast of Malabar, with an irregular fortress, built by the Portuguese. Jews are said to have been found in good circumstances at Cranganore so early as A.D. 490. In 1505 the Portuguese erected a fortress here, of which the Dutch obtained possession in 1663. The diocese of the Roman Catholic archbishop of Cranganore, extends from Mount Dilly towards Cochin. Most of the inland churches, formerly belonging to the Nestorian community, are included in it, and the see comprehends eighty-nine churches. In 1789 the Dutch sold Cranganore to the rajah of Travancore. But Tippoo disputing their right to dispose of it, a war ensued between him and the rajah; who being powerfully supported by the British and their allies, the nizam of the Deccan, and the Mahrattas, Tippoo was reduced to the necessity of ceding one half of his dominions to the confederate powers, and to pay, in 1792, above three crores of rupees towards the expenses of the war. Cranganore is twenty-four miles north by west of Cochin, and fifty-eight S.S.W. of Calicut.

CRANIOLARIA, in botany, a genus of the angiospermia order, and didynamia class of plants; natural order fortieth, personate: *CAL.* double, the under one tetraphyllous, the upper one a monophyllous spathe: *COR.* of the tube very long: *CAPS.* almost the same with that of the martyrnia. There are two species, both natives of hot climates.

CRANIOLOGY. See *PHRENOLOGY*, its more modern, and said to be its more proper name. We only fear that, before the period of our arriving at that article, the science will have evaporated.

CRANIUM, n. s. Lat. The skull.

In wounds made by contusion, when the *cranium* is a little naked, you ought not presently to crowd in dossils; for if that contused flesh be well digested, the bone will incarnate with the wound without much difficulty.

CRANIUM, the skull. See ANATOMY. The word comes from the Greek *κρανιον*, of *κρανος*, galea, a helmet: because it serves to defend the brain like a head-piece. Pezron, however, derives *κρανιον* from the Celtic *cren*, because of its roundness.

CRANK, *v. n., n. s. & adj.* } Etymologists
 CRA'NKLE, *v. n. & n. s.* } differ greatly as
 CRA'NKLES, *n. s.* } to the etymon of
 CRA'KNESSE, *n. s.* } crank, and some
 of their guesses are abundantly absurd. Perhaps the root of crank and crangle may be found in the Swedish verb *kranka*, to violate; to infringe. To crank and to crangle signify, to run in and out; to run into windings; to break into unequal surfaces or angles, which may be considered as a violating, or infringing upon, the circumjacent parts. Shakspeare makes Hotspur say,

See how this river comes me *cranking* in,
 And cuts me from the best of all my land
 A huge half moon, a monstrous cantle out.

Shakspeare. Henry IV.

A crank is, any bending or winding passage; a conceit, formed by twisting a word in any manner; the end of an iron axis turned square down, and again turned square to the first turning down; so that on the last turning down a leather thong is slipped, to tread the treadle-wheel about. As an adjective, crank is, healthy; sprightly; from the Dutch *onkrank*, says Skinner, which means not sick, but Serenius refers it to Goth. *kranger*, bold, daring. A ship is also said to be crank, when by the form of its bottom, or from being too much loaded above, it is liable to be overset. Crankles are, inequalities; angular prominences.

And for the house is *crenelid* to and fro,
 And hath so quaint wayis for to go,
 For it is shapin as the mase is wrought,
 Therto have I a remedy in my thought.

Chaucer. The Legend of Ariadne.

So many turning *crankes* these have, so many
 crookes.

Spenser. Faerie Queene.

They looken bigge, as bulls that ben bate,
 And bearen the crag so stiff and so state
 As coeke on his dunghill crowing *cranke*.
 I send it through the rivers of your blood,
 Even to the court, the heart to the seat o' the brain;
 And through the *cranks* and offices of man,
 The strongest nerves, and small inferiour veins,
 From me receive that natural competency,
 Whereby they live.

Shakspeare. Coriolanus.

Haste thee, nymph, and bring with thee
 Jest and youthful jollity,
 Quibs and *cranks*, and wanton wiles,
 Nods and becks, and wreathed smiles,
 Such as hang on Hebe's cheek,
 And love to live in dimple sleek.

Milton.

Old Vaga's stream,
 Forced by the sudden shock, her wonted track
 Forsook, and drew her humid train aslope,
Crangling her banks.

Philips.

In plying down the river, the Resolution was found to be very *crank*, which made it necessary to put into Sheerness in order to remove this evil, by making some alteration in her upper works.

Cook's Voyage.

CRANMER (Thomas), a celebrated reformer and martyr of the Reformation, was the son of Thomas Cranmer, Esq., of Aslacton, in Notting-

hamshire, where he was born in 1489. At the age of fourteen he was admitted a student of Jesus College, Cambridge, of which he afterwards became fellow; but vacated his fellowship, and quitted the college, on his marriage. On the death of his wife he was re-admitted. In 1523 he took the degree of D.D. and was made theological lecturer and examiner. The plague being now at Cambridge, he retired to the house of a relation at Waltham Abbey, where, meeting with Fox the king's almoner, and Gardiner the secretary, he expressed an opinion concerning the great question of Henry VIII.'s marriage, which was reported to the king. This was, that, instead of disputing about the validity of the marriage with Catharine, they should reduce the matter to this simple question, 'Whether a man may marry his brother's wife or not?' When the king was told of it, he exclaimed, 'This fellow has got the right sow by the ear;' sent for him to court, and made him one of his chaplains. He was also directed to compose a vindication of the intended divorce; and sent to France, Italy, and Germany, to dispute the matter with the divines of those countries. At Nuremberg Cranmer married a second wife. Returning to England in March 1533, he was consecrated archbishop of Canterbury; in May following he pronounced the sentence of divorce between the king and queen; and soon after married the amorous monarch to Ann Boleyn. Being now at the head of the church, he exerted himself in the business of the Reformation. The Bible was translated into English, and monasteries were dissolved principally by his means. In 1536, the royal conscience again requiring his assistance, he divorced the king from Ann Boleyn. In 1537 he visited his diocese, and endeavoured to abolish the superstitious observation of holidays. In 1539 he and some of the bishops fell under the king's displeasure, because they would not give their consent in parliament that the monasteries should be suppressed for the king's sole use. He also strenuously opposed the act for the six articles in the house of lords, speaking three days against it; and, upon its passing, sent away his wife into Germany. In 1540 he was one of the commissioners for inspecting into matters of religion, and explaining some of its chief doctrines. The result of their commission was the book entitled *A Necessary Doctrine and Erudition for any Christen Man*. After Lord Cromwell's death (in whose behalf he had written to the king) he retired and lived in great privacy. In 1541 he gave orders for taking away superstitious shrines; and, exchanging Bishopsbourn for Bekebourn, united the latter to his diocese. In 1542 he procured the 'Act for the advancement of true religion and the abolishment of the contrary,' which moderated the rigor of the six articles. The king continued afterwards to protect him from his enemies; and at his death appointed him one of the executors of his will, and one of the regents of the kingdom. In 1546 he crowned Edward VI. during whose short reign he promoted the Reformation to the utmost of his power; and was particularly instrumental in composing, correcting, and establishing the liturgy. He assisted also in compiling the thirty

nine articles. In 1553 he opposed the settlement of the crown upon lady Jane Grey, though at last, through impotency, he was prevailed upon to consent to it. Upon queen Mary's accession, he was committed to the Tower; partly for his connexion with the attempt of lady Jane, and partly for the public offer he had made of justifying openly the late religious proceedings. Some of his friends advised him to fly, but he refused. In the ensuing parliament (November 3) he was attainted, and found guilty of high treason. In April, 1554, he was removed with Ridley and Latimer to Oxford, for a public disputation with the papists; in which, as in most similar cases, it was already decided by the higher powers who was to obtain the victory. On the 20th of April, two days after the close of these disputations, Cranmer and the two others were brought before the commissioners, and asked, Whether they would subscribe to popery? which they unanimously refusing, were condemned as heretics. From this sentence the archbishop appealed to the just judgment of the Almighty; and wrote to the council, giving them an account of the disputation, and desiring the queen's pardon for his treason, which it seems was not yet remitted. Some of his friends petitioned the queen in his behalf; reminding her that he had once preserved her in her father's time, by his earnest intercessions. All solicitations, however, were ineffectual; and the archbishop being degraded and most ignominiously treated, was at last flattered and terrified into an insincere recantation and renunciation of the Protestant faith. But this triumph was not sufficient to gratify the pious vengeance of the Romanists. On the 24th of February, 1556, a writ was signed for his being burnt at the stake; and, on the 24th of March, he was brought to St. Mary's church, and placed on a kind of stage over against the pulpit, where Dr. Cole was appointed to preach a sermon on the occasion. While Cole was haranguing, Cranmer evinced great inward emotion; frequently lifting up his hands and eyes to heaven, and shedding tears. At the end of the sermon, when Cole desired him to make an open profession of his faith, as he had promised he would, he first prayed in the most fervent manner; then made an exhortation to the people present, not to set their minds upon the world, to love each other, and to be charitable. After this he made a confession of his faith, beginning with the creed, and concluding with these words: 'And I believe every word and sentence taught by our Saviour Jesus Christ, his apostles and prophets, in the Old and New Testaments.—And now,' added he, 'I come to the great thing that so much troubleth my conscience, more than any thing I ever did or said in my whole life; and that is, the setting abroad a writing contrary to the truth, which I here now renounce, as things written with my hand contrary to the truth which I thought in my heart; and written for fear of death, and to save my life if it might be: that is, all such bills and papers which I have written or signed with my hand since my degradation, wherein I have written many things untrue. And forasmuch as my hand offended, writing contrary to my heart, my hand shall first be punished; for, may I come to

the fire, it shall be first burned. As for the pope I refuse him, as Christ's enemy and antichrist with all his false doctrine. And as for the sacrament, I believe as I have taught in my book against the bishop of Winchester.' Thunderstruck with this unexpected declaration, lord Williams and the papists around admonished him not to dissemble. 'Ah!' replied he, 'since I lived hitherto, I have been a hater of falsehood, and a lover of simplicity, and never before this time have I dissembled,' and wept again. On this the party round the stage, being admonished by Cole from the pulpit to stop the heretic's mouth and take him away, pulled him down, and hurried him to the place of execution, near Baliol College. Here, being fastened with his shirt to the stake, and pressed to agree to his former recantation, he answered, stretching forth his right hand, 'This is the hand that wrote it, and therefore it shall first suffer punishment.' Fire being applied to him, he plunged his right hand into the flame, and held it there unmoved (except that he wiped his face with it once) till it was consumed; crying with a loud voice, 'This hand hath offended;' and often repeating, 'This unworthy right hand.' The fire increasing, he soon expired, never moving or crying out; but keeping his eyes raised towards heaven, and repeating more than once, 'Lord Jesus, receive my spirit.' His heart is said to have been found unconsumed among the ashes. Mr. Gilpin says, 'he left behind him a widow and children; but as he always kept his family in obscurity for prudential reasons, we know little about them. They had been kindly provided for by Henry VIII; who, without any solicitation from the primate, gave him a considerable grant from the abbey of Walbeck, which his family enjoyed after his decease. King Edward VI. made some addition to his private fortune; and his heirs were restored in blood by an act of parliament in the reign of Elizabeth.' The same writer well observes, 'The character of the archbishop has been equally the subject of exaggerated praise, and of undeserved censure. The most indefensible parts of it are, the readiness with which he sometimes concurred in the unjustifiable proceedings of Henry VIII., and the instances wherein he showed himself to be actuated by intolerant principles. But the cause animated him. With the illegality of the king's marriage, he endeavoured virtually to establish the insufficiency of the pope's dispensation; and the latter was an argument so near his heart, that it seems to have added merit to the former. We cannot indeed account for his embarking so zealously in this business, without supposing his principal motive was to free his country from the tyranny of Rome, to which this step very evidently led. So desirable an end would in some degree, he might imagine, sanctify the means.' One of the most honorable actions of his life was the firm stand that he made against the six articles. This act was so strongly supported by the king, that even the Protestants in parliament made little opposition to it. But Cranmer opposed it with great zeal and steadiness. 'The good archbishop,' says Mr. Gilpin, 'never appeared in a more truly Christian light than on this occasion. In the midst of so general

a defection, he alone made a stand. Three days he maintained his ground, and baffled the arguments of all opposers. But argument was not their weapon, and the archbishop saw himself obliged to sink under superior power. Henry ordered him to leave the house. The primate refused: 'It was God's business,' he said, 'and not man's.' And when he could do no more, he boldly entered his protest. Such an instance of fortitude is sufficient to wipe off many of those courtly stains which have fastened on his memory.' His behaviour in the case of the duke of Norfolk also was truly magnanimous. He was indeed remarkable for the placability of his temper, and for showing kindness to those by whom he had been greatly injured. Hence it is mentioned in Shakspeare's Henry VIII., as a common saying concerning him:

————— 'Do my Lord of Canterbury
But one shrewd turn, and he's your friend for ever.'

Of the learning of archbishop Cranmer, Mr. Gilpin remarks that 'it was chiefly confined to his profession. He had applied himself in Cambridge to the study of the Greek and Hebrew languages; which, though esteemed at that time as the mark of heresy, appeared to him the only sources of attaining a critical knowledge of the Scriptures. And he had so accurately studied canon law, that he was esteemed the best canonist in England. He was a sensible writer, rather nervous than elegant. His writings were entirely confined to the great controversy which then subsisted, and contain the whole sum of the theological learning of those times.'

Dr. Southey says of his death, 'Of all the martyrdoms during this great persecution, this was in all its circumstances the most injurious to the Romish cause. It was a manifestation of inveterate and deadly malice towards one who had borne his elevation with almost unexampled meekness. It effectually disproved the argument on which the Romanists rested, that the constancy of our martyrs proceeded not from confidence in their faith, and the strength which they derived therefrom; but from vain glory, the pride of consistency, and the shame of retracting what they had so long professed. Such deceitful reasoning could have no place here: Cranmer had retracted; and the sincerity of his contrition for that sin was too plain to be denied; too public to be concealed; too memorable ever to be forgotten. The agony of his repentance had been seen by thousands; and tens of thousands had witnessed how, when that agony was past, he stood calm and immovable amid the flames; a patient and willing holocaust; triumphant, not over his persecutors alone, but over himself, over the mind as well as the body, over fear, and weakness, and death.'

CRA'NNY, *n. s.* } Fr. *cren*; Latin *crena*;
CRA'NNIED, *adj.* } *κρηνη*. A chink; slit;
fissure. Full of chinks.

Revealing day through every *cranny* spies,
And seems to point her out where she sits weeping.
Shakspeare. The Rape of Lucrece.

A wall it is, as I would have you think,
That had in it a *crannied* hole or chink.
Id. Minstomer Nights Dream.

The eye of the understanding is like the eye of the sense; for as you may see great objects through small *crannies* or holes, so you may see great axioms of nature through small and contemptible instances.

Bacon's Natural History.

A very fair fruit, and not unlike a citron; but somewhat rougher chopt and *crannied*, vulgarly conceived the marks of Adam's teeth.

Brown's Vulgar Errors.

And therefore beat and laid about,
To find a *cranny* to creep out. *Hudibras.*

In a firm building the cavities ought not to be filled with rubbish, but with brick or stone, fitted to the *crannies*. *Dryden.*

Within the soaking of water and springs, with streams and currents in the veins and *crannies*.

Burnet's Theory.

He skipped from room to room, ran up stairs and down stairs, from the kitchen to the garrets, and he peeped into every *cranny*. *Arbuthnot's John Bull.*

The light of the moon may gleam unexpectedly through a *cranny*, and, where it falls on the broken pavement, form an appearance not unlike a human face illuminated, or a naked human body, which the peasant, whose chance it is to see it, may readily mistake for a ghost, or some other tremendous being.

Beattie.

For 'tis a truth well known to most,
That whatsoever thing is lost,
We seek it, ere it come to light,
In every *cranny* but the right. *Cowper.*

CRA'NTARA, among the ancient Britons, was a sort of military signal used for collecting the distant and scattered warriors to the standard of their chief. It was generally a stick burnt at the end and dipped in the blood of a goat, which was sent by a swift messenger to the nearest hamlet, where, being delivered in silence, it was understood to denounce destruction by fire and sword to all who did not obey the summons, and was carried with great rapidity from village to village.

CRA'NTOR, a Greek philosopher and poet, born at Solos in Cilicia. He left his native country and went to Athens, and there studied with Polemon under Xenocrates. He was considered as one of the chief supporters of the Platonic sect; and was the first who wrote commentaries upon Plato's works. He flourished about A. A. C. 270.

CRA'NTS, *n. s.* Icel. *kraus*; Swed. *kraus*; Dutch *krauts*; Ger. *krauz*. Garlands carried before the coffin of a maiden, and suspended over her grave.

Yet here she is allowed her virgin *crants*,
Her maiden strewments, and the bringing home
Of bell and burial. *Shakspeare. Hamlet.*

CRAPE, *n. s.* Fr. *crêpe*, *crêpe*; Ital. *crispo*; low Lat. *crepa*. A thin stuff, loosely woven, of which the dress of the clergy is sometimes made, and which is also used in mourning dresses. In the quotation from Cowper, it signifies the mask, generally a piece of crape, worn by robbers, to prevent their being recognised.

And proud Roxana, fired with jealous rage,
With fifty yards of *crappe* shall sweep the stage.

Swift.

To thee I often called in vain,
Against that assassin in *crappe*. *Id.*

'Tis from high life high characters are drawn ;
A saint in *crape* is twice a saint in lawn. *Pope.*

O innocent, compared with hearts like these,
Crape, and cocked pistol, and the whistling ball
Sent through the traveller's temples ! *Cowper.*

CRAPE is made of raw silk gummed and twisted on the mill; woven without crossing, and much used in mourning. Crapes are either craped (i. e. crisped), or smooth. The silk destined for the first is more twisted than that for the second; it being the greater or less degree of twisting, especially of the warp, which produces the crisping given it when taken out of the loom, steeped in clear water, and rubbed with a piece of wax for the purpose. Crapes are all dyed raw. The invention of this stuff came originally from Bologna; but Lyons was long said to have had the chief manufacture of it. History tells us, that St. Bathilda, queen of France, made fine *crapa* (crepa) of gold and silver, to lay over the body of St. Eloy. Binet says, this *crepa* was a frame to cover the body of the saint; but others, with reason, take it to have been a transparent stuff, through which the body might be seen; and that this was the *crepa* whence our word *crape* was formed.

CRA'PLE, *n. s.* Ger. *krappeln*, to seize; Ang.-Sax. grip-an, to gripe. An obsolete word, of the same family with grapple, signifying a claw.

Soone as they did the monstrous Scorpion vew,
With ugly *craples* crawling in their way,
The dreadfull sight did them so sore affray,
That their well known courses they forwent.

Spenser. Faerie Queene.

CRA'PULA, *n. s.* } Lat. *crapula*; *κραπάλη*.
CRA'PULENC, *n. s.* } Intoxication; sickness,
CRA'PULOUS, *adj.* } produced by intemperance. Drunken; sick from drunkenness.

The drunkard now supinely snores,
His load of ale sweats through his pores,
Yet when he wakes, the swine shall find
A *crapula* remains behind. *Cotton.*

CRASH, *v. a., v. n. & n. s.* } Fren. *craser*;
CRASHING, *n. s. & adj.* } Ger. *rauschen*;
Goth. *kressa*. Dr. Johnson supposes the word to be formed from the thing, in which he agrees with Skinner. To make a loud, sharp, complicated noise, as if many things were falling or breaking at once; to break or bruise. Crash, and crashing, are loud sudden mixed sounds, as of many things broken at the same time. Abrupt and dissonant sound is always implied by these words.

There shall be a great *crashing* from the hills.
Zeph. i. 10.

Senseless Ilium,
Seeming to feel this blow, with flaming top
Stoops to his base; and, with a hideous *crash*,
Takes prisoner Pyrrhus' ear. *Shakespeare. Hamlet.*

Moralizing sat I by the hazard-table: I looked upon
the uncertainty of riches, the decay of beauty, and
the *crash* of worlds, with as much contempt as ever
Plato did. *Pope.*

When convulsions cleave the labouring earth,
Before the dismal yawn appears, the ground
'Trembles and heaves, the nodding houses *crash*.
Smith.

When sudden, darting down the depth of heaven,
Fierce on th' expecting flock the cranes are driven,
The kindling frenzy every bosom warms,
The region echoes to the *crash* of arms. *Beattie.*

Now they reach thee in their anger:
Fire, and smoke, and hellish clangor
Are around thee, thou World's Wonder!
Death is in thy walls and under.
Now the meeting steel first clashes;
Downward then the ladder *crashes*,
With its iron load all gleaming,
Lying at its foot blaspheming!

Byron. The Deformed Transformed.

CRASHAW (Richard), an English poet, the son of the Rev. William Crashaw; was educated at the Charter-House, London, and afterwards sent to Pembroke Hall and Peterhouse, Cambridge. He was fellow of the latter college, and in both distinguished himself for his Latin and English poetry. He was afterwards ejected from his fellowship, with many others, for denying the covenant; and, at last, became a Roman Catholic. He went to Paris, in hopes of recommending himself to some preferment there; but, being a mere scholar, fell into great distress, which the poet Cowley relieved in 1646, and recommended him to queen Henrietta Maria, then residing at Paris. Obtaining her patronage, he travelled into Italy, became secretary to a cardinal at Rome, and at last one of the canons of the rich church of Loretto, where he died about 1664. Before he left England, he wrote some poems, entitled, Steps to the Temple, &c.; afterwards others, called The Delights of the Muses, Carmen Deo, Nostro, &c. He is said to have excelled in five languages, besides his mother tongue, viz. Hebrew, Greek, Latin, Italian, and Spanish.

CRA'SIS, *n. s.* *Κράσις*. Temperature; constitution arising from the various properties of humors.

The fancies of men are so immediately diversified by the individual *crasis*, that every man owns something wherein none is like him. *Glanville.*

A man may be naturally inclined to pride, lust, and anger; as these inclinations are founded in a peculiar *crasis* and constitution of the blood and spirits. *South.*

CRASS, *adj.* } Old Fr. *crasse*; Lat.
CRA'SSMENT, *n. s.* } *crassus*. Gross; coarse;
CRA'SSITUDE, *n. s.* } heavy; thick; dull;
CRA'SSNESS, *n. s.* } stupid. That which is gross; thick; dull.

They must be but thin, as a leaf, or a piece of paper or parchment; for, if they have a greater *crassitude*, they will alter in their own body, though they spend not. *Bacon.*

The Dead Sea, which vomiteth up bitumen, is of that *crassitude*, as living bodies, bound hand and foot, cast into it, have been borne up, and not sunk.

Bacon's Natural History.

Iron, in aquafortis, will fall into ebullition, with noise and emication; as also a *crass* and fuid exhalation, caused from the combat of the sulphur of iron with the acid and nitrous spirits of aquafortis.

Broune's Vulgar Errors.

Now, as the bones are principally here intended, so also all the other solid parts of the body, that are made of the same *crassiment* of seed, must be here included. *J. Smith.*

The ethereal body contracts *crasness* and impurity by the same degrees as the immaterial faculties abate in their exercise. *Glanville.*

The terrestrial matter carried by rivers into the sea, is sustained therein partly by the greater *crasitude* and gravity of the sea-water, and partly by its constant agitation. *Woodward.*

Metals are intermixed with the common terrestrial matter, so as not to be discoverable by human industry; or, if discoverable, so diffused and scattered amongst the *crasser* and more unprofitable matter, that it would never be possible to separate and extract it.

Id. Natural History.

CRASSULA, lesser orpine, a genus of the pentagynia order, and pentandria class of plants; natural order thirteenth, succulentæ: *CAL.* pentaphyllous: the petals five, with five nectariferous scales at the base of the germen: *CAPS.* five. There are sixty-nine species, all natives of warm climates. Several of them are cultivated in this country, but require the assistance of artificial heat for their preservation. They rise from one foot to six or eight; and are ornamented with oblong, thick, succulent leaves, and funnel-shaped pentapetalous flowers of a scarlet, white, or greenish color. They are propagated by off-sets, or cuttings, and must be potted in light sandy compost, retained in a sunny part of the green-house all winter, and very sparingly watered. In summer they may be placed in the full air in a sheltered place, and in dry weather watered twice a-week.

CRASSUS (M. Licinius), a celebrated Roman, surnamed the Rich, on account of his opulence, which he is said to have obtained by educating slaves and selling them at a high price. The cruelties of Cinna obliged him to leave Rome, and he retired to Spain for eight months. After Cinna's death he passed into Africa and Italy, where he ingratiated himself with Sylla. When the gladiators, with Spartacus at their head, had spread universal alarm in Italy, and defeated some of the Roman generals, Crassus was sent against them. A battle was fought, in which he slaughtered 12,000 of the slaves, put an end to the war, and was honored with an ovation at his return. He was soon after made consul with Pompey, A. U. C. 682, and in this high office displayed his opulence, by entertaining the populace at 10,000 tables. He was afterwards censor, and formed the first triumvirate with Pompey and Cæsar. Crassus never imitated the ambitious conduct of his colleagues, but was satisfied with the province of Syria, which promised to be an inexhaustible source of wealth. He crossed the Euphrates, and hastened to make himself master of Parthia, but was betrayed in his march by the delay of Artavases, king of Armenia, and the perfidy of Ariamnes. Surena, the Parthian general, met him in a large plain, and a battle was fought, in which 20,000 Romans were killed, and 10,000 taken prisoners. The darkness of the night favored the escape of the rest; and Crassus, forced by the mutiny and turbulence of his soldiers, and the treachery of his guides, trusted himself to the general of the enemy, on pretence of proposing terms of accommodation, and was killed. His head was cut off, and sent to Orodes, who poured melted gold

down his throat. Though avaricious, he was attached to philosophy, and his knowledge of history is said to have been extensive.

CRASTINATION, *n. s.* From Lat. *cras*, tomorrow. Delay.

CRATÆGUS, wild-service tree, hawthorn, &c., in botany, a genus of the digynia order, and icosandria class of plants; natural order thirty-sixth, pomaceæ: *CAL.* quinquefid: the petale five; the berry inferior, dispersuous. There are twenty-three species, all of the tree and shrub kind, hardy and deciduous. Those most valuable for economical and ornamental purposes in gardening are the following: 1. *C. aria* theophracti, the white-leaf-tree, is a native of most of the cold countries of Europe. It grows to about twenty feet, and has, even in winter, though naked of leaves, a fine straight stem, with smooth branches, spotted with white. At the end of them are the buds, swelled for the next year's shoot. In spring, the oval leaves look delightfully, having their upper surface green, and the lower white. They are unequally serrated, about three inches long, and half as wide. Several strong nerves run from the mid-rib to the border, and they are placed alternately on the branches, which appear as if powdered with the finest meal. The flowers are produced at the end of the branches in May; they are white, grow in large bunches, having mealy foot-stalks, and are succeeded by red berries, which are ripe in autumn. 2. *C. coccinea*, the Virginian azarole, is a native of Virginia and Canada, and of about equal height. The stem is robust, and covered with a light-colored bark. Each separate flower is large, but, as few of them grow together, the umbels they form are rather small. They come out in May, and are succeeded by large dark-red-colored fruit, which ripens late in the autumn. The varieties of this species are, the pear-leaved thorn; the plum-leaved thorn, with very long strong spines, and large fruit; the plum-leaved thorn, with short spines and small fruit. 3. *C. crus galli*, the cockspur thorn, also a native of Virginia and Canada, and of similar appearance; rises with an upright stem, irregularly sending forth branches, which are smooth, and of a brownish color, spotted thinly with small white spots. It is armed with thorns that resemble the spurs of cocks. In winter the leaf-buds appear large and turgid. In summer the leaves are oval, angular, serrated, smooth, and bend backwards. The flowers are succeeded by a large bright-red fruit. The principal varieties are, the cockspur hawthorn with many thorns; the cockspur hawthorn with no thorns; the cockspur with eatable fruit. 4. *C. oxyacanthus*, the hawthorn, or white-thorn, grows naturally all over Europe. In the state in which we usually see it, it is nothing better than a tall, uncouth, irregular shrub; but trained up as a standard, it swells to a large timber size, with a tall stem and a full spreading head. The standard hawthorn, whether we view its flowers in the spring, its foliage in the summer, or its fruit in the autumn and winter, is one of the most ornamental plants, standing singly, that can be scattered over a park or lawn. Of this species there are the following varieties: the

large scarlet, the yellow, the white, the maple-leaved, and the double-blossomed hawthorns: and the Glastonbury thorn. The scarlet hawthorn is exceedingly large, oblong, perfectly smooth, and of a bright scarlet. The yellow haw is a fine plant. The buds are of a fine yellow, and the fruit is of the color of gold. The tree retains its fruit all winter. It was originally brought from Virginia, is greatly admired, and no collection of hardy trees should be without it. White hawthorn hardly ever grows to the height of the common hawthorn, and the fruit is small. Maple-leaved hawthorns grow to nearly twenty feet high, and have very few thorns. The leaves are large, resembling those of the maple, and are of a whitish-green. The flowers are produced in large bunches in June, and are succeeded by remarkable fruit, of a shining red, which looks beautiful in winter. Double-blossomed hawthorn produces a full flower, and is one of the sweetest ornaments in the spring. These beautiful double flowers come out in large bunches in May, and the tree often appears covered with them. Glastonbury thorn differs in no respect from the common hawthorn, except that it sometimes flowers in winter. It is said to have been originally the staff of Joseph of Arimathea, who, according to tradition, attended by eleven companions, came over into Britain, and founded the first Christian church in this isle. As a proof of his mission, he is said to have stuck his staff into the ground, which immediately shot forth and bloomed. This tree is pretended to have blossomed on Christmas-day ever since: but Hanbury says, in fine seasons they will sometimes be in blow before Christmas, sometimes they afford their blossoms in February, and sometimes it so happens that they will be out on Christmas-day. 5. *C. tomentosa*, the gooseberry-leaved Virginia hawthorn, grows to about seven or eight feet. The branches are slender, and closely set with sharp thorns. The leaves are cuneiform, oval, serrated, and hairy underneath. The flowers are small, and of a white color; they are produced from the sides of the branches about the end of May, and are succeeded by yellow fruit, which ripens late in autumn. There is a variety of this called the Carolina hawthorn, which has longer and whiter leaves, larger flowers and fruit, and no thorns. 6. *C. viridis*, the green-leaved Virginia hawthorn, has the stem and branches altogether destitute of thorns. The leaves are lanceolate, oval, nearly trilobate, serrated, smooth, and green on both sides. The flowers are white, moderately large, come out the end of May, and are succeeded by a roundish fruit, which ripens late in autumn. All the different species are propagated by sowing the seeds in beds of fresh, light, rich earth; and the varieties are continued by budding them upon stocks of the white thorn. This latter method is generally practised for all the sorts: though, when good seeds can be procured, the largest and most beautiful plants are raised that way.

CRATCH, *n. s.* Fr. *crèche*: Lat. *crates*. The palisaded frame in which hay is put for cattle. The children's game called cratch-cradle, corruptly scratch-cradle, is meant to represent, by a

piece of string interwoven like hurdles, the cradle of our Saviour.

Begin from first, where he encradled was
In simple *cratch*, wrapt in a wad of hay.

Spenser. Hymn of Heavenly Love.

When, being expelled out of Paradise by reason of sin, thou wert held in the chains of death; I was inclosed in the virgin's womb, I was laid in the *cratch*, I was wrapped in swathing-cloaths.

Hakewill on Providence.

CRATCH, *v. a.* Welsh *crach*, scabies. To scratch; to tear. This is our old verb for scratch.

Cratching of chekes, rending eke of here.

Chaucer. Cant. Tales.

CRATCHES, in the manage, a swelling on the pastern, under the fetlock, and sometimes under the hoof; for which reason it is distinguished into the sinew cratches, which affect the sinew, and those upon the coronet called quitter-bones.

CRATE, *n. s.* Germ. *kraet*. A pannier, or vessel made of wicker, in which things are conveyed on a horse; a sort of case in which crockery ware is packed.

I have seen a horse carrying home the harvest on a *crate*. *Johnson.*

CRATER, *n. s.* Lat. *crater*; *κράτηρ*. A vent or aperture. It is chiefly used to designate the mouth of a volcano.

CRATES, a famous philosopher of Thebes, a disciple of Diogenes the Cynic. It is said that he threw all his money into the sea, that he might the more freely apply himself to the study of philosophy. Others assert that he placed it in his brother's hands, with orders to give it to his children if they should happen to be fools: for, said Crates, if they should be philosophers, they will have no need of it; in which case it was to be given to the people. He flourished about A. A. C. 328.—Also the name of a famous academic philosopher, the disciple and friend of Polemon. He had Arcesilaus and other celebrated philosophers for his disciples; and flourished about A. A. C. 300.

CRATEVA, the garlic pear, in botany, a genus of the monogynia order, and dodecandria class of plants; natural order twenty-fifth, putamineæ: cor. tetrapetalous: cal. quadrifid: berry inferior dispermous. There are five species; natives of India, and chiefly distinguished by their fruit. All the species may be propagated in this country by seeds sown upon a hot-bed in the spring; and when the plants come up, they are to be treated in the manner directed for the annona.

The chief is *C. tapia*, the garlic pear, which has a smooth round fruit, about the size of an orange, with a hard brown shell or cover, which encloses a mealy pulp, filled with kidney-shaped seeds. It has a strong smell of garlic, and communicates the same to such animals as feed upon it. The tender buds from the young branches being bruised, and applied to the naked skin, will blister as effectually as cantharides. It rises to about thirty feet.

CRATINUS, an ancient comic poet, mentioned by Quintilian, Horace, and Persius, along

with Eupolis, and Aristophanes, as the three great masters of the ancient comedy. It is said that he died in the 87th Olympiad. Suidas tells us that he wrote twenty-one plays.

CRATIPPUS, a celebrated peripatetic philosopher, was a native of Mitylene, where he taught philosophy; but at length went to Athens, where Brutus and the son of Cicero were his disciples. Pompey, after the battle of Pharsalia, proposed to him some difficulties respecting the belief of a Providence, which he answered. He wrote some pieces respecting divination: and is supposed to be the Cratippus whom Tertullian, in his book *De Animâ*, has ranked among the writers upon dreams.

CRAVAN, or CRAVANT, a town of France, in the department of Yonne and ci-devant province of Burgundy, remarkable for its good wine, and for a battle between the English and French, in 1423. It is seated near the confluence of the rivers Cure and Yonne, nine miles south-east of Auxerre.

CRAVAT. Fr. *cravate*. Menage says, the word is derived from an appellation of the Croats, who were usually called Cravates; but Serenius deduces it from Goth *kraþia* for *krage*, the neck. Cravat is a neck-cloth; any thing that is worn round the neck.

Less delinquents have been scourged,
And hemp on wooden anvils forged;
Which others for *cravats* have worn
About their necks, and took a turn. *Hudibras*.

When you draw him to do any thing that is fit by the offer of money, or reward the pains of learning his book by a precious morsel; when you promise him a lace *cravat*, or a fine new suit, upon performance of some of his little tasks; what do you by proposing these rewards, but allow them to be the good things he should aim at, and thereby encourage his longing for them, and accustom him to place his happiness in them? *Locke*.

The restrictives were applied, one over another, to her throat: then we put her on a *cravat*.

Wiseman's Surgery.

CRAVE, *v. a.* } Goth. *krefa*: Dan. *kra-*
CRAVEE, *n. s.* } *ve*; Swed. *krafja*; Welsh,
CRAVING, *n. s.* } *crifu*; Ang.-Sax. *cræfan*.
To ask earnestly; to ask submissively; to beg, to entreat; to have an inordinate or unreasonable desire for; to be insatiable. Craver is an insatiable asker; and craving, an unreasonable desire.

Waste, what thing we may nat lightly have.
Thereafter wol we cry all day and *crave*.
Chaucer. Cant. Tales.

Such is the fortune that I have,
To love them most, that love me the best,
And to my payne to seek and *crave*,
The thing that others have possess, *Wygatt*.

To which the damzel, full of doubtful thought,
Her mildly answered; ' Beldame, be not wroth
With silly virgin by adventure brought
Unto your dwelling, ignorant and loth,
That *crave* but roome to rest while tempest overblowth.
Spenser. Faerie Queene.

What one petition is there found in the whol: Li-
tany, whereof we shall ever be able at any time to
say, that no man living needeth the grace or benefit
the rein *craved* at God's hands? *Hooker*

As for my nobler friends, I *crave* their pardons;
But for the mutable rank-scented many,
Let them regard me as I do not flatter.

Shakspeare. Coriolanus.

Bid him with speed prepare to carry it,
The cause *craves* haste, and it will soon be writ.

Shakspeare. The Rape of Lucrece.

The poor people, not knowing where to hide them-
selves from the fury of their enemies, nor of whom to
crave help, fled as men and women dismayed.

Knoles.

Once one may *crave* for love,
But more would prove
This heart too little, that too great. *Suckling*.

The subjects armed, the more their princes gave,
The advantage only took the more to *crave*. *Denham*.

I would *crave* leave here, under the word action,
to comprehend the forbearance too of any action proposed. *Locke*.

I will not say, high interest was the cause of it.
For I rather think that our thriving trade was the
cause of high interest, every one *craving* money to
employ in a profitable commerce. *Id.*

Levity pushes us on from one vain desire to ano-
ther, in a regular vicissitude and succession of *crav-*
ings and satiety. *L'Esrange*.

He is actually under the power of a temptation, and
the sway of an impetuous lust; both hurrying him to
satisfy the *cravings* of it by some wicked action. *South*.

Him dost thou mean, who, spite of all his store,
Is ever *craving*, and will still be poor?
Who cheats for half-pence, and who doffs his coat
To save a farthing in a ferry-boat? *Dryden. Persius*.

Each ardent nymph the rising current *craves*,
Each shepherd's prayer retards the parting waves. *Prior*.

Many a long-lingering year, in lonely isle,
Stunned by the eternal turbulence of waves,
Lo, with dim eyes, that never learned to smile,
And trembling hands, the famished native *craves*
Of Heaven his wretched fare. *Beattie*.

CRAVEN, *v. a., n. s. & adj.* Skinner, Horne
Tooke, and Whiter, consider craven to be de-
rived from the verb to crave, implying that the per-
son bearing it has craved or craven his life from
his antagonist. Dr. Johnson suggests, that ' per-
haps it comes originally from the noise made by
a conquered cock.' Mr. Todd, however, agrees
with Dr. Jameson in deducing it from the old
French, *cravant*; a term of feudal jurisprudence,
which was a promise of fealty. 'By the use of
it therefore,' says Dr. Jameson, 'the vanquished
person merely did homage to the victor as his
superior.' A craven is a defeated and spirit-
broken cock; a coward; a recreant; a chicken-
hearted fellow; as an adjective, the word means
cowardly; base; degraded. The verb, which
seems to be a coinage of Shakspeare's, signifies
to make recreant or cowardly.

In mighty armes he was yclad anon,
And silver shield; upon his coward crest
A bloody crosse, and in his *craven* crest
A bouche of heares discoloured diversly.
Spenser. Faerie Queene.

Yet if the innocent some mercy find,
From cowardice, not ruth, did that proceed;
His noble foes durst not his *craven* kind
Exasperate by such a bloody deed. *Fairfax*.

'Gainst self-slaughter
There is a prohibition so divine,
That *cravens* my weak hand.

Shakspeare. Cymbeline.

What is your crest a coxcomb? —
— A combs cock, so Kate will be my hen.
— No cocks of mine; you crow too like a *craven*.

Id. Taming of the Shrew.

Is it fit this soldier keep his oath?

— He is a *craven* and a villain else.

Id. Henry V.

Whither it be

Bestial oblivion, or some *craven* scruple,
Of thinking too precisely on the event;
A thought which parts that which one part wisdom,
And every part unto his sword. *Id. Hamlet.*

CRAWNC, *n. s.* *Lat. stramon.* To crush
CRANCH, *n. s.* A crack between the teeth.

She cannot *cranch* at bars.

Or manage a great horse, unless she can *cranch*.

A sack of small coal, rat you lime and hair.

Ben Jonson.

She would *cranch* the wing of a lark, bones and
all, between her teeth. *Swift.*

CRAW, *n. s.* *Ger. kragen; Swed. krage;*
Dan. krøe. The crop or first stomach of birds.

In birds there is no mastication or comminution of
the meat in the mouth; but, in such as are not car-
nivorous, it is immediately swallowed into the crop
or *crue*, or at least into a kind of ante-stomach, which
I have observed in many, especially piscivorous birds.

Ray on the Creation.

CRAWFISH, *n. s.* Sometimes written *cray-*
fish, properly *crevice*; in *Fr. crevisse*. A small
crustaceous fish found in brooks; the small
lobster of fresh water. See **CANCER**.

Those that cast their shell are the lobster, the crab,
the *crayfish*, the hodmandod or dodman, and the tor-
toise. *Bacon.*

Let me to crack live *crayfish* recommend. *Pope.*

The common *crayfish*, and the large sea *crayfish*,
both produce the stones called crab's eyes. *Hull.*

CRAWFORD (Adair, M. D.), a medical
writer of considerable eminence, was born in
1749, and became physician to St. Thomas's
Hospital, London; professor of chemistry at
Woolwich; and fellow of the Royal Society.
His principal work is Experiments and Observa-
tions on Animal Heat, of which a second and
enlarged edition was published in 1784, 1 vol.
8vo. It was translated into German by L. F. F.
Crell, and into Italian by Vasalli; with Morgan's
Answer and Notes. Dr. Crawford also made
experiments on the matter of cancer, and was the
first writer who recommended muriate of barytes
as a remedy for scrofula. He died at Lymington,
July 29th, 1795. A posthumous tract of his
appeared in 1816, entitled An Experimental En-
quiry into the Effect of Tonics and other medi-
cinal Substances on the Cohesion of the Animal
Fibre. 8vo.

CRAWFURD, or **CRAUFURD** (David), a
Scottish historian, born at Drumsoy, near Glas-
gow, in 1665, is principally to be noted as a
wilful falsifier of history. Holding the place of
historiographer royal of Scotland to queen Anne,
he published, in 1706, Memoirs of Scotland
during the times of the Four Regents: a work
which had gone through two editions, had been

quoted by both Hume and Robertson and was held
in considerable estimation, until Mr. Laing pub-
lished, from the original MS., The Historie and
Life of King James Sext, when it was dis-
covered that Crawford had wretchedly inter-
polated and mutilated it, in all his alleged quotations
from it, to support his particular opinions as to
the character of Bothwell and queen Mary. He
was the author also of the two plays entitled
Courtship a la Mode, and Love at First Sight,
and died in 1726.

CRAWL, *v. n.* } *Goth. kragla; Sw. krala;*
CRAWLER, *n. s.* } *Dutch krielen.* The Dutch

CRAWLING, *adj.* } etymon Junius and Skinner
trace to the *Lat. gradulari, pro gradulari, i. e. gradu-*
atum seu pedetentim ire. To crawl is,
to creep; to move with a tardy motion; to move
with the lower parts on the ground like a worm;
to proceed onward tardily or timorously; to ad-
vance slowly and slyly; to move about hated and
despised. The meanings of the noun and ad-
jective are obvious.

And whylome by false Fairies stolen away,
Whyles yet in infant cradle he did *crall*.

Spenser. Faerie Queene.

'Tis our first intent
To shake all cares and business from our age,
While we unburthened *crawl* toward death.

Shakspeare. King Lear.

Cranmer

Hath *craveled* into the favour of the king,

And is his oracle. *Id. Henry VIII.*

They like tall fellows crept out of the holes; and
secretly *craving* up the battered walls of the fort, got
into it. *Knolles.*

I saw them under a green mantling vine,
That *cravels* along the side of yon small hill.

Milton.

Unarmed of wings and scaly oare,

Unhappy *crawler* on the land.

Lovelace.

For the fleets of Solomon and the kings of Egypt,
it is very apparent they went with great leisure, and
craveled close by the shore-side. *Heylin.*

A worm finds what it searches after, only by feeling,
as it *cravels* from one thing to another.

Grew's Cosmologia.

That *craveling* insect, who from mud began;
Warmed by my beams, and kindled into man.

Dryden.

The streams, but just contained within their
bounds,

By slow degrees into their channels *crawl*;

And earth increases as the waters fall. *Id.*

The vile worm, that yesterday began

To *crawl*; thy fellow-creature, abject man. *Prior.*

Man is a very worm by birth,

Vile reptile, weak and vain!

A while he *cravels* upon the earth,

Then shrinks to earth again. *Pope.*

He was hardly able to *crawl* about the room, far
less to look after a troublesome business.

Arbuthnot's John Bull.

It will be very necessary for the threadbare gown-
man, and every child who can *crawl*, to watch the
fields at harvest-time.

Swift.

An inadvertent step may crush the snail,

That *cravels* at evening in the public path;

But he that has humanity, forewarned,

Will tread aside, and let the reptile live. *Cowper.*

Dark brinded hairs, in bristling ranks, behind,
Rise o'er his back, and rustle in the wind;
Clothe his lank sides, his shrivell'd limbs surround,
And human hands with talons print the ground.
Silent in shining troops the courtier throng
Pursue the monarch, as he crawls along. *Darwin.*

CRAN. in ornithology, the curassow, a genus of birds belonging to the order of gallina. The base of the beak of each mandible is covered with wax; and the feathers of the head are curled. There are five species, viz. 1. *C.lector*, the Indian hen of Sloane, is found in Berbice, Essequibo, Demerara, Brasil, and the warm parts of America. It is about the size of a small turkey, and is black, with a white belly. A yellow wax covers about one-half of each mandible; the tongue is entire; the temples are bare and black; the tail is roundish, and consists of fourteen grume feathers; the legs are strong and of a dusky brown color. These birds are common in Guiana; and are called *powese* by the natives from their cry; are pretty numerous in the woods, and make no small part of the food of the planters, who are supplied by the Indian hunters; their flesh is reckoned as delicate as that of a turkey. They are easily brought up tame. 2. *C.richocera*, has a yellow protuberance between the nostrils, and is of a bluish-black color; the lower part of the belly is white. It is a native of Brasil. 3. *C. paxu*, the Mexican pheasant of Brissonius, is of a bluish color, with blue wax, and the tip of the tail and belly white; it is a native of Mexico. 4. *C. rubra*, the Peruvian hen, is red, with a bluish head. These birds are natives of Mexico and Peru. They feed on fruits, and perch on trees; the flesh is white, and esteemed good food. They are frequently kept tame in our menageries in England, and readily mix with other poultry.

CRAY, CRAYER, or CRABE. *n. s.* Old Fr. *crayer*; Sw. *krayer*; low Lat. *crayens*. A small maritime vessel; a bark.

Oh melancholy!

Whoever yet could see, and my bottom find
The core, to show what crast thy sluggish mind
Might earliest harbour in! *Shakespeare. Cymbeline.*

CRAYER Caspar de, an eminent painter, born at Antwerp in 1595. He was a disciple of Raphael Coxis, whose father had studied under Raphael; but he soon far surpassed his master, and formed for himself a style that was exceedingly pleasing. The first work which established him in the favor of the court at Brussels, was a portrait of cardinal Ferdinand, brother to the king of Spain. Rubens, who went to Antwerp on purpose to visit him, after examining attentively his picture of the Cenurion, in the abbey of Aftieghem, declared that no painter could surpass Crayer. He had somewhat less fire in his compositions than Rubens, but his design is frequently more correct. There is a remarkable variety and simplicity in his draperies; and his coloring is admirable.

CRAZFISH. *n. s.* See **CRAWFISH.** The river lobster.

The cure of the muriaick and armoniack saltiness requires slimy meats; as snails, tortoises, jellies, and *crayfishes*. *Fogey.*

CRAZFORD, or CREGANFORD, a town of England, in Kent, seated on the small river Cray, which serves to work a mill for slitting and rolling iron, and another for a cotton manufacture. This place is memorable for a great battle fought here in 497, between Hengist, the Saxon, and Vortigern the British king; in which the latter lost 4000 men and four of his chief commanders. The spot was so general and decisive, that they left Hengist from that time in quiet possession of his Kentish kingdom. This town is two miles west of Dartford and fourteen E. S. E. of London.

CRAYON. *n. & n. s.* Fr. *crayon*, *crayonne*. To delineate in dry colors; to sketch out the first lines of any thing. A kind of colored pencil; a drawing done with a crayon.

Let no day pass over you with drawing a line; that is to say, without working, without giving some strokes of the pencil or the crayon.

Dryden's Dunciado.

I wonder how any one can read the king's speech at the opening of that session, without seeing in that speech both the repeal and the declaratory act very sufficiently expressed in. *Burke.*

CRAYON is a general name for all colored stones, earths, or other minerals and substances used in designing or painting in pastel; whether they have been beaten and reduced to a paste, or are used in their primitive consistence, after sawing or cutting them into long narrow slips. In this last manner are red crayons made of bloodstone, or red chalk, and black ones of concolor and black lead. Crayons of all other colors are compositions of earthen reduced to paste.

CRAYON-PAINING. See **PAINTING.**

CRAZE. *n. s.* Fr. *crasse*. In this **CRAZEDNESS.** *n. s.* } etymology Infr. Lye,
CRAZINESS. *n. s.* } Sainnet, and Dr. Johnson
CRAZE. *v. lgt.* } agree. Minster on the contrary derives *crase* from *crase*, temperationum. To *crase* is, to break; to debilitate; to impart; to reduce to powder; to impair the intellect. *Crasy* signifies, broken down; decrepitate; weak; shattered; broken-winded. *Crazedness*, and *crasiness*, indicate the state of being weak, decrepitate, or *crasy*.

I am right sike that the pot was *crasid*,
Be as be may, be ye no thing amasid;
As usage is, let swape the fire as swither;
Plucke up your heras, and be glad and bithie. *Chaucer. Cant. Tales.*

For els my feeble vessel *crasid* and cracht;
Through thy strong buffets and outrageous blowes,
Cannot endure. *Spenser. Faerie Queene.*

In this consideration, the answer of Calvin unto Farel, concerning the children of Popish parents, doth seem *crasid*. *Hooker.*

The nature, as of men that have sick bodies, so likewise of the people in the *crasiness* of their minds, possessed with dislike and discontentment at things present, is to imagine that any thing would help them. *Id.*

Relent, sweet Hermia, and, Lysander, yield
Thy crazed title to my certain right. *Shakespeare. Midsummer Night's Dream.*

I loved him, friend,
No father his son dearer, true, to tell thee,
That grief hath *crazed* my wits. *Id. King Lear.*

Come, my lord,
We will bestow you in some better place,
Fitter for sickness and for *crazy* age. *Id. Henry VI.*

For no *crazed* brain could ever yet propound,
Touching the soul, so vain and fond a thought,
But some among these masters have been found,
Which in their schools the self same thing have
taught. *Davies.*

Like the vain bubble of Sherian pride,
That overcroweth all the world beside,
Which reared to raise the *crazy* monarch's fame,
Strives for a court and for a college name. *Hall.*
The tin ore passeth to the *crazing* mill, which,
between two grinding stones, bruisseth it to a fine sand. *Carew's Survey.*

Touching other places, she may be said to hold
them as one should do a wolf by the ears; nor will I
speak now of the *craziness* of her title to many of them. *Hovel's Vocal Forest.*

Till length of years,
And sedentary numbness, *craze* my limbs. *Milton.*

Then through the fiery pillar, and the cloud,
God looking forth, will trouble all his host,
And *craze* their chariot wheels. *Id.*

The queen of night, whose large command
Rules all the sea, and half the land,
And over moist and *crazy* brains,
In high spring-tides, at midnight reigns. *Hudibras.*

Physick can but mend our *crazy* state,
Patch an old building, not a new create. *Dryden.*

When people are *crazy* and in disorder, it is natu-
ral for them to groan. *L'Estrange.*

Wickedness is a kind of voluntary frenzy, and a
chosen distraction; and every sinner does wilder and
more extravagant things than any man can do that is
crazed and out of his wits; only with this sad differ-
ence, that he knows better what he does. *Tillotson.*

Were it possible that the near approaches of eter-
nity, whether by a mature age, a *crazy* constitution,
or a violent sickness, should amaze so many, had they
truly considered? *Wake.*

How drooping, woeful wan, like one forlorn,
Or *crazed* with care, or crossed with hopeless love! *Gray.*

It was in vain to think of doing any more good at
school. The remaining week I staid, I did nothing
but *craze* the faculties of my soul about her, or steal
out to meet her; and the two last nights of my stay
in the country, had sleep been a mortal sin, the image
of this modest and innocent girl had kept me guiltless. *Burns.*

The noblest friendship ever shown,
The Saviour's history makes known,
Though some have turned and turned it;
And whether being *crazed* or blind,
Or seeing with a biassed mind,
Have not, it seems, discerned it. *Cowper.*

Ne'er may the *crazy* hand of pining care
Thy mirth and youthful spirits break!
Never come sickness, or love-crossed despair,
To pluck the roses from thy cheek! *Sheridan.*

CRAZE-MILL, or CRAZING MILL, a mill in
all respects like a grist mill to grind corn,
and so called by the tin-miners, who use it to
grind their tin, which remains too great after
trampling.

CREAGHT, v. n. & n. s. Irish. To pasture
cattle. A herd of cattle.

It was made penal to the English to permit the
Irish to *creaght* or graze upon their lands, or present
them to the ecclesiastical benefices. *Davies on Ireland.*

In these fast places, they kept their *creaghts*, or
herds of cattle, living by the milk of the cow, without
husbandry or tillage. *Id.*

CREAK, v. n. & n. s. } Old Fr. *criquer*;
CREAKING, n. s. } Dut. *kricken*; *κρεκω*.
To make a stridulous protracted sound, such as is
made by dry shoes and unoiled hinges; to make
a sharp cry, like some birds and animals.

Let not the *creaking* of shoes, nor the rustling of
silks, betray thy poor heart to women.

Shakspeare. King Lear.
No door there was the unguarded house to keep,
On *creaking* hinges turned, to break his sleep. *Dryden.*

The *creaking* locusts with my voice conspire,
They fried with heat, and I with fierce desire. *Id.*

In a large and uninhabited building, like a church,
the wind may howl; the doors and windows may
clap; the *creaking* of rusty hinges may be heard: a
stone, or a bit of plaister, may drop with some noise
from the mouldering wall. *Beattie.*

Words learned by rote, a parrot may rehearse,
But talking is not always to converse;
Not more distinct from harmony divine,
The constant *creaking* of a country sign. *Cowper.*

So Juan stood, bewildered on the deck:
The wind sung, eordage strained, and sailors swore,
And the ship *creaked*, the town became a squeak,
From which away, so fair and fast they bore.

Byron's Don Juan.

CREAM, v. a., v. n. & n. s. } Fr. *creme*;
CREAMY, adj. } It. *crema*; Goth.
CREAM-BOWL, n. s. } *kreima*; Ang-
CREAM-FACED, adj. } Sax. *ream*; Lat.
CREAMING-PAN, n. s. } *cremor*; *χρημα*.

To cream is to skim off the cream; to take the
quintessence of any thing; to gather on the sur-
face. Cream is the unctuous part of milk; the
best part of any thing.

— thee doth draine
Her *creaming* pannes, and frustrate all her paine. *Spenser. Faerie Queene.*

There are a sort of men whose visages
Do *cream* and mantle like a standing pond;
And do a wilful stiffness entertain,
With purpose to be drest in an opinion
Of wisdom, gravity, profound conceit. *Shakspeare. Merchant of Venice.*

It is not your inky brows, your black silk hair,
Your bugle eye-balls, nor your cheek of *cream*,
That can entame my spirits to your worship. *Id. As You Like It.*

— Thou *cream-faced* lovn,
Where got'st thou that goose-look? *Id. Macbeth.*

I am as vigilant as a cat to steal *cream*. *Id. Henry IV.*

Cream is matured and made to rise speedily, by
putting in cold water; which, as it seemeth, getteth
down the whey. *Bacon's Natural History.*

How the drudging goblin sweet,
To earn his *cream-bowl* dully set;
When in one night, ere glimpse of morn,
His shadowy flail hath threshed the corn. *Milton.*

Let your various *creams* increled be
With swelling fruit, just ravished from the tree.

King.

Milk, standing some time, naturally separates into an oily liquor called *cream*; and a thinner, blue, and more ponderous liquor, called skimmed milk.

Arbuthnot on Aliments.

We skim, from abstracted and translation,
The *cream* of classic information:
Like *cream* from London cows translated,
Or butter-milk sophisticated. *Huddesford.*

And the small ripple split upon the beach
Scarcely o'erpass'd the *cream* of your champagne,
When o'er the brim the sparkling bumpers reach,
That spring dew of the spirit! the heart's rain!

Byron.

CREAM OF LIME is that part of the lime which had been dissolved in the water in its caustic state, but, having again attracted some fixed air from the atmosphere, becomes incapable of solution, and therefore separates from the water in the mild state of chalk or limestone.

CREAM OF MILK. Being naturally only mixed, and not dissolved in the rest it soon separates, being specifically lighter; after which it collects on the surface, from which it is generally skimmed, to complete the disengagement of the oily from the caseous and serous parts. Cream is not only an agreeable aliment when recent, but is also useful in medicine as a lenient, when applied to tetters and erysipelas, attended with pain and proceeding from an acrid humor.

CREAM OF TARTAR, the crystals of tartar pulverized. It is well known as a mild purgative, and of late years has been employed largely with advantage in dropsies.

CRE'ANCE, *n. s.* Fr. *is*, in falconry, a fine small line, fastened to a hawk's leash when she is first lured.

CREASE, *v. a. & n. s.* From Lat. *creta*, chalk, say Skinner and Dr. Johnson; but it is rather, as Herne suggests, from the old world creysed, cross'd. To make a mark by doubling any thing. The mark made by a fold in something stiff.

Men of great parts are unfortunate in business, because they go out of the common road: I once desired lord Bolingbroke to observe, that the clerks used an ivory knife, with a blunt edge, to divide paper, which cut it even, only requiring a strong hand; whereas a sharp penknife would go out of the *crease*, and disfigure the paper. *Swift.*

CREAT, in the manage, an usher to a riding master; or a gentleman bred in the academy, with an intent of making himself capable of teaching the art of riding the great horse.

CREATE, *v. a. & adj.* Fr. *creer*; Ital. *creare*; Sp. *criar*; Latin *creare*. To create is, to form out of nothing; to cause to exist; to produce; to beget; to invest with a new character or title; to give new qualities to any thing. As an adjective, create signifies, begetter; composed of; but it is

obsolete. Creation means, the act of calling into existence, or investing with new qualities or titles; the universe; any thing produced or caused. The power which does these acts is creative. Creator is the being that confers existence, especially the Supreme Being. A creature is, a being not self-existent; any created thing; an animal; a general term for man; a word of contempt or of endearment; a person who is indebted to another for his rise or fortune; or who acts the part of dependent or sycophant to another. Creaturely denotes having the qualities of a creature; and creatureship, the state of being a creature. Both these words are of uninfrequent occurrence.

In the beginning God *created* the heaven and the earth. *Genesis.*

And al be it so that God hath *create* all thing in right ordre, and nothing withouten ordre.

Chaucer. Cant. Tales.

No *creature* saw he that bare lif,
Save on the grune he saw sitting a wif,
A fouler wight ther may no man devise. *Id.*

I think nature hath lost the mould
Where she her shape did take;
Or else I doubt if nature could
So fair a *creature* make.

Songes and Sonnettes.

For since the day that they *created* beene,
-So many heavenlie faces were not scene
Assembled in one place. *Spenser. Faerie Queene.*

Yet crime in her could never *create* finl. *Id.*
Him long she so with shadows entertained,
As her *creatress* had in charge to her ordained. *Id.*

And the issue there *create*
Ever shall be fortunate. *Shakspeare.*

Arise, my knights o' the battle: I *create* you
Companions to our person, and will fit you
With dignities becoming your estates. *Id. Cymbeline.*

Art thou not, fatal vision, sensible
To feeling as to sight? Or art thou but
A dagger of the mind, a false *creation*,
Proceeding from the heart-oppressed brain?
Id. Macbeth.

In many looks the false heart's history
Is writ, in moods and frowns and wrinkles strange,
But heaven in thy *creation* did decree,
That in thy sweet face love should ever dwell.
Id. Sonnet xciii.

I've heard that guilty *creatures*, at a play,
Have, by the very unning of the scene,
Been so struck to the soul, that presently
They have proclaimed their malefactions.
Id. Hamlet.

And then, Sir, would he gripe and wring my hand;
Cry, Oh sweet *creature!* and then kiss me hard. *Id.*

The best British undertaker had but a proportion
of three thousand acres for himself, with power to
create a manor, and hold a court-baron.

Darvies on Ireland.

Open, ye heavens, your living doors; let in
The great *Creator*, from his work returned
Magnificent; his six days' work, a world. *Milton.*

His abilities were prone to *create* in him great confidence of undertakings, and this was like enough to betray him to great errors and many enemies.

King Charles.

He sent to colonel Massey to send him men,
which he, being a *creature* of Essex's, refused.

Clarendon.

We having but imperfect ideas of the operations of our minds, and much imperfecter yet of the operations of God, run into great difficulties about free *created* agents, which reason cannot well extricate itself out of. *Locke.*

Imperfect the world, and all the *creatures* in it must be acknowledged in many respects to be. *Tillotson.*

Such was the saint, who shone with every grace,
Reflecting, Moses-like, his master's face :
God saw his image lively was expressed,
And his own work as his *creation* blessed.

Dryden's Fables.

The several parts of relatives, or *creatures* infinitely, may have finite proportions to one another.

Cheyne's Philosophical Principles.

A good poet no sooner communicates his works, but it is imagined he is a vain young *creature* given up to the ambition of fame. *Pope.*

The design was discovered by a person whom every body knows to be the *creature* of a certain great man, *Swift.*

Long abstinence is troublesome to acid constitutions, by the uneasiness it *creates* in the stomach. *Arbutnot.*

But come, ye generous minds, in whose wide thought,

Of all his works, *creative* beauty burns
With warmest beam. *Thomson's Spring.*

Next to that which is due to the *Creator*, children owe to their parents the highest love, reverence, and gratitude ; for to a good parent, in all ordinary cases, his child is more obliged than to any other fellow *creature*. *Beattie.*

By thee inspired, O Virtue, age is young,
And music warbles from the faltering tongue ;
Thy ray *creative* cheers the clouded brow,
And decks the faded cheek with rosy glow. *Id.*

Me oft has Fancy ludicrous and wild
Soothed with a waking dream of houses, towers,
Trees, churches, and strange visages, expressed
In the red cinders, while with poring eye
I gazed, myself *creating* what I saw. *Cowper.*

So erst in Paradise *creation's* Lord,
As the first leaves of holy writ record,
From Adam's rib, who pressed the flowery grove,
And dreamt delighted of untasted love,
To cheer and charm his solitary mind,
Formed a new sex, the mother of mankind. *Darwin.*

Before *Creation* peopled earth,
Its eye shall roll through chaos back ;
And where the furthest heaven had birth,
The spirit trace its rising track.

Byron. Hebrew Melodies.

CREATION, in its primary import, signifies the bringing into being something which did not before exist. The term is therefore most generally applied to the original production of the materials of which the visible world is composed. It is also used, in a secondary or subordinate sense, to denote those subsequent operations of the Deity, upon the matter so produced, by which the whole system of nature and all the primitive genera of things received their form, qualities, and laws.

It is certain that none of the ancient philosophers had the smallest idea of its being possible to produce a substance out of nothing, or that even the power of the Deity himself could work

without materials. Hence some of them, particularly Aristotle, asserted that the world was eternal, both as to its matter and form. Others, though they believed that the gods had given the world its form, yet imagined the materials of which it is composed to have been eternal. Indeed the opinions of the ancients, who had not the benefit of revelation, were on this head so confused and contradictory, that nothing of any consequence can be deduced from them.

Plato, in his *Critias*, mentions Atlantis as having been buried in the ocean about 9000 years before the age in which he wrote. He asserts it to have been well known to the Egyptian priests and to the contemporary inhabitants of Attica. But the learned generally agree in regarding his account of that island as a fiction, which the author himself did not design to be understood seriously. The Chinese represent the world as some hundreds of thousands of years older : and we are also told that the astronomical records of the ancient Chaldeans carried back the origin of society no less than 473,000 years. The Egyptian priests reckoned between Menes and Sethon 341 generations. But these accounts are so discordant, and so slenderly supported by evidence, that we cannot hesitate to reject them as false ; the fables of historians scarcely merit so much attention as the hypotheses of philosophers.

From sacred history we may reasonably expect more accurate information concerning the antiquity of the globe ; but it is evidently only a secondary object of the Scriptures to establish the era of creation. We need not, therefore, be surprised that they do not fix it with accuracy ; or that they leave us at a loss whether to extend what they say concerning that era to the whole contents of space, or to confine it to our solar system, or to the earth and its immediate dependencies. Great varieties of dates have been assigned by close students of the Hebrew Bible as the epoch of the creation. The Samaritan Pentateuch fixes it at 4305 years before the birth of Christ. And the Greek translation known by the name of the Septuagint version gives—in the Vatican copy 5270, and in the Alexandrine 5508, as the number of the years which intervened between those two periods. See CHRONOLOGY. Archbishop Usher, on the other hand, makes out from the Hebrew Bible 4004 years as the term between the creation and the birth of Christ ; and Joseplus, according to Dr. Wills and Mr. Whiston, makes it 4658 years. We have entered, however, so much at large into the leading data of chronology under that article, that we feel it quite unnecessary to repeat our observations here.

Some difficulties occur in comparing the Mosaic account of the creation with the laws which appear at present to regulate the system of nature. It seems strange, for instance, to conceive how the earth, while yet a stranger to the influence of the sun, could experience the vicissitude of day and night. The condition of matter when the earth was without form and void, and the operation of the Spirit of God on the face of the waters, are equally mysterious. Some

ingenious men have eagerly labored to remove these difficulties. Among these is Dr. Thomas Burnet, who supposes all the celestial bodies, even the sun and all the other planets of the solar system, to have existed long before the earth. The chaos on which the spirit of God moved consisted, according to him, of the first principles from which all terrestrial bodies have been formed. When those laws by which the material world is regulated first began to operate on the mass, he supposes that its grosser and heavier parts would sink towards the centre, and there form a solid ball. Around this solid ball two species of particles would still float together in confusion. Of these he thinks one, being more volatile, would by degrees make its escape from the other, would leave it still recumbent on the solid centre, and spread around it in an atmosphere. The middle stratum he composes of aqueous and oleaginous fluids; and he makes no doubt, that after the air had made its escape, the levity of the oleaginous fluids would enable them to rise above the aqueous, and dispose themselves next the surface of the liquid mass. On them he supposes the impure atmosphere to have then deposited a quantity of terrene particles, sufficient to form, by intermixture with the oils, a thick crust of rich earth for the production of plants and herbage, and to afford an habitation to animals. This delicate shell he was careful not to furrow with seas or load with mountains; either of these would have reduced all to confusion. Such is his earth; and after moulding it with so much ingenuity, and into so happy a form, he contents himself, without venturing to use the same freedoms with the remaining part of Moses's account of the creation. We need not attempt to refute a theory which has long been justly condemned as equally unsupported by scripture and philosophy.

Whiston treats both the Scriptures and the laws of nature with greater reverence. Yet he certainly involves himself in no small difficulties in attempting to solve those of Moses. He supposes the sun, moon, and stars to be all more ancient than the earth. The chaos from which the earth was formed, he represents as having been originally the atmosphere of a comet. The six days of the creation he would persuade us to be equal to six of our years: for he is of opinion that the earth did not revolve daily round its axis, but only annually round its orbit, till after the fall. On the first day or year, therefore, the more ponderous parts of the chaos were according to this theory conglomerated into an orb of earth, the chinks and interstices over that orb filled up with water, and the exterior part or atmosphere rarefied, so as to admit some faint glimmering of the rays of the sun. On the second day, the atmosphere was diffused to its due extent around the earth, and reduced to a degree of rarity and purity which rendered it still more suitable for the transmission of light; the earth was still more consolidated; and the waters, being almost entirely excluded from the interstices which they before occupied, were partly spread over the surface of the earth, and partly raised in vapor into the atmosphere or firmament. On the third day the earth's surface became so irregular, in one

place rising into hills, in another sinking into valleys, as to cause the waters, which were before equally diffused, to collect into seas and lakes, leaving large tracts of ground unoccupied. And no sooner was a part of the earth's surface left bare by the waters, than the general influence of the sun produced on it a rich covering of herbage, and all the different species of vegetables. On the fourth day, the earth was rendered subject to the regular influence of the sun, moon, and stars. On the fifth day, or year, things were so far advanced, that fishes and fowls were now produced from the waters. On the sixth day the earth was furnished with animals; and the lord of all the other animals, man, was now created. Such is Mr. Whiston's account of the phenomena of the Mosaic creation. But he likewise assumes so much more than can be reasonably granted, that we need not attempt a formal refutation of his system. What appears to us the most natural way of understanding Moses's account of the creation is, that it was neither confined to the earth alone, nor extended to the whole universe. The relation which all the planets of the solar system bear to the same illuminating body countenances the conjecture, that they, together with the luminary by which they are enlightened, were all created at one period; but it would be conceiving too meanly of the benevolence, wisdom, and active power of the Deity, to suppose that before that period these had never been exerted in any work of creation. On the supposition, that the whole solar system was created at once, which has at least the merit of doing no violence to the narrative of Moses, the creation of the sun and the other planets may be understood to have been carried on at the same time with the creation of the earth. In that case, even in the course of the first day, though not longer than our present days, those bodies might be reduced to such order, and their relative motions so far established, as to begin the distinction between light and darkness, day and night. On the second day, we may naturally understand from Moses's narrative, that the atmosphere was purified, and the specific gravities of aqueous vapor and atmospheric air so adjusted, as to render the latter capable of supporting the former. On the third day the waters were first collected into lakes and seas; but in what manner, we cannot determine. Some call in the operation of earthquakes; others that of specific gravity, &c. But these are mere fancies; and we have not facts to offer in their stead. On the latter part of this day vegetables were caused to spring up over the earth. This growth must have been much more rapid than we ever behold it now; but by what supernatural power that might be effected, we should in vain enquire. On the fourth day, the sun, moon, and stars, were made to appear. But, according to the conjecture which we have mentioned as plausible, those heavenly bodies might be created before this day; though they had not till now begun to exert their full influence on the earth, as they have since continued to do. The creation of the inanimate world was now finished, and the earth prepared for the reception of animals. On the fifth day, therefore, were the living inhabitants

of the air and the waters created. On the sixth day the inferior animals inhabiting the earth were first created; and, after that, the whole work was crowned by the creation of a male and female of the human species. To the account of the creation of the animals, nothing can be added in explanation of Moses's narrative. As only one pair of the human species were at first created, the same economy might possibly be observed in the creation of the inferior animals.

St. Barnabas in the first century, speaking of the works of creation being finished by God in six days, says, 'This signifies that the Lord God will finish all things in six thousand years; as he himself testified, saying, Behold this day shall be as a thousand years. Therefore, in six days, that is, in six thousand years, shall all things be consummated. And he rested on the seventh day: this signifies, that when his Son shall come, and shall abolish the season of the wicked one, and shall judge the ungodly, and shall change the sun, and the moon, and the stars, then shall he rest gloriously on the seventh day.' And that the seventh day rest was symbolical, has been contended by many learned men since St. Barnabas. This is, however, purely a theological speculation, and we must be contented with suggesting it to our readers.

CREBILLON (Prosper Joliot de), a French tragic writer, usually ranked, in point of merit, after Corneille and Racine, was born at Dijon in 1674. He was originally destined to the law, and placed at Paris with that view; but he soon relinquished the bar for the drama. He at last obtained a place in the French Academy, and the employment of censor of the police, in which post he continued till his death. Being asked one day in company, which of his works he thought the best? 'I don't know,' replied he, 'which is my best production; but this (pointing to his son) is certainly my worst.' To this the son is said to have replied, 'That is, because no Carthusian had a hand in it,' alluding to a report that Crebillon was indebted to a monk of that order for some of his finest passages. His best works are, 1. Idomeneus, a tragedy; 2. Atreus; 3. Electra; and 4. Rhadamistus. He produced many other pieces, but they are all generally thought inferior to these. He was remarkably enthusiastic in his devotion to his task while composing. On one occasion some person entering his room during the concoction of a tragic plot, he cried out, 'Do not disturb me—I am just going to hang a knavish minister, and turn out a stupid one.' On another, while in his favorite retreat, the Jardin du Roi at Paris, his friend Duvernet, the naturalist, who had given him a key of admission, was called out by the gardener, and told, that some maniac had made his escape, and was ranging the walks of the garden. The naturalist hastened to the place, and found his friend Crebillon without his coat, filled with poetical furor; and writhing like the Sybil, about to pour forth her predictions. He died at Paris, 1672.

CREBROUS, *adj.* } Lat. *creber*. Frequent;
CREBRITUDE, *n. s.* } frequentness.
CREDE'NDA, *n. s.* Lat. Things to be be-

lieved; articles of faith: distinguished in theology from agenda, or practical duties.

These were the great articles and *credenda* of Christianity, that so much startled the world. *South.*

CRE'DIT, <i>v. a., & n. s.</i>	} Lat. <i>credere</i> . To credit is, to believe; to confide in; to procure credit or honor to; to admit as a debtor. Credit is, belief; reputation; good opinion; the correlative to debt; influence; promise given. Creditor signifies, he to whom a debt is owed; one who credits what he hears: but this last sense is obsolete. Creditable denotes, reputable; estimable: creditably, without disgrace: credulous, too apt to believe, or give credit to: and credulity, easiness of belief; readiness of credit.
CRE'DITABLE, <i>adj.</i>	
CRE'DITABLENESS, <i>n. s.</i>	
CRE'DITABLY, <i>adv.</i>	
CRE'DITOR, <i>n. s.</i>	
CRE'DITRIX, <i>n. s.</i>	
CRE'DULENCY, <i>n. s.</i>	
CRE'DU'LITY, <i>n. s.</i>	
CRE'DULOUS, <i>adj.</i>	
CRE'DULOUSLY, <i>adv.</i>	
CRE'DULOUSNESS, <i>n. s.</i>	

When the people heard these words, they gave no credit unto them, nor received them. *1 Mac. x. 46.*

The things which we properly believe, be only such as are received upon the *credit* of divine testimony.

Hooker.

The poor Plangus, being subject to that only disadvantage of honest hearts, *credulity*, was persuaded by him. *Sidney.*

Many sought to feed

The easy *creditors* of novelties,

By voicing him alive.

Shakespeare.

Now I change my mind,

And partly *credit* things that do presage.

Id. Julius Cæsar.

There came divers of Antonio's *creditors* in my company to Venice, that swear he cannot chuse but break.

Id. Merchant of Venice.

O hard believing Love! how strange it seems
Not to believe, and yet too *credulous*!

Id. Venus and Adonis.

There is no decaying merchant, or inward beggar, hath so many tricks to uphold the *credit* of their wealth, as these empty persons have to maintain the *credit* of their sufficiency. *Bacon.*

Who now enjoys these *credulous*, all gold,

Who always vacant, always amiable,

Hopes thee, of flattery gales

Unmindful? hapless they,

T' whom thou untried seemest fair. *Milton.*

May here her monument stand so,

To *credit* this rude age; and show

To future times, that even we

Some patterns did of virtue see. *Waller.*

They sent him likewise a copy of their supplication to the king, and desired him to use his *credit* that a treaty might be entered into. *Clarendon.*

Credit is nothing but the expectation of money within some limited time. *Locke.*

If you can once get into children a love of *credit*, and an apprehension of shame and disgrace, you have put into them the true principle, which will constantly work, and incline them to the right. *Id.*

At present you *credit* the church as much by your government, as you did the school formerly by your wit. *South.*

Many will chuse rather to neglect their duty safely and *creditably*, than to get a broken pate in the church's service, only to be rewarded with that which will break their hearts too. *Id.*

The contemplation of things, that do not serve to promote our happiness, is but a more specious sort of idleness, a more pardonable and *creditable* kind of ignorance. *Tillotson.*

Among all these snares, there is none more entangling than the *creditableness* and repute of customary vices. *Decay of Piety.*

Some secret truths, from learned pride concealed,
To maids alone and children are revealed:
What though no *credit* doubting wits may give,
The fair and innocent shall still believe. *Pope.*

Yes, while I live, no rich or noble knave
Shall walk the world in *credit* to his grave.

Id. Horace.

He settled him in a good *creditable* way of living, having procured him by his interest one of the best places of the country. *Arbuthnot's John Bull.*

The prejudice of *credulity* may, in some measure, be cured, by learning to set a high value on truth.

Watts's Logick.

The most trifling actions that affect a man's *credit* are to be regarded. The sound of your hammer at five in the morning, or nine at night, heard by a *creditor*, makes him easy six months longer; but if he sees you at a billiard-table, or hears your voice at a tavern, when you should be at work, he sends for his money the next day; demands it before he can receive it in a lump. *Franklin.*

If this state of his country had been foretold to him, would it not require all the sanguine *credulity* of youth, and all the fervid glow of enthusiasm, to make him believe it? Fortunate man, he has lived to see it! Fortunate indeed, if he lives to see nothing that shall vary the prospect, and cloud the setting of his day. *Burke.*

Not e'en the Sun, desirable as rare,
Could bend one knee, engage one votary there;
They were, what base *credulity* believes
True Christians are, dissemlers, drunkards, thieves. *Cowper.*

Cowper.

There's monie a *creditable* stock
O' decent, honest, fawsont fo'k,
Are riven out baith root and branch,
Some rascal's pridefu' greed to quench,
Wha thinks to knit himsel the faster
In favour wi' some gentle master. *Burns.*

Burns.

Sir Peter, I do not expect you to *credit* me—but the tenderness you expressed for me, when I am sure you could not think I was a witness to it, has penetrated so to my heart, that had I left the place without the shame of this discovery, my future life should have spoken the sincerity of my gratitude. *Sheridan.*

Sheridan.

As for that smooth-tongued hypocrite, who would have seduced the wife of his too *credulous* friend, while he affected honourable addresses to his ward—I behold him now in a light so truly despicable, that I shall never again respect myself for having listened to him. *Id.*

Id.

She hoped he would improve—perhaps believed;
A letter too, she gave (he never read it)
Of good advice—and two or three of *credit*.

Byron. Don Juan.

CREDIT was anciently a right which lords had over their vassals; consisting in this, that during a certain time they might oblige them to lend them money. In this sense, the duke of Brittany had credit during fifteen days on his own subjects, and those of the bishop of Nantes; and the bishop had the same credit of right among his subjects and those of that prince.

CREDIT, LETTERS OF, are those given to persons in whom a merchant, &c. can trust, to take money of his correspondent abroad, in case he happens to need it.

CREDITON, or **KIRKTON**, a town of England, in the county of Devon, formerly the see of a bishop, removed to Exeter in the year 1030. In the reign of Edward I. it sent members to the parliament then sitting at Carlisle. It was once a very flourishing town, but has suffered severely by fire. In 1743 no fewer than 460 houses were burnt down, besides the market-house, wool chambers, and other public buildings. The whole loss was estimated at between £50,000 and £60,000; and again, in 1772, the consequences of fire were nearly as disastrous. It is governed by a magistrate called a Portreeve. The principal manufacture is that of serges, which is carried on to a great extent. The church, which was the cathedral, is a noble Gothic structure, 150 feet long and forty-four wide; the altar-piece is a most exquisite piece of painting; the tower is 100 feet high, standing in the centre of the church, in a semicircular arch, supported by four pillars of uncommon magnitude; and containing eight bells, and a clock with chimes. The market is on Saturdays for provisions, wool, and yarn. It is eight miles south-east of Exeter; and 180 west by north of London.

CREE, a river of Scotland, which rises in the northern parts of the county of Wigton, and the stewarty of Kircudbright. It is very small for several miles, and runs through a bleak and dreary country; but is soon considerably increased by tributary streams. It now changes its appearance; and, instead of rocks and moors, it holds its course nearly south through a beautiful valley, till it empties itself into the bay of Wigton. It forms the boundaries between the counties of Wigton and Kircudbright. It abounds with salmon, and is navigable for vessels for several miles.

CREECH (Thomas), a translator of ancient authors, was born near Sherborne in Dorsetshire, in 1659. He was educated at Sherborne, and afterwards entered a commoner of Wadham College, Oxford. In 1683 he took the degree of M. A. and not long after was elected probationer fellow of All-souls College; to which his translation of Lucretius recommended him. He took the degree of B. D. on the 18th March 1696. In 1699, having taken holy orders, he was presented by his college to the living of Welwyn in Hertfordshire; but this he had not long enjoyed before he put an end to his own life. A letter presented to the Bodleian Library seems to prove that having frequently borrowed money of a fellow collegian, and repeating his applications too often, he met one day with such a cold reception, that he retired in a fit of gloomy disgust, and three days after was found hanging in his study. Creech's principal performances are, 1. A Translation of Lucretius. 2. A Translation of Horace, in which, however, he has omitted some few odes. 3. The Idylliums of Theocritus, with Rapin's Discourse of Pastorals. 4. A Translation of Manilius's Astronomicon. Besides translations of several parts of Virgil, Ovid, and Plutarch, printed in different collections.

CREED, *n. s.*

CRÉDENCE, *v. a. & n. s.*

CRÉDENT, *adj.*

CRÉDENTIAL, *n. s. & adj.*

CRÉDIBLITY, *n. s.*

CRÉDIBLE, *adj.*

CRÉDIBLENESS, *n. s.*

CRÉDIBLY, *adv.*

CREED-MAKER, *n. s.*

any thing which a person firmly believes. See the next article. Credence signifies, belief; credit; that which entitles to be credited or believed, as letters of credence, which are synonymous with credentials. As a verb, credence is out of use; it means to believe. Skelton has, 'in credencz his tales.' Credent is, believing; unquestionable. Credible is that which is worthy of belief; credibleness, credibility, and credibly, of course participate in the same meaning.

Such that can nat ysay ther *crede*

With prayer shul be made prelates;

Nothir can thei the gossell rede,

Such shul now weldin high estates.

Chaucer. Cant. Tales.

For Solomon sayth, hereth me and yeveth *credence*
to that that I shall say. *Id.*

Ne let it seem that *credence* this exceeds,

For he that made the same was known right well

To have done much more admirable deeds;

It Merlin was.

Spenser. Faerie Queene.

No leasing new, nor grandames fable stale,

But antient truth, confirmed with *credence* old.

Id. Colin Clout.

Things are made *credible*, either by the known condition and quality of the utterer, or by the manifest likelihood of truth in themselves. *Hooker.*

For me, my lords,

I love him not, nor fear him; there's my *creed*.

Shakspeare.

Love and wisdom,

Approved so to your majesty, may plead

For ample *credence*.

Id.

Then weigh what loss your honour may sustain,

If with too *credent* ear you list' his songs. *Id. Hamlet.*

They did not only underhand give out that this was the true earl; but the friar, finding some *credence* in the people, took boldness in the pulpit to declare as much. *Bacon.*

This, with the loss of so few of the English as is scarce *credible*; being, as hath been rather confidently than *credibly* reported, but of one man, though not a few hurt. *Id.*

Having now showed their *credential* letters on both sides. *Camden.*

The larger and fuller view of this foundation is set down in the *creeds* of the church.

Hammond on Fundamentals.

Thus we see how, amongst other good effects, *creed-making* always has, and always will necessarily produce and propagate ignorance in the world, however each party blame others for it. *Locke.*

The *credibleness* of a good part of these narratives has been confirmed to me by a practiser of physick.

Boyle.

None can demonstrate to me, that there is such an island as Jamaica; yet, upon the testimony of *credible* persons, I am free from doubt. *Tillotson.*

The first of those opinions I shall shew to be altogether incredible, and the latter to have all the *credibility* and evidence of which a thing of that nature is capable. *Id.*

An.-Sax. *creða*,

from Lat. *credo*.

A *creed* is a form of words which comprehends the articles of faith; any solemn profession of principles or opinion;

A few persons of an odious and despised country could not have filled the world with believers, had they not shewn undoubted *credentials* from the Divine Person who sent them on such a message.

Addison on the Christian Religion.

I never heard of a man of learning, sense, or observation, that was favoured with any of them; a strong presumption against their *credibility*. *Burke.*

My *creed* (whatever some *creed-makers* mean

By Athanasian nonsense, or Nicene)

My *creed* is, he is safe that does his best,

And death's a doom sufficient for the rest.

Couper. [Satirically]

There stands the messenger of truth: there stands The legate of the skies!—His theme divine, His office sacred, his *credentials* clear.

By him the violated law speaks out

Its thunders; and by him, in strains as sweet

As angels use, the Gospel whispers peace. *Id.*

Oh Love! how perfect is thy mystic art,

Strengthening the weak, and trampling on the strong,

How self-deceitful is the sagest part

Of mortals whom thy lure hath led along—

The precipice she stood on was immense,

So was her *creed* in her own innocence.

Byron. Don Juan.

CREED, APOSTLES'. See APOSTLES.

CREED, ATHANASIAN, and NICENE. These two, with the Apostles' Creed, are the most universal. They are used in the public offices of the church of England; and subscription to them is required of the clergy. See ATHANASIAN, and NICENE. Other ancient creeds are, 1. The form of apostolical doctrine, collected by Origen. 2. A fragment of a creed preserved by Tertullian. 3. A remnant of a creed in the works of Cyprian. 4. A creed composed by Gregory Thaumaturgus, for the use of his own church. 5. The creed of Lucian the martyr. 6. The creed of the apostolical constitutions. Besides these scattered remains of the ancient creeds, there are extant some perfect forms, as those of Jerusalem, Cesarea, Antioch, &c.

To CREEK, *v. a.* To make a harsh noise. See To CREAK.

Shall I stay here,

Creeking my shoes on the plain masonry?

Shakspeare.

CREEK, *n. s.* } Ang.-Sax. *crecca*; Dutch

CRÉEKY, *adj.* } *kreke*. A prominence in a

winding coast; a small port; a cove; familiarly,

any turn or alley. Creek of day, from Teut.

krieke, signifies the commencement of the dawn,

Creeky is, full of creeks; unequal; winding.

Who, leaning on the belly of a pot,

Poured forth a water, whose outgushing flood

Run bathing all the *creeky* shore a-flot,

Wheron the Trojan prince spilt Turnus' blood

Spenser.

A back-friend; a shoulder clapper; one that commands the passages of alleys, *creeks*, and narrow lands.

Shakspeare.

As streams, which with their winding banks do

play,

Stopped by their *creeks*, run softly through the plain.

Davies.

A law was made here to stop their passage in every port and *creek*. *Id. on Ireland.*

They on the bank of Jordan, by a *creek*,
Where winds with reeds and ozers whispering play,
Their unexpected loss and plaints outbreathed.

Milton.

They have a petty traffic with known correspondents
in some little *creek*: within that they confine them-
selves, and are dexterous managers enough of the
wares and products of that corner with which they
content themselves; but will not venture out into the
great ocean of knowledge.

Locke.

The wriggling fry soon fill the *creeks* around,
Poisoning the waters where their swarms abound;
Scorned by the nobler tenants of the flood,
Minnows and gudgeons gorge the 'unwholesome food.

Cowper.

It was a wild and breaker-beaten coast,
With cliffs above, and a broad sandy shore;
Guarded by shoals and rocks as by an host,
With here and there a *creek*. Byron. *Don Juan*.

CREEKS, or MUSCOGEEES, a nation of native
Indians, inhabiting the territory now included in
the Strait of Alabama in the neighbourhood.
They are reduced to about 20,000 in number.
See ALABAMA.

CREEP, *v. n.* } Goth. *kriepa*; Swed.
CREEPER, *n. s.* } *krypa*; Ang.-Sax. *creo-*
CREEPINGLY, *adv.* } *pan*; Dan. *krye*; Wel.
CREEPHOLE, *n. s.* } *croppian*; Lat. *reperere*;
ερωω. To move like a worm; to grow along the
ground, or on supports; to move forward with
regularly slow progression; to move clandestinely;
to proceed timorously; to steal upon
unawares; to act with servility. A creeper is,
a plant that needs other support, like the ivy; an
iron to slide along a kitchen grate; a kind of clog
worn by women; an insect; a small bird, called
also the ox-eye; a small grapnel or drag, used
to recover things that have fallen into the sea.
A creephole is, a hole into which an animal may
creep to avoid danger; a subterfuge. Creepingly
signifies tardily; after the manner of a reptile.
To creep and to crawl are generally used syn-
onymously, and Johnson seems to sanction the
practice; but though both verbs denote slowness
of motion and proximity to the earth, creep, when
used with reference to animals, ought, perhaps,
in strictness, to be applied to such creatures as
have legs, and crawl to those which have none.

Of this sort are they which *creep* into houses, and
lead captive silly women. 2 Timothy, iii. 6.

Thou makest darkness, and it is night, wherein all
the beasts of the forest do *creep* forth. Psalm civ. 20.

An hole he fond ful low upon the bord,
Ther as the cat was wont in for to *crepe*,
And at that hole he looked in ful depe.

Chaucer. *Cant. Tales*.

The flames upspring, and cruelly they *crepe*
From wall to roofe, til all to cinders waste. *Sackville*.

And the old woman carefully displayed
The clothes about her round with busy ayd,
So that at last a little *creeping* sleepe
Surprised her sence. Spenser. *Fairie Queene*.

———— like as a beare,

That *creeping* close amongst the hives to reare
An hency comb, the wakeful dogs espy. *Id.*

By those gifts of nature and fortune he *creeps*, nay
he lies, into the favour of poor silly women. *Sidney*.

The joy, which wrought into Pygmalion's mind,
was even such as, by each degree of Zelmane's words,
creepingly entered into Philoclea's. *Id.*

To-morrow, and to-morrow, and to-morrow,
Creeps in this petty pace from day to day,
To the last syllable of recorded time.

Shakspeare. *Macbeth*.

I'll *creep* up into the chimney. —

—There they always used to discharge their birding
pieces: *creep* into the kiln-hole.

Id. *Merry Wives of Windsor*.

It seems, the marriage of his brother's wife
Has *crept* too near his conscience. —

— No, his conscience

Has *crept* too near another lady. *Id.* *Henry VIII.*

That jealousy itself could not mistrust
False *creeping* craft and perjury should thrust
Into so bright a day such black-faced storms.

Id. *The Rape of Lucrece*.

Plants that put forth their sap hastily, have bodies
not proportionable to their length; therefore they are
winders or *creepers*, as ivy, briony, and woodbine.

Bacon,

Then like the coward after neighbours' fray,
They *creep* forth boldly, and ask, Where are they?

Hall.

And every *creeping* thing that *creeps* the ground.

Milton.

It is not to be expected that every one should guard
his understanding from being imposed on by the so-
phistry which *creeps* into most of the books of argu-
ment.

Locke.

The grottos cool, with shady poplars crowned,
And *creeping* vines on arbours waved around. *Dryden*.
Ambition often puts men upon doing the meanest
offices; so climbing is performed in the same posture
with *creeping*.

Swift.

— They that *creep* and they that fly

Shall end where they began.

Gray.

If we have deserved this kind of evil fame from
any thing we have done in a state of prosperity, I am
sure that it is not an abject conduct in adversity that
can clear our reputation. Well is it known that am-
bition can *creep* as well as soar.

Burke.

Thus Heaven enlarged his soul in riper years,
For nature gave him strength, and fire, to soar
On Fancy's wing above this vale of tears;
Where dark cold-hearted sceptics, *creeping*, pore
Through microscope of metaphysic lore.

Beattie.

Error has no place;

That *creeping* pestilence is driven away;

The breath of heaven has chased it.

Cowper.

A gentle slumber, but it was not deep,

For ever and anon a something shook

Juan, and shuddering o'er his frame would *creep*.

Byron. *Don Juan*.

CREEPER, in ornithology. See CERTUA.

CREEPLE, *n. s.* Ang.-Sax. *cræpel*. Dut.
krepel. A cripple. This was the usual way of
spelling cripple till about the close of the seven-
teenth century.

A *crepill* he saw comyng with grete spede and haste
Oppon a stilt onder his kne hound wonderfest.

Chaucer. *Cant. Tales*.

She to whom this world must itself refer
As suburbs or the microcosm of her,
She, she is dead, she's dead when thou knowest this,
Thou knowest how lame a *creepie* this world is.

Donne.

CREIGHTON (Robert), D. D., son of a bishop
of Bath and Wells of this name, was born in
1648. He accompanied Charles II. into his exile,
and prosecuted the study of music with great
success. An anthem of his, 'I will arise and go

to my father,' and a service in the key of E, are much admired, and constantly performed to this day in the cathedrals of England. Dr. Creighton died at Wells, 1736.

CRELLIUS (John), a celebrated Socinian writer, was born in 1590, in a village near Nuremberg. In 1612 he went into Poland, where the Unitarians had a school, in which he became professor of divinity, and minister at Cracow, where he died in 1632, aged forty-two. He was the author of, 1. A Treatise against the Mystery of the Trinity. 2. Commentaries on a part of the New Testament; and other works which are now very scarce.

CREMA, a town of Italy, a bishop's see, the *ci-devant* capital of Cremasco; and afterwards the biennial capital, alternately with Lodi, of the department of Adda. It is a fortified town, is well built, populous and commercial; containing five parish churches, several fine palaces, hospitals, and squares; and 8800 citizens. It now belongs to Austria, and is situated on the Serio, twenty miles north of Placentia, and twenty-two E. S. E. of Milan.

CREMASCO, a country of Italy, in the late Venetian territories, which took its name from Crema, the capital. It is seventy-four miles long, forty-six broad, and 230 in circumference; and contains one city, four villages, and fifty-three parishes. Its surface, except the Casta, is level, fertile in corn, wine, flax, and hemp.

CREMATION. Lat. *crematio*. A burning

And the Chinese, without *cremation* or urnal interment of their bodies, make use of trees and much burning, while they plant a pine-tree by the grave.

Browne.

CREMATION is particularly applied to the ancient custom of burning the dead. This custom is well known to have prevailed among most eastern nations, and continued with their descendants after they had peopled the different parts of Europe. It prevailed in Greece, Italy, Gaul, Britain, Germany, Sweden, Norway, and Denmark, till Christianity abolished it.

CREMONA, an ancient city of Italy, the *ci-devant* capital of the Cremonese, and now capital of the department of Upper Po, situated in a delightful plain, watered by the Oglio, about a quarter of a mile from the Po, over which is a bridge of boats protected by a fort. A Roman colony, with municipal rights, settled beyond the Po, below the confluence of the Addua, on the report of Hannibal's march into Italy. It was an opulent and mercantile city; but suffered greatly in the civil wars of Augustus. In the war with Vitellius, it was destroyed by the partisans of Vespasian; but was soon after rebuilt by the munificence of the citizens, by order of Vespasian. It is about five miles in circumference, and is defended by a castle. A canal passes through it which forms a communication between the Oglio and the Po. Its principal streets are broad and straight. It has forty churches, several squares, and a university. The population is about 30,000. The city with its fort was surrendered to Buonaparte, on the 12th May, 1796, and it has followed the fate of Lombardy in its ultimate subjection to the Austrians, during the late revolutionary wars. It

is thirty miles north-west of Parma, and thirty-eight south-east of Milan.

CREMONESE, a *ci-devant* territory of Italy, in the duchy of Milan, afterwards included in the department of the Upper Po. It was bounded on the east by the duchy of Mantua, on the north by Bresciano, on the west by Cremasco, and the Lodesan, and on the south by Parma. It is fertile in wine and fruit.

CREMOR, *n. s.* Lat. A milky substance; a soft liquor resembling cream.

The food is swallowed into the stomach, where, mingled with dissolvent juices, it is reduced into a chyle or *cremor*.

Ray.

CRENATED, *adj.* From Latin, *crena*. Notched; indented.

The cells are prettily *crenated*, or notched, quite round the edges; but not straited down to any depth.

Woodward.

CRENATUM FOLIUM. See BOTANY.

CRENELLE, in heraldry, one of the lines of partition representing the embattlements of towers, &c. as in the diagram, *argent*, party per fesse *gules*.

CREOLES, a name given to the families descended from the Spaniards, who settled at Mexico, in America. These are much more numerous than either the Spaniards properly so called, or the Mulattoes; which two other species of inhabitants are excluded from all considerable employments. The name throughout the rest of the West Indies is applied to all the natives who are descended from European parents.

CREON, king of Corinth, in fabulous history, the son of Sisyphus. He promised his daughter Glauce to Jason, who had repudiated Medea. To revenge the success of her rival, Medea sent her, as a present, a gown covered with poison. Glauce put it on, and was seized with sudden pains. Her body took fire; the house also was consumed with Creon and his whole family.

CREON, king of Thebes, in fabulous history, the son of Menætius, and father of Jocasta, the mother and wife of Oedipus. On the death of Laius, who had married Jocasta, Creon ascended the vacant throne of Thebes. As the ravages of the Sphinx were intolerable, Creon offered his crown and daughter in marriage to him who could explain the enigmas which the monster proposed. Oedipus explained the riddles, ascended the throne, and married Jocasta, without knowing she was his mother; and by her he had two sons, Polynices and Eteocles, and two daughters. The two sons agreed after their father's death to reign each a year alternately. Eteocles reigned first by right of seniority; but when once in power he refused to resign, and his brother led against him an army of Argives to support his right. The war was decided by single combat between the two brothers. They killed each other, and Creon again ascended the throne, till Leodamus the son of Eteocles should be of a sufficient age to assume the reins of government. He commanded that the Argives, and particularly Polynices, who was the cause of all the bloodshed, should remain unburied. Creon

was afterwards killed by Theseus, who made war upon him because he refused burial to the Argives.

CREPANŒ, *n. s.* With farriers. An ulcer seated in the midst of the forepart of the foot.

CREPIS, hawk-weed, in botany, a genus of the polygamia superflua order, and syngenesia class of plants; natural order forty-ninth, composite. The receptacle is naked; cal. calyculated with deciduous scales; the pappus feathery and stalked. There are thirty-one species, most of them herbaceous annuals, rising to twelve or eighteen inches, and having their branches terminated by ligulated compound red and yellow flowers. These are very large, and consist of many flat florets spread over one another imbricating, and when fully blown appear as if radiated. They are very beautiful; and appear in June, July, and August. They are succeeded by plenty of seeds, which, if permitted to scatter on the ground, will produce a number of young plants without further trouble.

CREPITATE, *v. a.* } Lat. *crepitare*. To
CREPITATION, *n. s.* } make a small crackling noise.

CREPITATION, in chemistry, the noise which some salts make over the fire in calcination.

CREPITATION, in surgery, the noise made by the ends or pieces of bones, when the surgeon moves a limb to assure himself by his ear of the existence of a fracture.

CREPT, part. of creep.

There are certain men *crept* in unawares. *Jude*.
Sooner as that uncouth light upon them shone,
Into her mouth they *crept*, and sudden all were gone.
Spenser. Faerie Queene.

This fair vine, but that her arms surround
Her married elm, had *crept* along the ground. *Pope*.

CREPUSCULE, *n. s.* } Fr. *crepuscule*; Lat.
CREPUSCULAR, *adj.* } *crepusculum*. Twi-
CREPUSCULINE, *adj.* } light. Crepuscular
CREPUSCULOUS, *adj.* } is, relating to the crepuscule: crepusculous, and crepusculine, denote glimmering; belonging to the twilight; in a twilight kind of state; imperfectly elucidated.

A close apprehension of the one, might perhaps afford a glimmering light and *crepusculous* glance of the other. *Brown*.

The beginnings of philosophy were in a *crepusculous* obscurity, and it is yet scarce past the dawn. *Glanville's Scyphis*.

He has made apertures to take in more or less light, as the observer pleases, by opening and shutting like the eye, the better to fit glasses to *crepusculine* observations. *Sprat*.

The *crepuscular* atmosphere, or the region where the light of the sun ceases to be refracted to us, is estimated by philosophers to be between forty and fifty miles high. *Darwin*.

CRESCENT, *v. a., n. s., & adj.* } Lat. *cre-*
CRESCENCE, *n. s.* } *scens*. pr. part.
CRESCIVE, *adv.* } of *crevere*.—

The verb is of modern introduction, and signifies to form into a crescent. The noun denotes the moon in her increasing state; any thing that resembles the moon in that state; the distinguishing emblem or sign of Mahomedanism: as an adjective, it means increasing; growing; in a

state of increase. Crescence is, the state of growing; and crescive, increasing; growing.

My power 's a *crescent*, and my auguring hope
Says it will come to the ' full.

Shakspeare. Antony and Cleopatra.

I have seen him in Britain; he was then of a *crescent* note.
Id. Cymbeline.

So the prince obscured his contemplation
Under the veil of wildness, which no doubt
Grew, like the summer grass, fastest by night,
Unseen, yet *crecive* in his faculty. *Id. Henry V.*

Or Bactrian sophy, from the horns
Of Turkish *crescent*, leaves all waste beyond
The realm of Aladule, in his retreat. *Milton.*

With these in troop
Came Astoreth, whom the Phœnicians called
Astarte, queen of heaven, with *crescent* horns. *Id.*
Jove in dusky clouds involves the skies,
And the faint *crescent* shoots by fits before their eyes.
Dryden.

And two fair *crescents* of translucent horn
The brows of all their young increase adorn.
Pope's Odyssey.

From west to east by equal influence tend,
And towards the moon's attractive *crescence* bend.
Brooke.

Now gliding remote, on the verge of the sky,
The Moon half-extinguished her *crescent* displays:
But lately I marked, when majestic on high
She shone, and the planets were lost in her blaze.
Beattie.

There, shall I road streets their stately walls extend,
The circus widen, and the *crescent* bend. *Darwin.*

With the far mountain *crescent* half surrounded
On one side, and the deep sea calm and chill
Upon the other, and the rosy sky,
With one star sparkling through it like an eye.
Byron. Don Juan

CRESCENT, in heraldry, is the figure of a half moon with the horns turned inwards toward the chief of the shield, in which latter respect it differs from *decrecent* and *increcent*. It is the prevailing badge among the followers of Mahomet, as the cross among Christians, but is sometimes borne in European shields, as *azure*, a *crescent*, *argent*, name Lucy. It is also the badge of the second son when on the crest, the second son of the second house when on another *crescent*, &c. See *House*, in heraldry.

CRESCENTED, in heraldry, a term applied to a cross that has at each end a *crescent*, as *argent*, a cross *crescented* gules, name, Wilkins.

CRESCENTIA, in botany, the calabash-tree, a genus of the angiospermia order, and didynamia class of plants; natural order twenty-fifth, putaminee. CAL. bipartite and equal; cor. gibbous; the BERRY pedicellated or stalked, unilocular, and polyspermous; the SEEDS bilocular. There are two species, viz.—1. *C. cujete*, with oblong narrow leaves and a large oval fruit, a native of Jamaica and the Leeward Islands. 2. *C. lausifolia*, the broad-leaved calabash, seldom rises more than fifteen or twenty feet high, with an upright trunk, covered with a white smooth bark, sending out many lateral branches at the top, garnished with leaves three inches in length, and one and a quarter broad, ranged alternately. The flowers

are small, and of a deep yellow color. The fruit of this sort is sometimes round, sometimes oval, but of very unequal sizes. Both these species are easily propagated by seeds; but the plants are too tender to live in this country, unless they are constantly kept in a stove. The shells of calabashes are used for various purposes. The pulp is seldom eaten, except by cattle in time of drought. The wood, which is hard and smooth, is made into stools, chairs, and other furniture.

CRESCIMBENI (John Mario), an Italian poet, born at Macerata in Ancona, in 1663. He was the founder of the Arcadian Society, of which he was appointed director in 1690, and in which post he remained till his death, in 1728. He wrote, 1. A History of the Italian Poetry; much esteemed, and reprinted in 1731, at Venice in 6 vols. 4to. It is accompanied with a commentary, containing anecdotes of Italian poets. 2. A History of the Academy of Arcadia, together with the Lives of the most Illustrious Arcadians. He published also many other works, in prose and verse.

CRESS, *n. s.* Fr. *crésson*; Ital. *crecione*; Ang.-Sax. *carse* or *cerse*; Dut. *kerse*; Ger. *kréss*; Sw. *krassa*. Menage and Johnson give, as the etymon, Lat. *crecere*, to grow. A herb. See the following article.

His court, with nettles and with *creesses* stored,
With soups unbought, and sallads, blest his board.

Pope.

CRESS, a species of lepidium.

CRESS, INDIAN. See **TROPÆOLUM**.

CRESS, SCIATIC. See **IBERIS**.

CRESS, SPANISH. See **VELLA**.

CRESS, WALL. See **TURRITIS**.

CRESS, WATER. See **SISYMBRIUM**.

CRÉSSEI, *n. s.* Fr. *croisette*. Because beacons had crosses anciently on their tops. So says Johnson; but Minsheu derives the word from the Dutch *kearse*, *candela*. A great light set upon a beacon, light-house, or watch-tower; also, a torch or lamp. 'They still raise armies in Scotland by carrying about the fire-cross,' says Johnson. Happily, they have now lost this dangerous habit.

At my nativity

The front of heaven was full of fiery sparks,
Of burning *creesses*. *Shakspeare. Henry IV.*

From the arched roof,

Pendent by subtle magick, many a row
Of starry lamps, and blazing *creesses*, fed
With naphtha and asphaltus, yielded light
As from a sky. *Milton's Paradise Lost.*

CRESSY, or **CRECY**, a town of France, in the department of Somme, and in the ci-devant province of Picardy; memorable for a great victory obtained over the French by Edward III. of England, in 1346. Edward having encountered and overcome many difficulties in his expedition, was at last so closely followed and harassed by the French army, commanded by Philip VI. king of France in person, that he determined to make a stand at this place, and to give his pursuers a check. The king of France, dreading nothing so much as the escape of the English, began the march of his great army from Abbeville early in the morning, August 26, and

continued it several hours with great eagerness till he received intelligence that the English had halted at Cressy, and were prepared to give him battle. He was advised at the same time not to engage that day, when his troops were fatigued with their march, and in great disorder; and he was disposed to have taken this advice. But the discipline of these times was so imperfect, that the orders given for halting were not obeyed; and one corps of this mighty host impelling another, they continued advancing till they came into the presence of their enemies in much confusion. Edward had employed the forenoon of this important day in drawing up his army in the most excellent order, in three lines. The first line or battalion was thus composed. The archers, 4000 in number, were drawn up in an oblong of about 200 in front and forty deep, at the bottom of which stood the prince of Wales among his men at arms drawn up in a solid square, and having on his left the earls of Arundel and Northampton commanding the second line, composed of 800 men at arms, 4000 halberdiers, and 2400 archers. The last line, or body of reserve, in which were 700 men at arms, 5300 billmen, and 6000 archers, was ranged along the summit of the hill, and conducted by the king in person, attended by the lords Moubray, Mortimer, and others. When the army was completely formed, Edward rode along the lines, and by his words and looks endeavoured to inspire his troops with the most ardent hopes of victory. He then commanded the cavalry to dismount, and the whole army to sit down upon the grass, in their ranks, and refresh themselves. As soon as the French army came in view, they sprang from the ground, full of strength and spirit, and stood ready to receive them. The king of France, assisted by the kings of Bohemia, and Majorca, the dukes of Lorraine and Savoy, and several other sovereign princes, with the flower of the French nobility, labored to restore some degree of order to his prodigious army, and drew it up also in three lines, but very indistinctly formed. The first line was commanded in chief by the king of Bohemia; the second by the earl of Alençon, the French king's brother; and the third by Philip in person; and each of these lines contained a greater number of troops than the whole English army. The battle was begun about three o'clock in the afternoon, by a great body of Genoese cross-bowmen, in the French service, who let fly their quarrels at too great a distance to do any execution, and were presently routed by a shower of arrows from the English archers. The earl of Alençon, after trampling to death many of the flying Genoese, advanced to the charge, and made a furious attack on that corps commanded by the prince of Wales. The earls of Arundel and Northampton advanced with the second line to sustain the prince, and Alençon was supported by as many troops as could crowd to his assistance. Here the battle raged for some time with uncommon fury; and the king of Bohemia, the earl of Alençon, and many other nobles, being slain, the whole first and second lines of the French army were put to flight. Philip, undismayed, advanced to the charge with the line under his immediate command. But this body soon

shared the same fate with the other two; and Philip, after having been unhorsed, and wounded in the neck and thigh, was carried off the field by John de Hainault, and fled with no more than five knights and about sixty soldiers in his company of all his mighty army, which at the beginning of the battle consisted of more than 120,000 men. Such was the famous victory of Cressy, the greatest ever previously gained by England. Edward continued with his army at Cressy three days, numbering and burying the dead. The French had left on this bloody scene the king of Bohemia, eleven other princes, eighty bannerets, 1200 knights, 1500 gentlemen, 4000 men of arms, and 30,000 other soldiers.

CRESSY (Hugh Paulin, or Serenus), a catholic divine, born at Wakefield, in Yorkshire, in 1605. He studied at Merton College, Oxford, where he became fellow, and took his degrees in arts. He afterwards became chaplain to lord Falkland, whom he attended to Ireland, and obtained the deanery of Leighlin, to which was added a canonry of Windsor. In 1641 he went to Rome, where he publicly renounced the Protestant religion; and afterwards entered among the Benedictines at Douay, on which occasion he changed his Christian name to Serenus. He returned to England at the Restoration, and was honored as chaplain to the queen of Charles II. He died at East Grinstead, in Sussex, in 1674. He was the author of several controversial pieces in defence of the Catholic faith, one of which lord Clarendon answered in an able manner. He also wrote *The Church History of Britanny*, fol. 1663; a work of great labor and learning, but abounding with legendary fables.

CREST, *v. a. & n. s.* } Fr. *creste*; Ital. and
CRÉSTÉD, *adj.* } Sp. *cresta*; Lat. *crista*.
CRÉSTLESS, *adj.* } To mark with streaks;
CREST-FALLEN, *adj.* } to serve as a crest for.
The plume or tuft on a helmet; the helmet itself; the comb of a cock; any tuft or ornament on the head; the ornament of the helmet in heraldry; figuratively, pride; spirit; loftiness of men. Crested is, adorned with a crest; wearing a comb. Crestless signifies, not having coat-armour; not being of an eminent family. Crest-fallen is, spirit-sunk; cowed; degraded; out of heart.

Like as the shining sky in summer's night,
What time the days with scorching heat abound,
Is *crested* all with lines of fierce light.

Spenser. Faerie Queene.

Long tho it be, at last I see it gloom,
And the bright evening star, with golden *crest*
Appear out of the east. *Id. Epithalamion.*

When horses should endure the bloody spur,
They fall their *crests*. *Shakespeare.*

His grandfather was Lionel duke of Clarence,
Third son to the third Edward king of England,
Sprung *crestless* yeomen from so deep a root. *Id.*

Over my altars hath he hung his lance,
His battered shield his uncontrolled *crest*.

Id. Venus and Adonis.

The horn;
It was a *crest* ere thou wast born:
Thy father's father wore it.

Id. As You Like It.

I warrant you, they would whip me with their fine
wits, till I were as *crest-fallen* as a dried pear.

Id. Merry Wives of Windsor.

Of what esteem *crests* were, in the time of king
Edward the Third's reign, may appear by his giving
an eagle, which he himself had formerly borne, for a
crest to William Montacute, earl of Salisbury.

Camden's Remains.

Nor hath some bribed herald first assigned
His quartered arms an *crest* of gentle kind. *Hall.*

The bold Ascalonites
Then grovelling soiled their *crested* helmets in the
dust. *Milton.*

They prolate their words in a whining kind of que-
rulous tone, as if they were still complaining and
crest-fallen. *Howel.*

At this, for new replies he did not stay;
But laced his *crested* helw, and strode away. *Dryden.*

The *crested* bird shall by experience know,
Jove made not him his master-piece below. *Id.*

Their *crests* divide,
And, towering o'er his head, in triumph ride.
Id. Virgil.

No foe to man
Lurks in the serpent now: the mother sees,
And smiles to see, her infant's playful hand
Stretched forth to dally with the *crested* worm. *Cæper.*

Quick darts the scaly monster o'er the plain,
Fold, after fold, his undulating train;
And bending o'er the lake his *crested* brow,
Starts at the crocodile that gaps below. *Darwin.*

CREST, in heraldry and armour, denotes the uppermost part of the armour; or that part rising over the casque or helmet. The ancient warriors wore crests to strike terror in their enemies, as the sight of the spoils of animals they had killed; or to give them the more formidable mien, by making them appear taller, &c. In the ancient tournaments, the cavaliers had plumes of feathers, especially those of ostriches and herons, for their crests; these tufts they called plumarts, and were placed in tubes, on the tops of high caps or bonnets. Some had their crests of leather; others of parchment, pasteboard, &c. painted or varnished, to keep out the weather; others of steel, wood, &c. on which were sometimes represented a member or ordinary of the coat; as, an eagle, fleur-de-lis, &c. but never any of those called honorable ordinaries, as pale, fesse, &c. The crests were changeable at pleasure; being reputed no other than as an arbitrary device or ornament. Herodotus attributes the rise of crests to the Carians, who first bore feathers on their casques, and painted figures on their bucklers; whence the Persians called them cocks. The Etruscans were also celebrated for their lofty crests, and modern artists have given similar additions to the helmets of the three Horatii. The mane of horsehair which was appended to the crest, was called by the Greeks *λόφος*, and by the Romans *crista* and *juba*, and the part which upheld it, or the metallic crest, was called *φάλαξ* by the Greeks, and *conus* by the Romans. Antique helmets were sometimes divided from the base, spreading like two horns, while the interval was filled with the flowing mane of a horse, and a plume arose on either side. Such is the crest of Minerva on Mr. Hope's

fine antique vase, which has a painting of the expiation of Orestes.

CREST, in heraldry, is a figure placed upon a wreath, coronet, or cap of maintenance, above both helmet and shield, as for instance the crest of a bishop is the mitre. See **HERALDRY**. The crest is esteemed a greater criterion of nobility than the armour generally, as being borne at tournaments; to which none were admitted till they had given proof of their nobility. Sometimes it serves to distinguish the several branches of a family. It has also served, on occasion, as the distinguishing badge of factions. Sometimes the crest is taken from the device; but more usually it is formed of some piece of the arms: thus, the emperor's crest is an eagle; that of Castile, a castle, &c. Families that exchange arms, as the houses of Brunswick and Cologne have done, do not change their crests; the first still retain the horse, and the latter the mermaid.

CREST, in the menage, the upper part of a horse's neck.

CREST-FALLEN, in the menage, a fault of a horse, when the crest hangs to one side. The cure is to place it upright, clipping away the spare skin, and applying plasters to keep it in a proper position.

CRETA'CEOUS, *adj.* } Lat. *creta*. Chalk-
CRETA'TED, *adj.* } like; chalky; abound-
 ing in chalk. Cretated signifies, rubbed with chalk.

What gives the light, seems hard to say; whether it be the *cretaceous* salt, the nitrous salt, or some igneous particles. *Greuv.*

Nor from the sable ground expect success,

Nor from *cretaceous*, stubborn and jejune. *Philips.*

CRETE, in ancient geography, one of the largest islands in the Mediterranean, according to Strabo 287 miles in length; according to Pliny 270; and according to Scylax 312. As to its breadth, it is not, as Pliny observes, above fifty-five miles where widest; whence it was styled, as Stephanus observes, the Long Island. It has the Archipelago to the north, the African Sea to the south, the Carpathian to the east, and the Ionian to the west. Anciently it was known by the names of Aeria, Chthonia, Curete, Ideæ, Maccaris, &c.; but its most common name was Crete. It is now called **CANDIA**, which see.

Homer, the celebrated Grecian bard, describes Crete, as it stood in his time, as an 'extensive island in the midst of the stormy main. The soil is rich and fertile: it contains an immense number of inhabitants: it is adorned with 100 cities, and its inhabitants speak in various languages.' The Cretan mythologists, quoted by Diodorus Siculus, relate that the first inhabitants of the island were the Dactyli Idaei, who dwelt around mount Ida; they were regarded as magicians, because they possessed a variety of knowledge, and were particularly skilled in religious mysteries. Orpheus, who distinguished himself so highly in poetry and music, was their disciple. They discovered the use of fire, iron, and brass, and invented the art of working these metals in Berecynthius, a mountain near Aptera. These discoveries procured them divine honors. One of them, named Hercules, rendered himself famous by his exploits. The Dactyli Idaei were

the ancestors of the Curetes, who at first inhabited the forests and caves of the mountains. They afterwards entered into domestic life, and taught men to collect flocks of sheep, to tame the ferocity of wild animals for domestic purposes, and to invite bees into hives, and gather their honey. They excited men to chase, taught the use of the bow, and were the inventors of swords and of military dances. The noise which they made by dancing in armour, hindered Saturn from hearing the cries of Jupiter, whose education Rhea had entrusted to them. With the assistance of the nymphs, they brought up that god in a cave in mount Ida, feeding him with the milk of the goat Amalthea, and with honey. To this period mythology assigns the origin of the Titans; their abode near Gnossus, where stood the palace of Rhea; their travels over the whole earth; their war against Animon, and his defence by Bacchus; the nuptials of Jupiter and Juno, celebrated near the river Therens in Crete; the gods, goddesses, and heroes, who descended from them. The most illustrious of those heroes were Minos and Rhadamanthus. They are said to have been the sons of Jupiter and Europa, who was conveyed into the island on a bull. Minos, becoming king, built several cities; the most considerable of which were Gnossus, on that side of the island which faces Asia, Phœstus on the southern shore, and Cydon on the western, facing Peloponnesus. Rhadamanthus distinguished himself by the impartiality of his judgments, and by the inflexible severity with which he inflicted punishment on the impious and wicked. His empire extended over the chief isles of the Archipelago, and the inhabitants of the adjacent coasts of Asia submitted to him on account of his high reputation for probity and justice. Mythologists constituted him judge in the regions below, to determine the future state of the righteous and the wicked. They conferred on him the same honors which were bestowed on Minos, the justest of kings. Thus far have been followed the Cretan traditions as they are related by Diodorus; but historians differ about the truth of them.

Leaving mythology for the more certain records and monuments of history, we find that Crete received its name from Cres, the first of its monarchs; and, to distinguish the true Cretans from strangers, they were named Eteocretes. A number of colonies, from different parts of Greece, settled on the island. Among the successors of Cres we find two Jupiters, and two of the name of Minos; but most writers confound them, and ascribe to one those transactions and exploits which should be shared between the two. Minos was esteemed the wisest legislator of antiquity. The office assigned him in the regions below, is a clear proof of his having gained an exalted reputation by his justice. His laws were engraven on tables of brass; and Talos, his chief minister, visited all the towns and cities in the island, three times a year, to observe in what manner they were executed and obeyed. The second Minos was the first of the Greeks who appeared in the Mediterranean at the head of a naval armament. He conquered the Cyclades, expelled the Carians, established Cretan colonies

in those islands, and committed the government of them to his son. Being informed, at Paros, that his son Androgeus was slain at Athens, he declared war against Ægeus, and imposed on him a disgraceful tribute; from the payment of which Theseus delivered his country. He took arms against Nisus, king of Megara, made him prisoner by the treachery of his daughter Scylla, and put him to death, together with Megarus, the son of Hippomanes, who had brought some forces to his assistance. Dædalus, who had incurred his displeasure, despairing of pardon from so severe and inflexible a prince, employed the resources of his inventive genius, to escape from his power. He fled to Sicily, gained the protection of king Cocalus, and obtained an asylum in his court. The Cretan monarch did not, however, give up his prey. He equipped a fleet, pursued the fugitive to Sicily, and fell before the walls of Camicum. But these two princes, are often confounded by the poets, and the epithets of the former applied to the latter.—See Ovid. *De Arte Amat.* lib. ii. The last king of Crete was Idomeneus, who conducted twenty-four ships (or according to Hyginus forty) to the assistance of Agamemnon; and at his departure from Crete committed the government to Leucus his adopted son. He having seduced the people from their allegiance, and gained over the nobles, sacrificed the wife and daughter of Idomeneus in the temple, and when Idomeneus, crowned with laurels, landed on the coasts, he attacked him with an armed force, and obliged him to reim-bark. But the usurper did not long enjoy the fruit of his crimes, for soon after the departure of Idomeneus, monarchy was abolished, and Crete became a republic.

Soon after the expulsion of Idomeneus, the Cretan government became partly aristocratical. The power was divided between the nobles and the people: yet as the chief employments were occupied by the nobles, they directed the administration of affairs. Ten magistrates were annually elected by a majority of voices, in the national assembly. These were named *cosmoi*, and their public office and character were the same with those of the ephori at Sparta. They were the generals of the republic in time of war, and directed all affairs of any importance, and they had the right of choosing certain elders for counsellors, who, to the number of twenty-eight, composed the Cretan senate. They were chosen from among such as had discharged the office of *cosmoi*, or had distinguished themselves by extraordinary merit and blameless probity. These senators continued in office during life, possessed a weighty influence, and were consulted in every affair of importance. This body was a barrier against the ambition of the ten chief rulers, and another restraint on their power was the limiting of their administration to one year. All the Cretans were subjected to the power of their magistrates, and divided into two classes, the adults and the youth. Men arrived at maturity were admitted into the first. The second consisted of all the young men who were not below the age of seventeen. The society of adults eat together in public halls. There rulers, magistrates, poor and rich, seated together, par-

took, without distinction, of the same simple fare. A large bowl, filled with wine and water, which went round the company from one to another, was the only drink that they were allowed. None but the old men had a right to call for more wine. A female was appointed to preside at each table, who openly distributed the most exquisite meats to those who had distinguished themselves by their valor or wisdom. Near where the citizens sat, two tables were laid, which they named *Hospitable*: all strangers and travellers were entertained at these: and there was also a particular house set apart by the public, in which they might spend the night. To supply the public expenses, every citizen was obliged to bring a tenth part of his annual income into the treasury, and the chief magistrates took care that every person contributed his proportion. The Cretans were also celebrated throughout Greece for the education of their youth. At the age of seven the boy was permitted to handle the bow; from that time he was admitted into the society of the adults, where he continued till the age of seventeen. There, sitting on the ground, and clothed in a plain and coarse dress, he served the old men, and listened with respectful silence to their advice. He was early accustomed to arms and to fatigue, that he might learn to endure excessive heat or cold, to clamber and leap among hills and precipices, and to bear manfully the blows and wounds he might receive, amid the gymnastic exercises or in battle. He was also taught to sing the laws, which were written in verse, with a certain species of melody; that the charms of music might dispose him to learn them with pleasure, and might impress them deeply on his heart. He next learned hymns in honor of the gods, and poems in praise of heroes. When he reached his seventeenth year, he retired from the society of the adults, and became a member of that of the young men. Here his education was still carried on. He exercised himself in hunting, wrestling, and fighting with his companions. The lyre played tunes of martial music; and he learned to follow the measures of the musician. One dance, in which the youth aspired most ardently to excel, was the *Pyrrhic*, originally invented in Crete. The performers in that dance were arrayed in complete armour: they wore a light short coat, which did not fall below the knee, and was bound with a girdle twice round the waist: on their feet and legs were buskins; above these they bore their arms, and performed various military evolutions to the sound of musical instruments. When the youth had finished their exercises, and attained the legal age, they became members of the class of adults: were permitted to vote in the national assemblies, and were entitled to stand candidates for any public office. They were then obliged to marry; but did not take home their wives till they were capable of managing their domestic concerns. Friendship was in high estimation among the Cretans; but, says Strabo, the manner in which they conducted the intercourse of friendship was extraordinary. He who conceived an affection for a young man of his own age, formed a scheme for carrying him off by violence; which having effected, he loaded

his young friend with favors, carried him from feast to feast, procured him the pleasures of the chase, &c. and after using all possible means to gain his heart for two months, brought him back to the city, and gave him up to his parents; with presents of a suit of armour, an ox, and a drinking cup. The young man sacrificed the ox to Jupiter, and gave an entertainment to those who had assisted when he was carried off. He then declared his sentiments concerning a connection with his friend. If he had reason to complain of the treatment which he had received, the law allowed him to forsake a friend so unworthy of the name, and to demand his punishment. Those who had been thus carried off received public honors. Theirs were the first places in the halls and at the race. They were permitted to wear, during the rest of life, those ornaments which they owed to the tenderness of friendship; and that mark of distinction testified to all who saw them, that they had been the objects of some fond attachment.

Under these wise regulations, the republic rose to glory, opulence, and power; and was honored with the panegyrics of the most celebrated philosophers of Greece. It served Lycurgus as a model for the form of government which he established at Sparta, and continued to flourish till the age of Julius Cæsar; and it is very remarkable, that from the period at which that state assumed a republican form, till the time when they were attacked by the Romans, the nation was not once known to send an hostile force into the territories of any of their neighbours. But though the independent cities which flourished in Crete did not unite their arms to subjugate the neighbouring islands, yet they were not so wise as to live in peace among themselves. Gnossus and Grotynia sometimes marched with social banners against their neighbours, levelled their fortresses, and subjected them to their power; at other times they attacked each other with hostile violence, and saw their bravest youth perish amid the horrors of civil war. Lyctos and Cydon opposed an invincible barrier to their ambition, and preserved their own liberty. The last of these cities had acquired such strength and influence, that she held the balance between the rival powers of the island; but these incessant wars destroyed a number of the cities, and drenched the native country of Jupiter with blood. At length the time arrived when the warlike and victorious Romans would suffer none but their subjects or slaves to inhabit within the reach of their arms. 'If any person wish to know the reasons which induced us to attack Crete,' says Florus, 'the true reason was our desire to subdue so celebrated an island. The Cretans had appeared to favor Mithridates, and the Romans thought proper to declare war against them on that pretext. Marc Antony, father of the triumvir, attacked them with strong hopes of success, but was severely punished for his presumption and imprudence. The Cretans took a great part of his fleet, hung up his soldiers and sailors on the masts amid the sails and cordage, and returned in triumph into their harbours.' The Romans never forgot nor forgave a defeat. As soon as the Macedonian war was brought to

a conclusion, they took up arms against the Cretans to revenge their ignominy and loss; and Q. Metellus was sent to Crete with a powerful armament. He met with an obstinate and vigorous resistance. Panarus and Lasthenes, two experienced leaders, collecting a body of 40,000 young warriors, all eager for battle, and of determined courage, employed their arms successfully against the Romans, and protracted the fate of Crete for three years. Those conquerors, indeed, could not make themselves masters of the island till they had destroyed all its bravest warriors. They lost a great number of troops, and bought a bloody victory at the price of many a danger and much fatigue. However, their usual good fortune at length prevailed. The first care of the conqueror was to abolish the laws of Minos, and to establish those of Numa. Strabo complains of this act of severity, and informs us that, in his days, the original laws of Crete were no longer in force, because the Romans compelled the conquered provinces to adopt their civil code. To secure themselves still more fully in the possession of the island, they sent a powerful colony to Gnossus.

Since the conquest of Crete by the Romans, the Cretans have no longer formed a separate nation, nor made any figure among the states and kingdoms of the world: their noble and ingenuous manners, their arts and sciences, their valor and their virtues, are no more. The island of Crete joined with the small kingdom of Cyrene, on the Lybian coast, formed a Roman province. It was at first governed by a proconsul; a quæstor and an assistant were afterwards sent there; at last, it was put under the government of a consul. It was one of the first islands that were favored with the light of the gospel. St. Paul introduced the Christian faith into it; and his disciple Titus, whom he left there to cultivate that precious plant, became the first bishop of the island. In the reign of the emperor Leo it had twelve bishops, all subject to the patriarch of Constantinople. Constantine separated Crete from Cyrene, in the new division which he made of the provinces of the empire; and left Crete, with Africa and Illyria, to his third son, Constans. In the reign of Michael II., emperor of Constantinople, a rebellion, which lasted three years, caused him to neglect the other parts of the empire. The Saracens, who had conquered the finest provinces of Spain, seized that opportunity. They fitted out a considerable fleet, plundered the Cyclades, attacked the island of Crete, and made themselves masters of it without opposition. To secure their conquest, they built a fortress which they named Khandak, i. e. entrenchment. From that citadel they made inroads into the interior parts of the island, carrying havoc and devastation wherever they appeared. By repeated attacks, they subdued all the cities in Crete except Cydon. Michael made some ineffectual efforts to expel them from Crete. The emperor Basinius I. was not more successful. They defeated him in a bloody battle; but being vanquished by one of his generals, they were subjected to the payment of an annual tribute. At the end of ten years the Arabians refused the tribute. It was reserved for Nicephorus Phocas, afterwards em-

peror, to deliver this fine island from the yoke of the infidels. He landed on it with a numerous army, boldly attacked them, and routed them in various engagements. The Saracens, no longer daring to meet so formidable a general in the field, fled for protection to their fortresses. Phocas, being plentifully supplied with all the warlike machines necessary for a siege, levelled their walls, took their cities and fortresses, and drove them into Khandak, their metropolis. In nine months he subdued the whole island, took their king Curup, and his lieutenant Aremas prisoners, and reunited to the empire a province which had been 127 years in the hands of the infidels. It remained under the dominion of the Roman still the time when Baldwin earl of Flanders, being raised to the throne, liberally rewarded the services of Boniface marquis of Montserrat, by making him king of Thessalonica, and adding the island of Crete to his kingdom. That lord sold it to the Venetians, A. D. 1194; under whom it assumed the name of CANDIA. See that article.

CRETIC, *n. s.* *Κρητικός*. A foot used in Greek and Latin verse; it consists of a short syllable between two long ones: e. g. Cāstītās.

CRETIO, in antiquity, a certain number of days allowed the heir, to consider whether he would act as heir to the deceased or not; after which time, if he did not act, he was excluded from the estate.

CREVELT, a town of Germany in the ci-devant duchy of Cleves, annexed to France, in December, 1797, and included in the department of the Roer, but since returned to Prussia. It was taken in October, 1794, by the French under general Jourdan. Near this town, the French were defeated by the Hanoverians, in 1758. It is ten miles south of Meurs; and has a manufacture of fine linen. Population 7450.

CREVICE, *v. a.* & *n. s.* Old Fr. *crevis*, from *crever*; Lat. *crepare*. To split into cracks; to make flaws in. A cleft; a chink; a crack; a very narrow opening.

The same harme do sometime the smal dropes of water that enterth thurgh a litle *crevis* in the thurroh, and in the bottom of the ship, if men ben so negligent that they discharge hem not by time.

Chaucer. Cant. Tales.

Till at the last I spide within the same,
Where one stood peeping through a *crevis* small.
Spenser. Faerie Queene.

I pried me through the *crevice* of a wall,
When for his hand he had his two sons heads.
Shakespeare. Titus Andronicus.

So laid, they are more apt in swagging down to pierce with their points, than in the jacent posture, and so to *erevice* the wall. *Wotton's Architecture.*

I thought it no breach of good manners to peep at a *crevice*, and look in at people so well employed.
Addison's Spectator.

CREVIER (John Baptist Lewis), a native of Paris, trained under the celebrated Rollin, and afterwards professor of rhetoric. Upon the death of that author, in 1741, he finished his Roman History. His death happened in 1765, at a very advanced age. Besides the continuation of

Rollin, he published, 1. An edition of Lavius cum Notis, in 6 vols. 4to, 1748; and afterwards another for the use of his pupils, in 6 vols, small 8vo. 2. La Histoire des Empereurs de Romains Jusqu' a Constantin, 1749, 12 tom. 12mo. 3. Histoire de l'Université de Paris, 7 tom. 12mo. 4. Rhetorique Francoise, a just and useful work. 5. Observations sur l'Esprit des Loix.

CREUSA, a daughter of Priam, king of Troy, by Hecuba. She married Æneas by whom she had Ascanius. When Troy was taken, she fled in the night with her husband; but they were separated in the confusion, and Æneas could not recover her. Some pretend that Cybele saved her, and carried her to her temple, of which she became priestess.

CREUSE, a department of France, so named from the river. It is bounded by those of Allier and Puy de Dome on the east; Correze on the south, Upper Vienne on the west, and Indre on the north. It contains the ci-devant province of Marche. Gueret is the capital.

CREUSE, a river of France, which rises eight miles south of Felletin, crosses the department, and that of Indre; and separates that of Indre and Loire from that of Vienne, till it falls into the river Vienne, five miles east of Hlave.

CREUTZENACH, CREUTZNACH, or KREUTZNACH, a town of the Prussian states, in the circle of the Upper Rhine. It is situated on the Nahe, which divides it into the Old and New Town. The ancient kings of the Franks had a palace here; and it was defended by a castle, which stood on an adjoining mountain, but which was destroyed by the French in 1689. This town was taken by the French in October, 1794, and annexed to their dominions in December, 1797. The inhabitants carry on a trade in wine, salt, corn, wood, and tobacco. Population 3200. A quarter of a league from the town are two salt mines, said to let for £10,000 per annum. It lies six miles south of Bingen, twenty south-west of Mentz, thirty N. N. W. of Worms, and thirty-eight north of Deux Ponts.

CREUX, a promontory in Catalonia, which was fixed on as the boundary between France and Spain in 1660. Long. 3° 20' 50" E., lat. 42° 13' 35" N.

CREW. Goth. *grua*; Per. *guruh*, kurah; Ang.-Sax. *cpud*, *cnead*. Minsheu and Mr. Todd are disposed to derive it from old Fr. *crue*, or *creue*, growth, accession, augmentation. Skinner refers it to the Dutch *kroeghen*, to carouse, to drink. A number of people associated for any purpose; the company of a ship. Except in the latter sense, it is now generally used to signify an improper or despicable assemblage, though its inoffensive meaning is not entirely obsolete, as we still hear of a jovial crew, &c.

If all the world to seek I overwent,
A fairer crew, yet no where could I see,
That that brave court did to the eye present.

Spenser.

Care we for all these bugs of idle feare:
For Tigel's grinning on the theatre?
Or scarce-babe threatenings of the rascal crew?
Or wind spent verdicts of each ale-knight's view?
Hall.

One of the banished crew,
I fear, hath ventured from the deep, to raise
New troubles. *Milton's Paradise Lost.*

He, with a crew, whom like ambition joins
With him, or under him to tyrannize,
Marching from Eden towards the west, shall find
The plain. *Id.*

The anchors drooped, his crew the vessels moor.
Dryden's Æneid.
The last was he, whose thunder slew
The Titan race, a rebel crew. *Addison.*

There was no light in heaven but a few stars,
The boats put off ere crowded with their crews ;
She gave a keel, and then a lurch to port,
And going down head foremost sunk in short.

Byron. Don Juan.

CREW, preterite of crow.
Immediately the cock crew. *Matthew xxvi. 74.*

It was about to speak when the cock crew.
Shakespeare. Hamlet.

CREW OF A SHIP. The sailors who are to work and manage a ship are regulated by the number of lasts it may carry ; each last making two tons. The crew of a Dutch ship, from forty to fifty lasts, is seven sailors and a swabber ; from fifty to sixty lasts, the crew consists of eight men and a swabber ; and thus increases at the rate of one man for every ten lasts ; so that a ship of 100 lasts has twelve men, &c. English and French crews are usually stronger than Dutch ; but always in about the same proportion. In a ship of war there are several particular crews, or gangs ; as the boatswain's crew, the carpenter's crew, the gunner's crew, &c.

CREWE (Nathaniel), an English bishop, the son of John lord Crewe was born at the family seat in Northamptonshire, in 1633. He was educated at Lincoln College, Oxford, where he took his degrees in arts, and joined the presbyterian party ; but at the Restoration he took orders in the established church, and in 1669 was made dean of Chichester. He was preferred to the bishopric of Oxford in 1671, from whence he was translated to Durham in 1674, for which preferment he was indebted to James duke of York ; upon whose accession to the throne the bishop supported all his measures, and was one of the commissioners appointed in the ecclesiastical commission in 1686. When, however, the prelate saw his master's ruin approaching, he began to change his conduct ; and in the convention parliament, he gave his vote with others, that James had abdicated the throne ; he was, however, excepted by name out of the pardon granted by William and Mary ; and found it necessary to abscond for some time. But he at last, not only received his pardon, but the indulgence of retaining his dignity ; and on the death of his brother, in 1691, he succeeded to the family title. He died in 1721, having held the see of Durham forty-seven years, a circumstance unparalleled in its history till the time of the late Hon. Shute Barrington, who held the same bishopric fifty-six years.

CREWEL, *n. s.* Dutch *klewel*. Yarn twisted, and wound on a knot or ball.

Take silk or crewel, gold or silver thread, and make these fast at the bent of the hook.

Hutton's Angler.

CREWKERNE, a market town on the borders of Dorsetshire, a mile from the Parret. It contains about 3000 inhabitants who manufacture dowlas, sail-cloth, girth-web, and stockings. It has a market for corn and provisions on Saturday. It is twenty miles south-east of Taunton, and 132 west by south of London.

CRIB, *v. a. & n. s.* Ang.-Sax. crybbe ; Dutch *krippe*, *krebbe* ; Ger. *krippe*, *kruppe*. To shut up in a narrow or inconvenient space ; to confine ; to circumscribe. A rack or manger ; the stall or cabin of an ox ; a small habitation ; a hut.

Now I am cabbined, *cribbed*, confined, bound in
To saucy doubts and fears. *Shakespeare. Macbeth.*

Let a beast be lord of beasts, and his crib shall stand at the king's messe. *Id. Hamlet.*

Why rather, sleep, lest thou in smookey cribs,
Upon uneasy pallets stretching thee,
Than in the perfumed chambers of the great ? *Id.*

The steer and lion at one crib shall meet,
And harmless serpents lick the pilgrim's feet. *Pope.*

In measure, as by force of instinct drawn,
Or by necessity constrained, they live
Dependent upon man ; those in his fields,
These at his crib, and some beneath his roof.

Cowper.

CRIB, *v. a.* Fr. *gripper* ; Ger. *krippen*. To pilfer ; to steal silyly. A low word.

CRIB, in the English salt-works, a name given to a sort of case, used in some places instead of the drab, to put the salt into as it is taken out of the boiling pan.

CRIBBAGE, *n. s.* A game at cards. See the next article.

A man's fancy world be summed up in *cribbidge*.
J. Hall.

CRIBBAGE, a popular game at cards. In this game the set must be sixty-one, and no cards are to be thrown out. It being an advantage to deal, on account of the crib, it is common to cut for it, and he that has the least cards deals. At this game there are only two players, and the cards are dealt out one by one, the dealer giving his antagonist the first, keeping the second to himself, and so on till each have five, when the rest are laid down in view upon the table. After this the dealer lays out the two best cards he can for his crib ; and his antagonist lays down other two, the very worst he can, the crib being the property of the dealer. A card from the parcel left after dealing is then turned up, after which the game is counted thus : any fifteen by the cards is two ; as king and five, ten and five, nine and six, eight and seven, &c. A pair is also two ; a pair-royal, or three aces, kings, &c. six ; a double pair-royal, or four aces, &c. twelve. Sequences of three cards, as four, five, and six, is three ; sequences of four, four ; five, five, &c. and the same holds of a flush. Knave-noddy, or of the suit turned up, is one in hand, and two to the dealer. If, after the cards for the crib are laid out, there remain in hand a nine and two sixes, that makes six, because there are two fifteens and a pair ; and if a chance be turned up, then you have twelve in your hand, viz. the pair-royal and three fifteens. These are to be marked with pegs, counters, or otherwise. Should you happen to have sequents, as of four, five, and six, in your

hand, and six is the turned up card, they are counted thus: first the sequents in your hand make three; and the sequents of the four and five in your hand, added to the six turned up, make other three; there are likewise two fifteens, counting first with the six in your hand, and then with that turned up. After this the antagonist to the dealer plays first, suppose six; and if the dealer can make it fifteen, by playing nine, he gains other two; otherwise they play on, and whoever reaches thirty-one exactly or comes nearest under it gains two or one. Here also, in playing the cards you may make pairs, pairs-royal, flushes, &c. The crib being the dealer's, he may make as many as he can out of it, together with the card turned up, counted as above; if he can make none, he is said to be bilked. In this manner they play and deal by turns, till the game of sixty-one is up; and if this be reached by one gamester before the other reach forty-five, the latter is said to be lurch'd, and the former gains a double game.

CRIBBLE, *v. a. & n. s.*) Old Fr. *crible*;

CRIBRATION, *n. s.*) Lat. *cribrum*. To sift through a sieve. A corn sieve; coarse meal, a degree better than pollard. The act of sifting.

CRICELASIA, the driving a ring or hoop. Driving a hoop was one of the ancient gymnastics: this hoop was as high as the breast of the person who used it. It was commended for rendering the limbs pliable, and for strengthening the nerves.

CRICHTON (James), a Scots gentleman who lived in the sixteenth century, and who, on account of his extraordinary endowments of body and mind, obtained the appellation of the admirable Crichton. He was descended of the blood royal; and is said to have received his grammatical education at Perth, and to have studied philosophy in the university of St. Andrew's. In his seventeenth year he went to Paris, where he caused placards to be fixed on all the gates of the schools, halls, and colleges, belonging to the university, inviting those who were well versed in any art or science, to dispute with him in the college of Navarre, that day six weeks, by nine o'clock in the morning, where he would attend them, and be ready to answer to whatever should be proposed to him, in any art or science; and in any of these twelve languages, Hebrew, Syriac, Arabic, Greek, Latin, Spanish, French, Italian, English, Dutch, Flemish, and Slavonian: and this either in verse or prose, at the discretion of the disputant. During the time appointed he attended the various places of amusement, rather than the colleges or seats of learning, which so provoked the students, that under the placard which was fixed on the Navarre gate, they caused the following words to be placed; 'If you would meet with this monster of perfection, make search for him either in the tavern or stews.' Nevertheless when the day appointed arrived, Crichton appeared in the college of Navarre, and acquitted himself so well in the disputation, that he was presented by the president, with a diamond ring, and a purse full of gold, as a testimony of esteem. It is added, that he was so little fatigued with the dispute, that he went on the very next day to the

Louvre, where he had a match of tilting, and in the presence of some of the French princes, and many ladies, carried away the ring twenty-five times successively. About two years after this we find him at Rome, where he affixed a placard upon all the eminent places in the city, in the following terms: Nos Jacobus Crichtonus Scotus, cuicumque rei propositæ ex improvise respondebimus; and in the presence of the pope, many cardinals, bishops, doctors of divinity, and professors in all the sciences, he displayed such wonderful proofs of his universal knowledge, that he excited no less surprise than he had done at Paris. From Rome he went to Venice; where he contracted an intimate friendship with Aldus Manutius, Laurentius Massa, Speron Speronius, Johannes Donatus, and other learned men, to whom he presented several poems in commendation of the city and university. He held, likewise, disputations on theology, philosophy, and mathematics, before the most eminent professors, and multitudes of people. He next went to Padua, the university of which city was at that time in great reputation. Amidst the discourses which were occasioned by our young Scotchman's exploits, and the high applauses that were bestowed upon his genius and attainments, some persons endeavoured to detract from his merit. For ever, therefore, to confound these invidious impugners of his talents, he caused a paper to be fixed on the gates of St. John and St. Paul's church, wherein he offered to prove before the university, that the errors of Aristotle, and of all his followers, were almost innumerable; and that the latter had failed both in explaining their master's meaning, and in treating on theological subjects; this he engaged to do, either in the common logical way, or by numbers and mathematical figures, or in 100 sorts of verses, at the pleasure of his opponents. According to Manutius, Crichton sustained this contest, without fatigue for three days; during which time he supported his credit, and maintained his propositions, with spirit and energy, and with the highest applause from an unusual concourse of people. From Padua, Crichton set out for Mantua; where there happened to be at that time a gladiator, who had foiled in his travels, the most famous fencers in Europe, and had lately killed three who had entered the lists with him in the city. This man Crichton challenged and slew, and divided the prize with the widows of the three whom the fencer had previously killed; in consequence of this and his other wonderful performances, the duke of Mantua appointed him preceptor to his son Vincentio di Gonzaga, who is represented as having been of a riotous temper and a dissolute life. One night, during the time of carnival, as he was walking along the streets of Mantua, and playing upon his guitar, he was attacked by six men in masks. In the issue, the leader of the company being disarmed, pulled off his mask, and begged his life, telling him that he was the prince's pupil. Crichton immediately fell upon his knees, and expressed his concern for his mistake; alleging that what he had done was only in his own defence, and that if his highness had any design upon his life, he might always be master of it. Then taking his own sword by

the point, he presented it to the prince, who was so irritated by the affront he had sustained, in being foiled with all his attendants, that he instantly ran Crichton through the heart. Thus died this celebrated man, in a drunken frolic, in the fifty-second year of his age. The following is the list of his works according to Dempster. 1. *Odæ ad Laurentium Massam plures*. 2. *Laudes Patavinæ, Carmen extempore effusum, eum in Jacobi Aloysii Cornelii domo experimentum ingenii, coram totâ Academiâ frequentiâ, non sine multorum stupore, faceret*. 3. *Ignorationis Laudatio, extemporale Thema ibidem redditus, post sex horarum disputationes, ut, præsentibus somnia potius fovere quam rem se veram videre affirmarint, ait Manutius*. 4. *De Appulsu suo Venetias*. 5. *Odæ ad Aldum Manutium*. 6. *Epistolæ ad Diversos*. 7. *Prefationes solennes in omnes Scientias Sacras et Profanas*. 8. *Judicium de Philosophis*. 9. *Errores Aristotelis*. 10. *Arma an Literæ præstant?* *Controversia Oratoria*. 11. *Refutatio Mathematicorum*. 12. *A Comedy in the Italian language*.

CRICKET, *n. s.* } Ital. *cricch*; Ang.-Sax. }
 CRICKET, *n. s.* } crýce; Dutch *krickel*. Crick }
 CRICKETER, *n. s.* } is the noise made by a }
 door, in which case it is derived from the Italian; }
 unless, indeed, both words may be supposed to }
 be imitative of the sound. It also means, a }
 painful stiffness in the neck; and in that sense }
 Junius thinks the Anglo-Saxon word for a stick }
 or staff is the parent, because the neck is as stiff }
 as a staff. Cricket is a noisy insect that haunts }
 warm places (see GRYLUS); a well-known }
 game, (see the next article); and a low seat or }
 stool. Cricketer is one who plays at cricket.

Didst thou not hear a noise?—

—I heard the owl scream, and the crickets cry.
Shakspeare. Macbeth.

Far from all resort of mirth,
 Save the cricket on the hearth. *Milton.*

The solemn death-watch clicked the hour she died,
 And shrilling crickets in the chimney cried. *Gay.*

The judge, to dance, his brother serjeant call;
 The senator at cricket urge the ball. *Pope.*

But come, thou genial son of spring,
 Whitsuntide! and with thee bring
 Cricket, nimble boy and light,
 In slippers red and drawers white. *Heddesford.*

'Yet, tho' 'tis too rural,—to come near the mark,
 We all herd in one walk, and that nearest the Park;
 There with ease we may see, as we pass by the wicket,
 The chimneys of Knightsbridge, and footmen at
 cricket. *Sheridan.*

There's something cheerful in that sort of light,
 Even as a summer sky's without a cloud:
 I'm fond of fire, and crickets, and all that,
 A lobster-salad, and champagne, and chat.
Byron Don Juan.

CRICKET, in zoology. See GRYLUS.

CRICKET, the name of a manly English game in which one party endeavours to strike down one wicket with a ball thrown from the other, and which the other endeavours to strike in its course, with sufficient force to give time to change wickets before the ball can be again brought to them. Every change of wickets constitutes a notch, and the game is decided by the greatest number of

notches on either side. The full complement of players is twelve on each side and two umpires. The following are the principal laws of the game, as settled by the Mary-le-bonne club, and are universally acknowledged.

The ball must weigh not less than five ounces and a half, and not more than five ounces and three quarters.

The bat must not exceed four inches and a quarter in the widest part.

The stumps, which are three, must be twenty-four inches out of the ground, the bail seven inches in length.

The bowling mark must be in a line with the stumps, three feet in length, with a return mark.

The popping crease must be three feet ten inches from the wicket, and parallel to it.

The wickets must be opposite to each other, at the distance of twenty-two yards.

The wicket-keeper must stand at a reasonable distance behind the wicket, and not move till the ball is out of the bowler's hand.

The bowler must deliver the ball with one foot behind the bowling-crease, and within the return-crease, and bowl four or six balls before he changes wickets, which he is allowed to do but once in the same innings.

The striker is out; 1. if the bail be bowled off, or the stump bowled out of the ground; 2. if the ball, from a stroke over or under his bat, or upon his hand (but not wrists), is held before it touches the ground; 3. if in striking, or at any other time while the ball is in play, both his feet are over the popping-crease, and his wicket put down; except his bat be grounded within it; 4. if in striking the ball he hit down his wicket; 5. if the ball be struck up, and either wilfully strike it again; 6. if in running a notch, the wicket is struck down by a throw, or with the ball in hand, before his foot, hand, or bat, is grounded over the popping-crease; 7. if he stop the ball with his foot, when it would have hit the wicket.

If the players have crossed each other, he that runs for the wicket which is put down, is out; if they have not crossed, he that has left the wicket which is put down, is out.

When a ball is caught, or when a striker is run out, the notch run for is not to be reckoned. When the ball has been in the bowler's, or wicket-keeper's hand, it is considered as no longer in play, and the strikers need not keep within their ground till the umpire has called *play*; but, if the player go out of his ground with an intent to run before the ball is delivered, the bowler may put him out.

In single wicket matches, if the striker move out of his ground to strike the ball, he shall be allowed no notch for such stroke.

Not out if the striker hit the opposite wicket, and his partner be off his guard.

CRICKETING APPLE, *n. s.* A small species of apple.

CRICKHEATH, or CRICKIETH, a town of North Wales, in Caernarvonshire, on the coast of the Irish sea, with a castle said to have been built in the reign of king John, twenty-one miles south of Caernarvon, and 233 north-west of London. It has a weekly market on Wednesday, and three fairs.

CRICKHOWELL, a town of South Wales in Brecknockshire, situated near the Usk, much resorted to by invalids, for the purpose of drinking goats' milk and whey. The ruins of an ancient castle are yet visible. There is a weekly market on Thursday, well supplied with fish and provisions. It is six miles W. N. W. of Abergavenny, thirteen E. S. E. of Brecknock, and 154 W. N. W. of London.

CRICKLADE, a borough of Wiltshire, situated on the river Thames, anciently a place of considerable consequence. It contains about 250 houses, and sends two members to Parliament; but the electors having been convicted of corruption, the freeholders of several adjacent places were added to the number of voters. The river Thames is navigable to this town, and a canal is now made between the Thames and the Severn, which joins the former at this place. It has a weekly market on Saturday; and is thirty miles west of Oxford, and eighty-four W. N. W. of London.

CRICOIDES, in anatomy, a cartilage of the larynx, called also the annular cartilage. It occupies the lowest part by way of base to the rest of the cartilages, and to the lower part of it the aspera arteria adheres. See ANATOMY.

CRILLON (Louis de Berthou), a knight of Malta celebrated for his bravery, was born of a noble family in the court at Venaissin, in 1541. At the age of fifteen he served at the siege of Calais, and afterwards, in the battles of Dreux and Jarnac, distinguished himself against the Huguenots. He was also at the battle of Lepanto, and assisted in 1573 at the siege of Rochelle. Henry III., proposing to him to assassinate the duke of Guise, he resolutely refused but offered to fight him. In the reign of Henry IV. he repulsed the leaguers from before Boulogne, and in 1592 successfully defended Millebœuf against the army of Villars. He was found, while able to keep the field, in every service of danger. The bad state of his health obliged him to retire early from active life, and he died at Avignon in 1615, in his seventy-fifth year.

CRIME, *n. s.*
 CRIMEFUL, *adj.*
 CRIMELESS, *adj.*
 CRIMINAL, *n. s. & adj.*
 CRIMINALITY, *n. s.*
 CRIMINALLY, *adv.*
 CRIMINALNESS, *n. s.*
 CRIMINATE, *v. a.*
 CRIMINATION, *n. s.*
 CRIMINATORY, *adj.*
 CRIMINOUS, *adj.*
 CRIMINOUSLY, *adv.*
 CRIMINOUSNESS, *n. s.*

Fr. *crime*; It. Sp. & Lat. *crimen*. Crime is, an act which is contrary to divine or human law; a heinous offence; an act of wickedness. It is also used by old writers to signify merely reproach; in which sense it is a Latin *is n.* Criminal, as a noun, means, an accused person; a guilty person. As an adjective, it denotes, contrary to right, to duty, to law; tainted with crime; relating to penal as distinguished from civil legal proceedings. Crimeful, and criminous, indicate, a high degree of crime; enormous guilt. To criminate is to accuse of crime. The kindred words are so closely allied in meaning, that it is unnecessary to explain them.

I shal him tellen which a gret honor,
 It is to be a flattering limitor,

And eke of many another maner *crime*,
 Which nedetli not reheren at this time.

Chaucer. Cant. Tales.

Nath'lesse most heavenly faire in deed and vew
 She by creation was, till she did fall,
 Thenceforth she sought for helpe to cloke her *crime*
 withall.

Spenser. Faerie Queene.

The tree of life, the *crime* of our first father's fall.

Id.

For on his backe a heavy load he bare
 Of nightly steldis and pillage severall,
 Which he hed got abroad by purchase *criminall. Id.*
 Devise extremes beyond extremity,
 To make him curse this cursed *crineful* night.

Shakspeare. The Rape of Lucrece.

My foes could not procure me any *scathe*,
 So long as I am loyal, true, and *crimeless*.

Id. Henry VI.

All three persons that had held chief place of
 authority in their countries; all three ruined, not by
 war, or by any other disaster, but by justice and sen-
 tence, as delinquents and *criminals*.

Bacon.

Of what is bad, a little's a great deale,
 Better is more: but best is nought at all,
 Lesse is the next, and lesser *criminal*.

Hall.

I could never be convinced of any such *criminos-
 ness* in him, as willingly to expose his life to the stroke
 of justice, and malice of his enemies.

King Charles.

Undergo with me one guilt, one *crime*

Of tasting.

Milton.

The punishment that belongs to that great and
criminos guilt, is the forfeiture of his right and claim
 to all mercies, which are made over to him by Christ.

Hammond.

Some particular duties of piety and charity, which
 were most *criminosly* omitted before.

Id.

Was ever *criminal* forbid to plead?

Curb your ill-mannered zeal.

Dryden's Spanish Friar.

No *crime* was thine, if 'tis no *crime* to love. *Pope.*
 The neglect of any of the relative duties, renders us
criminal in the sight of God.

Rogers.

As our thoughts extend to all subjects, they may be
criminosly employed on all.

Id.

Embracing in their arms the carcases of base *crimi-
 nals*, and promoting their relations on the title of their
 offences, they drive hundreds of virtuous persons to
 the same end, by forcing them to subsist by beggary or
 by *crime*.

Burke.

Lord Coke, the oracle of the English law, conforms
 to that general sense, where he says that 'those things
 which are of the highest *criminosity*, may be of the
 least disgrace.'

Id.

It is no slight authority which shall persuade us
 (by receiving as proofs of loyalty the mistaken princi-
 ples lightly taken up in these addresses) obliquely to
criminate, with the heavy and ungrounded charge of
 disloyalty and disaffection, an uncorrupt, independent,
 and reforming parliament.

Id.

Shall he, must in the Peasant's lowly shed,
 To hardy Independence bravely bred,
 By early Poverty to hardship steeld,
 And trained to arms in stern Misfortune's field;
 Shall he be guilty of their hircling *crimes*,
 The servile, mercenary Swiss of rhymes.

Burns.

If killing birds be such a *crime*,

(Which I can hardly see,)

What think you, sir, of killing Time,

With verse addressed to me?

Cowper.

Hear him, ye Senates! hear this truth sublime,
 He who allows oppression, shares the *crime*.'

Darwin.

If he has transgressed the constitution with impunity, if his *criminality* is suffered to pass even without rebuke,—this is nothing less than a radical change of system. *Sheridan.*

If now and then there happened a slight slip,

Little was heard of *criminal* or *crime*—

The story scarcely passed a single lip—

The sack and sea had settled all in time.

Byron. Don Juan.

CRIMES. The cognizance and admeasurement of crimes and punishments form, in every country, the code of criminal law; or, as it is more usually denominated in England, the doctrine of the pleas of the crown: so called, because the king, in whom the majesty of the whole community centres, is supposed, by the law, to be the person injured by every infraction of the public rights belonging to that community; and is, therefore, in all cases, the proper prosecutor for every public offence. However important this branch of jurisprudence may appear, either from the peculiar admixture of human passions, and its topics and subjects; from giving a lasting efficacy to sanctions that were intended to be temporary, and made, as lord Bacon expresses it, merely upon the spur of the occasion; or, lastly, from too hastily employing such means as are greatly disproportionate to their end, in order to check the progress of some very prevalent offence; from some, or from all of these causes, it has happened, that the criminal law is, in every country of Europe, more rude and imperfect than the civil. The student of law will find the general inhumanity and mistaken policy in the local constitutions of other nations, sufficiently pointed out by Montesquieu, Beccaria, and other ingenious foreign writers. In our own country, Mr. Bentham, Mr. Montague, Sir Samuel Romilly, and numerous modern authors, have called the public attention to this subject. Sir William Blackstone observes, b. iv. ch. 1, 'It is a melancholy truth, that among the variety of actions which men are daily liable to commit, no less than one hundred and sixty have been declared, by act of parliament, to be felonies, without benefit of clergy; or, in other words, to be worthy of instant death. So dreadful a list, instead of diminishing, increases the number of offenders.' And Mr. Willerforce is reported to have said, in his place in the house of commons, 'that he well remembered, that a great and lamented public character, Mr. Pitt, at an early period of his life, had intended to have a digest made of the whole of our criminal code, with a view of lessening, in a great degree, the number of capital punishments which it contained, and the objections to which it was impossible to confute.' In England, indeed, we seem to have been, of late, imbibing better and more humane views of this interesting subject, while, on the continent, they have boldly carried into effect some striking and very admirable innovations. We have here only room to present the reader with the substance of the new Bavarian and French codes; hoping that our remaining article on the same subject, the PUNISHMENT OF CRIMES, may yet enable us to record some decided improvements in our own system.

The former was drawn up by M. Bexon, by

direction of the king of Bavaria, and published at Paris, in folio, in 1807. It professes to contain a complete system of criminal law, including punishments and police.

M. Bexon begins with a digest of police-laws, under the title of *Legislation de la Sureté*. In the subdivisions of his work, the principal heads are, 1. Principes généraux. 2. Des auteurs, des complices et des fauteurs, des délits et des crimes. 3. Des peines en général, et du mode de leur exécution. 4. De la récidive, de l'influence de l'âge sur le caractère et la durée des peines. 6. De l'autorité paternelle et de famille. 7. Du devoir des juges, dans l'application et la graduation des peines, de circonstances excusantes, atténuantes, et aggravantes. 8. Des actions et de leur prescription. 9. Des absens ou contumaces, et de la prescription des condamnations. 10. Des frais des procès criminels, et des dommages intérêt. 11. De la grace. 12. De la diminution de la durée des peines, pendant leur cours, ou de la remission que le coupable peut obtenir par son travail et son repentir. 13. De la réhabilitation. The arrangement of the matter of this part of the work is certainly neither clear nor convenient. Crimes, punishments, tribunals, and procedure, are mixed together, instead of being kept separate and distinct, as they ought to be.

In the penal code itself this writer has adopted the old classification of offences under the heads of, 1. Crimes against the public. 2. Crimes against persons. 3. Crimes against things. What is new in his work, is the distribution of these into three distinct classes, according to their supposed delinquency, and which he calls, 1. Contraventions et fautes. 2. Délits. 3. Crimes.

The modern French penal code was decreed the 12th February, 1810, and promulgated the 22nd of the same month. The whole penal code, including punishments, is comprised in 114 octavo pages. It begins by declaring, that a violation of the law, cognizable by the police, is a contravention; that a violation of the law, that is visited by correctional punishment, is an offence; and that a violation of the law, that is visited by an afflictive and infamous punishment, is a crime. The several species of punishments employed are, 1. Death. 2. Hard labor for life. 3. Transportation. 4. Hard labor for limited periods. 5. Seclusion. 6. The carcan, similar to our pillory. 7. Banishment. 8. Civil degradation. 9. Imprisonment, during a limited period, in a house of correction. 10. Suspension, temporary, of certain civil rights. 11. Making satisfaction to the party injured. To these are added, in specified cases, the drawing a ball, to be attached to the feet; imprinting on the right shoulder, by means of a red-hot iron, certain letters; standing on the carcan, having a writing, in large and legible characters, affixed to the head, &c. Some of the punishments are also attended with certain temporary, and others with perpetual, civil disabilities. Forfeiture of property, it is declared, shall not attach, in any case, as the necessary consequence of conviction, but is to have place only when expressly pronounced as part of the punishment, and, in the few instances in which it is used, the property

remains liable to all just incumbrances, and to the obligation of furnishing children, or other descendants, a half of such part of their portion as the criminal could not have deprived them of.

Offences are divided into two classes: 1. Those affecting the public. 2. Those affecting individuals. Under the first, the principal offences that are comprised are, offences against the exterior and interior of the state, levying war, counterfeiting the coin, and malversation on the part of public functionaries, ecclesiastical and civil. Under the second head, offences affecting particular assignable persons, such as murder and other personal injuries, perjury, and offences against property.

In the section relating to the administrative and judicial authority, it is declared, that, whenever any judge shall, after it has been notified to him that a cause has been removed before a superior tribunal, proceed to pronounce judgment notwithstanding, he shall be punished by a fine of not less than sixteen francs, nor greater than 150 francs; so again, wherever any judge shall enter the house of a citizen, in cases in which the law shall not have invested him with authority so to do, or in a manner not prescribed by the law, he shall be punished by a fine of not less than sixteen francs, nor greater than 200 francs; and there are several other cases in which the misconduct of judges renders them subject to penalties.

CRIMEA (The), a peninsula of European Russia, is situated between the parallels of $44^{\circ} 40'$ and $46^{\circ} 5' N.$, and the meridians of $32^{\circ} 45'$ and $36^{\circ} 39' E.$ It is of an irregular rhomboid shape, surrounded on all sides by the Black Sea and the Sea of Azof, except at its northern angle, where the isthmus of Perekop connects it with the continent. Its extent from north to south is about 124 English miles, and from west to east 208 English miles. Its superficies is computed at about 3,500,000 English statute acres, the greater proportion of which consists of desert plains, or steppes. This peninsula has been known under a variety of names; the ancients called it Taurica Chersonesus, also Chersonesus Scythica, and Chersonesus Magna; in the middle ages it was sometimes called the Island of Caffa; and, in more modern times, it has been known under the appellations of Crim Tartary and the Crimea.

The Crimea is naturally divided into three parts; Crimea Proper, the eastern subordinate peninsula of Kertsch, and the Isle of Tamar. Upwards of three-fourths of Crimea Proper, towards the north, is composed of steppes, and totally devoid of trees; but affording excellent pasturage, and abounding in salt lakes and marshes. The soil in this division is partly of a white sandy clay, and partly of black vegetable loam, mixed in some parts with chalk and limestone. The vast quantities of petrifications and marine productions which are found in this district, have given rise to the supposition that it was originally submerged by the Black Sea. The salt marshes are so productive, that upwards of 200 vessels are annually laden with salt from the single port of Caffa, besides which vast quantities are transported by land, to Poland and Rus-

sia, even as far as Petersburg and Riga. The southern portion of the Crimea is mountainous; the principal ridges extending from east to west. Some of these mountains are said to be 1200 feet above the level of the Black Sea, and are covered with snow the greater part of the year. From the summit of Ischadir-daghi, or the pavilion mountain, the prospect stretches nearly over the whole peninsula. The union of the sublime and beautiful is nowhere more manifest than in the southern portion of Crimea Proper; where, while from a stupendous height the tops of the mountains glitter with silvery snow, their sides are covered with wide-spreading forests, and their bases with the blushing vine, the olive, the fig-tree, and the pomegranate. These mountains also enclose innumerable corn-fields, and verdant plains, refreshed with natural fountains and cascades.

The peninsula of Kertsch (anciently the kingdom of Bosphorus) presents a widely different aspect from the Crimea Proper. Its extent from west to east is about eighty-four English miles; its medium breadth from north to south twenty-four English miles. The isthmus which connects it with the Crimea, is a level plain, ten miles broad. The shores, both of the Euxine and the sea of Azof, which encircle this peninsula, are very steep and difficult of access. The interior is almost entirely destitute of wood, but abounds with fruit-trees; and the soil, excepting in the immediate neighbourhood of the salt-marshes, is very fertile. The strip of land which separates the Mud Sea from the Sea of Azof, is composed of sand and shells, and for the most part affords excellent pasture. On the leaves and stems of vegetables growing near a salt-marsh in this peninsula, is found what is supposed to be sulphur, or sulphuret of soda. Salt-springs, a spring of petroleum, or rock-oil, a mineral said to be prussiate of iron, and petrified shells, compose the remaining natural curiosities of this strip of land.

Tamar is included under the same government as the Crimea. This island is surrounded by the seas of Azof and the Black Sea; its length is forty miles, and its breadth twenty-six. The shores are remarkable for their steepness. The soil in some parts is fertile; but, owing to the prevalence of thick fogs, its humidity, and the bad quality of its water, the climate is unhealthy. In this island are found large quantities of petroleum, some saline springs, and many springs of fresh water, but no running streams. On the western extremity is a mud volcano, which the Tchernomorski, the present inhabitants, call Prekla (hell); its eruptions consist of disjections of vast masses of viscous mud, accompanied by smoke and fire. The Salghir is the only river of any importance in the Crimea. The Bólbeck, Alna, Byak, Aithaddr, Badraka, Balganack, Katsha, &c., are small streams, which are so very rapid after heavy falls of rain, as to be excessively dangerous; in the dry season, however, they are nearly destitute of water.

The climate of the Crimea is very variable. The winters are occasionally severe, whilst the springs are moderate and serene. The summer, for the most part, is very hot; and the autumn.

sultry, moist, and unhealthy. Tertian fevers are the most prevalent complaints of the inhabitants. The Crimea is subject to the plague of locusts. Two species, the *gryllus tartaricus* and *migratorius*, are found here, which at certain seasons devastate the fields, the gardens, and the vineyards. Dr. Lyall mentions having seen as many as 200 Tartars, armed with branches of trees tied together, and clubs, occupied in destroying them, by beating them against the ground. Tarantulas, black, and of a tremendous size, infest this peninsula; also the *phalangium arachnoides*, a species of spider of a smaller size, the bite of which Pallas declares to be fatal. The *scelopendra morsitans*, or centipede, is likewise very common; the bite of this insect is very terrible. In the mountainous districts, scorpions are not infrequently found. A small kind of caterpillar, which is very destructive to the vines, is regarded by the celebrated Pallas as peculiar to this peninsula.

The present capital of the Crimea is Sympheropol, called by the Tartars *Ak-metchet* (white mosque) from an edifice of this description built by Ibrahim Bey. It is reported, that on the occasion of the Russian conquest, prince Potemkin threw up coin with his principal officers for the decision of a place for the seat of government, and it fell on this town. It is situated in a valley, watered by the Solghir, and presents a very picturesque appearance in summer, from the number of gardens, clumps of trees, and extensive fields, with which it is surrounded. It is 963 miles from Moscow, and 1408 from St. Petersburg. Like all Tartar towns, it consists of narrow unpaved streets, intersecting each other at irregular angles; the whole city is excessively dirty and confined. It contains no public buildings worthy of notice, with the exception of its cathedral, which Dr. Lyall considers the handsomest ecclesiastical structure in the Russian empire. There are within its compass four mosques, with minarets, an Armenian church, a Roman Catholic church, and a synagogue. Its population, consisting of Tartars, Greeks, Armenians, Moldavians, and Jews, is about 2000. This city was long the place of residence of the celebrated professor Pallas.

Bakhtchiserai (garden palace), the ancient capital, is situated thirty versts from Sympheropol. The view presented to the traveller, as he journeys to this city, is said to be very beautiful. The houses rise in terraces along the declivities of the hills, and are interspersed with vineyards, gardens, and clumps of Lombardy poplars, watered by numerous fountains and canals. The innumerable minarets, the ruins of the ancient palace of the khans, and a profusion of white chimneys rising amidst the richest foliage, produce a tout-ensemble of the most picturesque effect. The interior of the town, however, is no way corresponding with its external beauty. It is said to contain three churches, thirty-two mosques, a synagogue, and seventy-four fountains. The population in 1822 is stated by Dr. Lyall to have amounted to 10,212 souls, of whom 8200 were Mahomedans.

About four versts distance from this city is the Jewish colony of Ichufaut Kala (Jew's castle).

It contains about 200 houses and 1200 inhabitants, who so far differ from the usual character given to their brethren in other countries, that Dr. Clarke says their honesty in the Crimea is proverbial, the word of a Karaite Jew being considered equal to a bond. Adjoining to this village is a cemetery, called the field of the dead; a place, we are informed, most admirably calculated to inspire holy meditation. It is said the Jews hold this valley in such veneration, that when the khans wished to extort a contribution, they had only to threaten them with the destruction of these sacred trees, under the pretence of wanting timber or fuel, to ensure a speedy compliance.

Ak-yar, or Serastopol, is situated upon a neck of land interposed between two bays. Its harbour is one of the finest in the world; the largest vessels being able to lie within cable's length of the shore; it extends nearly four miles inland, and is only 200 yards wide at the entrance, which is well defended, and nine or ten fathoms deep. The houses in this town are extremely good, built principally after the Italian style of architecture; and the streets are wide, though not paved. Its principal public edifices are three churches, the admiralty, the hospital, the arsenal, the magazines, the barracks of the garrison, and the marine barracks. Its population was estimated at 22,000 in the year 1822; the number of its houses is said to be 1750. It is a rising town. Ak-yar is described by Dr. Clarke as the very centre of the most interesting antiquities of the Crimea; the Russians, however, have labored daily to annihilate every vestige of them. Within a short distance of this town stood the cities of Old and New Chersonesus, Eupatorium, the temples of Diana, and the promontory Parthenium, celebrated as the scene of the story of Iphigenia; the famous Chersonesian wall, with innumerable ramparts, tombs, canals, and other works, the memory of which has been embalmed in the writings of classical authors. The most remarkable curiosity in the Crimea is also situated in the neighbourhood of Ak-yar. The ruins of In-kerman (the town of caverns), consisting of innumerable chapels, cells, monasteries, sepulchres, and a variety of works, which, by their intricacy, astonish and confound the beholder. (See Dr. E. D. Clarke's Travels, vol. ii. p. 203). Bellaclara is situated to the south of the Hellenic Chersonesus; it contains about 1200 Greek inhabitants, and is particularly remarkable for its beautiful port (Bella Clara), from which it takes its name. This harbour is most accurately described by Strabo; it is about a mile in length, 200 fathoms in breadth, and from fifteen to twenty fathoms in depth in its shallowest part.

Karassa-bazaar (black water market), is the principal mart for the sale of fruit, wine, horses, and cattle, on the peninsula. The town is a straggling mass of mean buildings, containing about 5000 inhabitants. It is noted, however, for its tanneries, tile-works, candle and soap manufactories, and its manufactures of red and yellow morocco, and silks.

Sudak is built amongst the vineyards and groves of the vale which bears its name. This place was of such commercial celebrity at one

period of its history, that all the Greek possessions in the peninsula were denominated Sugdania (its ancient name). It is at present noted for its wines.

Caffa, in Crimea Proper, was once the most splendid city in the peninsula; at present it presents but a few irregular streets, and the wrecks of its former magnificence. Whilst in the possession of the Genoese, it was termed Krim Stambol, or the Constantinople of the Crimea, and contained, inclusive of its suburbs, 44,000 houses; in 1800, fifty Tartar families formed the whole of its population! Taman is a fortress of considerable strength, and the only town worthy of mentioning in the island which bears its name.

Before the Crimea came under the power of the Russians, it is said to have contained a population of 1,500,000, consisting of Turks, Greeks, Armenians, and Tartars. At present there are no Turks; not many Armenians; and vast numbers of the Tartars have removed with their families and flocks to the steppes of the continent. Professor Pallas, whom we have already mentioned, divides the Tartars of the Crimea into three classes. The Nogays, the least mixed of the Mongolian race, devote their whole attention to agriculture and the rearing of cattle. A second race resembling the first, but not of so pure a descent from the Mongolians, who are chiefly scattered over the undulating steppes, from the borders of the mountainous country to the isthmus of Perecop. The third class occupy the valleys of the mountains; they are of a distinct physiognomy from the preceding two, having stronger beards and lighter colored hair; they are always stationary, and devote their whole attention to the cultivation of flax, hemp, and tobacco.

The native Tartars are divided into three distinct grades:—viz. the moorzas, or noblemen; the mullahs, or priests; and the peasantry. A mullah is always at the head of every settlement, and no measure is undertaken, which is likely to be important in its results, without first consulting with him. The moorzas amount to about 250; their dress for the most part resembles the Circassians; their manners are elegant, and they are excellent equestrians. The cottages even of the poorer sort of peasants are extremely clean; and the meanest Tartar has a double dwelling, one for himself and his guests, and the other for his wives. To every cottage is attached a garden, in which the mulberry, the fig, the vine, the olive, the pomegranate, the peach, the apricot, and the walnut, abound. These latter trees grow to a most amazing size. Pallas mentions one which annually produced from 80,000 to 100,000 nuts. The old Tartar nobles allow their beards to grow, whilst the young wear only whiskers. The general covering for the head in summer, is a turban; those who have been a pilgrimage to Mecca or Medina, wear white ones, as a badge of honor; in winter they wear a kind of helmet made of wool; and beneath both, at all times, even within doors, is worn a skull-cap. The peasants have the legs and feet bare in summer; but bandaged, after the manner of the Russians, during the winter. Their shirts are made very wide in the sleeves, and hang over their fingers'

ends. They wear a jacket of silk or cotton, with a small pocket, in which they keep the steel and flint for lighting their pipes. Their trowsers are large and loose, bound tight below the knee, but falling in thick folds round the legs. The women are generally diminutive, wearing drawers or long wide trowsers, shirts open before, an open silk gown with long narrow sleeves, ornamented according to the station of the wearer; and, over all, a great coat with short sleeves, and a band round the waist. They plait their hair, which is usually covered with a small cap; a long piece of cloth hangs down behind from the top of their heads, and tresses of hair, stained of a red color, fall down on their cheeks. They paint the nails of their hands and feet red, and stain their eyebrows black. Many of their customs display a taste for finery; thus, their pillows are covered with colored linen; the napkins which they use for their ablutions are fringed and gaily embroidered; and the stool which is used for supporting a tray during their meals, is often inlaid with mother-of-pearl. The food consists of mutton and lamb, boiled or roasted, eggs, butter, honey, milk, fruits, vegetables, &c. Their ordinary drink is water, or sour milk mixed with water, and a kind of beer called barsa. In every house is to be found one or more copies of the koran, which they teach their children to read and copy at a very early age. Like other oriental nations, they are excessively fond of ablutions, using them repeatedly during the day. The highest points of excellence, in the Tartar character, are their hospitality, sobriety, and chastity; for all of which they are universally distinguished. The Tartar law in cases of infidelity is very curious; the offender is placed in a grave, and the whole number of inhabitants for many versts round being assembled, each one flings a stone at the delinquent, who is thus at once stoned to death and buried. Since they have been governed by the Russian laws, however, they are no longer able to exercise their own customs, and this, like many others, is fast sinking into desuetude.

The Cimmericians, a tribe of the Thracians, are the most anciently known inhabitants of the Taurica Chersonesus. This warlike tribe, for a long time, defended the peninsula against the Scythians, but were at length driven into the mountainous parts by their more powerful adversaries, about 665 years before the birth of Christ. About 100 years after this, the Greeks formed colonies, and carried on a flourishing commerce on the southern shores; and the eastern peninsula was raised into the Greek kingdom of Bosphorus. About a century before the Christian era, Mithridates, king of Pontus, reduced the whole of the Chersonesus under his power. After the ruin of Mithridates, by the Romans under Pompey, who took possession of the Crimea, the kingdom of Bosphorus subsisted till the Christian era as a dependent power. The Alani, the Goths, the Huns, and other barbarous nations, successively overran the Chersonesus. The Crimea became a province of the western Tartar empire in 1237. But it is principally indebted to the Venetians and Genoese for its recovery from the desolated and impoverished state to which it was reduced under so many mas-

ters. The Genoese established large commercial cities on the coast of the Black Sea, and also opened a lucrative trade with China and the East Indies. In 1441 the Crimea, for a short period, became an independent monarchy; but the Turks destroyed this, and expelled the Genoese from the peninsula. In 1774 the empress, Catherine II. of Russia, stipulated for the independence of the Crimea under its own khans. In 1781 a civil war broke out, in which the Russians interposed; and, in 1783, Sahim Gheray, the reigning khan, abdicated his throne, and transferred his power to Russia. This acquisition was confirmed to the czar, by a treaty with the sultan, in 1784, since which time the Crimea has remained a province of the Russian empire.

CRIMP, *v. a., n. s. & adj.* } Ang.-Saxon
CRIMPLE, *v. a.* } ge-crypt; Ger. *krampen*; Dut. *krimpen*; Swed. *krimpa*. To crimp is to curl the hair, but this sense is obsolete; to cut fish while alive or very fresh, in order to render the flesh firm; in cant phraseology, to decoy persons to serve in the army. To crimp is, to contract; to corrugate; to cause to shrink up. Crimp formerly was the name of a game at cards; it is now the appellation of those who enlist men by unfair means. That which is friable, brittle, easily pulverisable, is crimp. The adjective is also used to signify, not consistent or forcible; but this usage was never elegant, and is now obsolete.

Laugh and keep company at glee or *crimp*.

Ben Jonson.

He passed the cautery through them, and accordingly *crimped* them up.

Wiseman's Surgery.

Now the fowler, warned

By these good omens, with swift early steps,
Treads the *crimp* earth, ranging through fields and glades.

Phillips.

The evidence is *crimp*; the witnesses swear backwards and forwards, and contradict themselves; and his tenants stick by him.

Arbutnot's John Bull.

From turkey poult transfixed, and sirloins slashed,
From marrow puddings mauled, and custards quashed,
Crimp cod, and mutilated mackarel,
And desolation of the turtle's shell,
Some alderman of giant appetite,
A surfeit sweeps to everlasting night.

Huddesford.

CRIMSON, *v. a., n. s. & adj.* Fr. *cramoisi*; It. *cramesioro*; Sp. *cremesin*, *cremesino*; Dutch, *karmesin*; Per. *kermesy*, *karmesy*; Ar. *kermez*. It was formerly written *crimosin* and *cremosin*. Crimson is red, with a tinge of blue; poetically, red in general. To crimson is to tinge or dye with crimson.

Upon her head a *cremosin* coronet,
With damask roses and daffedillies set.

Spenser's Shepherd's Calendar.

Still is he sullen, still he lowers and frets,
Twixt *crimson* shame, and anger ashy pale.

Shakespeare. Venus and Adonis.

Can you blame her, then, being a maid yet rosed over with the virgin *crimson* of modesty, if she deny the appearance of a naked blind boy, in her naked seeing self?

Id. Henry V.

Pardon me, Julius. Here wast thou bayed, brave hart!

Here didst thou fall; and here thy hunters stand
Signed in thy spoil, and *crimsoned* in thy lethe.

Shakespeare.

As *crimson* seems to be little else than a very deep red, with an eye of blue; so some kinds of red seem to be little else than heightened yellow.

Boyle on Colours.

The *crimson* stream stained his arms around;
And the disdainful soul came rushing through the wound.

Dryden's Æneid.

Why does the soil endure

The blushing poppy with a *crimson* hue?

Prior.

Mark, where Ambition leads the adverse hand,
Each feature fierce and haggard, as with pain!
With menace loud he cries, while from his hand
He vainly strives to wipe the *crimson* stain.

Beattie

Tinged by the *crimson* sun, vast columns rise
Of eddy sands, and war amid the skies,
In red arcades the billowy plain surround,
And whirling turrets stalk along the ground.

Darwin.

Her cheek with native *crimson* glows,

But *crimson* softened by the rose:

'Twas Hebe's self bestowed the hue!

Yet Health has added something too:

But if an over-tinge there be,

Impute it to her modesty.

Sheridan.

And she was chill as they, and on her face

A slender streak of blood announced how near

Her fate had been to that of all her race;

For the same blow which laid her mother here

Had scarred her brow, and left its *crimson* trace

As the last link with all she had held dear.

Byron. Don Juan.

CRINCUM, *n. s.* A cant word. A *cramp*; a contraction; whimsy.

For jealousy is but a kind

Of clap and *crincum* of the mind.

Hudibras.

CRINGE, *v. a., v. n., & n. s.* } Ger. *kricchen*.

CRINGER, *n. s.* } To bow servilely;

to fawn; to flatter; to act the sycophant; to draw together; to contract: but in the last two senses the verb is unusual. Cringe is servile civility. A cringer is one who will bow to and fawn upon another for the sake of interest, who will even submit to a kicking if it will forward the attainment of his purpose.

Whip him, fellows,

Till, like a boy, you see him *cringe* his face,

And whine aloud for mercy.

Shakespeare. Antony and Cleopatra.

Flatterers have the flexor muscles so strong, that they are always bowing and *cringing*.

Arbutnot.

The *cringing* knave, who seeks a place

Without success, thus tells his case.

Swift.

Let me be grateful; but let far from me

Be fawning *cringe*, and false dissembling looks.

Phillips.

Purblind to poverty the worldling goes,

And scarce sees rags an inch beyond his nose,

But from a crowd can single out his grace,

And *cringe* and creep to fools who strut in lace.

Churchill.

The pride of no person in a flourishing condition is more justly to be dreaded, than that of him who is mean and *cringing* under a doubtful and unprosperous fortune.

Burke.

Horatio's servant once, with how and *cringe*,
Swinging the parlour door upon its hinge,
Dreading a negative, and overawed
Lest he should trespass, begged to go abroad.

Cowper.

CRINGLE, a small hole made in the bolt rope of a sail, by intertwisting one of the divisions of a rope, called a strand, alternately round itself and through the strands of the bolt-rope, till it becomes threefold, and assumes the shape of a wreath or ring. The use of the cringle is generally to contain the end of some rope, which is fastened thereto for the purpose of drawing up the sail to its yard, or of extending the skirts by the means of bridles, to stand upon a side wind.

CRINGEROUS, *adj.* } Lat. *crinis*. Cri-
CRINET, *n. s.* } nigerous, crinose,
CRINITE, *adj.* } and crinite, signify,
CRINGE, *adj.* } hairy; abounding
CRINOSITY, *n. s.* } with hair. Crino-
sity is hairiness. Gascoigne gives the appella-
tion of crinet to a lock of hair, and, as the word
is pithy and well sounding, it deserves to be re-
tained in the language.

How comete, *crinite*, caudate, stars are framed.

Fairfax.

CRINKLE, *v. a., v. n., & n. s.* } Dut *kron-*
CRINKLING, *n. s. & adj.* } *kelen*. To run
into bendings; to wind in and out; to mould
into inequalities. Crinkle, and crinkling, denote
a wrinkle; a sinuosity; something moulded into
small prominences, like the edge of a pie-crust.
See **CRANKLE**.

Unless some sweetness at the bottom lie,
Who cares for all the *crinkling* of the pie?

King's Cookery.

CRINUM, asphodel lily, in botany, a genus
of the monogynia order, and hexandria class of
plants; natural order ninth, spathaceæ: cor.
funnel-shaped, monopetalous, and sexpartite, with
three alternate segments having hooked ap-
pendages; the germen is covered in the bottom
of the corolla, the stamina standing asunder.
They are very beautiful green-house plants, rising
two or three feet, each crowned by a large um-
bellate cluster of spathaceous, monopetalous,
long funnel-shaped flowers, blue, white, or striped,
having a very fragrant smell. They are prop-
agated by off-sets.

CRIPPLE, *v. a., n. s. & adj.* } Goth. *kryppil*;
CRIPPLENESS, *n. s.* } Ang.-Sax. *cry-
pel*; Dut. *krepel*. Mr. Whiter derives cripple
from grapple, and Junius from *κραπαλη*; but
Mr. Todd justly observes, that the root is clearly
to be found in creep; and, indeed, our old au-
thors wrote it in conformity with this derivation.
See **CREEPLE**. A cripple is a man lame either
by nature or by accident; a man who is obliged
to creep, because he has not the full use of his
limbs. To cripple is to deprive of the use of the
limbs; figuratively, to deprive of the power of
exertion. Crippleness is the state of being a
cripple.

He, poor man, by your first order died,
And that a winged Mercury did bear;
Some tardy *cripple* had the countermand,
That came too lag to see him buried.

Shakspeare, Richard III.

But perhaps justice is denied, or I am *crippled* and
cannot stir, robbed and have not the means to do it.
If God has taken away all means of seeking remedy,
there is nothing left but patience. But my son, when
able, may seek the relief of the law, which I am de-
nied: he or his son may renew his appeal, till he
recover his right. *Locke.*

I am a *cripple* in my limbs; but what decays are
in my mind, the reader must determine. *Dryden.*

Knots upon his gouty joints appear,
And chalk is in his *crippled* fingers found. *Id.*

See the blind beggar dance, the *cripple* sing,
The sot a hero, lunatick a king. *Pope.*

Tettyx, the dancing-master, threw himself from
the rock, but was *crippled* in the fall. *Addison.*

For he has wings, that neither sickness, pain,
Nor penury can *cripple* or confine,
No nook so narrow but he spreads them there
With ease, and is at large. The oppressor holds
His body bound; but knows not what a range
His spirit takes, unconscious of a chain. *Cowper.*

CRISIS, *n. s.* Fr. *crise*; Ital. *crisa*, *crisi*;
Span. and Lat. *crisis*; *κρίσις*. The critical mo-
ment at which a disease either becomes mortal,
or changes to the better; the decisive point of
time in any affair.

Wise leeches will not vain receipts obtrude;
Deaf to complaints, they wait upon the ill,
Till some safe *crisis* authorize their skill. *Dryden.*

This hour's the very *crisis* of your fate;
Your good or ill, your infamy or fame,
And all the colour of your life, depends
On this important now. *Id. Spanish Friar.*

The undertaking, which I am now laying down, was
entered upon in the very *crisis* of the late rebellion,
when it was the duty of every Briton to contribute his
utmost assistance to the government, in a manner
suitable to his station and abilities.

Addison's Freeholder.

Such men are raised to station and command,
When Providence means mercy to a land.
He speaks, and they appear; to him they owe
Skill to direct, and strength to strike the blow;
To manage with address, to seize with power
The *crisis* of a dark decisive hour. *Cowper.*

Is there nothing that whispers to the right honour-
able gentleman that the *crisis* is too long, that the
times are too gigantic, to be ruled by the little hack-
neyed and every-day means of ordinary corruption?—
or are we to believe, that he has within himself a
conscious feeling that disqualifies him from rebuking
the ill-timed selfishness of his new allies? *Sheridan.*

CRISIS, in medicine, is used in different
senses, both by the ancient and modern phy-
sicians. With some it means frequently no
more than the excretion of any noxious sub-
stance from the body. Others take the word for
a secretion of the noxious humors made in a
fever. Others use it for the critical motion
itself; and Galen defines a crisis in fevers, the
point at which it changes finally for better or
worse.

CRISP, *v. a. & adj.* } Old Fr. *erespe*; Ital.
CRISPATION, *n. s.* } and Sp. *erespo*; Ang-
CRISPNESS, *n. s.* } Sax. *crypsian*; Latin,
CRISPY, *adj.* } *crispus*. To curl; to
CRISPING-IRON, *n. s.* } twist; to indent; to
CRISPING-PIN, } make wavy. Crispation
is, the act of curling; the state of being curled.

Crisp signifies, curled; indented; brittle; brisk, like liquor that sparkles. Crispy, and crispness, mean curled; curledness. Crisping-iron, and crisping-pin, are the ancient names of curling-irons.

The changeable suits of apparel, and the mantles, and the wimples, and the *crisping-pins*. *Isaiah* iii. 22.

His *crispe* here like rings was yronne,
And that was yelwe, and glitered as the sonne.

Chaucer. Cant. Tales.

Her tress also should be of *crisped* gold. *Wjatt*.
Her yellow lockes, *crisped* like golden wyre,
About her shoulders weren loosely shed.

Spenser. Faerie Queene.

You nymphs, called Naiads, of the winding brooks,
With your sedged crowns, and ever harmless looks,
Leave your *crisp* channels, and on this green land
Answer your summons; Juno does command.

Shakspeare. The Tempest.

Severn, affrighted with their bloody looks,
Ran fearfully among the trembling reeds,
And hid his *crisped* head in the hollow bank.

Id. Henry IV.

So are those *crispy* snaky lockes, oft known
To be the dowry of a second head.

Id. Merchant of Venice.

Young I'd have him too;
Yet a man, with *crisped* hair,
Cast in thousand snares and rings,
For love's fingers, and his rings.

Ben Jonson.

Friar, you must have
Your neat *crisp* claret.

Beaumont and Fletcher.

In frosty weather, musick within doors soundeth better; which may be by reason, not of the disposition of the air, but of the wood or string of the instrument, which is made more *crisp*, and so more porous and hollow.

Bacon.

Some differ in the hair and feathers, both in the quantity, *crispation*, and colours of them; as he lions are hirsute, and have great manes; the she's are smooth, like cats.

Id.

The Ethiopian black, flat-nosed, and *crisp-haired*.

Hale.

Along the *crisped* shades and bowers
Revels the spruce and jocund spring.

Milton.

From that saphire fount the *crisped* brooks,
Rolling on orient pearl and sands of gold,
Ran nectar, visiting each plant.

Id.

Spirit of wine is not only unfit for inflammations in general, but also *crisps* up the vessels of the dura mater and brain, and sometimes produces a gangrene.

Sharp's Surgery.

There, ranged in reverend majesty,
The taper shafts ascending high

To decorate the *crispd* roof

Their mingling branches shoot aloof:

Where, blazoned in projecting gold,

Flame the proud crests of Barons' bold.

Huddesford.

CRISPIANUS, and CRISPINUS, two legendary saints, whose festival is on the 25th of October. They are said to have been brethren, born at Rome; whence they travelled to Soissons in France, about A.D. 303, to propagate the Christian religion; and, that they might not be chargeable to others for their maintenance, they exercised the trade of shoemakers; but the governor of the town, discovering them to be Christians, ordered them to be beheaded: from which

time the shoe-makers have claimed them as their tutelary saints.

CRISPISU'LCANT, *adj.* Lat. *crispisucans*. Waved, or undulating, as lightning is represented.

CRISTA GALLI. See ANATOMY. This process is so named from its figure, which resembles a cock's comb. To it is fastened that part of the dura mater which divides the brain, called falx. In adults this process appears of a piece with the septum narium.

CRITERION, *n. s.* Κριτηριον. A mark by which any thing is judged of, with respect to its badness or goodness.

Mutual agreement and endearments was the badge of primitive believers; but we may be known by the contrary *criterion*. *Glauville's Scepis.*

We have here a sure infallible *criterion*, by which every man may discover and find out the gracious or ungracious disposition of his own heart. *South.*

By what *criterion* do you eat, d'ye think,
If this is prized for sweetness, that for stink?

Pope's Horace.

To proceed in this manner, that is, to proceed with a presiding principle, and a prolific energy, is with me the *criterion* of a profound wisdom. *Burke.*

Saws of experience, sage and sound.

Say, man's true, genuine estimate,

The grand *criterion* of his fate,

Is not, Art thou high or low?

Did thy fortune ebb or flow?

Did many talents gild thy span?

Or frugal nature grudge thee one?

Burns.

Can any thing be of more consequence to man, than to know what is his duty, and how he may arrive at happiness? It is from the examination of his own heart that he receives the first intimations of the one, and the only sure *criterion* of the other. *Beattie.*

CRITHE, in surgery, commonly called the sty, a sort of tubercle that grows on the eyelids. See SURGERY.

CRITHMUM, samphire, in botany, a genus of the digynia order and pentandria class of plants; natural order forty-fifth, umbellatæ. The fruit is oval and compressed, the florets equal. There are two species, the principal of which is *C. maritimum*, the common maritime samphire, produced naturally on the sea-coast among the gravel and rocks. Its leaves are an excellent pickle for sauces, and are by many eaten raw in salads.

CRITHOMANCY, from κριθη, barley, and μαντεια, divination, a species of divination, by considering the dough or matter of the cakes offered in sacrifice, and the meal strewed over the victims to be killed. Barley meal was commonly used; whence the name.

CRITICK, *v. n., n. s., & adj.*

CRITICAL, *adj.*

CRITICALLY, *adv.*

CRITICALNESS, *n. s.*

CRITICISE, *v. n.*

CRITICISER, *n. s.*

CRITICISM, *n. s.*

CRITIQUE, *n. s.*

Fr. *critiquer*; κριτικος. To critic and to criticize are synonymous; but the former verb is now nearly superseded by the latter. They signify, to examine; to investigate; to point out defects or beauties; to write remarks on any work; to play the critic. Critic,

criticism, and critique, are also equivalent terms, denoting critical remarks; the science of criticism; but the first of these words is disused in these senses. It now designates a man whose profession it is to judge of literary works; a man skilled in any art or science; a criticiser; a snarler; a censurer. Critical is, nicely judicious; relating to criticism; captious; important; momentous. Critically means, in a critical manner; at the exact point of time.

What wouldst thou write of me, if thou shouldst praise me?—

O, gentle lady, do not put me to 't;
For I am nothing, if not *critical*.

Shakspeare. Othello.

The moon is supposed to be measured by sevens, and the *critical* or decretory days to be dependent on that number.

Brown's Vulgar Errors.

This settles truer ideas in men's minds of several things, whereof we read the names in ancient authors, than all the large and laborious arguments of *criticks*.

Locke.

If ideas and words were distinctly weighed, and duly considered, they would afford us another sort of logick and *critick* than what we have hitherto been acquainted with.

Id.

Nor would I have his father look so narrowly into these accounts, as to take occasion from thence to *criticise* on his expences.

Id.

What you say about *criticks* and *critical* interpretations, particularly of the Holy Scriptures, is not only in my opinion very true, but of great use to be observed on reading learned commentators, who not seldom make it their business to show in what sense a word has been used by other authors; whereas the proper business of a commentator is barely to show in what sense a word has been used by the author in that place.

Id.

They do but trace over the paths that have been beaten by the ancients; or comment, *critick*, and flourish upon them.

Temple.

Virgil was so *critical* in the rites of religion, that he would never have brought in such prayers as these, if they had not been agreeable to the Roman customs.

Stillingfleet.

I should be glad if I could persuade him to continue his good offices, and write such another *critick* on any thing of mine.

Dryden.

Criticism, as it was at first instituted by Aristotle, was meant a standard of judging well.

Id.

They who can *criticise* so weakly, as to imagine I have done my worst, may be convinced, at their own cost, that I can write severely with more ease than I can gently.

Id.

Difficult it is to understand the purity of English, and *critically* to discern good writers from bad, and a proper stile from a corrupt one.

Id.

Nor shall I look upon it as any breach of charity, to *criticise* the author, so long as I keep clear of the person.

Addison.

There is not a Greek or Latin *critick*, who has not shewn, even in the style of his *criticisms*, that he was a master of all the eloquence and delicacy of his native tongue.

Id.

Now learn what morals *criticks* ought to show, For 'tis but half a judge's task to know.

Pope.

What is every year of a wise man's life, but a censure and *critique* on the past?

Id.

Not that my quill to *criticks* was confined;
My verse gave ampler lessons to mankind.

Id.

Thence arts o'er all the northern world advanced,
But *critick* learning flourished most in France. *Id.*

Know well each ancient's paper character;
Without all this at once before your eyes,
Cavil you may but never *criticise*. *Id.*

Criticism, contrary to all other faculties of the intellect, is ever held the truest and the best, when it is the first result of the *critic's* mind; as fowlers reckon the first aim for the surest, and seldom fail of missing the mark, if they stay not for the second.

Swift.

The people cannot but resent to see their apprehensions of the power of France, in so *critical* a juncture, wholly laid aside.

Id.

Where an author has many beauties consistent with virtue, piety, and truth, let not little *criticks* exalt themselves, and shower down their ill-nature. *Watts.*

Gulliver's Travels are a sort of allegory, but rather satirical and political than moral. The work is in every body's hands, and has been *criticised* by many eminent writers.

Beattie.

This folio of four pages, happy work!
Which not e'en *critics* *criticise*; that holds
Inquisitive Attention, while I read,
Fast bound in chains of silence, which the fair,
Though eloquent themselves, yet fear to break;
What is it, but a map of busy life,
Its fluctuations, and its vast concerns? *Cowper.*

Attend, ye virgin *critics*, shrewd and sage,
Ye matron ensors of this childish age,
Whose peering eye and wrinkled front declare
A fixed antipathy to young and fair;
By cunning, cautious, or by nature, cold,
In maiden madness, virulently bold! *Sheridan.*

DAN. Well, Sir Fretful, I wish you may be able to get rid as easily of the newspaper *criticisms* as you do of ours.

Id.

They cannot read, and so don't lisp in *criticisms*;
Nor write, and so they don't affect the muse.

Byron. Beppo.

CRITICISM, is the art of judging with propriety, concerning any object or combination of objects. In a more limited sense, the science of criticism is confined to the fine arts. The principles of the fine arts are best unfolded by studying the sensitive part of our nature, and by learning what objects are naturally agreeable and what are naturally disagreeable. But the man who aspires to be a critic in these arts, must pierce still deeper: he must clearly perceive what objects are lofty, what low, what are proper and improper, what are manly, and what are mean or trivial. Hence a foundation for judging of taste, and for reasoning upon it; where it is conformable to principles, we can pronounce with certainty that it is correct; otherwise, that it is incorrect, and perhaps whimsical. Thus the fine arts, like morals, become a rational science; and, like morals, may be cultivated to a high degree of refinement. See **BEAUTY**.

CRITO, an Athenian philosopher, who flourished A. A. C. 400. He was one of the most zealous disciples of Socrates, and supplied him with whatever he wanted. Several pupils of his proved eminent men, and he composed some dialogues which are lost.

CRITOLAUS, a citizen of Tegea in Arcadia, who, with his two brothers fought against the three sons of Demostratus of Pheneus, to put an end to a long war between their respective

nations. The brothers of Critolaus were both killed, and he alone remained to withstand his three antagonists. He conquered them; and when at his return his sister deplored the death of one of his antagonists, to whom she was betrothed, he killed her in a fit of resentment. The offence deserved capital punishment; but he was pardoned on account of the services he had rendered his country. He was afterwards general of the Achæans; and is said to have poisoned himself because he had been conquered at Thermopylæ by the Romans, about A. A. C. 146.

CROAK, *v. n.* & *n. s.* } Old Fr. *croaquar* ;
CROAKING, *n. s.* & *adj.* } modern Fr. *croasser* ;
CROAKER, *n. s.* } Ital. *crocidare*, *cro-*
cidare ; Ang.-Sax. *croccetan* ; Lat. *crocitare* ; Sw. *kroaka* ; *kravye*. To make a hoarse dissonant noise, like a frog; to caw or cry, as a raven or crow; figuratively to make any unpleasant hoarse sound. Croak is the cry or voice of a frog or raven. A croaker is one who is perpetually complaining, starting difficulties, and anticipating evil.

Yeeld me an hostry mongst the croking frogs,
And harbour here in safety from those ravenous dogs.

Spenser. Faerie Queene.

The raven himself is hoarse,
That croaks the fatal entrance of Duncan
Under my battlements. *Shakspeare. Macbeth.*

The subtle swallow flies about the brook,
And querulous frogs in muddy pools do croak.

May's Virgil.

Their understandings are but little instructed, when
all their whole time and pains is laid out to still the
croaking of their own bellies. *Locke.*

The hoarse raven on the blasted bough,
By croaking from the left, presaged the coming blow.

Dryden.

The swallow skims the river's watry face ;
The frogs renew the croaks of their loquacious race.

Id.

Was that a raven's croak, or my son's voice ?
No matter which, I'll to the grave and hide me. *Lee.*

At the same time the walk of elms, with the croak-
ing of the ravens, looks exceeding solemn and venera-
ble. *Addison.*

So when Jove's block descended from on high,
Loud thunder to its bottom shook the bog,
And the hoarse nation croaked. *Pope.*

Blood, stuffed in skins, is British christian's food ;
And France robs marshes of the croaking brood. *Gay.*

The raven croaks forlorn on naked spray :
And hark ! the river, bursting every mound,
Down the vale thunders, and with wasteful sway
Uproots the grove, and rolls the shattered rocks away. *Beattie.*

Thus kings were first invented, and thus kings
Were burnished into heroes, and became
The arbiters of this terraqueous swamp ;
Storks among frogs, that have but croaked and died. *Cowper.*

The croaking nuisance lurked in every nook ;
Nor palaces, nor even chambers, escaped :
And the land stank, so numerous was the fry. *Id.*

There the hoarse stag his croaking rival scorns,
And butts and parries with his branching horns. *Darwin.*

CROATIA, a country of Europe, and part
of the ancient Illyricum, bounded on the east by

Slavonia and Bosnia, on the south and south-
west by Morlachia, on the west by Carniola, and
on the north by the Drave, which separates it
from a part of Slavonia. It is about 160 miles
long, and from sixty to 100 broad. In the
eleventh century, Croatia and Dalmatia devolved
to the king of Hungary; and has ever since
continued under the dominion of that monarchy,
except a small part subject to the Turks. It is
divided into two parts, viz. that under, and that
beyond the Save. In the wars between the em-
press queen and Frederic the Great, of Prussia,
above 50,000 men were raised out of this small
territory. Both horse and foot are good soldiers,
especially the former. The soil, where cultivated
is fruitful in wine and oil, &c. but being a frontier
country, it is not so well cultivated as otherwise
it might be. Carlstadt is the capital. Austrian
Croatia is thus distributed.

	Sq. Mi.	Pop.
1. The Banat, or civil department, composed of the counties of Zagrao, Warasdin, and Creutz	3927	370,000
2. The Generalat, or military division, comprising the districts of Carlstadt, Warasdin, and the Banalgranze	5340	380,000
3. The Littoral (otherwise called Hungarian Dalmatia), being the maritime tract between Fiume and Carlopago	154	50,000
Total	9421	800,000

The first of these divisions has a government
and provincial states similar to those of Hun-
gary; and the constitution of the second is entirely
military; and the third has a separate governor.
That part of Croatia, which belongs to the
Turks, is seated on the Unna, and is about forty
miles long and twenty broad.

CROATS, light irregular troops from Croatia.
Their method of fighting is the same as the Pan-
dours. They wear a short waistcoat, and long
white breeches, with light boots, and a cap greatly
resembling the hussar cap. Their arms are a
long firelock with rifled barrel, and short bayonet,
a crooked hanger, and a brace of pistols. The
late empress queen of Austria had 5000 of these
troops, the greatest part of which had no pay,
but lived by plunder.

CROCEOUS, *adj.* Lat. *croceus*. Consist-
ing of saffron; like saffron.

CROCITATION, *n. s.* Lat. *crocitatio*. The
croaking of frogs or ravens.

CROCK, *n. s.* } Isl. *kro* ; Swed. *kruka* ;
CROCKERY, *n. s.* } Ang.-Sax. *crocca* ; Germ.
krug ; Welsh, *crochan*. A cup; any vessel made
of earth; a little stool; the soot on a kettle, or
chimney stack. Crockery is earthenware.

And when that drunken was all in the croake,
To bedde went the daughter right anon.

Chaucer. Cant. Tales.

Therefore the vulgar did about him flocke,
And cluster thicke unto his leasings vaine,
Like foolish flies about an honey crocke.

Spenser. Faerie Queene.

I bid her come out of the crowd, and seated her upon a little *crook* at my left hand. *Tatler*.

CROCKET, *n. s.* Fr. *croc*. An ornament with which, in Gothic architecture, the edges of gable ends, the angles of pinnacles, and other parts, are adorned.

CROCODILE, *n. s.* From *κροκος*, saffron, and *δαλων*, fearing; because the animal was supposed to dislike or fear saffron. An amphibious and voracious animal, in shape resembling a lizard, and found in Egypt and the Indies. See **LACERTA** and **CROCODILE**, fossil.

By muddy shore of broad seven-mouthed Nile,
Unweeting of the perilous wandering wayes,
Doth meet a cruell craftie *crocodile*.

Spenser. Faerie Queene.

Gloster's show

Beguiles him; as the mournful *crocodile*
With sorrow snares relenting passengers.

Shakespeare. Henry VI.

Crocodiles were thought to be peculiar unto the Nile.

Broune's Vulgar Errors.

Enticing *crocodiles*, whose tears are death;
Syrus, that murder with enchanting breath.

Glanville.

Cæsar will weep, the *crocodile* will weep. *Dryden.*

Crocodile is also a little animal, otherwise called *stinx*, very much like the lizard, or small *crocodile*. It lives by land and water; has four short small legs, a very sharp muzzle, and a short small tail. It is pretty enough to look at, being covered all over with little scales of the color of silver, intermixed with brown, and of a gold color upon the back. It always remains little. *Trevour.*

In silent herds the wandering sea-calves leave,
Or nod their slimy foreheads o'er the wave;
Poised on still wing attentive vultures sweep,
And winking *crocodiles* are lulled to sleep. *Darwin.*

CROCODILE, in zoology. See **LACERTA**.

CROCODILE, in rhetoric, a name sometimes given to a captious and sophistical kind of argumentation, contrived to seduce the unwary, and draw them speciously into a snare. It has its name from the following fable, invented by the poets. A poor woman, begging a *crocodile*, that had caught her son walking by the river side, to spare and restore him, was answered, that he would restore him, provided she should give a true answer to a question he should propose; the question was, Will I restore thy son or not? To this the poor woman, suspecting a deceit, sorrowfully answered, Thou wilt not: and demanded to have him restored, because she had answered truly. Thou lyest, says the *crocodile*; for if I restore him thou hast not answered truly; I cannot, therefore, restore him without making thy answer false. Under this head may be reduced the propositions called *mentientes* or insolubles; which destroy themselves.

CROCODILINE, *adj.* Lat. *crocodilinus*. Like a *crocodile*.

CROCUS, *n. s.* A flower.

Fair handed Spring unbosoms every grace,
Throws out the snow-drop and the *crocus* first.

Thomson.

CROCUS, in botany, saffron, a genus of the monogynia order, and triandria class of plants; natural order sixth, *ensatæ*: cor. sexpartite and

equal; stigmata convoluted or rolled spirally inwards. Species three; of these *C. sativus* has a small roundish, brown, bulbous root, compressed at the bottom. Directly from the root issue many long narrow leaves, of a deep green color; and amidst them the flowers are protruded from a thin univalvular radical spatha; the tube of the flower is long, standing on the root, and serving as a foot-stalk to the limb or upper part, which is erect, six-parted, widens gradually upward, and grows from about three to five or six inches high. The varieties of the first are the *crocus officinalis*, or saffron of the shops; for the properties of which and its cultivation for sale, see **SAFFRON**. It has a long-tubed bluish-purple flower, with three stigmata of a fine golden color. Other varieties are the autumnal small blue *crocus*; deep blue, sky-blue, whitish blue, many flowered whitish blue, purple, large rush-leaved purple, autumnal white *crocus*, and autumnal yellow *crocus*. 2. *C. vernus*, the varieties of which are, the small and large, and golden yellow *crocuses*, and the yellow black striped, the yellow purple-striped and double cloth of gold ones; the white, white purple-striped, white purple-bottom, white black-striped, whitish cream-colored, whitish ash-colored, little narrow-leaved white, and white blue-striped *crocuses*. Besides these there are a great many others of a blue and purple color finely variegated. The autumnal *crocuses* flower about the beginning of October, but never ripen their seeds in this country. They are very beautiful if sown in patches in the front of borders, or in beds by themselves, and very proper ornaments for gardens of every extent, as coming up at a time when most other flowers are on the decay. They grow freely in any kind of soil, and may be propagated by off-sets. The vernal kinds flower in February, March, and April. They are also very ornamental, and are so hardy that they will grow almost any where. They are propagated by seeds, which are produced in plenty. 3. *C. nudiflorus* with three-cleft stigma enclosed in the corolla.

CROCUS, in chemistry, denotes any metal calcined to a red or deep yellow color.

CROCUS of ANTIMONY. See **ANTIMONY**.

CRÆSUS, the last king of Lydia, remarkable for his riches, his conquests, his temporary prosperity, and his sad reverse of fortune. He subdued the Phrygians, Mysians, Paphlagonians, Thracians and Carians; amassed together immense riches; and became one of the most powerful and magnificent princes in the world. Thales of Miletus, Pittacus of Mitylene, Bias of Priene, Cleobulus of Lindus, and most of the other wise men, as they are emphatically styled, who lived in that age, as well as Æsop the fabulist, and the elegant Greek poets of the times, were bountifully received at the court of Cræsus. There is still on record a memorable conversation between that prince and Solon, which seemed to predict the subsequent events of his reign, and which had a late but important influence on the character and fortune of the Lydian king. Cræsus having entertained his Athenian guest, according to the ancient fashion, for several days, ostentatiously showed him the magnificence of

his palace, and particularly the riches of his treasury. After all had been displayed to the best advantage, the king asked him, Whom of all men he esteemed most happy? expecting flattery rather than information. But Solon replied with manly freedom, 'Tellus, the Athenian, who was not conspicuous for his riches or his grandeur, being only a simple citizen of Athens; but was descended from parents who deserved the first honors of the republic, and was equally fortunate in his children.' Cræsus had little encouragement after this answer, to ask Solon, in the second place, Whom next to Tellus, he deemed most happy? Such, however, is the illusion of vanity, that he still ventured to make this demand; and still entertained hopes of being favorably answered. Solon replied with the same freedom as before, 'the brothers Cleobis and Biton; two youths of Argos, whose strength and address were crowned with repeated victory at the Olympic games.' 'And is the happiness of a king, then,' said Cræsus, 'so little regarded, that you prefer to it the mean condition of an Athenian or Argive citizen?'—'The life of man,' replied Solon, 'consists of seventy years, which make 25,550 days; an immense number: yet in the longest life, the events of any one day will not be found exactly alike to those of another. The affairs of men are liable to perpetual vicissitudes; and all human life, if not condemned to calamity, is at least liable to accident. Whoever has uninterruptedly enjoyed a prosperous tide of success may justly be called fortunate: but he cannot before his death be entitled to the epithet of happy.' The events, which soon followed this conversation, proved but too decidedly the wisdom of the sage. Victorious in war, unrivalled in wealth, and supreme in power, Cræsus felt his warmest affection centered in his son Atys, who had often fought and conquered by his side, and who was slain by a dart aimed at a boar, by Adrastus, a Phrygian prince, then in the court of his father. Cræsus had remained two years disconsolate for the loss of this son, when the growing greatness of Persia threatened the safety of his dominions. Being told by the Delphian oracle that if he crossed the Halys, a river between his country and that of Cyrus, it would be the destruction of a great empire, he marched against Cyrus with a vast army, but was defeated; and retreating to his capital Sardis, was there besieged; thus fulfilling in himself the double answer of the Pythian priestess. The city was taken by assault; and as a Persian soldier was going to kill Cræsus, that prince's only surviving son, who had hitherto been dumb, terrified at his danger, cried, 'Stop, soldier, and touch not Cræsus.' He seemed, however, only to be reserved for a harder fate. Dragged into the presence of his conqueror, he was loaded with irons; and the stern Cyrus ordered him, with his Lydian attendants, to be committed to the flames. An immense pile of wood and other combustibles was erected in the most spacious part of the city. The miserable victims, bound hand and foot, were placed on the top of the pyre. Cyrus, surrounded by his generals, witnessed the dreadful spectacle. Hearing his un-

fortunate captive, oppressed by the intolerable weight of his calamity, utter with a deep groan the name of Solon, Cyrus enquired by an interpreter, 'Who he was?' 'He', replied Cræsus, 'whose words ought ever to speak to the hearts of kings.' Being desired to explain himself, he related the important discourse of Solon, of which his fate was the great moral. The words of a dying man make a strong impression on the heart. Those of Cræsus deeply affected the mind of Cyrus, who considered the speech as addressed to himself, and at once relenting in his intended cruelty towards Cræsus, gave orders that he should be seated by his side, and thenceforth treated him as a king. The kingdom of Lydia terminated in the person of this prince, the manner of whose death is unknown.

CROFT, *n. s.* Swed. *kraft*; Ang.-Sax. *craft*. A little close joining to a house, that is used for corn or pasture.

This have I learned,
Tending my flocks hard by, i' the hilly *crofts*
That brow this bottom glade. *Milton.*

CROIA, or CROJA, a town of European Turkey, in Albania, anciently the capital of the Albanian kings. It was fortified in the time of the celebrated Scanderbeg, who greatly harassed the Turks from it. They have since demolished the fortifications. It is a bishop's see, and seated near the Gulf of Venice; thirteen miles north-east, and thirty south of Scutari.

CROISA'DE, or } Fr. *croisade*; Ital. *cro-*
CROISA'DO, *n. s.* } *ciata*; Sp. *crusada*, from
CROI'SES, *n. s.* } *crur*, a cross. A holy war; a war carried on, under the banner of the cross, against infidels. Croises signify, pilgrims who carry a cross; soldiers who, under the banner of the cross, combat with infidels. See CRUSADE.

See that he take the name of Urban, because a pope of that name did first institute the *croisado*; and, as with an holy trumpet, did stir up the voyage for the Holy Land. *Bacon.*

The conquests of the *Croises*, extending over Palestine and a part of Syria, had been erected into a sovereignty, under the name of the kingdom of Jerusalem. *Burke.*

CROISES, or CROIZES, the knights of St. John of Jerusalem, instituted for the defence and protection of pilgrims, were particularly so called from a cross they wore as a badge.

CROISERS, a religious order, founded in honor of the discovery of the cross by the empress Helena. They were, till of late, dispersed in several parts of Europe, particularly in the Netherlands, France, and Bohemia. Those in Italy were suppressed even before the late revolutions. These religious follow the rule of St. Augustine. They had in England the name of *croched friars*.

CROIX. See PETIS.

CROIX (St.), LAKE, a lake of North America, commencing about 500 yards from the mouth of a river of this name, and is from one and a-half to three miles wide, and thirty-six miles in length. The river St. Croix communicates with Lake Superior by the Burnt River, by a reach of half

a mile only, and is by far the most preferable communication that can be had with that lake and the surrounding countries.

CROMACK WATER. a romantic lake of Cumberland, between Buttermere and Lowes-water, with both of which it is connected by the Cocker. It is four miles long, nearly half a mile broad, and has three small isles.

CROMARTY, from *Crom-Ba*, Gaelic, i. e. Crooked Bay, a county of Scotland, which comprehends part of a peninsula, bounded on the north by the bay of Cromarty; on the east and south by the Moray Frith, and on the west by Rosshire. It is only twelve miles long from east to west, and not above four broad. It is well cultivated and fertile. In the reign of James V. it was a forest, and abounded with wolves. It sends a member to parliament alternately with Nairn.

CROMARTY, the capital of the above county, seated on a narrow neck of land, which stretches out into the Moray Frith, at the mouth of Cromarty Bay. It has a considerable coasting trade in corn, thread, yarn, fish, and skins; and a good harbour. A manufacture of hempen cloth is carried on in it.

CROMARTY FRITH, a bay of Scotland, extending between the county of Ross on the north and west, and Cromarty and Ross on the south and east, nearly twenty miles. Its entrance is between the Sutor promontories, distant from one another about a mile and a half. It expands to more than four miles in breadth, but again contracts to less than two. This frith affords a good depth of water almost close to the shore, and the constant shelter of the surrounding country, renders it a most commodious resort for vessels from the northern and eastern seas.

CROMER, a town of England, on the north-east coast of Norfolk, chiefly inhabited by fishermen. It was formerly much larger, and had two churches; but one of these, together with many houses, were overflowed by the sea, which has encroached much on this coast. It has a harbour for fishing vessels, and considerable sums

have been expended, at different times, in attempting to raise a pier, but without success, the sea always washing it away. It is a place of resort for sea-bathing, and has a weekly market on Saturday. It lies twenty-three miles north of Norwich, and 129 N.N.E. of London.

CROMLECH. Welsh *cromlech*; Cornish *cromlech*. Celtic monuments, common in various parts of Europe, particularly in Great Britain. See the next article.

CROMLECH, or **CROMLEH**, in British antiquity, huge, broad, flat stones, raised upon other stones set up on end. They are common in Anglesey. See **ANGLESEY**. These monuments are described by Mr. Rowland, Dr. Borlase, &c. under the name of *Aræ*, or altars. Mr. Rowland, however, is divided in his opinion, supposing them to have been originally tombs, but that in after times sacrifices were performed upon them to the heroes deposited within. Mr. Keiller preserves an account of king Harold having been interred beneath a tomb of this kind in Denmark, and Mr. Wright discovered in Ireland a skeleton deposited under one of them. Mr. Toland mentions a cromlech in Nevern parish in Pembrokeshire, South Wales, having the middle stone eighteen feet high, and nine broad towards the base, but narrowing upwards: and by it there lay a broken piece ten feet in length, which seemed to be of a weight heavier than twenty oxen could draw. But at Poitiers in France, there is one supported by five lesser stones, much exceeding all in the British islands, as it is fifty feet in circumference. This he conceives to have been a 'rocking-stone.' At Bodouyr, in Anglesea, there is a noble cromlech; many of the stones being thirty tons in weight. The following is the appearance of some of the cromlechs of Anglesey.

CROMWELL.

CROMWELL. If we are not absolute converts to the opinion of a respectable modern writer, that 'there is no portion of history in which it so much behoves an Englishman to be thoroughly versed as in that of Cromwell's age,' we attach great importance to this part of our annals, and shall be found, in the article **EXGLAND**, to have considered the relative pretensions of every respectable narrative of its occurrences. The life and character of the Protector himself certainly occupy a large moral and political space, and they have had, therefore, a proportionable degree of attention bestowed upon them by writers of various parties, down to the present time. We shall fully avail ourselves of all the conflicting accounts of this great man with which we are acquainted.

The pedigree of his family is traced to Glothyan, lord Powys, who lived in the eleventh

century, and married Morveth, the daughter and heiress of Edwyn ap Tydwell. William ap Yevan, the head of the family in the fifteenth century, was in the service first of Jasper duke of Bedford, Henry VII's uncle, and afterwards in that of the king himself. His son, Morgan Williams, married a sister of the celebrated Thomas Cromwell, earl of Essex. (See **CROMWELL, THOMAS**.) The eldest son of this marriage was Richard Cromwell, *alias* Williams: the *alias* was long retained by the family in their deeds and wills. He was one of the six challengers who held a tournament in 1540 at Westminster against all comers, and who entered the field richly accoutred, and their horses trapped in white velvet; the knights and gentlemen who rode before them being apparelled in velvet and white sarsnet, and their servants in white doublets, and 'hosen cut in the Burgonian fashion.'

Sir Richard was knighted on the second day, and performed his part so well that the king cried out to him, 'Formerly thou wast my Dick, but hereafter thou shalt be my diamond;' and bade him bear a diamond ring in the fore gamb of the demy lion in his crest.

This Sir Richard Cromwell, being appointed one of the visitors of the religious houses, received for his reward upwards of £30,000 a year out of the church lands, besides which he had great estates in the counties of Cambridge, Bedford, Northampton, and Rutland.

Henry, his eldest son and heir, was knighted by queen Elizabeth, who esteemed him highly, and slept once at his seat, the Nunnery, at Hinchinbrook. From his wealth and liberality he was called the Golden Knight. The death of a second lady Cromwell being charged upon certain witches of Warboys, they were convicted and executed; their property, amounting to £40, being forfeited to Sir Henry, as lord of the manor; who gave it to the corporation of Huntingdon, on condition that a doctor or bachelor of divinity should be procured to preach annually in that town against the sin of witchcraft; a condition regularly fulfilled about thirty years ago.

Robert Cromwell, the father of the protector, was one of his younger sons, and left with an estate of about £300 a year, near the town of Huntingdon. The house in which he resided was either part of the original hospital of St. John, or built upon the site. He married Mrs. Elizabeth Lyne, formerly Steward, of the city of Ely, of a family said to be allied to the royal house of Stuart. Oliver Cromwell was the second of ten children, and the only one of three boys who lived to maturity. His father was in the commission of the peace, and member for the borough of Huntingdon in the parliament of the 35th of Elizabeth: he also entered into a considerable brewing business.

The protector was born 25th April, 1599; when an infant his life was endangered by a monkey kept at his grandfather's, who took him out of the cradle, and carried him upon the leads of the house, to the dreadful alarm of the family (who made beds and blankets ready, in the hope of catching him), but who, at last, brought him safely down. He was also saved from drowning in his youth by the Rev. Mr. Johnson, a curate in the neighbourhood.

During his education, at the grammar-school of his native town, he is said to have been an active and resolute boy, fond of exploits, and little inclined to study. Yet, according to the traditions respecting his youth, he was once excited to uncommon emotion in playing the part of Tactus, who finds a royal robe and a crown, in the old comedy of *Lingua*. In the height of his fortune he is said to have mentioned a gigantic figure which, when he was a boy, opened the curtains of his bed, and told him he should be the greatest person in the kingdom. There is another tale concerning his childhood; that being at his uncle's house at Hinchinbrook when the royal family rested there on their way from Scotland in 1604, he was brought to play with prince Charles, then duke of York, quarrelled with him, beat him, and made his nose bleed,

which was remembered as a bad omen for the king when Cromwell first began to distinguish himself. Mr. Noble relates this only as the tradition of the place, but adds that Hinchinbrook was well known as one of the royal resting-places on the north road. Cromwell was removed in his seventeenth year to Sydney Sussex College, Cambridge, where, though he acquired the name of 'a roisterer,' he seems to have made a respectable proficiency in the learning of the day. He had not been there more than a year when his father died, and he was placed at Lincoln's Inn. Why, specifically, he went thither seems to be as obscure a matter as when he left; but it seems he was but a short time; thus engaged, and, returning to reside upon his paternal property, is said to have led a low and dissolute life. He certainly offended his uncle, Sir Thomas Steward, by his conduct at this time; and wishing, we are told, to get possession of his estate, he petitioned for a commission of lunacy against him, which was refused. But he soon reformed his conduct, for Sir Thomas was reconciled to him, and left him his estate. When he came of age, he married Elizabeth, daughter of Sir James Bourchier, of Essex, a woman who was throughout life of irreproachable character. She brought him a small fortune, and, in the year 1625, he was returned for Huntingdon to king Charles's first parliament. He sat for the same borough in the parliament of 1628, and spoke severely against the promotion of Dr. Manwaring; complaining at the same time of persons who 'preached flat popery.' About this time he openly quitted the church of England, and, becoming a dissenter, occasionally preached among the puritans. A house was recently standing at Huntingdon, where he often 'exercised,' as it was called. Three years afterwards he stocked a grazing farm at St. Ives, and removed thither from Huntingdon. The barn which he built there was standing, and bore his name, when Mr. Noble published his *Memoirs of the Protectoral House*. His sheep-marking irons, having O. C. upon them, were also then in the farmer's possession who held the property. At this period he returned the sums of £30 and £120, which he had won some time before by gaming, thinking it sinful to keep them. The death of Sir Thomas Steward placed him, in 1635, in affluence; and he removed very soon after to the city of Ely. Taking an active share in the local business of the neighbourhood, he opposed an unpopular scheme for draining the fens of Lincolnshire and the Isle of Ely: a work, however, which proceeded when he was protector, and received his patronage.

But Cromwell became suddenly discontented and unsettled in his disposition; and the lords Say and Serle, and Brooke, with Mr. Pym and other distinguished persons, resolving to establish a colony in New England, he joined, after some hesitation, in the scheme. They had freighted eight vessels with emigrants and property, and were ready to sail from the Thames, when the king, by an order in council, forbade their departure, and compelled the intended passengers to come on shore: among these were Hampden, and Cromwell with all his family. We shortly

after find him re-settled in a quiet and pious life at Ely.

His appearance in the Long Parliament, to which he was returned for Cambridge, is thus described by Sir Philip Warwick. 'The first time,' says he, 'that ever I took notice of him, was in the beginning of the parliament held in November 1640, when I vainly thought myself a courtly young gentleman, for our courtiers valued ourselves much upon our good clothes. I came one morning into the house well clad, and perceived a gentleman speaking, whom I knew not, very ordinarily apparelled, for it was a plain cloth suit, which seemed to have been made by an ill, country taylor. His linen was plain, and not very clean; and I remember a speck or two of blood upon his little band, which was not much larger than his collar: his hat was without a hat-band; his stature was of a good size; his sword stuck close to his side, his countenance swoln and reddish, his voice sharp and untunable, and his eloquence full of fervor.' On one occasion upon which he spoke in this parliament, in opposition to lord Kimbolton, he behaved so intemperately, according to lord Clarendon, that the chairman of the committee found himself obliged to reprehend him, and to tell him 'if he proceeded in the same manner, he would presently adjourn the committee, and the next morning complain to the house of him.' On the question of the 'Remonstrance,' he declared to lord Falkland, that if it had not been carried, he would the next morning have sold all he had, and seen England no more.

One day when Cromwell had spoken warmly in the house, lord Digby asked Hampden who he was; the latter is said to have replied, 'That sloven whom you see before you, hath no ornament in his speech; that sloven, I say, if we should ever come to a breach with the king (which God forbid!) in such a case I say, that sloven will be the greatest man in England.'

Cromwell took no leading part during the proceedings which provoked the war, but was only one of those upon whom the leaders of the disaffected party could rely. He was at this time more sincerely a puritan than a politician: but when the war commenced, in 1642, he received a captain's commission, and raised in his own county a troop of horse. And now it was that he gave the first proof of that sagacity which afterwards governed him in every thing, and made him ultimate master of three kingdoms. 'I did labor as well as I could,' he said, 'to discharge my trust, and God blessed me as it pleased him. I had a very worthy friend then, and he was a very noble person, and I know his memory is very grateful to all, Mr. John Hampden. Your troops, said I, are most of them old decayed serving men, and tapsters, and such kind of fellows; and (said I) *their* troops are gentlemen's sons, younger sons, and persons of quality: do you think that the spirits of such base and mean fellows will ever be enabled to encounter gentlemen that have honor and courage, and resolution in them? Truly, I presented him in this manner conscientiously; and truly I did tell him, You must get men of spirit, and, take it not ill what I say (I know you will not), of a

spirit that is likely to go on as far as gentlemen will go, or else I am sure you will be beaten still; I told him so, I did truly. He was a wise and worthy person, and he did think that I talked a good notion, but an impracticable one. Truly I told him I could do somewhat in it; I did so; and truly I must needs say that to you, I raised such men as had the fear of God before them, and made some conscience of what they did; and from that day forward, I must say to you, they were never beaten, and wherever they were engaged against the enemy, they beat continually.'

Cromwell's troop, in fact, were mostly freeholders and freeholders' sons, thoroughly imbued with his own religious opinions, and engaging in the war 'upon matter of conscience,' they invited the celebrated Richard Baxter to be their chaplain. His first military exploit was to take possession of Cambridge for the parliament; and to secure the university plate. At the same time Cromwell paid a visit to his uncle and godfather, Sir Oliver Cromwell, and took away his arms and plate; but behaving towards him with the greatest personal respect. He also kept down the loyal party in Suffolk and Norfolk with great vigilance. At Peterborough his troop occupied themselves with demolishing the painted windows of the cathedral, breaking the organ, defacing tombs and statues, and destroying what they called superstitious books. In other places where the spirit of the party, as religionists, was not called forth, their conduct was more orderly than that of any other of the parliamentary troops. 'No man swears but he pays his twelvenpence,' says one of the journals of the day; 'if he be drunk, he is set in the stocks, or worse; if one calls the other round-head, he is cashiered; inasmuch that the countries where they come leap for joy of them, and come in and join with them.'

'But the relief of Gainsborough,' says White-lock, 'was the beginning of his great fortunes.' Cromwell speaks of having had 'the *execution* of the enemy' two or three miles, and that some of his soldiers killed two or three men each. When part of the marquis of Newcastle's army was defeated this year near Horncastle, he commanded under lord Manchester; his horse was killed under him, and as he rose he was again knocked down by the cavalier who charged him; he was, however, soon remounted, and by a good fortune, that never forsook him, without a wound. At the close of the year he took Hilsdon House by assault, and alarmed Oxford. The battle of Marston Moor occurred soon after. The Scotch, who were in the right wing, were completely routed by the royalists, and, flying in all directions, were taken or knocked on the head by the peasantry; but the fortune of the day was decided by the English horse under Fairfax and Cromwell. The troop of the latter in particular so distinguished themselves on this occasion, as to be afterwards surnamed 'iron-sides.'

Cromwell was now the object of envy and jealousy with the other parliamentary leaders, and not a little elated with his own splendid success. Proposing something to lord Manchester, to which his lordship replied that the parlia-

ment would never approve it, he made answer, 'My lord, if you will stick firm to honest men, you shall find yourself at the head of an army that shall give the law to king and parliament.' A mutual dislike seems after this to have arisen between them. After the second battle of Newbury, Cromwell would have attempted to bring the conflict to a decided issue, by charging the king's army in their retreat; but Manchester thought the hazard too great, and that the evil consequences of a disappointment would be far greater than the possible advantage of a victory; 'for,' said he, 'if they should be routed before Essex's army is reinforced, there would be an end of their pretences; and they should be all rebels and traitors, and executed as such by law.' Cromwell repeated this to the parliament as a proof of lord Manchester's cowardice, when Manchester in return charged Cromwell with the above advice which he had given him, to despise both the king and parliament. This dispute occasioned considerable debate and alarm in the house, and Manchester soon retreated out of the storm. But Essex, the commander-in-chief, thought so fair an opportunity of displacing Cromwell was not to be slighted. To meet his hostile efforts, the self-denying Ordinance, as it was called, was proposed by Cromwell and his partisans. Essex was removed, and Fairfax appointed lieutenant-general. He was now induced to request that the Ordinance might be dispensed with in Cromwell's behalf, first for a limited, and then for an indefinite time.

The king had, at this period, struck a great blow by the taking of Leicester, and his fortunes began to appear still retrievable, when, after some unwise movements, the celebrated battle of Naseby drew on. Prince Rupert, who commanded the royal forces, was, as usual, in the onset irresistible, and Ireton was borne wounded from the field; on this the prince, having broken and routed the wing of the enemy opposed to him, pursued them as if the victory were secure. Charles, in person, was now about to charge Cromwell's horse, at the head of his reserve, when lord Carnewaith suddenly seized his bridle, and exclaimed, 'Will you go upon your death in an instant?' A cry ran through the troops from this interruption, that they should march to the right, in which direction the king's horse had been turned, and which, in the present situation of the battle, was bidding them shift for themselves. In vain the king, with great personal efforts, endeavoured to rally them. All was lost. On the royal side 700, it is said, were killed, and 5000 were taken prisoners together with all the artillery, the king's cabinet, and the baggage.

Cromwell wrote to the speaker of the house of commons: 'Sir, this is none other but the hand of God, and to him alone belongs the glory, wherein none are to share with him. The general served you with all faithfulness and honor; and the best commendation I can give him is, that I dare say he attributes all to God, and would rather perish than assume to himself, which is an honest and a thriving way; and yet as much for bravery may be given to him in this

action, as to a man. Honest men served you faithfully in this action. Sir, they are trusty, I beseech you in the name of God not to discourage them. I wish this action may beget thankfulness and humility in all that are concerned in it. He that ventures his life for the liberty of his country, I wish he trust God for the liberty of his conscience, and you for the liberty he fights for: so thus he rests who is your humble servant, Oliver Cromwell.' During the siege of Bristol, which followed, Fairfax and Cromwell narrowly escaped being killed by the same ball, when the latter declared none but an atheist could deny that their success was the work of the Lord. Cromwell next took Devizes, Winchester, and Basing House, and dispersed the club-men in Hampshire; after which he rejoined Fairfax in the west.

The king, it is well known, now fled towards the north, and delivered himself to the Scotch army, before Newark. In the bargain that afterwards resulted for the possession of his person, Cromwell was conspicuous as a commissioner. In the subsequent division of the public spoils, he received £2500 a year, charged on the estates of the marquis of Worcester.

Of the AGITATORS who rose to power at this time, we have already given some account. See that article. They were Cromwell's devoted creatures. Speaking of the parliamentarians, and the ascendant star of the lieutenant-general, Hollis says 'We fell as low as dust; all was dash't: instead of a generous resistance to the insolencies of perfidious servants, vindicating the honor of the parliament, discharging the trust that lay upon them to preserve a poor people from being ruined and enslaved to a rebellious army, they deliver up themselves and kingdom to the will of their enemies; prostitute all to the lust of heady and violent men; and suffer Mr. Cromwell to saddle, ride, switch, and spur them at his pleasure.'

It is generally agreed that Cromwell was, at this period, desirous of making terms with the king, and that he stipulated for the title of the earl of Essex, now vacant by the death of the late general, to be made first captain of the guards, and vicar-general of the kingdom. He declared, with tears, that the interview between Charles and his children, was 'the tenderest sight that ever his eyes beheld; that never man was so abused as he in his sinister opinion of the king, who, he thought was the most upright and conscientious of his kingdom; and that he only wished that God would be pleased to look upon him according to the sincerity of his heart towards the king.' The republican party, however, prevailed; all he could actually do for the king was, as it seems, to instigate his escape from Hampton Court, with a view, it is probable, to his getting out of the kingdom; though others have supposed that he was directed to Carisbrook only because Cromwell knew he could rely on Hammond as a jailor. The zealots opposed to him, asserted that monarchy was in itself an evil; that the Jews had committed a great sin against the Lord in choosing it; and now, for the first time, avowed a desire of putting the king to death, and establishing a common-

wealth. Cromwell professed to be undecided; he concluded a conference on this solemn topic by flinging a cushion at Ludlow's head, and then running down stairs: the next day he told Ludlow he was convinced of the desirableness, but not of the practicability, of what his party proposed. He was soon, however, compelled to act a more decided part. An accusation was preferred against him in the house of lords by major Huntington, as having instigated the army to disobey and resist the parliament, and as having pledged himself to make the king the most glorious prince in Christendom. The charges passed off, but the general was evidently decided by them to proceed in the diligent way he now did in suppressing the insurrections that arose in favor of the king in Wales, and to resist the Scotch invasion. After defeating the Scotch, he passed to Edinburgh, where he was hailed as a deliverer, and settled the administration of that kingdom, for the parliament, in the hands of the duke of Argyll.

The part which Cromwell took in the ensuing tragedy of the death of the king, was, doubtless, like many of his later measures, forced upon him by others, to whom, and with whom, however, he had first voluntarily committed himself. On the second debate in the house of commons respecting appointing the high court of Justice (January 4th, 1649), he said, 'Should any one have voluntarily proposed to bring the king to punishment, I should have regarded him as the greatest traitor; but since Providence and necessity have cast us upon it, I will pray to God for a blessing on your counsels; though I am not prepared to give you any advice on this important occasion. Even I myself (said he), when I was lately offering up petitions for his majesty's restoration, felt my tongue cleave to the roof of my mouth, and considered this preternatural movement as the answer which heaven, having rejected the king, had sent to my supplications.'

We see in this speech neither the 'levity' nor 'hypocrisy' with which Cromwell has been often said to have acted on this occasion. He appears never to have fully approved the measure of the king's death; yet all the moral responsibility and guilt of the transaction he clearly partook, and that he *felt* it is as clear. We doubt, however, whether for that reason, it was ever a topic of levity with him, and whether, on this occasion he was not too entirely deluded by the canting habit of the times and of his associates, to be found chargeable with insincerity. He was deceived, we believe, far too much, and perhaps judicially, (because he loved the wages of the deceit), to be a hypocrite. It is remarkable to what a point he had screwed up his conscience at this time; that he went to look at the decollated king; opened the coffin himself; put his finger to the neck where it had been severed; and even, inspecting the inside of the body, observed in how healthy a state it had been, and how well made for long life.

It is well known that Cromwell accepted the command in Ireland at a critical period, but he reduced that kingdom to submission with more than his usual energy. Of the battle of Drogheda, which was garrisoned with 1500 men, he writes

with a kind of exultation. 'I do not believe,' he says, 'neither do I hear, that any officer escaped with his life, save only one lieutenant, who, going to the enemy, said he was the only man that escaped of all the garrison. The enemy were filled upon this with much terror, and truly I believe this bitterness will save much effusion of blood, through the goodness of God. I wish that all honest hearts may give the glory of this to God alone, to whom, indeed, the praise of this mercy belongs, for instruments they were very inconsiderable the work throughout.' Lord Clarendon accuses him of instigating all manner of cruelty here, and Ludlow says the slaughter continued two days, and that 'such extraordinary severity was used to discourage others.' It had at any rate this effect: he marched into Munster to receive the keys of Cork, almost without resistance, and in less than six months extinguished all the hopes of the Irish royalists. He returned to fight successively, and with his usual good fortune, the battles of Dunbar and Worcester; by the latter of which the Commonwealth was left without disturbance in its sovereignty. Cromwell called it his 'crowning mercy.'

The Long Parliament had now made themselves odious by their undisguised tyranny and desire to perpetuate their power, by the war which they had provoked with the Dutch, and the severities which they exercised in their high court of justice. Cromwell assembled certain members of parliament, and some of the chief officers, at the speaker's house, and told them it was necessary to come to a settlement of the nation, delivering his own opinion in favor of a settlement in 'some-what of a monarchical power.' The lawyers present were for a mixed monarchy; and some proposed choosing the duke of Gloucester king. Cromwell soon spoke out more plainly: 'Their pride,' said he to Whitlock, 'and ambition and self-seeking, ingrossing all places of honor and profit to themselves and their friends; and their daily breaking forth into new and violent parties and factions; their delays of business, and design to perpetuate themselves and to continue their power in their own hands; their meddling in private matters between party and party, contrary to the institution of parliaments; and their injustice and partiality in those matters, and the scandalous lives of some of the chief of them,—these things do give too much ground for people to open their mouths against them and to dislike them. Nor can they be kept within the bounds of justice and law or reason, they themselves being the supreme power of the nation, liable to no account to any, nor to be controlled or regulated by any other power; there being none superior or co-ordinate with them.' Whitlock, acknowledging the evil, said it would be hard to find a remedy. What, said Cromwell, if a man should take upon him to be king? To this Whitlock replied, that this remedy would be worse than the disease; that being general he had less envy and less danger than if he were called king, but no less power and real opportunities of doing good. He further represented to him that he was environed with secret enemies; that his own officers were elated with success; 'many of them,' said he, 'are busy and of turbulent spirits, and are

not without their designs how they may dismount your excellency, and some of themselves get up into the saddle,—how they may bring you down and set up themselves.' The memorable scene now followed (20th April, 1653), when Cromwell turned out the parliament, and locked the doors of the house of commons. To this succeeded the calling of Bare-bones' parliament: then the renewed dominion of the council of officers, and finally their declaration, called an Instrument of Government, by which they ordained that the government of the Commonwealth should reside in the single person of Oliver Cromwell, with the title of Lord Protector of the Commonwealth of England, Scotland, and Ireland, and a council of one-and-twenty to assist him.

It was further ordained, that the Protector should call a parliament once in every three years, and not dissolve it till it had sat five months; that the bills which were presented to him, if he did not confirm them within twenty days, should become laws without his confirmation; that his select council should not be more in number than twenty-one, nor less than thirteen; that with their consent, he might make laws which should be binding during the intervals of parliament; that he should have power to make peace and war; that immediately after his death, the council should choose another protector, and that no protector after him should be general of the army. He now addressed himself in good earnest to the business of the chief magistracy; made peace with the Dutch and with Portugal, upon terms highly advantageous to England, and caused his friendship to be courted by France and Spain. His first parliament assembled Sep. 3. 1654, and though orders were given that no persons should be chosen who had borne arms on the king's part, nor the sons of any such, and care was taken to return such members as were believed to be the best affected to his government, yet, in the first debate, his authority was questioned; and the assembly was dissolved Jan. the 22nd, 1655. He called his next parliament at the juncture when a war with Spain had made him master of Jamaica, and two well laden treasure-ships had been taken. Most of the members took the test of declared allegiance to the protector; an act was passed binding all men to renounce Charles Stuart and his family; they declared it high treason to attempt the life of the lord protector, and granted him larger supplies than had ever before been raised. Finally, they offered him the title of king. There was great opposition, however, to this; one member applied to him in the house the words of the prophet to Ahab, 'Hast thou killed, and also taken possession?' and after a long and painful struggle in the bosom of his own family, and with himself, he refused the crown on a plea of conscience.

He would now have governed constitutionally, mildly, and even liberally, if he could have done it in his situation. But self-preservation compelled him to a suspicious and severe system, and he was haunted by ten thousand fears. He wore armour under his clothes; would hardly ever sleep two nights together in one chamber; he went abroad surrounded by his guards, and never suffered it to be known which way he was going till he was

in his coach. His last were most miserable days. His final feelings of religion implied a misgiving, concerning his condition in the world on which he was about to enter—we mean the question proposed to his preachers, 'if the doctrine were true, that the elect could never finally fall!' Upon receiving a reply, that nothing could be more certain; 'Then am I safe,' said he, 'for I am sure that *once* I was in a state of grace.' He told his physicians boldly that he should not die, whatever they might think from the symptoms of his disorder, for 'God was far above nature, and had promised his people his recovery.' Thanks were even publicly given for the undoubted pledges of his recovery, which had been vouchsafed! His disease was a slow fever, which terminated in an intermittent, and he died in a lethargic state, 3d September, 1658.

The character of him drawn by lord Clarendon will never be exceeded for truth or beauty; and we transcribe it as most singularly the portrait also of a fortunate modern usurper. Posterity will often compare them. 'He was,' says this great writer, 'one of those men, quos vituperare ne inimici quidem possunt, nisi ut simul laudent; whom his very enemies cannot condemn without commending him at the same time: for he could never have done half that mischief without great parts of courage, industry, and judgment. He must have had a wonderful understanding in the natures and humors of men, and as great a dexterity in applying them; who from a private and obscure birth (though of a good family), without interest or estate, alliance or friendship, could raise himself to such a height, and compound and knead such opposite and contradictory tempers, humors, and interests into a consistence, that contributed to his designs, and to their own destruction; whilst himself grew insensibly powerful enough to cut off those by whom he had climbed, in the instant that they projected to demolish their own building. What was said of Cinna may very justly be said of him, *ausum eum, quæ nemo auderet bonus; perfecisse, quæ à nullo, nisi fortissimo, perfici possent.* He attempted those things which no good man durst have ventured on; and achieved those in which none but a valiant and great man could have succeeded. Without doubt, no man with more wickedness ever attempted any thing, or brought to pass what he desired more wickedly, more in the face and contempt of religion, and moral honesty: yet wickedness as great as his could never have accomplished those designs, without the assistance of a great spirit, an admirable circumspection and sagacity, and a most magnanimous resolution.' To this should be added, that as a chief magistrate, like Napoleon, he was generally inclined to be tolerant, and was liberal in his conduct to different religious parties; that he was a protector of literature and the arts; that his private character, unlike his, seems without a blemish; that he was a faithful husband and a good father; and that he boldly and consistently aided the persecuted Protestants of France.

CROMWELL (Richard), eldest son of Oliver, was by his father appointed successor to the protectorship, but soon deposed by the army, who

discharged his debts, and gave him a protection for six months, on which he retired. On the Restoration he went abroad; but returned in 1630 under the assumed name of Clark, and settled at Cheshunt in Hertfordshire, where he lived privately, and died in 1712, aged 86; leaving several children.

CROMWELL (Oliver), a gentleman recently deceased, was the great-grandson of Henry Cromwell. He practiced as a solicitor in Essex-street, London, for several years, and was clerk to St. Thomas's hospital. He succeeded to the estate of Theobalds, which descended to him through the children of the above Richard Cromwell; and died at Cheshunt Park, Hertfordshire, May 31st, 1821, aged seventy-nine. He wrote the *Memoirs of the Protector, Oliver Cromwell*, and his sons Richard and Henry, illustrated by Original Letters, and other Family Papers, 4to.

CROMWELL (Thomas), earl of Essex, was the son of a blacksmith at Putney, and born in 1498. Without a liberal education, but endowed with a strong natural genius, he became by degrees the confidential favorite, and prime minister of Henry VIII. and from the moment he acquired any authority in the cabinet, employed it in promoting the Reformation, to his zeal for which he became a victim; for, the more firmly to secure the Protestant cause, he contrived to marry the king to Anne of Cleves, whose friends were all Lutherans. Unfortunately Henry took a disgust to this lady, which brought on Cromwell's ruin: the king, with his usual cruelty and caprice, taking the opportunity to sacrifice this minister to the Roman Catholic party, to whom he seemed desirous of reconciling himself, when he had Catharine Howard in view. Cromwell was a great politician, and a good man; but, in his zeal for the new religion, he introduced the unjustifiable mode of attainer in cases of treason and heresy: and his enemies, who were numerous, having preferred many complaints against him, availed themselves of his own law. He was attainted of treason and heresy, convicted unheard, and beheaded in 1540. He was the chief instrument of the suppression of the abbeyes and monasteries, and the destruction of images and relics; to him also we are indebted for the institution of parish registers of births, marriages, and burials.

CRONE, *n. s.* } Anglo-Sax. *crone*; Dutch
CROÏX, *n. s.* } *Kronie*. *Crone* signifies an old ewe; contemptuously, an old woman. *Crony*, which is a word of familiar parlance, is one who is an old acquaintance; one with whom a person is very intimate.

Fresh herrings plenty Michel brings,
With fatted *crones*, and such old things. *Tusser.*

Take up the bastard,
Take 't up, I say; give 't to thy *crone*.
Shakspeare. Winter's Tale.

So when the Scots, your constant *cronies*,
The espousers of your cause and monies.
Hudibras.

The *crone* being in bed with him on the wedding night, and finding his aversion, endeavours to win his affection by reason. *Dryden.*

To oblige your *crony* Swift,
Bringing our dame a new year's gift. *Swift.*

Strange an astrologer should die
Without one wonder in the sky!
Not one of all his *crony* stars
To pay their duty at his herse! *Id.*

— Your sage Belgic *cronies*
Won't in this weighty point mislead ye,
Consult them and *experto crede*. *Huddesford.*

CRONEL, or CRONELL, in heraldry, the iron head of a tilting spear, often borne in coat armour, as sable, a chevron, ermine, between three cronels, argent; name, Wiseman.

CRONENBURG, or CRONBORG, a strong fortress of Denmark, in the isle of Zealand, situated on a point of land, on the west coast of the Sound, a little to the east of Elsinour and opposite to Helsingborg, in Sweden. It was built in 1577 by Frederick II. on piles of oak, and pillaged by the Swedes in 1658, who took away among the spoils, some statues of massy silver. It was restored to Denmark in 1660. Queen Matilda was imprisoned in it, before she was removed to Zell. About half a mile from it is a garden called Hamlet's Garden, which, tradition says, is the spot where that prince's father was murdered by his brother. It is flanked with four towers; contains extensive barracks; and is accounted one of the keys of the kingdom, being intended to guard the passage of the Sound; but the British fleet passed it on 29th March, 1801. Criminals are confined in this fortress. In the neighbourhood is a government manufactory of fire-arms. It is twenty-four miles north of Copenhagen.

CRONET, or CRONET, *n. s.* Fr. *couronne*; Dutch *kroon*. The hair which grows over the top of a horse's hoof.

CRONIUS, or CRONIUS, in chronology, the ancient name of the Athenian month Hecatomhæon; which was the first of their year, and answered to the latter part of our June and beginning of July.

CRONSTADT, or the Crown City, a seaport town of Russia, situated on the island of Retusari, in the gulf of Finland. It was founded by Peter I. on account of its safe harbour, and as forming a strong bulwark by sea for the defence of his new metropolis. The greatest part of the Russian fleet usually lies here. The only passage by which ships of burden can approach Petersburg lies on the south side of Retusari, through a narrow channel; one side of which is commanded by Cronstadt, and the opposite by Cronslot and the citadel. All large vessels must sail between Cronstadt and these two fortresses, exposed to the fire of the opposite batteries; for the other parts of the gulf are only from one to eleven feet in depth. All these fortifications, when first built, were esteemed places of considerable strength; but they would offer feeble resistance to the attack of a powerful fleet. Cronstadt is built upon the south-east extremity of the island, and is defended towards the sea by wooden piers projecting into the water and towards the land by ramparts and bastions. It is a very straggling place, and occupies, like all the Russian towns, a larger space of ground than the number of inhabitants seems to require; their houses are mostly of wood, excepting a few fronting the harbour,

which are of brick stuccoed white. Among the latter are the imperial hospital for sailors, the barracks, and the academy for marines and officers of the navy. Cronstadt has a separate haven appropriated to the men of war, and another to merchant ships. The largest is the merchants' harbour, which is fitted to contain 600 vessels, and is touched at by most ships going to St. Petersburg, but is exposed, as well as the middle harbour, to the west wind. The war harbour, which is designed for ships of war which are on service, or stand in need of repairs, is of small size and depth, and the brackishness of the water often produces rot. The man of war's mole, as it is called, is a structure, enclosed by a strong rampart of granite, built in the sea, and containing a foundry for casting cannon, and a rope-work for manufacturing cables of all sizes, naval stores, &c. Close to the merchants' harbour is a canal, with several dry docks, begun in 1719 by Peter I. for the purpose of refitting the men of war. This useful work was neglected under his successors, and was not completed until the reign of his daughter Elizabeth. It has since been further improved, and is now used for building as well as careening ships of the line. At the extremity of these docks is a reservoir, constructed of granite, 568 feet in length, which contains water more than sufficient to supply all the docks, and is pumped into them by a steam engine. The length of this work, from the beginning of the canal to the end of the last dock, is 4221 feet. The sides of the docks are faced with stone, and the bottom is paved with granite. They are forty feet deep, and 105 broad; and are capable of containing nine men of war upon the stocks. A few miles below Cronstadt lie the guardships for the protection of the revenue, and the examination of passports. The number of vessels that entered the Neva, (and of course passed by Cronstadt), in 1817, was about 2000, and the departures were nearly as many. The principal exports are iron, flax, hemp, linseed, oil, and tar. Cronstadt is twenty miles west of Petersburg, and contains a population of about 40,000.

CRONSTEDT (Axel-Frederick), a Swedish mineralogist, born in 1722, and educated at the university of Upsal, where he paid particular attention to the study of natural history. In 1742 he was admitted into the college of mines, and in 1744 he was employed to inspect the mines of Sweden. In 1753 he became a member of the Royal Academy of Sciences at Stockholm; and in 1758 he was appointed inspector of all the western mines of the kingdom. He published *An Attempt towards an Arrangement of Minerals*, or of the different substances of the mineral kingdom; and several other tracts on mineralogy. He died in 1745, aged forty-three.

CROOK, <i>v. a., v. n. & n. s.</i>	} Fr. <i>crocher</i> ; Goth. and Swed. <i>krok, kroka</i> ; Welsh <i>crwcca</i> ; Dut. <i>krook</i> . To crook is to curve; to be curved; to deflect from the proper line.
CROOKED, <i>adj.</i>	
CROOKEDLY, <i>adv.</i>	
CROOKEDNESS, <i>n. s.</i>	
CROOKEN, <i>v. a.</i>	
CROOKBACK, <i>n. s.</i>	
CROOK-BACKED, <i>adj.</i>	
CROOK-KNEED, <i>adj.</i>	
CROOK-SHOULDERED, <i>adj.</i>	

Crook signifies, any crooked instrument; a sheep-hook; a meander; an artifice; a gibbet. To crooken is an obsolete verb, meaning, to make crooked. Crooked, crookedly, and crookedness, in their direct sense, of course denote curvature; and from this flows naturally the metaphorical sense, of pervers; obstinate; bad-tempered.

They have corrupted themselves: they are a perverse and crooked generation. *Deut. xxxii. 5.*

He made the people piously to sing,
For er the bishop hent hem with his crook,
They weren in the archedekens book.

Chaucer. Cant. Tales.

Ful crokid were her bondis two,
For coverise is evir wode
To gripin other folkis gode.

Id. The Romaunt of the Rose.

To grounde as dede she fallith as a stone,
She cramphiseth her limmis crokidyly.

Id. Amnelida and False Arcite.

For beauty with her band
These croked cares hath wrought,
And shipped me into the land
From whence I first was brought.

Sonjyes and Sonnettes.

His tyreling jade he fierly forth did push
Through thicke and thin, both over banck and bush,
In hope her to attaine by hooke or crooke.

Spenser. Faerie Queene.

At last, with creeping crooked pace forth came
An old, old man, with beard as white as snow,
That on a staffe, his feeble steps did frame. *Id.*

Whence he with crooked claws so long did crall,
That at the last he found a cave with entrance small. *Id.*

There fall those saphire-coloured brooks,
Which conduit-like, with curious crooks,
Sweet islands make in that sweet land. *Sidney.*

He that knoweth what is straight, doth even thereby
discern what is crooked; because the absence of
straightness, in bodies capable thereof, is *crookedness*.

Hooker.

Being moved, he strikes whatever is in his way,
And whom he strikes his crooked tushes slay. *Shakspeare. Venus and Adonis.*

Hence, heap of wrath; foul, indigested lump!
As crooked in thy manners as thy shape.

Id. Henry VI.

Ay, crookback, here I stand to answer thee,
Or any he the proudest of thy sort. *Id.*

Whatsoever affairs pass such a man's hands, he
crooketh them to his own ends; which must needs be
often eccentric to the ends of his master or state.

Bacon.

Their shoes and pattens are snouted and piked more
than a finger long, *crooking* upwards. *Camden.*

When the heathens offered a sacrifice to their false
gods, they would make a severe search to see if there
were any *crookedness* or spot, any uncleanness or de-
formity, in their sacrifice.

Taylor's Worthy Communicant.

If we walk perversely with God, he will walk
crookedly towards us. *Id. Rule of Living Holy.*

I sing the man who Judah's sceptre bore
In that right hand which held the crook before.

Cowley.

A man shall never want *crooked* paths to walk in,
if he thinks that he is in the right way, wherever he
has the footsteps of others to follow. *Locke.*

There are millions of truths that a man is not, or
may not think himself, concerned to know; as whe-
ther our king Richard III. was *crookbacked* or no. *Id.*

We were not born *crooked*; we learned those windings and turnings of the serpent. *South.*

A bell or a cannon may be heard beyond a hill which intercepts the sight of the sounding body; and sounds are propagated as readily through *crooked* pipes, as through straight ones. *Newton's Opticks.*

He left his *crook*, he left his flocks,
And wandering through the lonely rocks,
He nourished careless woe. *Prior.*

She that would raise a noble love, must find
Ways to beget a passion for her mind;
She must be that which she to be would seem;
For all true love is grounded on esteem;
Plainness and truth gain more a generous heart,
Than all the *crooked* subtleties of art. *Buckingham.*

It is highly probable, that this disease proceeds from a redundant acidity, because vinegar will soften and *crook* tender bones. *Arbuthnot on Diet.*

Among the *crooked* lanes on every hedge,
The glow-worm lights his gem. *Thomson's Summer.*

Unhappy they, confiding in the length
Of horny beak, or talon's *crooked* strength,
Who durst abide his rage; the blade descends,
And from the panting trunk the pinion rends. *Beattie.*

Yet is thy root sincere, sound as the rock,
A quarry of stout spurs, and knotted fangs,
Which *crooked* into a thousand whimsies, clasp
The stubborn soil, and hold thee still erect. *Cowper.*

Thus men go wrong with an ingenious skill;
Bend the straight rule to their own *crooked* will;
And with a clear and shining lamp supplied,
First put it out, then take it for a guide. *Id.*

CROOKED ISLAND, or rather a cluster of islands of the Bahama group, is known as, North Crooked Island, South Crooked Island, commonly called Acklin's Island, and Long Key, or Fortune Island. Castle Island is very small, and situated at the south end of Acklin's, which is the largest of the group, being about fifty miles in length. North Crooked Island is about twenty-one miles long, and from two to six broad; Long Key is about two miles in length, and very narrow. It contains a valuable salt pond. Long. of the middle of Crooked Island 74° W., lat. 22° 30' N.

CROOKED LAKE, a lake of North America, in the state of New York, eighteen miles in length. Forty miles south of Lake Ontario.

CROOKED LAKE, one of the chain of small lakes which connect the lake of the Woods with Lake Superior, on the boundary line between the United States and Upper Canada, remarkable for its rugged cliffs, in the cracks of which are a number of arrows sticking.

CROOKED REACH, a channel in the straits of Magellan, between the South American shore and an island in the strait. It is about four miles broad, and extends between Elizabeth Bay and Cape Quod.

CROOKED RIVER, a river of the United States n. Camden county, Georgia, which runs into the opposite Cumberland Island, twelve or fourteen miles north from the mouth of St. Mary's. Its banks are well wooded, and its course is east by north.

CROP, *n. s.* } Swed. *kropp*; Dut. *krop*,
CROPSFUL, *adj.* } *kroppe*; Ang.-Sax. *crop*.
CROPSICK, *adj.* } The craw, or first stomach
CROPPER, *n. s.* } of a bird. Cropful is,

filled perfectly; cropsick, sick from repletion; cropper, a kind of pigeon which has a large crop.

He, stretched out all the chimney's length,
Basks at the fire his hairy strength;
And *crop-full*, out of door he flings
Ere the first cock his matin rings. *Milton.*

There be tame and wild pigeons; and of tame
there be *croppers*, carriers, runts. *Walton's Angler.*

In birds there is no mastication or comminution of the meat in the mouth; but in such as are not carnivorous, it is immediately swallowed into the *crop* or *craw*. *Ray.*

But fluttering there they nestle near the throne,
And lodge in habitations not their own,
By their high *croops* and corny gizzards known. *Dryden.*

Strange odds! where *crop-sick* drunkards must
engage
A hungry foe, and armed with sober rage. *Tate's Juvenal.*

So, stooping down from hawthorn top,
He thought to put him in his *crop*.
The worm, aware of his intent,
Harangued him thus, right eloquent. *Cowper.*

CROP, *v. a., v. n. & n. s.* } Ang.-Sax. *crop*.
CROPPING, *n. s.* } from *ripan*, gery-
CROPP-EAR, *n. s.* } *pan*, to reap. In
CROPP-EARED, *adj.* } its primary sense

the noun *crop* means, that which is the highest part of any thing, as an ear of corn, the top of a tree; thence, the harvest; whatever is cut off. To *crop*, therefore, is to mow, reap, or lop the top off any thing; to gather a thing before it falls; and, in its neuter sense, to yield harvest. Cropping, as a noun, is the act of putting the future *crop* into the soil; the act of cutting off any thing. *Crop-ear* signifies a horse whose ears are cropped; and *crop-eared* that of which the ears have been cropped, or which is cut short about the ears.

I will *crop* off from the top of his young twigs a tender one, and will plant it upon an high mountain. *Ezekiel*, xvii. 22.

When Zephus eke with his sweete brette
Ensiped hath in every holte and hethe
The tendre *croppes*. *Chaucer. Prol. to Cant. Tales.*

Or like the hell-borne hydra, which they faine
The greate Alcides whilome overthrew,
After that he had laboured long in vaine
To *crop* his thousand heads. *Spenser. Faerie Queene.*

Whose shady boughs sharp Steele did never lop,
Nor wicked beastes their tender buds did *crop*. *Id.*

And this of all my harvest hope I have,
Nought reaped but a weedy *crop* of care. *Id. Pastorals.*

All the budding honours on thy crest
I'll *crop*, to make a garland for my head. *Shakspeare. Henry IV.*

Cropped are the flower-de-luces in your arms;
Of England's coat, one half is cut away. *Id. Henry VI.*

He upon whose side
The fewest roses are *cropped* from the tree,
Shall yield the other in the right opinion. *Id.*

Royal wench!
She made great Cesar lay his sword to-bed;
He ploughed her, and she *cropt*. *Id. Antony and Cleopatra.*

What horse? a roan, a *crop-ear*, is it not?

Id. 1 *Henry IV.*

A *crop-eared* scrivener this.

B. Jonson.

Age, like ripe apples, on earth's bosom drops,
While force our youth, like fruits, untimely *crops*.

Denham.

Lab'ring the soil, and reaping plenteous *crop*,
Corn, wine, and oil.

Milton's Paradise Lost.

O fruit divine!

Sweet of thyself, but much more sweet thus *cropped*.

Id.

No more, my goats, shall I behold you climb
The steepy cliffs, or *crop* the flow'ry thyme!

Dryden's Virgil.

Guiltless of steel, and from the razor free,
It falls a plenteous *crop* preserved for thee.

Id. Fables.

Death destroys

The parent's hopes, and *crops* the growing boys.

Creech.

The fountain which from Helicon proceeds,
That sacred stream, should never water weeds,
Nor make the *crop* of thorns and thistles grow.

Roscommon.

Nothing is more prejudicial to your *crop* than mow-
ing of it too soon.

Mortimer's Husbandry.

The richest genius, like the most fertile soil, when
uncultivated, shoots up into the rankest weeds; and
instead of vines and olives for the pleasure and use
of man, produces to its slothful owner, the most
abundant *crop* of poisons.

Hume.

The first year, from unfortunately buying seed, the
second, from a late harvest, we lost half our *crops*.
This upset all my wisdom, and I returned, 'like
the dog to his vomit, and the sow that was washed
to her wallowing in the mire.'

Burns.

I saw him with that lily *cropped*

Impatient swim to meet

My quick approach, and soon he dropped

The treasure at my feet.

Couper.

Shaggy, and lean, and shrewd, with pointed ears
And tail *cropped* short, half lurcher and half cur,
His dog attends him. Close behind his heel
Now creeps he slow; and now, with many a frisk
Wide-scrampering, snatches up the drifted snow
With ivory teeth, or ploughs it with his snout;
Then shakes his powdered coat, and barks for joy. *Id.*

— Each young Hour its sickle fine employs,
And *crops* the sweet buds of domestic joys. *Darwin.*

Tombstones and monuments he took

For pills to cool his palate;

And *cropped* the church-yard yew-trees all—

They served him for a salad.

Huddesford.

Make lords and *crop-eared* petit maitres
Their prowess prove on tavern waiters;
Challenge their corn-cutter and taylor
To arms, and catch contagious valour
From contact with each raggamuffin. *Id.*

Alas, thou hast no wings, oh Time!

It was some thoughtless lover's rhyme,

Who, writing in his Chloe's view,

Paid her the compliment through you.

For had he, if he truly loved,

But once the pangs of absence proved,

He'd *cropped* thy wings and in their stead,

Have painted thee with heels of lead. *Sheridan.*

Then the full flaxen wig, spread o'er the shoulders,
Concealed the shallow head from the beholders!
But now the whole's reversed—each fop appears,
Cropped and trimmed up, exposing head and ears. *Id.*

CRO'SIER, *n. s.* Fr. *croisse*; barbarous Latin,
crocia, from *crux*, a cross. The pastoral staff of
a bishop, which is surmounted by a cross.

When prelates are great, there is also danger from
them; as in the times of Anselmus and Thomas
Becket, who, with their *croisiers*, did almost try it with
the king's sword. *Bacon.*

Grievances there were, I must confess, and some
incongruities in my civil government; wherein some
say the *crocier*, some say the distaff, was too busy.

Howel's England's Tears.

Her front erect with majesty she bore,
The *crocier* wielded, and the mitre wore.

Dryden.

Croisiers for lordly priests provide,

Let warriors wield the truncheon;

I ask no implement beside

A tankard and a luncheon. *Huddesford.*

CROSIER, in astronomy, four stars in the
southern hemisphere, in the form of a cross,
serving those who sail in south latitudes to find
the Antarctic Pole.

CROSIER, or **CROZIER**, the shepherd's crook,
is a symbol of pastoral authority, consisting of
a gold or silver staff, crooked at the top, carried
occasionally before bishops and abbots, and held
in the hand when they give the solemn benedic-
tions. The custom of bearing a pastoral staff
before bishops is very ancient, as appears from
the Life of St. Cæsarea, of Arles, who lived about
A. D. 500. Among the Greeks, none but the
patriarchs had a right to the *crocier*. The *cro-*
siers were, at first, only simple wooden staves, in
form of a T, used to lean upon. By degrees
they were made longer, and at length arrived to
their present form.

CROSIET, in heraldry, is when
a cross is crossed again at a small
distance from each of the ends.
According to Lucholm, 'it is an
honorable bearing, and is gene-
rally distributed at large in the
field,' as *gules*, a saltire *argent*,
between twelve cross-croslets, counter-changed,
name, Pinkney.

CROSS, *v. a., v. n., n. s., adj. & prep.* } Fren.
CRO'SSING, *n. s.* } *croix*;
CRO'SSIV, *adv.* } Italian,
CRO'SSNESS, *n. s.* } *croce*;
CRO'SSWISE, *adv.* } Gothic,
CRO'SLET, *n. s.* } *kross*;

Sw. *kors*; Ang.-Sax. *cors*; Wel. *croes*; Lat.
crux. The meanings of the noun, verb, and ad-
jective are multifarious. A cross is primarily an
instrument of punishment, composed of one
straight body laid over another at right angles,
on an instrument of which kind our Saviour suf-
fered, and which thence became the ensign of the
Christian religion. It also denotes a monument
with a cross on it, to excite devotion; a line
drawn through another; any thing that thwarts
us, or puts our patience to the trial; intermix-
ture of breed; figuratively, money, from its
bearing the mark of a cross; Irish church lands.
Cross, and pile, is a play, in which a piece of
money is spun round into the air, and the player
who has called 'cross' wins, in case of the cross

falling uppermost. The adjective signifies, transverse; falling athwart something else; oblique; adverse to; untractable; fretful; ill-humored; contrary to wish or expectation; unfortunate; interchanged. As a preposition it stands for athwart; over; from side to side. It forms compounds with many other words, as the succeeding articles will show. Crossing is, the act of signing with the cross; opposing; frustrating. Crossly, and crossness, are transversely; adversely; transverseness; peevishness. Cross-wise is in the manner of a cross. To cross is, to lay a body, or draw a line athwart another; to make the sign of the cross; to cancel; to pass from one side to the other; to pass from one place to another; to thwart; to defeat any purpose; to be inconsistent with; to contradict; to debar; to lie athwart another thing. A crosslet is a small cross. The word is chiefly used in heraldry; but Chaucer employs it to designate a crucible.

He had a *cross* of laton ful of stones,
And in a glas he hadde pigges bones.

Chaucer. Prolog. to Cant. Tales.

Of gentilwomen faire there were also
Disporting hem everiche afir her gise,
In *cross* aleis walking by two and two.

Id. The Assemblie of Ladies.

Men's actions do not always *cross* with reason.

Sidney.

Wishing unto me many *crosses* and mischances in
my love, whensoever I should love. *Id.*

Still do I *cross* this wretch, whatso he taketh in
hand. *Hooker.*

In all this there is not a syllable which any ways
crosseth us. *Id.*

And on his brest a bloodie *cross* he wore,
The deare remembrance of his dying Lord.

Spenser. Faerie Queene.

But he them spying, 'gan to turn aside,
For fear, as seemed, or for some feined loss;
More greedy they of news, fast towards him do *cross*.

Id.

Then Una 'gan to ask, if aught he knew,
Or heard abroad, of that her champion true,
That in his armour bare a *crosslet* red. *Id.*

No governour is suffered to go on with any one
course, but upon the least information he is either
stopped and *crossed*, or other courses appointed him
from hence. *Spenser. On Ireland.*

It may make my case dangerous, to *cross* this in the
smallest. *Shakspeare. Measure for Measure.*

Was this a face,

To stand against the deep dread-olted thunder,
In the most terrible and nimble stroke
Of quick *cross* lightning? *Id. King Lear.*

From his loins no hopeful branch shall spring,
To *cross* me from the golden time I look for.

Id. Richard III.

Thou ceaseless lacky to Eternity;
With some mischance *cross* Tarquin in his flight.

Id. The Rape of Lucrece.

She doth stray about

By holy *crosses*, where she kneels and prays. *Id.*

From many men I do not bear these *crossings*.

Id. 1 Henry IV.

Heaven prepares good men with *crosses*; but no ill
can happen to a good man. *Ben Jonson's Discoveries.*

Cross marriages, between the king's son and the
archduke's daughter; and, again, between the arch-
duke's son and the king's daughter.

Bacon's Henry VII.

The lighter sort of malignity, turneth but to a *cross-ness* or aptness to oppose; but the deeper sort, to envy, or mere mischief. *Bacon.*

It is certain, howsoever it *cross* the received opinion, that sounds may be created without air.

Id. Natural History.

They make a little *cross* of a quill, longways of that part of the quill which hath the pith, and crossways of that piece of the quill without pith. *Id.*

The enemy had, in the woods before them, cut down great trees *cross* the ways, so that their horse could not possibly pass that way. *Knolles.*

The absolute palatines made their own judges, so as the king's writ did not run in those counties, but only in the church lands lying within the same, which were called the *cross*; wherein the king made a sheriff; so in each of these counties palatines there was one sheriff of the liberty, and another of the *cross*.

Sir J. Davies.

How his enraged ghost would stamp and stare,
That Caesar's throne is turned to Peter's chayre;
To see an old shorae lozell perched on high,
Crossing beneath a golden canopy. *Hall.*

Your magical exorcisms; your clerical shavings;
your uncleanly unctions; your *crossings*. *Id.*

You are first to consider seriously the infinite love of your Saviour, who offered himself for you as a sacrifice upon the *cross*.

Taylor's Guide to the Penitent.

A great estate hath great *crosses*, and a mean fortune hath but small ones. *Id. Rule of Living Holy.*

He was said to make soldiers spring up out of the very earth to follow him, though he had not a *cross* to pay them salary. *Howell's Vocal Forest.*

This forced the stubbornest, for the cause,
To *cross* the cudgels to the laws;
That what by breaking them 't had gained,
By their support might be maintained. *Hudibras.*

Whacum had neither *cross* nor pile;

His plunder was not worth the while. *Id.*

He was so great an enemy to Digby and Colepeper, who were only present in debates of the war with the officers, that he *crossed* all they proposed. *Clarendon.*

Then their wills clash with their understandings,
and their appetites *cross* their duty. *Locke.*

They must not be *crossed*, forsooth; they must be permitted to have their wills in all things; and they being in their infancies not capable of great views, their parents think they may safely enough indulge their little irregularities, and make themselves sport with that pretty perverseness, which they think well enough becomes that innocent age. *Id.*

A fox was taking a walk one night *cross* a village.

L' Estrange.

Friars

Resort to farmers rich, and bless their halls,
And exorcise the beds, and *cross* the walls. *Dryden.*
Betwixt the midst and these, the gods assigned

Two habitable seats of human kind;
And *cross* their limits cut a sloping way,
Which the twelve signs in beauteous order sway.

Id. Virgil.

He conquered this proud Turk as far as the Hellespont, which he *crossed*, and made a visit to the Greek emperor at Constantiuople. *Temple.*

The mind brings all the ends of a long and various hypothesis together; sees how one part coheres with, and depends upon, another; and so clears off all the appearing contrarieties and contradictions, that seemed to lie *cross* and uncouth, and to make the whole unintelligible. *South.*

All *cross* and distasteful humorous, and whatever else may render the conversation of men grievous and uneasy to one another, must be shunned. *Tillotson.*

He that provides for this life, but takes no care for eternity, is wise for a moment, but a fool for ever; and acts as untowardly and *crossly* to the reason of things, as can be imagined. *Id.*

The loxia, or cross-bill, whose bill is thick and strong, with the tips *crossing* one another, with great readiness breaks open fir-cones, apples, and other fruit, to come at their kernels; as if the *crossing* of the bill was designed for this service.

Derham's Physico-Theology.

Whatsoever penumbra should be made in the circles by the *cross* refraction of the second prism, that penumbra would be conspicuous in the right lines which touch those circles. *Newton.*

They help us to forget the *crossness* of men and things, compose our cares and our passions, and lay our disappointments asleep.

Collier of the Entertainment of Books.

I shall most carefully observe, not to *cross* over or deface the copy of your papers for the future, and only to mark in the margin. *Pope.*

Here an unfinished diamond *crosslet* lay,
To which soft lovers adoration pay. *Gay's Fables.*

Her holy faith and Christian *cross* opposed
Against the Saxon gods. *Rowe.*

This I humbly conceive to be perfect boys' play;
cross, I win, and pile, you lose; or, what's your's is mine,
and what's mine is my own. *Swift.*

The ships must needs encounter, when they either
advance towards one another in direct lines, or meet
in the intersection of *cross* ones. *Bentley.*

Will ye one transient ray of gladness dart
Cross the dark cell where hopeless Slavery lies?
To ease tired Disappointment's bleeding heart,
Will all your stores of softening balm suffice?
Beattie.

O Henderson! the man! the brother!
And art thou gone, and gone for ever!
And hast thou *cross* that unknown river,
Life's dreary bound!
Like thee, where shall I find another,
The world around! *Burns.*

By our blood in Afric wasted,
Ere our necks received the chain;
By the miseries that we tasted,
Crossing in your barks the main. *Cowper.*

Shrill cats, whom fierce domestic broils delight,
Cross cats, who nothing want but teeth to bite.
Huddesford.

See! through the grove a narrow lake extends,
Crosses each plot, to each plantation bends;
And while the fount in new meanders glides,
The forest brightens with refreshing tides. *Sheridan.*

Thou hast done a fearful deed
In falling away from thy father's creed:
But dash that turban to earth, and sign
The sign of the *cross*, and for ever be mine;
Wring the black drop from thy heart,
And to-morrow unite us no more to part.
Byron. Siege of Corinth.

This heathenish *cross* restored the breed again,
Ruined its blood, but much improved its flesh;
For, from a root, the ugliest in Old Spain
Sprung up a branch as beautiful as fresh.
Id. Don Juan.

Cross. The ancient cross was made with two
pieces of wood, placed crosswise, either crossing

at right angles at the top, like a T, or in the middle of their length, like an X. The cross to which our Saviour was fastened is thus represented on old monuments, coins, &c.; and St. Jerome compares it to a bird flying, and a man swimming, or praying, with his arms extended. The punishment of the cross was common among the Syrians, Egyptians, Persians, Africans, Greeks, Romans, and Jews. It was the most dreadful of all others, both for the shame and pain of it; and so scandalous, that it was inflicted as the last mark of degradation upon the vilest of people. It was the punishment of robbers and murderers, provided that they were slaves too; for if they were free, and had the privilege of the city of Rome, it was thought too infamous a punishment for them, whatever might be their crimes. The body of the criminal was fastened to the upright piece, naked, by nailing the feet to it, and on the other transverse piece, generally by nailing the hands on each side. Sometimes he was fastened with cords to the fatal tree, with his head downwards. Nonnius thinks that our Saviour's arms were bound fast to the cross with chains; and St. Hilary speaks of the cords wherewith he was tied to it. Sometimes they who were fastened upon the cross lived a long time in that condition. St. Andrew is said to have continued three days alive upon it. Eusebius speaks of certain martyrs in Egypt who were kept upon the cross till they were starved to death. Pilate was surprised, we see, at our Saviour's dying so soon. Among some nations they were suffered to remain upon the cross a long time, even until they were devoured alive by birds and beasts of prey. Guards were appointed to observe that none of their friends or relations should take them down and bury them. The Roman soldiers, who had crucified Jesus Christ and the two thieves, thus continued near the crosses till the bodies were taken down and buried.

Crosses were usually, in former times, erected on the tops of houses, by which tenants pretended to claim the privileges of the Templars Hospitallers, to defend themselves against their rightful lords. This was condemned by the statute William II. cap. 37. It was usual also, in those days, to set up crosses in places where the corpse of a nobleman rested as it was carried to be buried, that passengers might pray for his soul. Crosses, &c. are forbidden to be brought into England by 13th Eliz. cap. 2, on pain of a prebendure. &c.

Fables, in abundance, are connected with the alleged history of the true cross. An ancient feast was solemnised on the 3rd of May, in memory of the true cross of Christ being found by St. Helena, the mother of Constantine, deep in the ground on Mount Calvary, where she erected a church for the preservation of part of it, the rest being brought to Rome, and deposited in the church of the Holy Cross of Jerusalem. Theodoret mentions the finding of three crosses; that of Jesus Christ, and those of the two thieves; and that they distinguished between them by means of a sick woman, who was immediately healed by touching the true cross. The place is said to have been pointed out to her by St.

Quiriacus, then a Jew, afterwards converted and canonised.

The adoration of the cross appears to have been practised at a remote period; inasmuch as the Heathens, particularly Julian, reproach the primitive Christians with it; and we do not find that their apologists disclaimed the charge. Mornay, indeed, asserted, that this had been done by St. Cyril, but could not support his allegation at the conference of Fontainebleau. St. Helena is said to have reduced the adoration of the cross to its just principle, as she adored in the wood, not the wood itself, but him who had been nailed to this wood. With such modifications some Protestants have been induced to admit the adoration of the cross. John Huss admitted of the phrase, provided it were expressly added, that the adoration was to the person of Christ. Imbert, the good prior of Gascony, was severely prosecuted, in 1683, for telling the people, that in the ceremony of adoring the cross, practised in that church on Good Friday, they were not to adore the wood, but Christ, who was crucified on it. The curate of the parish told them the contrary: it was the wood! the wood! they were to adore. Imbert replied, it was Christ, not the wood: for which he was cited before the archbishop of Bourdeaux, suspended from his functions, and even threatened with chains and perpetual imprisonment. It little availed him to cite the bishop of Meaux's distinction; it was answered, that the church allowed it not.

Cross, in coins, the right side or face, the other being called the pile, or reverse. It has been a common error that the reverse was meant by the cross; because at this time, with us, it is marked with figures disposed in that form; but the stamping of the head of the prince in these kingdoms on the right side of the coin, was preceded by a general system of striking on that part the figure of a cross; while the pile contained the arms, or some other device.

Cross, in heraldry, is defined by Guillim, an ordinary composed of fourfold lines; whereof two are perpendicular, and the other two transverse; for so we must conceive of them, though they be not drawn throughout, but meet by couples, in four right angles, near the fess point of the escutcheon. See HERALDRY. This bearing was first bestowed on such as had performed, or at least undertaken, some service for the Christian profession; and is held by many to be the most honorable charge in all heraldry. It came into frequent use from the ancient expeditions into the Holy Land; the ensign of that war being the cross. In those wars, says M'Kenzy, the Scots carried St. Andrew's cross; the French, a cross *argent*, the English, a cross *or*; the Germans, *sable*; the Italians, azure; the Spaniards, *gules*. Leigh mentions forty-six several crosses; Sylvanus Morgan, twenty-six; Upton, thirty; Johannes de Bado Aureo, twelve. Upton owns he dares not presume to ascertain all the various crosses used in arms, for that they are at present almost innumerable; and, therefore, he only takes notice of such as he had seen used in his own time. See HERALDRY.

Cross, in law, instead of a signature to a deed, &c., is derived from the Saxon practice of

affixing the sign of the cross, whether they could write or not.

Cross (Michael), an English artist, famous for copying paintings in the reigns of Charles I. and Charles II. Of this talent, there is a story current, more to the honor of his skill than of his probity. He is said to have been employed by Charles I. to copy the celebrated Madona of Raphael, in St. Mark's church, at Venice; and that, having obtained leave of the state for that purpose, he executed his piece so well, as to bring away the original, and leave the copy in the place of it.

CROSS, MAIDS OF THE, a ci-devant community of young women, instituted in 1265, at Roye, in Picardy, and afterwards dispersed to Paris and other towns of France. They instructed young persons of their own sex. Some took the vows of poverty, chastity, and obedience; others retained their liberty. They were under the direction of a superior.

CROSS, ORDER OF THE, or CROISADE, an order of ladies instituted in 1668, by the empress Eleonora de Gonzagna, wife of the emperor Leopold I. on occasion of the miraculous recovery of a little golden cross, wherein were enclosed two pieces of the true cross, out of the ashes of part of the palace. The fire is said to have burnt the case wherein it was enclosed, and melted the crystal, yet the wood remained untouched!

CROSSARMED, *adj.* From cross and arm. With arms folded across; melancholy.

Yet neither will I vex your eyes to see
A sighing ode, nor cross-armed elegie. *Donne.*

CROSSARROW, *n. s.* From cross and arrow. The arrow of a cross-bow.

Why I was run twice through the body, and shot
i' the head with a cross-arrow, and yet am well again.
Beaumont and Fletcher.

CROSS-BARRED, *adj.* From cross and bar. Barred with transverse bars.

Substantial doors,
Cross-barred and bolted fast.
Milton's Paradise Lost.

CROSS-BAR SHOT, *balle ramée*, Fr.; shot, with iron bars crossing through them, sometimes standing six or eight inches out at both sides; they are used at sea for destroying the enemy's rigging. At a siege they are of great service in demolishing the enemy's palisading, &c.

CROSS-BEARER, *porte-croix* cruciger; in the Romish church, the chaplain of an archbishop or primate, who bears a cross before him on solemn occasions. The pope used to have the cross borne before him everywhere; a patriarch any where out of Rome; and primates, metropolitans, and those who have a right to the pallium, throughout their respective jurisdictions. Gregory IX. forbade all patriarchs and prelates to have it borne in presence of cardinals. A prelate bears a single cross, a patriarch a double cross, and the pope a triple one on their arms.

CROSS-BEARERS also denote certain officers in the inquisition, who make a vow before the inquisitors, or their vicars, to defend the Catholic faith, though with the loss of fortune and life. Their business is to provide the inquisitors with necessaries.

CROSS-BILL, *n. s.* A bill brought by a defendant against the plaintiff in chancery.

CROSS-BILL, in ornithology. See **LOXIA**.

CROSSBITE, *v. a. & n. s.* From cross and bite. To circumvent by deception. A deception; a cheat.

The fox, that trusted to his address and manage, without so much as dreaming of a *cross-bite* from so silly an animal, fell himself into the pit that he had digged for another.
L'Estrange.

No rhetoric must be spent against *cross-biting* a country evidence, and frightening him out of his senses.
Collier.

That many knotty points there are,
Which all discuss, but few can clear;
As nature slyly had thought fit,
For some by-ends, to *cross-bite* wit. *Prior.*

CROSSBOW, *n. s.* } From cross and bow.
CROSSBOWER, *n. s.* } A missive weapon, formed by placing a bow athwart a stock, which has a groove for the reception of the arrow. One who shoots with a crossbow.

The master of the *cross-bows*, lord Rambures.

Shakspeare.

The French assisted themselves by land with the *cross-bowers* of Genoa against the English.

Raleigh's Essays.

Gentlemen suffer their beasts to run wild in their woods and waste ground, where they are hunted and killed with *cross-bows* and pieces in the manner of deer.

Caruc of Cornwall.

Testimony is like the shot of a long bow, which owes its efficacy to the force of the shooter; argument is like the sho. of the *cross-bow*, equally forcible whether discharged by a giant or a dwarf.
Boyle.

Cross-Bow. See **BALISTA**, and **ARTILLERY**.

CROSSBUN, *n. s.* From cross and bun. A bun marked with the figure of the cross, which is sold on Good Friday.

CROSS-COUNTRY, *adj.* From cross and country. That which crosses the country.

These carpets, so soft to the foot,
Caledonia's traffic and pride!

Oh spare them ye knights of the boot,
Escaped from a *cross-country* ride! *Couper.*

CROSS-SCUT, *v. a.* From cross and cut. To cut across.

CROSSEN, a town and duchy of Germany, in Upper Saxony, ceded in 1746 to the king of Prussia. It abounds in wine and fruits. The town was burnt down in 1708, and taken by Russia in 1757. It contains about 3500 inhabitants, and is sixty-eight miles E. S. E. of Berlin.

CROSS-EXAMINE, *v. a.* } From cross and

CROSS-EXAMINATION, *n. s.* } examine. To examine a witness, by putting catching and difficult questions to him. The act of cross-examining.

If we may but *cross-examine* and interrogate their actions against their words, these will soon confess the invalidity of their solemnest confessions.

Decay of Piety.

The judges shall, as they think fit, interrogate or *cross-examine* the witnesses.
Spectator.

CROSSFLOW, *v. a.* From cross and flow. To flow in an opposite direction.

The flood

That staid her flight with his *cross-flowing* course.

Milton. Comus.

CROSSGRAINED, *adj.* From cross and grain. Having the fibres transverse or irregular; perverse; bad tempered; fond of giving vexation.

If the stuff proves *crossgrained* in any part of its length, then you must turn your stuff to plane it the contrary way, so far as it runs *crossgrained*. *Moxon.*

We find in sullen wits,

And *crossgrained* works of modern wits,
The wonder of the ignorant, *Hudibras.*

The spirit of contradiction, in a *cross-grained* woman, is incurable.
L'Estrange.

She was none of your *cross-grained*, termagant, scolding jades, that one had as good be hanged as live in the house with.
Arbuthnot's John Bull.

But wisdom, peevish and *cross-grained*,
Must be opposed, to be sustained. *Prior.*

Sad strife arose, for they were so *cross-grained*,
Instead of bearing up without debate,
That each pulled different ways with many an oath,
'Areades ambo,'—id est—blackguards both.
Eyron. Don Juan.

CROSSE'GGED, *n. s.* From cross and leg. Having the legs crossed, like tailors at work.

Crosslegged, and yet ungartered, hath been seen.

Messenger.

CROSSOSTYLUS, in botany, a genus of the polyandria order, and monadelphia class of plants: **CAL.** a quadrangular, quadrifid, turbinate perianthium; **COR.** consists of four elliptical petals; **STAM.** are twenty filiform filaments, almost the length of the calyx; anthera small and roundish: **PERICARP.** an hemispherical, unilocular berry, with many striæ on its upper part: **SEED** numerous and roundish.

CROSS-PIECE, a rail of timber extended over the windlass of a merchant-ship, from the knight-heads to the belfry. It is stuck full of wooden pins, which are used to fasten the running-rigging as occasion requires. See **WINDLASS**.

CROSSPURPOSE, *n. s.* From cross and purpose. A kind of riddle; a contradictory system.

I see an eye of comfort in her case, and will take all proper measures to extricate her out of this unhappy game of *crosspurposes*.
Tatler.

To allow benefit of clergy, and to restrain the press, seems to have something of *crosspurpose* in it.

Shaftesbury.

CROSSPOST, *n. s.* From cross and post. A post across the country, by the cross roads.

Mr. Allen rose to great consideration by farming the *crossposts*.
Warburton.

CROSSQUESTION, *v. a.* To cross-examine; to embarrass by questions.

CROSSREADINGS, *n. s.* From cross and reading. Ludicrous sentences produced by reading across the newspaper, instead of from top to bottom.

Then strew all around it (you can do no less),
Crossreadings, ship news, and mistakes of the press.
Goldsmith.

CROSSROAD, *n. s.* From cross and road. A road across the country; a road connecting the main roads.

Be the plain track from henceforth mine,
Crossroads to Allen I resign.
Churchill.

CROSSROW, *n. s.* From cross and row. Alphabet; so named because a cross is placed at the beginning, to show that the end of learning is piety.

He hearkens after prophecies and dreams,
And from the *crossrow* plucks the letter G;
And says a wizard told him, that by G
His issue disinherited should be.

Shakspeare. Richard III.

CROSS-STAFF, *n. s.* From cross and staff. An instrument commonly called the fore-staff, used by seamen to take the meridian altitude of the sun or stars.

CROSSWAY, *n. s.* From cross and way. A small obscure path intersecting the chief road.

Neither shouldst thou have stood in the *crossway*.
Obadiah v. 14.

Damned spirits all,
That in *crossways* and floods have burial,
Already to their wormy beds are gone.
Shakspeare.

CROSSWIND, *n. s.* From cross and wind. Wind blowing from the right or left.

When lo
A violent *crosswind* from either coast
Blows them transverse ten thousand leagues away
Into the devious air.
Milton.

The least unhappy persons do, in so fickle and so tempestuous a sea as this world, meet with many more either *crosswinds* or stormy gusts than prosperous gales.
Boyle.

CROSSWORD, *n. s.* From cross and wort. A plant.

It hath soft leaves, like the ladies bedstraw, from which it differs in the number of leaves that are produced at every joint; which in this are only four, disposed in form of a cross.
Miller.

CROTALARIA, rattle-wort, in botany, a genus of the decandria order, and diadelphica class of plants: natural order thirty-second, papilionaceae. The legume is turgid, inflated, and pedicellated; the filaments are coalited with a fissure on the back. There are eleven species, all natives of warm climates. They rise from eighteen inches to five feet in height, and are adorned with flowers of a blue or yellow color. The most remarkable species is the *C. retusa*, with simple oblong wedged leaves. It is a native of the island of Ceylon, and some other parts of the East Indies. The flowers are yellow, the pods smooth, cylindrical, inflated, and placed horizontally: they are filled with seeds, which when dried, and shaken by the slightest wind, emit a rattling noise: and this, by the rude inhabitants of the countries where the plant is a native, is attributed to the devil, who is thought to deliver his oracles in this whimsical manner.

CROTALO, an instrument in modern military music, resembling the ancient crotalum. The Turks were the first, among the moderns, who introduced the use of it for their troops. It has only one tone; but its effect in marking time may be distinctly heard through the noise of forty drums. It is the same with the ancient cymbalum.

CROTALUM, an ancient kind of musical instrument, found on medals, in the hands of the priests of Cybele. It differed from the sistrum, though authors frequently confound the two. It consisted of two little brass plates or rods, which were shaken in the hand, and in striking against each other made a noise. It was sometimes also made of a reed split lengthwise, one part whereof they struck against the other; and, as this made a noise somewhat like that of a crane's bill, they called that bird *crotalystria*, a player on the *crotala*: and Aristophanes calls a great talker a *crotalum*. Clemens Alexandrinus attributes the invention to the Sicilians; and forbids the use of it to the Christians, because of the indecent motions and gestures that accompany it.

CROTALUS, the rattle-snake, in zoology, a genus belonging to the order of amphibia serpentes; the characters of which are these: the belly is furnished with scuta, and the tail has both scuta and scales; but the principal characteristic of this genus is the rattles at the end of the tail. These rattles consist of several articulated, crustaceous, or rather horny bags, which make a considerable rattling noise when the creature moves, and serve to warn people of its approach. There are five species, and the bite of all of them is so highly poisonous, that it generally kills in a short time. Of these, the chief is *C. horridus*, the American rattle-snake. It grows sometimes to the length of eight feet, and weighs between eight and nine pounds. The color of the head is brown, and the eye red; the upper part of the body of a yellowish-brown color, transversely marked with irregular broad black lists. The rattle is of a brown color; composed of several horny, membraneous cells, of an undulated pyramidal figure. These are articulated within one another in such a manner that the point of the first cell reaches as far as the basis of the protuberant ring of the third, and so on; which articulation, being very loose, gives liberty to the parts of the cells that are enclosed within the outward ring, to strike against the sides of them, and so to cause the rattling noise which is heard when the snake shakes its tail. This is the most inactive and slow moving of all the snakes, and is never the aggressor except in what it preys upon. Catesby is of opinion that no remedy is yet discovered for the bite of this animal. He had frequently access to see Indians bitten by it, and always thought that those who recovered were cured more through the force of nature, or by reason of the slightness of the bite, than by the remedies used. He says, the Indians know their destiny the moment they are bit; and if the bite happens to be on any of the large veins, they apply no remedies, knowing them to be entirely useless.

CROTCH, *n. s.*

CROTCHET, *v. n. & n. s.* } Fr. *croc, crotchet.*
CROTCHETED, *part. adj.* } A crotch is a hook or fork. Crotchet signifies, one of the notes in music; a support or prop; [hooks in which words are included]; an instrument used in midwifery; a conceit; a whim; an odd fancy. To crotchet is to play in a measured time of music; crotcheted is, marked by musical notation.

Save elme, ash, and crab tree for cart and for plough,
Save step for a style of the *crotch* and the bough.

Tusser.

There is a tradition of a dilemma that Moreton used to raise the benevolence to higher rates; and some called it his fork and some his *crotch*.

Bacon's Henry VII.

As a good harper stricken far in years,

Into whose cunning hands the gout doth fall,

All his old *crotchets* in his brain he bears,

But on his harp plays ill or not at all. *Davies.*

All the devices and *crotchets* of new inventions,
which crept into her, tended either to twitch or enlarge the ivy.

Howel.

The horse smelt him out, and presently a *crotchet*
came in his head how he might countermine him.

L'Strange.

A stately temple shoots within the skies,

The *crotchets* of their cot in columns rise. *Dryden.*

The third on four concordant lines

Prints the lone *crotchet*, and the quaver joins;

Marks the gay trill, the solemn pause inscribes,

And parts with bars the undulating tribes. *Darwin.*

CROTO, or CROTON, in ancient geography, a city of the Brutii, in Italy, built by the Achæans; 150 stadia to the north of Lacinium, and in the neighbourhood of Metapontum. It was twelve miles in compass before the arrival of Pyrrhus in Italy; but, after the desolation produced by the war, scarcely half of it was inhabited. The citadel, on one side, hung over the sea, on the other towards the land. It was naturally strong from its situation, but afterwards walled round. It was taken by Dionysius, however, by stratagem, by means of the rocks behind it. Pythagoras, after his long peregrinations in search of knowledge, fixed his residence in this place, which some authors think his native one, or at least that of his parents. Of all the colonies sent out from Greece, this alone furnished succour to the mother-country when invaded by the Persians. By its avenging arms the Sybarites were punished for their shameful degeneracy; but victory proved fatal to the conquerors, for riches, and all their pernicious consequences, soon contaminated the purity of the Crotonites. Long after the Locrians, who were less corrupted, defeated them on the banks of the Sagra, and reduced the republic to distress and penury. This restored the remaining Crotonites to their pristine vigor of mind, and enabled them to make a brave, though unsuccessful resistance, when attacked by Dionysius of Syracuse. They suffered much in the war with Pyrrhus; and, by repeated misfortunes, decreased in strength and numbers, from age to age, down to that of Hannibal, when they could not muster 20,000 inhabitants. This small population being incapable of manning the extensive works erected in the days of its prosperity, Croton was taken by the Carthaginians, and its citizens transported to Locri. The Romans sent a colony thither 200 years before Christ. In the Gothic war, this city was conspicuous for its fidelity to Justinian, and Totila besieged it long in vain.

CROTON, in modern geography, a river of Connecticut, which rises in New Fairfield, and, running through Dutchess county, falls into

Tappan Bay. A bridge is thrown over the river three miles from its mouth, on the great road to Albany. It is a solid substantial bridge, 1400 feet long, piercing through a slate hill, and supported by sixteen stone pillars. Here is an admirable view of Croton Falls, where the water precipitates itself between sixty and seventy feet perpendicular, with high slate banks, in some places 100 feet, and the river spreading into three streams, as it enters the Hudson.

CROTON, in botany, wild ricinus, a genus of the monadelphica order and monœcia class of plants; natural order thirty-eighth, tricoceæ. Male, CAL. cylindrical and quinque-dentated; cor. pentapetalous; the stamina from ten to fifteen. Female, CAL. polyphyllous; three bifid styles: CAPS. trilocular; one seed. There are twenty-one species, of which the most remarkable are, 1. *C. aromaticum*, with heart-shaped serrated leaves, and an arborescent stem. The bark of the tree is the same as the cascarilla and eluteria, though these have been considered by some as distinct barks, and sold in the shops as different productions. It is a hot, acrid, aromatic bitter, resembling in appearance the Peruvian bark, but more bitter and pungent, though not so rough and astringent. It was first introduced into Europe about the end of the seventeenth century. 2. *C. sebifera*, the tallow-tree, with rhomboidal egg-shaped leaves, pointed, smooth, and very entire. The Chinese make their candles of it, which would, doubtless, be as good as those in Europe, if they knew how to purify their vegetable tallow, as we do our animal kind, and to make their wicks as well. 3. *C. tinctorium*, the plant from which the French turnsole is made. See TURNSOLE. It grows naturally in the south of France; is an annual plant, rising about nine inches, with an herbaceous branching stalk, garnished with irregular or rhomboidal figured leaves, near two inches long and one and a quarter broad in their widest part. These stand upon slender foot-stalks near four inches long. The flowers are produced in short spikes from the sides of the stalks, at the end of the branches; the upper part is composed of male flowers, having many stamina, which coalesce at the bottom; the lower part has female flowers, which have each a roundish three-cornered germen. This afterwards becomes a roundish capsule, with three lobes, having three cells, each including one roundish seed. It flowers in July; but, unless the plants are brought forward on a hot-bed, they do not ripen seeds in this country.

CROTONA, an ancient city of Naples, in the province of Calabria Ultra, originally built by the Greeks. It is seated upon the mouth of the Essaro, at its influx into the gulf of Tarento, on the coast of the Ionian Sea, fifty miles east of Cosenza, and fifteen south-east of St. Severina.

CROTOPHAGA, in ornithology, a genus of birds belonging to the order of picæ; the characters of which are, the bill is thin, compressed, greatly arched, half oval, and cultrated at top; the nostrils are round; the tongue flat, and pointed at the end; the tail consists of ten feathers; and the toes are placed two and two.

The most remarkable species are, 1. *C. ani*, about the size of a blackbird; the color of the whole bird is black, in some parts glossed with purple, and about the neck faintly tinged with green on the margins; the base of the bill is furnished with black bristles, which turn forwards; the eye-lids have long hairs like eye-lashes; the tail is six inches long, and much cuneated; and the legs are black. This species is found in Jamaica, St. Domingo, and other islands in the West Indies; also, at Cayenne, and other parts of South America. Contrary to all other birds, they have the singularity of many laying in the same nest; to make which, they all unite in concert, and, after laying their eggs, sit on them close to each other in order to hatch them, each unanimously striving to do the best for the general good; and when the young are hatched, the parents, without reserve, do the best to feed the whole flock. It generally has two broods in a year, except accidents happen; in which case it has been known to make three nests. The eggs are about the size of those of a pigeon, of a sea-green color, spotted at the ends. Their food is various; worms, insects, fruits, and grain, according to the season. 2. *C. ani major*, is about the size of a jay, and is by some reckoned only a variety of the former, differing merely in size.

CROUCH, *v. a. & n. s.* } Fr. *crochu*; Isl. *Cróuched*, *adj.* } *kreika*; Ger. *kau-*
CROUCHING, *n. s. & adj.* } *chen*. It is proba-
CROUCH-BACK, *n. s.* } bly, says the Ency.
Met. by the common change of *k* into *ch*, merely. To crouch signifies to stoop low; to lie with the belly to the ground, as some beasts do; to cringe; to act servilely; anciently, to sign with the cross. Crouch-back is synonymous with crook-back.

Every one that is left in thine house, shall come and crouch to him for a piece of silver and a morsel of bread. 1 Sam. ii. 26.

I crouche thee from elves and from wightes,
Therewith the nightspel said he anon rightes
On foure helves of the hours aboute
And on the threswold of the dore withoute.

Chaucer. *Cant. Tales.*

I cannot crouche nor knele to such a wronge,
To worship them like God on earth anon,
That are as wolves these sely lambes among. Wjatt.

Kissing his hondes and crouching to the ground.
For other language had he none nor speech.

Spenser. *Faerie Queene.*

At his heels,

Leasht in like hounds, should famine, sword, and fire,
Crouch for employment. Shakspeare. *Henry V.*

The crouching client, with low bonded knee,
And manie worships and faire flatterie,
Tells on his tale as smoothly as him list,
But still the lawyer's eye squints on his list. Hall.

They fawn and crouch to men of parts, whom they cannot ruin; quote them when they are present; and, when they are absent, steal their jests. Dryden.

Too well the vigour of that arm they know;
They lick the dust, and crouch beneath their fatal foe. Id.

When lo! the self-same lion from his cage
Flies to devour him, furnished into rage.
He flies, but viewing in his purposed prey
The man, his healer, pauses on his way,

And, softened by remembrance into sweet
And kind composure, crouches at his feet. Couper.

He knew himself a villain—but he deemed
The rest no better than the thing he seemed,
And scorned the best as hypocrites who hid
Those deeds the bolder spirits plainly did.
He knew himself detested, but he knew
The hearts that loathed him, crouched and dreaded
toe. Byron. *Corsair.*

CROUP, *n. s.* Fr. *croupe*. The rump of a fowl; the buttocks of a horse. See CRUPPER.

The carter thakketh his hors upon the croupe.
Chaucer. *Cant. Tales.*

Away thou heedless boy! prepare the spear:
Now is thy time, to perish, or display
The skill that yet may check his mad career.
With well-timed croup the nimble coursers veer;
On foams the bull, but not unscotched he goes;
Streams from his flank the crimson torrent clear.
Byron. *Childe Harold*

CROUPADES, *n. s.* From croup. Higher leaps than those of corvets, that keep the fore and hind quarters of the horse in an equal height, so that he trusses his legs under his belly without jerking.

CROUSAZ (John Peter de), a learned philosopher and mathematician, born in 1663. Having made great progress in the mathematics and the philosophy of Des Cartes, he travelled to Geneva, Holland, and France; was successively professor in several universities, and at length was chosen governor to prince Frederick, of Hesse Cassel, nephew to the king of Sweden. He wrote many works; the most esteemed of which are, 1. his *Logic*, in six vols. 8vo. in 1741. 2. *A Treatise on Beauty*. 3. *A Treatise on the Education of Children*, two vols. 12mo. 4. *Several Treatises on Philosophical and Mathematical Subjects*, &c. He died at Lausanne in 1748.

CROUTE, **SOUR CROUTE**, or **KROUTE**, saur kraut, German, i. e. sour herb; a preparation of cabbage, which has been found of sovereign efficacy as a preservative from the sea-scurvy in long voyages. The process for making it is as follows: the soundest and most solid cabbages are selected, and cut very small, commonly with an instrument made for this purpose, resembling the plain for slicing cucumbers. A knife is used when the preparation is made with great nicety. The cabbage, thus minced, is put into a barrel, in layers, hand high, and over each is strewed a handful of salt and carraway-seeds; in this manner it is rammed down with a rammer stratum super stratum, till the barrel be full, when a cover is put over it, and pressed down with a heavy weight. After standing some time in this state it begins to ferment, and it is not till the fermentation has entirely subsided, that the head is fitted to it, and the barrel is finally shut up and preserved for use. There is not a drop of vinegar employed in this preparation.

CROW, *v. n. & n. s.* } Goth. *krukjan*; Ger.
CROWING, *n. s.* } *krachen*; Ang.-Saxon,
CROWS-FEET, *n. s.* } *crawan*; for the verb.
CROW-KEEPER, *n. s.* } For the noun, Per.
kro; Swed. *kraka*; Ang.-Sax. *crawe*; Latin, *corvus*; *κοραξ*. To crow is, to make the noise which a cock makes for the purpose of express-

ing pleasure or defiance; to vaunt; to bluster; to swagger; to express triumph over. Crow is, a large black bird, that feeds on carcasses. See *Corvus*; the voice of the cock; a bar of iron with a beak, used as a lever. To pluck a crow with, is a trivial expression, which means, to have a dispute with; to reprimand for some offence. It is generally used with reference to trifling subjects. Crows'-feet are, the wrinkles which old age produces under the eyes. A crow-keeper is, a scare-crow.

When the first cock hath *crowe*, a non
Up rist this jolly lover Absolon.

Chaucer. Cant. Tales.

We! sikerer was his *crowing* in his loge,
Than is a clok or any abbey orloge. *Id.*

As blake he lay as any cole or *crow*,
So was the blood yonnen in his face. *Id.*

So longe mote ye liven, and all proude,
Till *crowis-fete* growin under your eie.
Id. Troilus and Creseide.

I am not he, such cloquence to bost,
To make the *crow* in singing, as the swanne.

Wyatt

And now the *crowing* cocke, and now the owle,
Lowd shriking; him afflicted to the very sowle.

Spenser. Faerie Queene.

That fellow handles his bow like a *crowkeeper*.

Shakespeare.

But even then the morning cock *crow* loud.

Id. Hamlet.

The *crow*s and choughs, that wing the midway air,
Shew scarce so gross as beetles. *Id. King Lear.*

Diogenes called an ill physician, cock. Why?
saith he. Diogenes answered, Because when you
crow, men use to rise. *Bacon.*

Resolve, before we go

That you and I must *pull a crow*. *Hudibras.*

If you dispute, we must even *pluck a crow* about it.
L'Estrange.

To *crow*s he like imperial grace affords,
And choughs and daws, and such republick birds.

Dryden.

Within this homestead lived, without a peer
For *crowing* loud, the noble Chanticleer,
So high her cock. *Id. Fables.*

The *crow* is used as a lever to lift up the ends of
great heavy timber, and then they thrust the claws
between the ground and the timber; and laying some
stuff behind the *crow*, they draw the other end of the
shank backwards, and so raise the timber.

Morron's Mechanical Exercises.

Selby is *crowing*, and, though always defeated by
his wife, still *crowing* on. *Richardson.*

How lonely every freeborn creature broods!

The sweetest song-birds nestle in a pair;

The eagle soars alone; the gull and *crow*

Flock o'er the carrion, just as mortals do.

Byron. Don Juan.

CROWD, *v. a. & n. s.* } Welsh *crwth*. A
CROWDER, *n. s.* } fiddle; a fiddler.

Hark how the minstrels 'gin to shrill aloud
Their merry musick that resounds from far,
The pipe, the tabor, and the trembling *crowd*,
That well agree withouten breach or jar.

Spenser's Epith.

Chevy-chase sung by a blind *crowder*. *Silney.*

Fiddlers, *crowd* on, *crowd* on; let no man lay a
block in your way *Massinger.*

His fiddle is your proper purchase,

Won in the service of the churches;

And by your doom must be allowed
To be, or be no more, a *crowd*. *Hudibras.*

CROWD, *v. a., v. n., & n. s.* } Ang.-Sax. *cruth*;
CROWDING, *n. s.* } Dutch *kruyden*.

To thrust in confusedly; to press into an incon-
venient space; to incumber by multitudes; to
throng together without order; to thrust among
a multitude. To crowd sail, is to hoist as much
sail as possible; to hurry on. A crowd is, a
promiscuous multitude, or medley of any thing;
the vulgar; the populace.

A rude disordered rout he did espy
Of men and women, that most spitefully
Did one another throng, and *crowd* so sore,
That his kind eye in pity wept therefore. *Davies.*

Thus Love persuades, and all the *crowd* of men
That stands around doth make a murmuring. *Id.*

The time misordered, doth in common sense
Crowd us and crush us to this monstrous form,
To hold our safety up. *Shakespeare. Henry IV.*

A mighty man, had not some cunning sin
Amidst so many virtues *crowded* in.

Cowley's Davideis.

They follow their undaunted king;
Crowd through their gates; and, in the fields of light,
The shocking squadrons meet in mortal fight.

Dryden's Virgil.

He went not with the *crowd* to see a shrine,
But fed us by the way with food divine. *Id. Fables.*

How short is life! Why will vain courtiers toil.
And *crowd* a vainer monarch for a smile? *Granville.*

He could then compare the confusion of a multi-
tude to that confusion he had observed in the Icarian
sea, dashing and breaking among its *crowd* of islands.
Pope.

A mind which is ever *crowding* its memory with
things which it learns, may cramp the invention itself.
Watts.

Trees produced without culture, here straggling
or single, and there *crowding* into little groves and
bowers. *Beattie.*

'Tis morning; and the sun, with ruddy orb
Ascending, fires the' horizon; while the clouds,
That *crowd* away before the driving wind,
More ardent as the disk emerges more,
Resemble most some city in a blaze,
Seen through the leafless wood. *Cowper.*

Imperious man, who rules the bestial *crowd*,
Of language, reason, and reflection proud,
With brow erect who scorns this earthy sod,
And styles himself the image of his God. *Darwin.*

Amidst the barren sand and rocks so rude
She and her wave-worn love had made their bower,
Where nought upon their passion could intrude,
And all the stars that *crowded* the blue space,
Saw nothing happier than her glowing face.

Byron. Don Juan.

A *crowd* of shivering slaves of every nation,
And age, and sex, were in the market ranged. *Id.*

CROWFLOWER, *n. s.* From *crow* and
flower. A species of campion.

Fantastick garlands did she make
Of *crow-flowers*, nettles, daisies, and long purples.
Shakespeare. Hamlet.

CROWFOOT, *n. s.* From *crow* and foot; in
Lat. *ranunculus* A flower; the butter-flower,
or butter-cup.

CROWFOOT, n. s. From crow and foot. A caltrop, or piece of iron with four points, two, three, or four inches long; so that whatever way it falls, one point is up. It is used in war for incommoding the cavalry.

CROWFOOT. See **RANUNCULUS.**

CROWFOOT, on ship-board, a complication of small cords spreading out from a long block, like the smaller parts which extend from the back-bone of a herring. It is used to suspend the awnings; or to keep the top-sails from striking violently, and fretting against the tops.

CROWLAND, a small town of Lincolnshire, seated in the fens, and having formerly a market of some note. It consists of four streets, separated from each other by water-courses, and connected by a curious bridge, formed of three segments of a circle, meeting in a point at the top, but so steep that only foot-passengers can pass over; horses and carriages go underneath. On the south-west wing, which faces the London road, is an image of king Ethelbald, in a sitting posture, having a crown fleury on the head, and a globe in the right hand. Its chief trade is in fish and wild ducks, which are in great plenty in the adjacent marshes.

The history of this place is involved in that of its far-famed abbey. It appears, from a charter of Ethelbald, that the lands belonging to the abbey comprehended 'the whole island of Croyland, formed by the four waters of Shepsee on the east, Nene on the west, Southsee on the south, and Asendyk on the north; in length four leagues, in breadth three, with the marshes adjoining on both sides the Weland; part of which, to the north, called Goggisland, is two leagues long from Croyland bridge to Aspath, and one league broad from the Weland south to Apenhall, and another part of the marsh south of the Weland, two leagues long, from Croyland bridge to South Lake; and two leagues broad from the Weland to Fynset, with fishery in the waters of Nene and Weland.' This charter is dated A. D. 716, and witnessed by Brithwald, archbishop of Canterbury; Winfred, archbishop of the Mercians; Ingwald, bishop of London; Aldwin, bishop of Litchfield; Tobias, bishop of Roehester; Ethelred, abbot of Bardney; Egbert, abbot of Medeshamsted; Egga, earl of Lincoln; Lurie, earl of Leicester, &c. &c. The monarch further gave towards the building of the monastery £300 in silver, and £100 a-year for ten years to come; he also authorised the monks to build, or enclose, a town for their own use, with a right of common for themselves and their servants.

The monastery was dedicated to the honor of St. Mary, St. Bartholomew, and St. Guthlac, who, 'by divine guidance, came in a boat to one of those solitary desert islands, called Crulande, on St. Bartholomew's day; and in an hollow, on the side of an heap of turf, built himself a hut in the days of Conrad, king of Mercia, when the Britons gave their inveterate enemies, the Saxons, all the trouble they could.' (Gough's History and Antiquities of Croyland). In the year 870 the Danes burned the monastery, and murdered the religious; it was, however, refounded in the year 943 by king Edred,

VOL. VI.

out was afterwards destroyed by fire in the year 1091. It was rebuilt in the year 1112 by liberal contributions, and burnt and rebuilt again between the years 1142 and 1170. About the year 1720 the roof of the abbey-church fell in, and was found to consist of Irish oak, finely carved and gilt; pieces of which are to be found in almost every house in Crowland. The venerable remains of this once celebrated abbey are extremely magnificent, and consist chiefly of a portion of the conventual church, which is highly interesting to the architect and antiquary. The choir, central tower, transepts, and the whole of the east end are down; what portions are found standing, are the skeletons of the nave, with parts of the south and north aisles; the latter of which is covered over, pewed, and fitted up as the parish-church. This edifice was made a garrison during the civil wars. Over the west gate are images of several kings and abbots; and among the rest of St. Guthlac, with a whip and knife, his usual symbols, and St. Bartholomew, with a knife.

Crowland is seven miles from Spalding, twelve N. N. E. of Peterborough, and ninety-three north by west of London.

CROWN, n. s. & v. a.

CROWNER, n. s.

CROWN-GLASS, n. s.

CROWN-LESS, adj.

CROWN-PORT, n. s.

CROWN-SEAL, n. s.

CROWN-THISTLE, n. s.

CROWN-WHEEL, n. s.

CROWN-WORKS, n. s.

Goth. *krona*; Dut. *kroonc*; Fr. *couronne*; Lat. *corona*. 'Anciently written chorona,' says Selden, 'and made Latin from *χορωνος*, which they civile (derive) from *χορος* or *χορευται*. i. e. the dancers or singers, and number of the solemnising sacrificers;' and perhaps this from *כָּרַךְ*, Hebrew, to dance around or in circles. The primitive idea seems to have been that of something surrounding the head. 'The antientest mention of a royal crown,' continues the above learned writer, 'is in the holy story, in that of the Amalekites bringing Saul's crown to David.' It was in the East more commonly a fillet circling the head, he adds. A diadem, the type of imperial, regal, or papal dignity; the authority of a king; as a verb, to invest with a diadem, or with such dignity; also the top or upper part of the head, or of a mountain; the upper part of the hat; a piece of money bearing royal ensignia; and, metaphorically, honor, reward, dignity in general; to confer honor or dignity; to complete, perfect, or praise. Crownet is the same with **CORONER**, which see. Crowner is a perfection, the old word for coroner, and still in use among the vulgar; and is also used by Shakspeare for the chief end or purpose; see the extract. The compounds denote severally; something large, superior, or excellent of their kind.

Now they do it to obtain a corruptible crown, but we an incorruptible. 1 Cor. ix. 25.

A seyn Stevenes day a non þe crowne vorst he here. Robert of Gloucester.

Thou has maad him a little lesse than aungelis, thou hast crowned him with glorie and onour, and thou hast ordeyned hym on the workis of thin hondis. Wiclif. Eusewiz 2.

2 N

And *crowmed* were as kyngis,
With *crowns* wrought full of losynges.
Chaucer. The House of Fame.

O pale is whilom *crowne* of housis al!
Id. Troilus and Creseide.

Witness the guiltlesse blood poured off on ground,
The *crownd* often slain, the slayer *crownded*.
Spenser. Faerie Queene.

And like a Persian mitre on her hed
Shew wore, with *crownes* and ouches garnished. *Id.*

The wyfe came yet,
And with her fete,
She helpe to kepe him downe,
And with her rocke
Mony a knocke
She gave him on the *crowne*.
Sir T. More.

The kings of England before his (Edward I.) time,
used to wear their *crowne* upon all solemne feast dayes :
he first omitted that custome, sayeing merrily that
crowns do rather ornerate than honour princes.
Camden's Remains.

If thou be a king where is thy *crowne*?
—My *crowne* is in my heart, not in my head .
My *crowne* is called content :
A *crowne* it is that seldom kings enjoy. *Shakspeare.*

Upon my head they placed a fruitless *crowne*,
And put a barren sceptre in my gripe,
Thence to be wrenched with an unlineal hand,
No son of mine succeeding. *Id. Macbeth.*

For within the hollow *crowne*,
That rounds the mortal temples of a king,
Keeps death his court ; and there the anticiks sits,
Scoffing his state, and grinning at his pomp.
Id. Richard II.

I'll have this *crowne* of mine cut from my shoulders,
Before I'll see the *crowne* so foul misplaced.
Id. Richard III.

Upon the *crowne* o' th' cliff, what thing was that
Which parted from you ? *Id. King Lear.*

In his livery
Walked *crowns* and *crownets* ; realms and islands were
As plates dropped from his pocket.
Id. Antony and Cleopatra.

Oh, this false soul of Egypt ! this gay charm !
Whose eye becked forth my wars, and called them
home ;

Whose bosom was my *crowne* ! my chief end ;
Like a right gipsy hath, at fast and loose,
Beguiled me to the very heart of loss. *Shakspeare.*

She shall be, to the happiness of England,
An aged princess ; many days shall see her,
And yet no day without a deed to *crowne* it. *Id.*
Trust not to your servants who may misinform you,
by which perhaps they may gain a few *crowns*.
Bacon.

He left behind him the reputation of a very fine
gentleman, and a most accomplished courtier ; and
after having spent in a very jovial life above four
hundred thousand pounds, which, upon a strict com-
putation, he received from the *crowns*, he left not a
house, nor acre of land, to be remembered by.
Clarendon.

The lasting and *crowning* privilege, or rather pro-
perty, of friendship, is constancy. *South.*

But he that can eat beef, and feed on bread which
is so brown,
May satisfy his appetite, and owe no man a *crowne*.
Suckling.

Black he stood as night ;
Fierce as ten furies ; terrible as hell ;
And shook a deadly dart. What seemed his head
The likeness of a kingly *crowne* had on. *Milton.*

An ounce of silver, whether in pence, groats, or
crowne pieces, stivers, or ducatoons, or in bullion, is,
and eternally will be, of equal value to another ounce
of silver. *Locke.*

Let merit *crowns*, and justice laurels give,
But let me happy by your pity live. *Dryden's Ep.*

All these a milk-white honeycomb surround,
Which in the midst the country banquet *crownd*.
Dryden.

While his head was working upon this thought, the
toy took him in the *crowne* to send for the songster.
L'Estrange.

Behold ! if fortune or a mistress frowns,
Some plunge in business, others shave their *crowns*.
Pope.

I once opened a remarkable atheroma ; it was about
as big as the *crowne* of a man's hat, and lay underneath
the pectoral muscle. *Sharp's Surgery.*

To conclude, my lords, if ministers thus persevere
in misadvising the king, I will not say that they can
alienate the affections of his subjects from the *crowne*,
but I affirm they will make the *crowne* not worth his
wearing. *Lord Clithard.*

They consider themselves as emancipated from
obedience, and as being no longer the subjects of the
British *crowne*. They leave us no choice but of yield-
ing or conquering, of resigning our dominion, or main-
taining it by force. *Johnson.*

King was a name too proud for man to wear
With modesty and meekness ; and the *crowne*,
So dazzling in their eyes who set it on,
Was sure to intoxicate the brows it bound. *Cropper.*

The castled crag of Drachenfels
Frowns o'er the wide and winding Rhine,
Whose breast of waters broadly swells
Between the banks which bear the vine,
And hills all rich with blossomed trees,
And fields which promise corn and wine,
And scattered cities *crowning* these. *Byron.*

The Niobe of nations ! there she (Rome) stands
Childless and *crowndless*, in her voiceless woe ;
An empty urn, within her withered hands,
Whose holy dust was scattered long ago.
Id. Childe Harold.

Crown is also used to signify the possessions
and dignity of a king. The crown of England,
according to Sir William Blackstone, is, by
common law, and constitutional custom, heredi-
tary, and this in a manner peculiar to itself ;
but the right of inheritance may, from time to
time, be changed or limited by act of parlia-
ment, under which limitations the crown still
continues hereditary. See SUCCESSION.

CROWN OFFICE, an office belonging to the
court of king's bench, of which the king's cor-
oner, or attorney, is commonly master. In this
office, the attorney-general and clerk of the
crown severally exhibit informations for crimes
and misdemeanors at common law, as in the
case of batteries, conspiracies, libelling, &c., on
which the offender is liable to pay a fine to the
king.

CROWN, PLEAS OF THE. See ARRAIGNMENT,
and PLEA.

CROWN, in commerce, is a general name for
coins, both foreign and domestic, of or near the
value of five shillings sterling. In its limited
sense, crown is only applicable to the British
coin of that name, which is worth 5s., and equi-
valent to six livres French money ; but, in its

extensive sense, it takes in several others; as the French *ecu*, which we call the French crown, struck in 1641, for six sols, or three livres; also, the patagon, dollar, ducatoon, rix-dollar, and piece of eight.

Crowns, in an ecclesiastical sense, is used for the clerical tonsure, the mark of the Romish ecclesiastics. This is a little circle of hair shaved off from the crown of the head, more or less broad, according to the quality of the orders received. That of a mere clerk is the smallest; that of priests and monks the largest. The clerical crown was anciently a round list of hair shaved off around the head, representing a real crown; this is easily observable in several ancient statues, &c. The religious of St. Dominic and St. Francis still retain it.

Crowns, Ancient. The first crowns were no more than a bandelet drawn round the head, and tied behind, as we still see it represented on medals round the heads of Jupiter, the Ptolemies, and the kings of Syria. See our article **Coronation**. Afterwards they consisted of two bandelets; by degrees they took branches of trees of divers kinds; at length they added flowers; insomuch that, Claudius Saturninus says, there was not any plant whereof crowns had not been made. The Roman emperors had four kinds of crowns, still seen on medals, viz. a crown of laurel, a radial or radiating crown, a crown adorned with pearls and precious stones, and the fourth a kind of bonnet, or cap, something like the mortar. The Romans had also various kinds of crowns, which they distributed as rewards of merit, which were considered as marks of nobility to the wearers; and, upon competitions with rivals for rank and dignities, often determined the preference in their favor.

Crowns, Modern. See **HERALDRY**.

Crowne (John), a celebrated dramatic writer, born in Nova Scotia, where his father was a minister. Impatient of the restraint under which he had been educated, he came to England, where he was reduced to enter into the service of an old lady. He then had recourse to his pen, which quickly procured him favor at court; but this kind of subsistence proving precarious, he ventured to solicit Charles II. for some establishment. Charles promised to provide for him; insisted, however, first on having another comedy; and suggested to him the plan of a Spanish play, from which Crowne produced the comedy of *Sir Courtly Nice*; but the sudden death of the king, on the last day of the rehearsal, disappointed his hopes. He died about 1703, and left seventeen tragedies and comedies, a romance called *Pandion and Amphigera*, and a burlesque poem, *Dæneids*, partly imitated from Boileau's *Lutrin*. His merit lay chiefly in his comedies. Dryden was jealous of him, and used to compliment him when any of his pieces failed.

Crow-net, an invention for catching wild fowl in winter, which may be used in the day-time. It is made of a fine pack-thread; the meshes should be two inches wide, the length about ten yards, and the depth three; it must be verged on the side with good strong cord, and stretched out very stiff on long poles prepared for that pur-

pose. At the proper place, open it, and lay it out at its full length and breadth; then fasten the lower end of it all along the ground, so as only to move it up and down; the upper end of the net must stand extended on the long cord; the further end thereof being staked first to the earth by a strong cord about five yards from the net. Place this cord in an even line with the lower edge of the net. The other end must be at least twenty-five yards distant to reach into some natural or artificial shelter, where one may lie concealed from the fowl, otherwise no success can be expected. The net must be placed in such exact order that it may give way to play on the fowl on the least pull of the cord, which must be done smartly lest the fowl should escape. This net may be used for pigeons, crows, or other birds, on corn-fields newly sown; also in stubble-fields provided the stubble conceal the net from the birds.

CROWNING, in architecture, is understood, in the general, of any thing that terminates or finishes a member or decoration. Thus, a cornice, a pediment, &c. are called crownings; the abacus is said to crown the capital; and any moulding is said to be crowned when it has a fillet over it; and a niche is crowned when it is covered with a capital.

CROWNING, in sea-language, denotes the finishing part of a knot made at the end of a rope. It is performed by interweaving the ends of the different stands artfully amongst each other, so as they may not become loosened or untwisted. They are useful in all kind of stoppers.

CROWN-POINT, a township of New York, in Clinton county, so called from the celebrated fortress in it, which was garrisoned by British troops, from the time of its reduction by general Amherst in 1759, till the late revolution. It was taken by the Americans on the 14th of May, 1773, and retaken by the British the year after. The point upon which it was erected by the French, in 1731, extends north into lake Champlain.

CROWTH, or **CRUTH**, a kind of musical instrument anciently in use among the common people of Wales.

CROWTOE, *n. s.* From crow and toe. A plant.

Bring the rather primrose that forsaken dies,

The tufted *crow-toe*, and pale jessamine. *Milton.*

CROXALL (Samuel), an ingenious English divine, born at Walton-upon-Thames, in Surrey, and educated at St. John's College, Cambridge. While at the University he wrote *The Fair Circassian*, a licentious imitation of Solomon's Song. On entering into orders he obtained the living of Hampton in Middlesex, with several preferments in Hereford Cathedral; and afterwards the united parishes of St. Mary Somerset, and St. Mary Mounthaw, in London; both which he held till his death in 1751. He was chaplain in ordinary to king George II. He published *Scripture Politics*, and various poems and translations, with an entire English edition of Esop's Fables. He was a zealous whig.

CROYDEN, a township of New Hampshire, in Cheshire county, adjoining Cornish, and about eighteen miles north-east of Charlestown. It was incorporated in 1763.

CROYDON, a town of England, in Surry, near the head of the river Wandle. It is surrounded with hills, and was formerly a seat of the archbishop of Canterbury. It has a large handsome church, an hospital, and a free school. The trade of this town is considerably increased by means of a canal which communicates with the Grand Surry, previously to its falling into the Thames, and, by an iron rail-way, from Wandsworth to Croydon, thence extending forward to Mersham, near Reigate. The archbishop's palace was sold by act of parliament, in 1780, and has since been converted into a cotton manufactory: market day Saturday.

CROYLSTONE, *n. s.* Crystallised cauk. or spar, found in Derbyshire. In this, says Woodward, the crystals are small.

CRUCIAL, *adj.* Lat. *crux, crucis*. Transverse; intersecting one another.

Whoever has seen the practice of the *crucial* incision, must be sensible of the false reasoning used in its favour. *Sharp's Surgery.*

CRUCIANELLA, petty madder, a genus of the monogynia order, and tetrandria class of plants; natural order forty-seventh, stellatæ. cor. monopetalous, and funnel-shaped, with the tube filiform and the limb unguiculated, or having an inflexed segment on the top of each segment; cal. diphyllous, and there are two linear seeds. There are five species, natives of the southern part of Europe.

CRUCIATE, *v. a.* } Lat. *crucio*. To tor-
CRUCIATION, *n. s.* } ture; to torment; to
 excruciate. See EXCRUCIATION.

— Thinking—Why God would suffer his children and servants so vehemently to be *cruciated*.

For's Martyrs.

No man can be so insensate, to think there can be more dreadful in the place of those infernal tortures, than there is pleasure and joy in the height of that sphere of blessedness; since we know we have to do with a God, that delights more in the prosperity of his saints, than in the *cruciation* and howling of his enemies. *Bishop Hall.*

CRUCIBLE, *n. s.* Lat. *crucibulum*; Ital. *crocola*. A chemist's melting pot, made of earth; said to be so called, because they were formerly marked with a cross to preserve the operations of the chemist from the interference of infernal spirits.

Take a quantity of good silver, and put it in a *crucible* or melting cruse, and set them on the fire, well covered about with coals. *Peacham.*

Wit, like every other power, has its boundaries. Its success depends on the aptitude of others to receive impressions; and that as some bodies, indissoluble by heat, can set the furnace and *crucible* at defiance, there are minds upon which the rays of fancy may be pointed without effect, and which no fire of sentiment can agitate, or exalt. *Johnson.*

These calces therefore, when mixed with the enamel flux, are melted in *crucibles*, once or oftener, and the deep coloured opaque glass thence resulting is ground into impalpable powder, and used for enamel. *Darwin.*

CRUCIFY, *v. a.* } Lat. *crux, crucis*. To
CRUCIFIX, *n. s.* } put to death by nailing
CRUCIFIXION, *n. s.* } on a CROSS, which see.
CRUCIFIER, *n. s.* } The instrument or cross
CRUCIFEROUS, *adj.* } on which the person cru-
CRUCIFORM, *adj.* } cified generally our Sa-
CRUCIGEROUS *adj.* } viour, is represented.

Crucifixion is the punishment so inflicted, and crucifier, he who inflicts it. Cruciferous and cruciferous are explained by exactly the same phrase, 'bearing the cross,' by Dr. Johnson; but he gives no instance of their use. Cruciform is, having the form of a cross. Metaphorically, the verb is used for the infliction of extreme pain of any kind.

Thei crieden and seiden, take awei, take awei, *crucify* him. Pila. seith to hem, sehal I *crucify* ghoure kyng? the bisschopis answeriden, we han no kyng but the emperour, and thanne Pilat bitook him to hem that he schulde be *crucified*. And thei tooken Iesus and ledden him out and he bar to himsilif a cross, and wente out into that place that is seid ecalarie in ebrew golgatha, where thei *crucified* him. *Wiclif, Jon 19.*

They *crucify* to themselves the Son of God afresh, and put him to an open shame. *Heb. vi. 6.*

How scourged, how crowned, how buffeted, how bruised,

And, lastly, how twist robbers *crucified*.

Spenser. Hymn of Heavenly Love.

The misbelieving Christian, therefore, *crucifies* Christ again. Each of his willing sins is a plain despite to his Redeemer. *Bishop Hall.*

He that prayed for his first *crucifiers* curseth his second: they *crucified* him in his weakness; these in his glory, they fetched him from the garden to the cross; these pull him out of heaven. *Id.*

I believe that Jesus Christ was *crucified*, dead and buried, rose again the third day from the dead, and ascended into heaven. *Locke.*

But to the cross he nails thy enemies, The law that is against thee, and the sins Of all mankind, with him there *crucified*. *Milton.*

Visible judgments were executed on Christ's *crucifiers*. *Hammond.*

There stands at the upper end of it a large *crucifix*, very much esteemed. The figure of our Saviour represents him in his last agonies of death.

Addison on Italy.

This earthquake, according to the opinion of many learned men, happened at our Saviour's *crucifixion*. *Id.*

The sight of Christ in glory, with his saints, will, in an inexpressible manner, torment the *crucifiers* of the one, and the persecutors of the others.

Bishop Horne, Psa. cxii. 10.

Some were disguised in the skins of wild beasts, and worried to death by dogs. Some were *crucified*, and others were wrapped in pitched shirts and set on fire when the day closed, that they might serve as lights to illuminate the night. *Patey's Evidences.*

He died as born, a Catholic in faith,
 Like most in the belief in which they're bred,
 And first a little *crucifix* he kissed,
 And then held out his jugular and wrist.

Byron. Don Juan.

CRUCITA, in botany, a genus of the dignynia order, tetrandria class of plants. Interior cal. tetraphyllous; exterior cal. triphyllous; cor. none; only one seed.

CRUDE, *adj.*
 CRU'DELY, *adv.*
 CRU'DENESS, *n. s.*
 CRU'DITY, *n. s.*
 CRU'DY, *adj.*

Lat. *crudus*; Gr. *κρως*;
 from קרה cold. Raw;
 harsh; unripe; uncon-
 cocted; immature.

A juice so crude as cannot be ripened to the degree of nourishment. *Bacon.*

While the body, to be converted and altered, is too strong for the efficient that should convert or alter it, whereby it holdeth fast the first form or consistence, it is *crude* and inconcoct; and the process is to be called *crudity* and inconcoction. *Id.*

Sherris sack ascends into the brain; dries me there all the foolish, dull, and *crudy* vapours which environ it. *Shakspeare.*

They are very temperate, whereby they prevent indigestion and *crudities*, and consequently putrescence of humours. *Broune.*

Others, whom mere ambition fires, and dole Of provinces abroad, which they have feigned To their *crude* hopes, and I as amply promised. *Ben Jonson.*

In a moment up they turned Wide the celestial soil; and saw beneath The' originals of nature, in their *crude* Conception: sulphurous and nitrous foam They found, they mingled, and with subtle art, Concocted and adusted. *Milton's Paradise Lost.*

Deep versed in books, and shallow in himself, *Crude*, or intoxicated, collecting toys. *Id.*

Absurd expressions, *crude* abortive thoughts, All the lewd legions of exploded faults. *Roscommon.*

Common *crude* salt, barely dissolved in common aqua fortis, will give it power of working upon gold. *Boyle.*

Fermented liquors have quite different qualities from the point itself; for no fruit, taken *crude*, has the intoxicating quality of wine. *Arbutnot.*

A diet of viscid aliment creates flatulency and *crudities* in the stomach. *Id.*

The' advice was true; but fear had seized the most, And all good counsel is on cowards lost: The question *crudely* put, to shun delay, 'Twas carried by the major part to stay. *Dryden.*

Wisdom and power in God are absolutely necessary, because God himself is absolutely necessary: but we cannot *crudely* say, the curing in men their aversion to the true religion, is absolutely necessary. *Locke.*

Where *cruder* juices swell the leafy vein, Stint the young germ, the tender blossom stain; On each lopped shoot a foster scion bind, Pith pressed to pith, and rind applied to rind. *Darwin.*

Bowles—if some new-born whim, or larger bribe Prompt thy *crude* brain, and claim thee for a scribe, If chance some bard, though once by dunces feared, Now prone in dust, can only be revered, If Pope, whose fame and genius from the first Have foiled the best of critics, needs the worst, Do thou essay; each fault and failing scan; The first of poets was, alas! but man! *Byron. English Bards.*

CRUDEN (Alexander), M. A. principally known as author of a Concordance to the Holy Scriptures, was the son of Mr. William Cruden, merchant, and one of the magistrates of Aberdeen. He was born in 1701, and educated at the grammar school of that city. He studied divinity at Marischal College; but betraying symptoms of insanity, through disappointment in a love affair,

he was confined for some time after in a house for the reception of lunatics, at Aberdeen. He was afterwards a private tutor, and a corrector of the press in London, where his Concordance was first published in 1737, dedicated to queen Caroline. The details of his life in the metropolis embrace only a mournful exhibition of great mental weakness, united with much that was amiable and instructive. He was more than once confined, we believe; called himself Alexander the Corrector, and published Adventures and Admonitions to the public under that title; and died at Islington, Nov. 1770, possessed of some little property.

CRU'DLE, *v. a.* } From CURD, which see.
 CRU'DY, *adj.* } To coagulate, congeal, or make into curd. Congealed; concreted; coagulated.

His cruel wounds with *crudy* blood congealed, They binden up so wisely as they may. *Spenser.*

I felt my *crudled* blood
 Congeal with fear; my hair with horror stood. *Dryden. Virgil.*

The Gelons use it, when, for drink and food, They mix their *crudled* milk with horses' blood. *Id.*

CRUEL, *adj.* } Fr. *cruel*; Ital. *crudel*;
 CRU'ELLY, *adv.* } Lat. *crudelis*, from *crudens*.
 CRU'ELNESS, *n. s.* } See CRUDE. Savage; barbarous; fierce; hard-hearted; inhuman.

Consider mine enemies; for they are many, And they hate me with *cruel* hatred. *Psaln xxv. 19.*

When he endured hed a yere or two
 This *cruel* torment, and this peine and wo,
 At Thebes, in his contree, as I said. *Chaucer. Cant. Tales.*

The *cruelle* of thee, Quene Medea,
 Thy litel children hanging by the hals
 For thy Jason, that was of love so fals. *Id.*

Ones have the wyndes the trees dyspooled elene,
 And once agayne beginnes their *cruelnesse*,
 Synce I have hyd under my brest the harme
 That never shall recover healthfulness. *Surrey.*

Use then my death, soe shall your *crueltye*
 Spite of your spyte, rid me from all my smart. *Wyatt.*

But she more *cruel*, and more savage wild,
 Than either lion or the lioness,
 Shames not to be with guiltless blood defiled,
 She taketh glory in her *cruelness*. *Spenser.*

Wretched man! wretched tree! whose nature
 weake

A *cruell* witch, her cursed will to wreake,
 Hath thus transformed, and plast in open plaines. *Id. Faerie Queene.*

The Scottish arrows, being sharp and slender, enter into a man or horse most *cruelly*, notwithstanding they are shot forth weakly. *Id. On Ireland.*

We beheld one of the *cruelst* fights between two knights, that ever had adorned the most martial story. *Sidney.*

REG. Wherefore to Dover?
 GLO. Because I would not see thy *cruel* nails
 Pluck out his poor old eyes, nor thy fierce sisters
 In his anointed flesh stick boorish fangs. *Shakspeare. King Lear.*

The *cruelty* and envy of the people,
 Permitted by our dastard nobles,
 Have suffered me by the voice of slaves to be
 Whooped out of Rome. *Shakspeare.*

Who can express the savage *cruelty* of the enemies of the gospel? Look into the ancient story of the infancy of Christianity, ye shall see how men set their wits on the rack to devise torments. *Bishop Hall.*

Now hath the spider caught a wandering flye,
And drags her captive at her *cruell* thigh. *Id. Sat.*

He relies upon a broken reed, that not only basely fails, but also *cruelly* pierces, the hand that rests upon it. *South.*

If thou art that *cruel* god, whose eyes
Delight in blood, and human sacrifice. *Dryden.*

There were great changes in the world by the revolutions of empire, the *cruelties* of conquering, and the calamities of enslaved nations. *Temple.*

Jefferies, who wanted in *cruelty*, had already given a specimen of his character in many trials where he presided; and he now set out with a savage joy, as to a full harvest of death and destruction. *Hume.*

Illusions vain! Can sacred Peace reside
Where sordid gold the breast alarms,
Where *cruelty* inflames the eye of Pride,
And Grandeur wantons in soft Pleasure's arms? *Beattie.*

I am a bending aged tree,
That long has stood the wind and rain;
But now has come a *cruel* blast,
And my last hold of earth is gone. *Burns.*

Why did they net then die?—they had lived too long
Should an hour come to bid them breathe apart;
Years could but bring them *cruel* things or wrong. *Byron. Don Juan.*

CRUENTATE, *adj.* Lat. *crucntatus*. Smear'd with blood.

Atomical aporrhæas pass from the *crucntate* cloth or weapon to the wound. *Glanville.*

CRU'ET, *n. s.* Dutch *kruicke*; perhaps from Lat. *grus*. A crane or heron, from both the bird and the vessel having a long neck; a vial for vinegar or oil.

Within thy reach I set the vinegar;
And filled the *cruet* with the acid tide,
While pepper-water worms thy bait supplied. *Swift.*

CRUIKSHANK (William), F.R.S. an eminent surgeon and anatomist, was born at Edinburgh, and completed his medical education at Glasgow in 1771, when he became librarian to the celebrated Dr. William Hunter. He afterwards became also his assistant in his anatomical lectures. On the death of Dr. Hunter he associated himself as a lecturer with the late Dr. Baillie, and published, in 1786, *The Anatomy of the Absorbent Vessels of the Human Body*, 4to, of which an improved edition appeared in 1790. He was also the author of *Experiments on the Insensible Pepspiration of the Human Body*, 1795, 8vo; and several scientific essays and papers in the *Transactions of the Royal Society*. He died in 1800.

CRUISE, *v. n.* Dutch *kruicke*; Teut. *kruis*; Fr. *cruche*; Lat. *grus*. Derived as above. A small vessel or pitcher.

I have not a cake, but an handful of meal in a barrel, and a little oil in a *cruiſe*. *1 Kings.*

Now shalt thou never see the salt beset
With a big-bellied gallon flagonet
Of an ebbe *cruiſe* must thirsty Silen sip,
That's all forestalled by his upper lip. *Ep. Hall's Sat.*

The train prepare a *cruiſe* of curious mould,
A *cruiſe* of fragrance, formed of blunished gold. *Pope's Ossesey*

CRUISE, *v. n. & n. s.* } Fr. *cruiſe*. Either
CRUI'SER, *n. s.* } from the croisaders, th-
CRUI'SING, *adj.* } Christian pirates of the
twelfth century, or more directly from Lat. *crux*, *crucis*, as Skinner says, from their sailing up and down, or cross-ways, in quest of an enemy. To pass backward and forward, by sea; to rove; to sail in search of an enemy.

Amongst the *cruiſers* it was complained, that their surgesons were too active in amputating fractured members. *Wiscman.*

Thy thoughts are vagabonds; all outward-bound
Mid sands, and rocks, and storms, to *cruiſe* for pleasure;
If gained, dear bought; and better missed than gained. *Young. The Complaint.*

Cruiſers are small men of war, made use of to-and-fro in the Channel, and elsewhere, to secure our merchant-ships and vessels from the enemy's small frigates and privateers. They are generally such as sail well, and are commonly well manned. *Chambers.*

Thus she came often, not a moment losing,
Whilst her piratical papa was *cruiſing*. *Byron. Don Juan.*

Thus having settled his marine affairs,
Dispatching single *cruiſers* here and there,
His vessel having need of some repairs,
He shaped his course to where his daughter fair.
Continued still her hospitable cares. *Id.*

CRUM, or
CRUMB, *v. n. & n. s.* } Goth. *krome*; Ang.-
CRUMBLE, *v. a.* } Sax. *cruma*. A small
part of a loaf or portion of bread; that which readily breaks off; the soft part of a loaf, as distinguished from the crust; a small portion of any thing.

It is not good to take the breed of children and gyve to hounds. An sche answerde and seyde to him, ghis lord, for litil whelpis eten undir the bord of the *crummys* of children. *Wiclif. Mark vii.*

Think on the woman Cananee, that saide
That whelpes eten som of the *crumes* alle
That from hir lordes table ben yfalle. *Chaucer. Cant. Tales.*

Take of manchet about three ounces, the *crumb* only thin cut; and let it be boiled in milk till it grow to a pulp. *Bacon.*

Flesh is but the glass which holds the dust
That measures all our time, which also shall
Be *crumbled* into dust. *Herbert.*

There is so hot a summer in my brain,
That all my bowels *crumble* up to dust. *Shakespeare. King John.*

He with his bare wand can unthread thy joints,
And *crumble* all thy sinews. *Milton.*

By frequent parcelling and subdividing of inheritances, in process of time they became so divided and *crumbled*, that there were few persons of able estates. *Hale's Law of England.*

At the same time we were *crumbled* into various factions and parties, all aiming at by-interests, without any sincere regard for the public good. *Atterbury.*

The bill leaves three hundred pounds a year to the mother church; which they can divide likewise, and *crumble* as low as their will and pleasure will dispose of them. *Swift.*

If the stone is brittle, it will eten *crumble*, and pass in the form of gravel. *Arbuthnot on Diet.*

Nor is the profit small the peasant makes,
Who smooths with harrow, or who pounds with rakes,
The *crumbling* clods. *Dryden's Georgicks.*

Ambition sighed: she found it vain to trust
The faithless column, and the *crumbling* bust. *Pope.*

More familiar grown, the table *crums*
Attract his slender feet. *Thomson's Winter.*

On these principles he chooses to suppose (for he does not pretend more than to suppose) a naked possibility, that he shall draw some resource out of *crumbs* dropped from the trenchers of penury; that something shall be laid in store from the short allowance of revenue officers, overloaded with duty, and famished for want of bread. *Burke.*

Daily near my table steal,
While I pick my scanty meal;
Doubt not little tho' there be,
But I'll cast a *crumb* to thee. *Langhorne.*

The storied pyramid, the laurelled bust,
The trophied arch, had *crumbled* into dust. *Darwin.*

How numerous, at the tables there,
The sparrows beg their daily fare.
For there, in every nook and cell,
Where such a family may dwell,
Sure as the vernal season comes,
Their nests they weave in hope of *crumbs*. *Cowper.*

CRUMENAL, *n. s.* Lat. *crumena*; from Gr. *κρουαο*. To hang down as a purse, which was anciently borne at the girdle. A purse.

The fat ox, that wont ligge in the stall,
Is now fast stalled in her *crumenal*. *Spenser's Pastoral.*

CRUMP, *adj.* } Anglo-Saxon *crump*;
CRUMPLE, *v. a.* } Goth. *krome*; Dut. *rom-*
CRUMPLING, *n. s.* } *pelen*. Crooked; bent, or driven into folds; to make crooked; to wrinkle, or rumple. Crumpling is an apple of a rumpled appearance.

When the workmen took measure of him, he was *crump*-shouldered, and the right side higher than the left. *L' Etranger.*

Sir Roger alighted from his horse, and exposing his palm to two or three that stood by him, they *crumpled* it into all shapes, and diligently scanned every wrinkle that could be made. *Addison.*

On inspecting the locomotion of about thirty acres of earth with a small house, near Bicker's Bridge in Shropshire, about twenty years ago, from the foot of a mountain towards the river, I well remember it bore all the marks of having been thus lifted up, pushed away, and as it were *crumpled* into ridges, by a column of water contained in the mountain. *Darwin.*

CRUOR, sometimes signifies the blood in general; sometimes only the venous blood; and sometimes extravasated or coagulated blood; but is most frequently used for the red globules of the blood, in contradistinction to the limpid or serous part.

CRUTPER, *n. s.* Fr. *croupier*, probably from *κρυπτω*, to conceal. The leather of a saddle, which fastens it to the croup of a horse.

A male twofold on his *cruper* lay,
It seemed that he carried life's array. *Chaucer. Cant. Tales.*

But Guyon selfe, ere well he was aware,
Nigh a speare's length behind his *cruper* fell. *Spenser. Faerie Queene.*

Citiphon had received such a blow, that he had lost the reins of his horse, with his head well nigh touching the *crupper* of the horse. *Sidney.*

Where have you left the money that I gave you?
—Oh—sixpence that I had a Wednesday last,
To pay the saddler for my mistress' *crupper*. *Shakespeare.*

Full oft the rivals met, and neither spared
His utmost force, and each forgot to ward:
The head of this was to the saddle bent,
The other backward to the *crupper* sent. *Dryden.*

That with fishes and loaves loads his *crupper*
While sectaries squat at the bait,
And get nothing but kicks for their supper. *Huddesford.*

CRURÆUS, or **CRURÆUS MUSCLES**, in anatomy, a fleshy mass, covering almost all the fore-side of the os femoris, between the two vasti, which likewise cover the edges of this muscle on each side. See **ANATOMY**.

CRURAL, *adj.* Lat. *crus*, *cruris*, the thigh. Belonging to the leg.

The sharpness of the teeth, and the strength of the *crural* muscles, in lions and tigers, are the cause of the great and habitual immorality of those animals. *Arbuthnot.*

CRUSADE, *n. s.* } See **CRUSADE**. An
CRUSA'DO, *n. s.* } expedition against the in-
fidels; a coin stamped with a cross.

Believe me, I had rather have lost my purse
Full of *crusadoes*. *Shakespeare. Othello.*

CRUSADES, or **CRUSADES**, in modern ecclesiastical history, may be applied to any war undertaken on pretence of defending the cause of religion; but it has been chiefly used to designate certain expeditions of the powers of Europe against the infidels for the conquest of Palestine. These expeditions commenced A. D. 1096. The foundation of them was a superstitious veneration for those places where our Saviour performed his miracles, and accomplished the work of man's redemption. Jerusalem had been taken, and Palestine conquered, by Omar. See **KHALIFS**. This proved a considerable interruption to the pilgrims, who flocked from all quarters to perform their devotions at the holy sepulchre. They had however still been allowed this liberty, on paying a small tribute to the Saracen caliphs, who were not much inclined to molest them. But in 1065 this city changed its masters. The Turks took it from the Saracens; and being much more fierce and barbarous, the pilgrims now found they could no longer perform their devotions with the same safety. An opinion was at this time also prevalent in Europe, which made these pilgrimages much more frequent than formerly. It was imagined that the 1000 years, mentioned in Rev. xx., were fulfilled; that Christ was soon to make his appearance in Palestine, to judge the world; and consequently that journeys to that country were in the highest degree meritorious, and even absolutely necessary. The multitude of pilgrims who now flocked to Palestine, meeting with a very rough reception from the Turks, filled all Europe with complaints against those infidels, who profaned the holy city, and derided the sacred mysteries of Christianity, even in the place where they were fulfilled. Pope Gregory VII. had formed a design e

uniting all the princes of Christendom against the Mahomedans; but his exorbitant encroachments upon the civil power of princes had created him so many enemies, and rendered his schemes so suspicious, that he was not able to make great progress in his undertaking. The work was reserved for a meaner instrument. Peter, commonly called the hermit, a native of Amiens, in Picardy, had made the pilgrimage to Jerusalem; and being deeply affected with the dangers, to which that act of piety now exposed the pilgrims, as well as with the oppression under which the eastern Christians now laboured, formed the bold, and in all appearance impracticable, design of leading into Asia, from the farthest extremities of the West, armies sufficient to subdue those potent and warlike nations that now held the holy land in slavery. He proposed his scheme to pope Martin II., who, prudently resolving not to interpose his authority till he saw a probability of success, summoned, at Placentia, a council of 4000 ecclesiastics and 30,000 seculars. As no hall could be found large enough to contain such a multitude, the assembly was held in a plain. Here the pope himself, as well as Peter, harangued them, representing the dismal situation of their brethren in the east, and the indignity offered to the Christian name in allowing the holy city to remain in the hands of the infidels. These speeches were so agreeable to those who heard them, that the whole multitude suddenly and violently declared for the war, and solemnly devoted themselves to perform a service which they believed to be meritorious in the sight of God. But, though Italy seemed to have embraced the design with ardor, Martin thought it necessary, in order to ensure perfect success, to engage the greater and more warlike nations in the same enterprise. Having therefore despatched Peter to the chief cities and sovereigns of Christendom, he summoned another council at Clermont in Auvergne. The fame of this great and pious design, being now universally diffused, procured the attendance of the greatest prelates, nobles, and princes; and when the pope and the hermit renewed their pathetic exhortations, the whole assembly, as if impelled by immediate inspiration, exclaimed with one voice, 'it is the will of God!' These words were deemed so much the effect of a divine impulse, that they were employed as the signal of rendezvous and battle in all future exploits of these adventurers. Men of all ranks now flew to arms with the utmost ardor, and a cross was affixed to their right shoulder by all who enlisted in this holy enterprise. At this time Europe was sunk in the most profound ignorance and superstition. The ecclesiastics had gained the greatest ascendancy over the human mind; and persons who committed the most horrid crimes and disorders, knew of no other expiation than the observances imposed on them by their spiritual pastors. But amidst the abject superstition which now prevailed, the military spirit had also universally diffused itself; and, though not supported by art or discipline, was become the general passion of the nations governed by the feudal law. All the great lords possessed the rights of peace and war. They were engaged in continual hostilities with one

another; the open country was become a scene of outrage and disorder: the cities, still mean and poor, were neither guarded by walls nor protected by privileges. Every man was obliged to depend for safety on his own prowess or private alliances; and valor was the only excellence which was held in esteem, or gave one man the pre-eminence above another. When, therefore, all the particular superstitions were here united in one great object, the ardor for private hostilities took the same direction; 'and all Europe,' as the princess Anna Commena expresses it, 'torn from its foundations, seemed ready to precipitate itself in one united body upon Asia.'

I. The nobles were moved, by the romantic spirit of the age, to hope for opulent establishments in the east, the chief seat of arts and commerce at that time. In pursuit of these chimerical projects, they sold at low prices their ancient castles and inheritances, which had now lost all value in their eyes. The infirm and aged contributed to the expedition by presents and money; and many of them attended it in person, being determined, if possible, to breathe their last in sight of that city where their Saviour died for them. Even women, concealing their sex under the disguise of armour, attended the camp. The greatest criminals were forward in a service which they considered as an expiation for all crimes; and the most enormous disorders were, during the course of these expeditions, committed by men inured to wickedness, encouraged by example, and impelled by necessity. The adventurers were at last so numerous, that their sagacious leaders became apprehensive lest the greatness of the armament should be the cause of its own disappointment. For this reason they permitted an undisciplined multitude, computed at 300,000 men, to go before them under the command of Peter the hermit, and Gautier or Walter, surnamed the Moneyless from his being a soldier of fortune. These took the road towards Constantinople through Hungary and Bulgaria; and trusting that heaven, by supernatural assistance, would supply all their necessities, they made no provision for subsistence in their march. They now, therefore, soon found themselves obliged to obtain by plunder what they vainly expected from miracles; and the enraged inhabitants of the countries through which they passed, attacked and slaughtered them without resistance. The more disciplined armies followed after; and, passing the straits of Constantinople, were mustered in the plains of Asia, and amounted in the whole to 700,000 men. The princes engaged in this first crusade were, Hugo, count of Vermandois, brother to Philip I. king of France; Robert, duke of Normandy; Robert, earl of Flanders; Raimond, earl of Toulouse and St. Giles; the celebrated Godfrey of Bouillon, duke of Lorraine, with his brothers Baldwin and Eustace; Stephen, earl of Chartres and Blois; Hugo, count of St. Paul's; with many other lords. The general rendezvous was at Constantinople. In this expedition, Godfrey besieged and took the city of Nice. Jerusalem was taken by the confederated army, and Godfrey chosen king. The Christians gained the famous battle of Ascalon against the sultan of Egypt, which put an end to

the first crusade; but not to the spirit of crusading. The rage continued for nearly two centuries.

II. The second crusade, in 1144, was headed by the emperor Conrad III., and Louis VII. king of France. The forces of the emperor were either destroyed by the enemy, or perished through the treachery of Mamiel, the Greek emperor; and the second army, through the unfaithfulness of the Christians of Syria, was forced to break up the siege of Damascus.

III. The third crusade, in 1188, immediately followed the taking of Jerusalem by Saladin the sultan of Egypt. The princes engaged in this expedition were, the emperor Frederick Barbarossa; Frederick, duke of Suabia, his second son; Leopold, duke of Austria; Berthold duke of Moravia; Herman, marquis of Baden; the counts of Nassau, Thuringia, Missen, and Holland; and above sixty other princes of the empire; with the bishops of Besarcon, Cambrai, Munster, Osnaburg, Missen, Passau, Visburg, and several others. In this expedition the emperor Frederick defeated the sultan of Iconium; his son Frederick, joined by Guy Lusignon king of Jerusalem, in vain endeavoured to take Acre or Ptolemais. During these transactions, Philip Augustus king of France, and Richard II. king of England, joined the crusade; by which means the Christian army consisted of 300,000 fighting men; but, great disputes happening between the kings of France and England, the former quitted the holy land, and Richard concluded a peace with Saladin.

IV. The fourth crusade was undertaken, in 1195, by the emperor Henry VI. after Saladin's death. In this expedition the Christians gained several battles against the infidels, took a great many towns, and were in prospect of great success, when the death of the emperor obliged them to quit the holy land, and return into Germany.

V. The fifth crusade was published by pope Innocent III. in 1198. Those engaged in it made fruitless efforts for the recovery of the holy land; for though John de Neule, who commanded the fleet equipped at Flanders, arrived at Ptolemais a little after Simon of Montfort, Renard of Dampierre, and others; yet the plague destroying many of them, and the rest either returning or engaging in the petty quarrels of the Christian princes, there was nothing done; so that the sultan of Aleppo easily defeated their troops in 1204.

VI. The sixth crusade began in 1228; in which the Christians took the town of Damietta, but were forced to surrender it again. In 1229 the emperor Frederick made peace with the sultan for ten years. About 1240 Richard earl of Cornwall, brother to Henry III. king of England, arrived in Palestine at the head of the English crusade; but finding it most advantageous to conclude a peace he re-embarked, and steered towards Italy. In 1244 the Karasians, being driven out of Persia by the Tartars, broke into Palestine, and gave the Christians a general defeat near Gaza.

VII. The seventh crusade was headed, in 1249, by St. Lewis, who took the town of Damietta;

but, a sickness happening in the Christian army, the king endeavoured a retreat; in which, being pursued by the infidels, most of his army were miserably butchered, and himself and his nobility taken prisoners. A truce was agreed upon for ten years, and the king and lords set at liberty.

VIII. The eighth crusade, in 1270, was headed by the same prince, who made himself master of the port and castle of Carthage in Africa; but, dying a short time after, he left his army in a very ill condition. The king of Sicily coming up with a good fleet, and joining Philip the Bold, son and successor of Lewis king of Tunis, after several engagements with the Christians, in which he was always worsted, desired peace, which was granted upon conditions advantageous to the Christians: after which both princes embarked for their own kingdoms. Prince Edward of England, who arrived at Tunis at the time of this treaty, sailed towards Ptolemais, where he landed a small body of 300 English and French, and hindered Bendochar from laying siege to Ptolemais; but being obliged to return, to take possession of the crown of England, this crusade ended without contributing any thing to the recovery of the holy land. In 1291 the town of Acre, or Ptolemais, was taken and plundered by the sultan of Egypt, and the Christians quite driven out of Syria.

This, happily for the honor of the Christian name, was the last of the crusades, although various attempts were made by the popes to revive them, particularly by Nicholas IV. in 1291, and Clement V. in 1311. Voltaire computes the people who perished in the different expeditions at upwards of 2,000,000. Many there were, however, that returned; and these, having conversed so long with more civilized and magnificent races of people, began to entertain some taste for a refined mode of life. Thus the barbarism, in which Europe had been so long immersed, began soon after to wear off. The princes, also, who remained at home, found means to avail themselves of the frenzy of the people. By the absence of such numbers of restless adventurers, peace was established in their dominions. They also took the opportunity of annexing to their crowns many considerable fiefs, either by purchase or the extinction of the heirs; and thus the mischiefs which must always attend feudal governments were considerably lessened. Mr. Gibbon, in tracing the consequences and effects of the crusades, considers that the intercourse between Constantinople and Italy diffused the knowledge of the Latin tongue; and that several of the fathers and classics were thus at length honored with a Greek version. If we compare, he says, at the era of the crusades, the Latins of Europe with the Greeks and Arabians, their respective degrees of knowledge, industry, and art, our rude ancestors must be content with the third rank in the scale of nations. Their successive improvement and present superiority may be ascribed to a peculiar energy of character, to an active and imitative spirit, unknown to their more polished rivals, who, at that time, were in a stationary or retrograde state. With such a disposition, the Latins might have derived essen-

tial benefits from events which opened to them a long and frequent intercourse with the more cultivated regions of the east. Their first and most obvious progress was in trade and manufactures, in the arts, which are strongly prompted by the thirst of wealth, the calls of necessity, and the gratification of the sense of vanity. But the intellectual wants of the Latins were more slowly felt and supplied; and, in the age of the crusades, they viewed with careless indifference the literature of the Greeks and Arabians; nor did they derive any substantial advantage from it. The principle of the crusades was a savage fanaticism; and the most important effects were analogous to the cause. Each pilgrim was ambitious to return with his sacred spoils, the relics of Greece and Palestine; and each relic was preceded and followed by a train of miracles and visions. The active spirit of the Latins preyed on the vitals of their reason and religion, and if the ninth and tenth centuries were the times of darkness, the thirteenth and fourteenth were the ages of absurdity and folly. The embers of the arts of antiquity, as Mr. Gibbon conceives, were rekindled by the northern conquerors of the Roman empire; and after a long interval, from the reign of Charlemagne forward, the tide of civilisation began to flow, about the eleventh century, with a steady and accelerated course. During the two centuries of the crusades its increase was great, and its progress rapid; and some philosophers, as we have already stated, have applauded the propitious influence of these holy wars; but Mr. Gibbon thinks that they checked rather than forwarded the maturity of Europe. The lives and labors of millions, who were buried in the east, would have been more profitably employed in the improvement of their native country; the accumulated stock of industry and wealth would have overflowed in navigation and trade; and the Latins would have been enriched and enlightened by a free and friendly correspondence with the climates of the east. In one respect he perceives the accidental operation of the crusades, not so much in producing a benefit as in removing an evil. 'The larger portion of the inhabitants of Europe was chained to the soil, without freedom, or property, or knowledge; and the two orders of ecclesiastics and nobles, whose numbers were comparatively small, alone deserved the name of citizens and men. This oppressive system was supported by the acts of the clergy and the swords of the barons. The authority of the priests operated, in the darker ages, as a salutary antidote:—they prevented the total extinction of letters, mitigated the fierceness of the times, sheltered the poor and defenceless, and preserved or revived the peace and order of civil society. But the independence, rapine, and discord, of the feudal lords were unmix'd with any semblance of good; and every hope of industry and improvement was crushed by the iron weight of the martial aristocracy. Among the causes that undermined that Gothic edifice, a conspicuous place must be allowed to the crusades. The estates of the barons were dissipated, and their race was often extinguished, in these costly and perilous expeditions. Their poverty extorted from their pride those charters of

freedom which unlocked the fetters of the slave, secured the farm of the peasant and the shop of the artificer, and gradually restored a substance and a soul to the most numerous and useful part of the community. The conflagration which destroyed the tall and barren trees of the forest gave air and scope to the vegetation of the smaller and nutritive parts of the soil.' See *Gibbon's History of the Roman Empire*, vol. ii.; *Robertson's History*, chap. 5. vol. i.; *Historical dissertations concerning India*, p. 131, &c.; *Smith's Wealth of Nations*, vol. i. chap. 3; *Mosheim's Ecclesiastical History*, vols. ii. and iii.; and *Hume's History*, vols. i. and ii.

The late lamented Mr. Mill is the last and not least interesting writer on this fruitful topic. He clothes a narrative full of romantic adventure and anecdote in a correct, clear, and energetic style. We cannot forbear extracting some of his closing reflections.

'A view of the heroic ages of Christianity, in regard to their grand and general results, is a useful and important, though a melancholy, employment. The crusades retarded the march of civilisation; thickened the clouds of ignorance and superstition; and encouraged intolerance, cruelty, and fierceness. Religion lost its mildness and charity; and war its mitigating qualities of honor and courtesy. Such were the bitter fruits of the holy wars! Painful is a retrospect of the consequences; but interesting are the historical details of the heroic and fanatical achievements of our ancestors. The perfect singularity of the object, the different characters of the preachers and leaders of the crusades, the martial array of the ancient power and majesty of Europe, the political and civil history of the Latin States in Syria, the military annals of the orders of St. John and the Temple, fix the regard of those who view the history of human passions with the eyes of a philosopher or a statesman. We can follow with sympathy both the deluded fanatic and the noble adventurer in arms, in their wanderings and marches through foreign regions, braving the most frightful dangers, patient in toil, invincible in military spirit. So visionary was the object, so apparently remote from selfish relations, that their fanaticism wears a character of generous virtue. The picture, however, becomes darkened, and nature recoils with horror from their cruelties, and with shame from their habitual folly and senselessness. Comparing the object with the cost, the gain proposed with the certain peril, we call the attempt the extremest idea of madness, and wonder that the western world should for 200 years pour forth its blood and treasure in chase of a phantom. But the crusades were not a greater reproach to virtue and wisdom, than most of those contests to which in every age of the world pride and ambition have given rise. If what is perpetual be natural, the dreadful supposition might be entertained that war is the moral state of man. The miseries of hostilities almost induce us to think, with the ancient sage, that man is the most wretched of animals. Millions of our race have been sacrificed at the altar of glory and popular praise, as well as at the shrine of superstition. Fanciful claims to foreign thrones, and the vanity of foreign do-

minion, have, like the crusades, contracted the circle of science and civilisation, and turned the benevolent affections into furious passions. But

They err, who count it glorious to subdue
By conquest far and wide, to overrun
Large countries, and in field great battles win,
Great cities by assault; what do these worthies,
But rob and spoil, burn, slaughter, and enslave
Peaceable nations, neighbouring, or remote,
Made captive, yet deserving freedom more
Than those their conquerors, who leave behind
Nothing but ruin wheresoe'er they rove,
And all the flourishing works of peace destroy ?

We feel no sorrow at the final doom of the crusades, because in its origin the war was iniquitous and unjust. "THE BLOOD OF MAN SHOULD NEVER BE SHED BUT TO REDEEM THE BLOOD OF MAN. IT IS WELL SHED FOR OUR FAMILY, FOR OUR FRIENDS, FOR OUR GOD, FOR OUR KIND. THE REST IS VANITY, THE REST IS CRIME." vol. ii. pp. 373—376.

CRUSCA, Ital. i. e. bran, the title assumed by a celebrated academy established at Florence, for purifying and perfecting the Tuscan language. The academy took its name from its office and object, which were to refine the language, and, as it were, to separate the bran from it. Accordingly, its device is a sieve; and its motto. Il piu bel fior ne coglie; that is, 'It gathers the finest flour.' The vocabulary Della Crusca is an excellent Italian dictionary, composed by this academy.

CRUSH, *v. a. & n. s.* } Maso-Goth. *krius-*
CRUSHING, *adj.* } *tan*; Fr. *craser*. To
break with violence, and perhaps originally, with
a violent noise. To compress with force; to
squeeze; drive together; press down; subdue;
oppress.

The ass thrust herself unto the wall, and crushed
Balaam's foot against the wall. *Numbers* xxii. 25.

They use them to plague their enemies, or to oppress
and crush some of their own too stubborn free-
holders. *Spenser on Ireland*.

Cold causes rheums and distensions from the head,
and some astringent plasters crush out purulent matter.
Bacon.

He crushed treasure out of his subjects' purses, by
forfeitures upon penal laws. *Id.*

Certainly virtue is like precious odours, most fragrant
where they are incensed or crushed: for prosperity
doth best discover vice, but adversity doth best
discover virtue. *Id.*

Put in their hands thy bruising irons of wrath,
That they may crush down, with a heavy fall,
The usurping helmets of our adversaries!

Shakspeare. Richard III.

You speak him far—

—I don't extend him, Sir: within himself

Crush him together, rather than unfold

His measure fully. *Id. Cymbeline.*

This act

Shall bruise the head of Satan, crush his strength,
Defeating sin and death, his two main arms. *Milton.*

Bacchus, that first from out the purple grape
Crushed the sweet poison of misused wine. *Id.*

When loud winds from different quarters rush,
Vast clouds encount'ring one another crush. *Waller.*

Vain is the force of man, and heaven's as vain,
To crush the pillars which the pile sustain.

Dryden's Æncid.

I fought and fell like one, but death deceived me;
I wanted weight of feeble Moors upon me.

To crush my soul out. *Id. Don Sebastian.*

Thou shalt flourish in immortal youth,

Unhurt amidst the war of elements,

The wreck of matter, and the crush of worlds.

Addison's Cato.

Dr. Merish has further observed, that many of the
echini are crushed in their form, and yet filled with
fint, which has taken the form of the crushed shell.

Darwin.

No sycophant or slave, that dared oppose
Her sacred cause, but trembled when he rose;
And every venal stickler for the yoke
Felt himself crushed at the first word he spoke.

Cowper.

How profound

The gulf! and how the giant element

From rock to rock leaps with delirious bound.

Crushing the cliffs, which downward worn and rent

With his fierce footsteps, yield in chasms a fearful

vent.

Byron.

Ye race of Frederic! Frederics but in name

And falsehood—heirs to all except his fame;

Who, crushed at Jena, crouched at Berlin, fell

First, and but rose to follow.

Id.

CRUST, *v. & n.*

CRUSTACEOUS, *adj.* } Ital. *crosta*; Lat. *crus-*
CRUSTATION, *n. s.* } *ta*, from Gr. *κρυσταλλος*.
CRUSTILY, *adv.* } See CRYSTAL. To con-
CRUSTINESS, *n. s.* } geal; to make hard, or
CRUSTY, *adj.* } cover with a coat or
case; the coat or case
so produced; crustaceous is hard or covered
with a spell.

For shepherds (said he) there doen lead

As lords doen otherwhere;

Their sheep han crust, and they the bread;

The chips and they the cheer.

Spenser. Shepherd's Calendar.

Pretending, that the face of nature may be now
quite changed from what it was; and that formerly
the whole collection of waters might be an orbicular
abyss, arched over with an exterior crust or shell of
earth, and that the breaking and fall of this crust
might naturally make a deluge. *Bentley.*

The 7th of December I put some very strong French
brandy into a China cup, such as they drink coffee
out of, and exposed it to the air; in three hours
time it was turned into a crusty ice all about the sides
of the cup, as if some cold blast had forced it abroad.

Boyle. On Cold.

I contented myself with a plaster upon the place
that was burnt, which crusted and healed in very few
days.

Ye are liberal now, but when your turn is sped,
You'll wish me choaked with every crust of bread.

Dryden.

It is true, that there are some shells, such as those
of lobsters, crabs, and others of crustaceous kinds, that
are very rarely found at land.

Woodward's Nat. Hist.

The egg itself deserves our notice: its parts within,
and its crusty coat without, are admirably well fitted
for the business of incubation.

Derham's Physico-Theology.

If your master hath many musty, or very foul and
crusted bottles, let those be the first you truck at the
alchouse.

Swift.

He was never suffered to go abroad, for fear of
catching cold; when he should have been hunting
down a buck, he was by his mother's side, learning
how to season it, or put it in crust.

Addison's Spectator.

With thee to smile upon him as he eats his *crust*,
the swain is happier than his monarch, from whose
probability thou art exiled. *Sterne.*

All else was hushed as Nature's closed ee ;
The silent moon shone high o'er tower and tree :
The chilly frost, beneath the silver beam,
Crept, gently *crusting*, o'wre the glittering stream.
Burns.

From cliff to cliff, the liquid treasure falls ;
In beds of stalactite, bright ores among,
O'er corals, shells, and crystals, winds along ;
Crusts the green mosses, and the tangled wood,
And sparkling plunges to his native flood.
Darwin.

I praise you much, ye meek and patient pair,
For ye are worthy ; choosing rather far
A dry but independent *crust*, hard earned,
And eaten with a sigh, than to endure
The rugged frowns and insolent rebuffs
Of knaves in office, partial in the work
Of distribution. *Cowper.*

To this family party I do not wish to belong.
He may invite persons, if he please, to dinner, and, like
lord Peter, say, that this tough *crust* is excellent
nutton. He may toss a sceptre to the king of Etruria
to play with, and keep a rod to scourge him in the
corner, &c. *Sheridan.*

CRUST is also applied, by naturalists and chemists, to those bony coverings of which the whole external surface of crabs, lobsters, and other sea animals is composed. And, as these consist of, 1. cartilaginous substance, possessing the properties of coagulated albumen ; 2. carbonate of lime ; 3. phosphate of lime (the presence of which distinguishes them from bones), they are considered as an intermediate substance betwixt bones and shells, partaking of the properties and constitution of both. The shells of eggs, though the animal cement is much less in them, may likewise be considered in this class, as they contain both carbonate and phosphate of lime ; and it seems very probable, from the experiments of Bernard and Hatchett, that the shells of snails are composed of the same ingredients, as these chemists detected phosphate of lime in them. The last mentioned gentleman examined the crust of crabs, lobsters, prawns, and crayfish. Being immersed in diluted nitric acid, they effervesced a little, and gradually assumed the appearance of a yellowish-white soft elastic cartilage, each retaining its respective form. The solution yielded a precipitate to acetate of lead, and ammonia threw down phosphate of lime ; carbonate of ammonia threw down a much more copious precipitate of carbonate of lime. See COXCHOLOGY.

CRUSTACEOUS FISH have their shells usually softer than those of the testaceous kind, which consist of a single piece, generally much thicker and stronger than the former ; such as those of the oyster, scallop, cockle, &c. Dr. Woodward observes, in his Natural History, that of all the shells found in beds of all the different matters dug out of the earth, there are scarce any of the crustaceous kind : the reason he gives for it is, that these being much lighter than the rest, must have floated on the surface at the time of the deluge, when all the strata were formed, and there have corrupted and perished.

CRUTCH, *n. s.* } Swed. *kruka* ; Teut.
CRUTCH-LIKE, } *Skrucke* ; Fr. *croce*, in all
probability from *κρᾶτος*, strength ; and *κρᾶτω*,
is to lay fast hold. A support or staff of age or
lameness.

My lymes been both hole and sound, me needeth
stilt ne *crouch*,
He cast asyde them both, and lepe oppon an huche.
Chaucer. Cant. Tales.

Ah, thus king Henry throws away his *crutch*,
Before his legs be firm to bear his body.
Shakspeare. Henry VI.

Hence, therefore, thou nice *crutch* ;
A scaly gauntlet now, with joints of steel,
Must glove this hand. *Id. Henry IV.*

On these new *crutches* let them learn to walk.
Dryden's Georjicks.

This fair defect, this helpless aid called wife,
The bending *crutch* of a decrepit life. *Dryden,*

The dumb shall sing, the lame his *crutch* forego,
And leap exulting like the bounding roe.
Pope's Messiah.

The broken soldier, kindly bade to stay,
Sate by his fire and talked the night away ;
Wept o'er his wounds, or, tales of sorrow done,
Shouldered his *crutch* and shewed how fields were
won. *Goldsmith.*

Halting on *crutches* of unequal size,
One leg by truth supported, one by lies ;
They sidle to the goal with awkward pace,
Secure of nothing but to lose the race. *Cowper.*

And Circumstance, that unspiritual god
And miscreator, makes and helps along
Our coming evils with a *crutch-like* rod,
Whose touch turns hope to dust—the dust we all have
rod. *Byron. Child Harold.*

CRUZ, SANTA, one of the Caribbee Islands, in the West Indies, about twenty-four miles in length, and nine in breadth. It enjoys a good air, but the water is not wholesome, until allowed to settle in jars. Sugar-canes, oranges, citrons, and various other fruits flourish here. It was first discovered by Columbus, and possessed afterwards by the English and Dutch. The latter were then driven out by the English, who, in their turn, were expelled by the Spaniards. At last the French seized upon the island in 1650, and sold it the following year to the knights of Malta, from whom it was again purchased by the French West India Company. It was finally sold to the Danes, who held it until the year 1801, when it was taken by the British. The value of the exports and imports for the years 1809 and 1810 :—

Imports.	Exports.
£435,378	£84,964
422,033	89,949

Long. 64° 35' W., lat. 17° 45' N.

CRUZ, SANTA, 1. A island in the straits of Magellan, opposite Cape Monday. 2. The name of a small island on the coast of Brasil. 3. A small island in the gulf of California, situated near the coast. 4. An island in the north Pacific Ocean, about twenty miles from the coast of New Albion, from which it is separated by the straits of Santa Barbara. It is nearly fifty miles in circumference.

CRUZ, SANTA, a river of South America, in the province of Maracaibo, which falls into the great

lake of this name. Also a river of Patagonia, which runs into the Atlantic, in lat. 50° 25' S.

CRUZ, SANTA, DE LA SIERRA, a town and province of Peru, bounded on the north by Moxos, east and south by the territory of the Indians, south-west by the province of Tomina, and west by that of Mizque. It is eighty-four miles in length, and fifty-four in breadth. It is of a moist and hot temperature. Population 16,000.

CRY, *v. a. & n. s.* } Fr. and Welsh. *crie* ;
CRYING, *n. s.* } Germ. Span. and Port.
CRYER, *n. s. or* } *grita* ; Gr. *κραυγή*. *Cri*
CRIER, *n. s.* } and *gri* seem, in most
languages, to signify a call or sharp hailing. The Scottish word *greit* is of similar origin. To utter a loud sound of distress or anxiety : to bewail ; to deplore ; this seems its primitive acceptation. It came then to indicate the loud expression of other passions ; any noisy, sharp, or clamorous exertion of the voice.

Forsoth the Jhesus eftsoene *criede* with a greet voys and gaf up the goost. *Wiclif* Matt. 27.

At midnight a *cry* was maad : lo the spouse cometh, go ye out to meete him. *Id.* Matt. 25.

But swiche a *crie* and swiche a wae they make,
That in this world n'is creature living
That ever herd swiche another waimenting.
Chaucer. Cant. Tales.

What folk be ye that at min houe coming
Perturben so my feste with *cryyng* ! *Id.*

With *cry* of boundes and merry blastes betwene,
Where we did chase the fearful herte of force.
Surrey.

No other noyse, nor peoples troublous *cryes*,
As still are wont to annoy the walled town
Might there be heard ; but careless Quiet lyes,
Wrapt in eternal silence farre from enitnyes.
Spenser. Faerie Queene.

Richely she fedes, and at the riche mannes cost.
And for her meate she nedes not crave nor *cry*.
Wygatt.

By all means *cry down* that unworthy course of
late times, that they should pay money,
Bacon to Villiers.

No comfortable star did lend his light,
No voice but owls' and wolves' death boding *cries*.
Shakspeare. The Rape of Lucrece.

Methought I heard a voice *cry*, Sleep no more !
Macbeth, doth murder sleep ? the innocent sleep.
Shakspeare.

You common *cry* of curs, whose breath I hate
As reek o' th' rotten fens ; whose loves I prize
As the dead carcases of unburied men,
That do corrupt my air. *Id. Coriolanus.*

What's the matter,
That in the several places of the city
You *cry* against the noble senate ? *Id.*

Yet let them look they glory not in mischief,
Nor build their evils on the graves of great men,
For then my guiltless blood must *cry* against them.
Shakspeare.

I'll to the king,
And from a mouth of honour quite *cry down*
This Ipswich fellow's insolence. *Id. Henry VIII.*

For ere vengeance begin, repentance is seasonable ;
but if judgment be once gone out, we *cry* too late.
Bishop Hall.

Cry out upon the stars for doing
Ill offices, to cross our wooing.

The astrologer, if his predictions come to pass, is
cried up to the stars from whence he pretends to draw
them. *South.*

Actors I've seen, and of no vulgar name,
Who being from one part possessed of fame,
Whether they are to laugh, *cry*, whine, or bawl,
Still introduce the fav'rite part in all. *Churchill.*

He scorns the dog, resolves to try
The combat next ; but if their *cry*
Invades again his trembling ear,
He strait resumes his wonted care. *Waller.*

When men are become accomplished knaves, they
are past *cryyng* for their cake. *Shaftesbury.*

Epiphanes *cries out upon* it, as rank idolatry, and
destructive to their souls who did it. *Stillingfleet.*

The partial crowd their hopes and fears divide,
And aid, with eager shouts, the favoured side,
Cries, murmurs, clamours, with a mixing sound,
From woods to woods, from hills to hills rebound.
Dryden.

The philosopher deservedly suspected himself of
vanity, when *cried up* by the multitude.
Glaucilla's Scepis.

All the effect that I conceive was made by *cryyng*
up the pieces of eight, was to bring in much more of
that species, instead of others current here. *Temple.*

They slight the strongest arguments that can be
brought for religion, and *cry up* very weak ones
against it. *Tillotson.*

When any evil has been upon philosophers, they
groan as pitifully, and *cry out* as loud, as other men.
Id.

We are ready to *cry out* of an unequal manage-
ment, and to blame the Divine administration.
Atterbury.

In popish countries some impostor *cries out*, A mi-
racle ! a miracle ! to confirm the deluded vulgar in
their errors ; and so the *cry* goes round, without ex-
amining into the cheat. *Swift.*

The child certainly knows, that the worm-seed or
mustard-seed it refuses, is not the apple or sugar it
cries for. *Locke.*

Tumult, sedition, and rebellion, are things that the
followers of that hypothesis *cry out* against. *Id.*

I find every sect, as far as reason will help them,
make use of it gladly ; and where it fails them, they
cry out, It is matter of faith, and above reason. *Id.*

Cryyng is a fault that should not be tolerated in
children ; not only for the unpleasant and unbecom-
ing noise it fills the house with, but for more consider-
able reasons, in reference to the children themselves ;
which is to be our aim in education. *Id.*

To all my weak complaints and *cries*,
Thy mercy lent an ear,
Ere yet my feeble thoughts had learnt
To form themselves in prayer. *Addison.*

Mute was the wail of Want, and Misery's *cry*,
And grateful Pity wiped her lucid eye ;
Peace with sweet voice the Seraph form addressed,
And virtue clasped him to her throbbing breast.
Darwin.

Laugh when I laugh, I seek no other fame,
The *cry* is up, and scribblers are my game ;
Speed Pegasus !—ye strains of great and small,
Ode ! Epic ! Elegy ! have at you all.
Byron. English Bards.

CRYOPHORUS, the frost-bearer, or carrier
of cold, an elegant instrument invented by Dr.
Wollaston, to demonstrate the relation between
evaporation at low temperatures, and the pro-
duction of cold. Take a glass tube, whose in-

ternal diameter is about one-eighth of an inch, with a ball at each extremity of about one inch diameter; and let the tube be bent to a right angle at the distance of half an inch from each ball. One of these balls should be somewhat less than half full of water, and the remaining cavity should be as perfect a vacuum as can readily be obtained; which is effected by making the water boil briskly in the one ball, before sealing up the capillary opening left in the other. If the empty ball be immersed in a freezing mixture of snow and salt, the water in the other ball, though at the distance of two or three feet, will be frozen solid in the course of a very few minutes. The vapor contained in the empty ball is condensed by the common operation of cold, and the vacuum produced by this condensation gives opportunity for a fresh quantity to arise from the opposite ball, with proportional reduction of its temperature.

CRYPsis, a genus of the diandria digynia class and order: *cal.* a glume, two-valved, one-flowered: *cor.* a glume, two-valved, and awnless. There is one species, a grass of Siberia.

CRYPT, *n. s.* } Lat. *crypta*; Gr. *κρυπ-*
CRYPTIC, *adj.* } *τω*, to hide; a secret or
CRYPTICAL, *adj.* } hidden place; a cave;
CRYPTICALLY, *adv.* } 'Etsolus mediæ cryp-
CRYPTOGRAPHY, *n. s.* } tan penetrare Suburræ.'
Juv. sat. 5. v. 106. A part of ancient churches under the high altar. Secret; hidden; occult; unknown. Cryptography is a secret kind of writing, or writing in copper.

When Christian religion was most pure, and indeed golden, Christians had but low and poor conventicles, and simple oratories; yea caves under the ground, called *Cryptæ*, where they, for fear of persecution, assembled secretly together. A figure whereof remaineth in the vaults, which yet are builded under the great churches, to put us in remembrance of the old state of the primitive church. *Humilis.*

We take the word acid in a familiar sense, without *cryptically* distinguishing it from those saps that are akin to it. *Boyle.*

The students of nature, conscious of her more *cryptick* ways of working, resolve many strange effects into the near efficiency of second causes.

Glanville's Apol.

Speakers, whose chief business is to amuse or delight, do not confine themselves to any natural order, but in a *cryptical* or hidden method adapt every thing to their ends. *Watts.*

In consequence of the ardour which he expressed on this subject, it was thought proper to deposit his body in the *crypt* of that magnificent church. *Malone.*

CRYPTA, from *κρυπτω*, to hide, a subterranean cell or vault, especially under a church, for the interment of particular families or persons. S. Ciampini, describing the outside of the Vatican, speaks of the *cryptæ* of St. Andrew, St. Paul, &c. Vitruvius uses the word for a part of a building, answering nearly to our cellar; Juvenal for a cloaca.

CRYPTO-CALVINISTS, a name given to the favorers of Calvinism in Saxony, on account of their secret attachment to the Genevan doctrine and discipline. Many of them suffered by the decrees of the convocation of Torgaw, held

in 1576. These Calvinists in their progress have divided into various lesser sects.

CRYPTOCEPHALUS, in entomology, a genus of insects of the coleoptera class. The antennæ are filiform; feelers four; thorax margined; shells immarginate; and the body somewhat cylindrical. This genus is very extensive, consisting of 268 species.

CRYPTOGAMIA, from *κρυπτος*, concealed, and *γαμος*, nuptials, the twenty-fourth class in the Linnaean system, comprehending those plants whose fructification is concealed, either through minuteness, or within the fruit. See *BOTANY*.

CRYPTOSTOMUM, a genus of the pentandria class and order: *cal.* five-cleft: *cor.* tube inserted into the throat of the calyx; borders five-toothed; nectarium five-toothed; berry, seeds scarred. There is one species, a shrub of Guiana.

CRYSTAL, *n. s. & adj.* } Fr. *crystal*;
CRYSTALLINE, *n. s. & adj.* } Span. *crystal*; It.
CRYSTALLISE, *v. n.* } *cristallo*; Latin
CRYSTALLISATION, *n. s.* } *crystellus*; Gr.
CRYSTAL-COVERED, *adj.* } *κρυσταλλος*, ice,
CRYSTAL-CRUSTED, *adj.* } from Heb. *קרקר*,
CRYSTAL-STREAMING, *adj.* } to join; coalesce;
as water when frozen. The Romans adopted the word for salts and minerals, as supposing them permanent congelations. See the following article.

And he schewide to me a flood of quyeke watr schynynge as *crystal* comynge forth of the secte of god and of the lombc. *Wiclif. Apocalips. 22.*

O closit, gardin, voide of wedis wreke,
Crystallin well, of clereness clere consigned. *Chaucer.*

Alas the clear *crystall*, the bright transplend ant glasse,
Doth not bewray the colours hid which underneath it base. *Wyllt.*

Such seamed they, and so their yellow here
Crystalline humor dropped down apace. *Spenser. Faerie Queene.*

Furth from her iyen the *crystal* teares outbrast,
And syghing sore, her handes she wrong and folde. *Suckville.*

Water, as it seems, turneth into *crystal*; as is seen in divers caves, where the *crystal* hangs in stillicidiis. *Bacon.*

Mount eagle to my palace *crystalline*.
Shakspeare. Cymbeline.

If *crystal* be a stone, it is not immediately concentered by the efficacy of cold, but rather by a mineral spirit. *Brown.*

As earth, so he the world
Built on circumfluous waters, calm, in wide
Crystalline ocean, and the loud misrule
Of chaos far removed; lest fierce extremes
Contiguous might distemper the whole frame. *Milton.*

If you dissolve copper in aqua-fortis, or spirit of nitre, you may, by *crystallizing* the solution, obtain a goodly blue. *Boyle.*

In groves we live, and lie on mossy beds,
By *crystal* streams that murmur through the meads. *Dryden.*

All natural metallick and mineral *crystallizations* were effected by the water, which first brought the particles, whereof each consists, out from amongst the matter of the strata. *Woodward's Nat. Hist.*

The parts of the eye are made convex, and especially the *crystalline* humour, which is of a lenticular figure, convex on both sides. *Ray on the Creation.*

Island *crystal* is a genuine spar, of an extremely pure, clear, and fine texture, seldom either blemished with flaws or spots, or stained with any other colour.

Hill.

High in the flood her azure dome ascends,
The *crystal* arch on *crystal* columns bends ;
Roofed with translucent shell the turrets blaze,
And far in ocean dart their coloured rays.

Darwin.

The colours of these siliceous vegetables are generally brown, from the iron, I suppose, or manganese, which induced them to *crystallize*, or fuse more easily.

Id.

How blest the Solitary's lot,
Who, all-forgetting, all-forgot,
Within his humble cell,
The cavern wild with tangling roots,
Sits o'er his newly-gathered fruits,
Beside his *crystal* well!

Burns.

A taste seen in the choice of his abode,
A love of music and of scenes sublime,
A pleasure in the gentle stream that flowed
Past him in *crystal*, and a joy in flowers,
Bedewed his spirit in his calmer hours.

Byron. Don Juan.

CRYSTAL is found. 1. Opaque, or semitransparent, and white, or of a milk color. 2. Opaque and red, or of a cornelian color, from Oran in Barbary. 3. Opaque and black, from the same place. 4. Clear. The specific gravity of these kinds of crystals is from 2650 to 2700. Professor Bergman extracted from them about six parts of argilla, and one of calcareous earth per hundred weight; but Mr. Gerhard found some so pure as to contain neither. 5. Clear and blackish brown, the smoky topaz, or rauh topaz of the Germans. It is found at Egan in Norway, and at Lovisa in Finland. These crystals are said to become clear by boiling them in tallow. 6. Clear and yellow; found in Bohemia, and sold for topazes. 7. Clear and violet-colored; the amethyst, from Saxony, Bohemia, and Danemore in Upland. The most transparent of these are called false diamonds, Bristol, Kerry stones, Alençon diamonds, &c. 8. Colorless rock crystal, properly so called, found in Bohemia, the province of Jemtland, and many other places. 9. Pyramidal crystal with one or two points. These have no prismatic shape, but either stand upon a base in cavities of quartz veins; have only a single pyramid, and are of various colors; or they lie in a clayey earth, and have both pyramids, but no prism. They are found at Blackenburg upon the Harz, and at Moserosh in the Silverland in Transylvania. The colored transparent crystals derive their tinge from an exceedingly small portion of metallic calces, but lose them entirely when strongly heated. They are called false gems; viz. the red from Oran in Barbary, false rubies; the yellow from Saxony, false topazes; the green from Dauphny, very rare, false emeralds or prases; the violet from Vil in Catalonia, false amethysts; the blue from Puy in Valey in France, false sapphires. There are likewise opal or rainbow

crystals, the various colors of which are thrown out in zones across the surface. They make a very fine appearance, though they never shine like the oriental opal. Crystal is also found in many parts of Britain and Ireland. About Bristol it is found of an amethystine tinge. In Silesia, and Bohemia, it is found stained with the colors of the ruby, sapphire, emerald, and topaz; in which case jewellers take great advantage of it, selling it under the name of occidental sapphire. Fourcroy makes a remarkable difference between the crystals and quartz, by affirming that the former are unalterable in the fire, in which they neither lose their hardness, transparency, nor color, while the quartz loses the same qualities, and is reduced by it to a white and opaque earth. He classes the rock crystals, I. According to their form, viz. 1. Insulated hexagonal crystals ending in pyramids of six faces, which have a double refraction, or show two images of the same object when looked through. 2. Hexagonal crystals united, having one or two points. 3. Tetrahedral, dodecahedral, flatted crystals; and which, though hexagonal, have nevertheless their planes irregular. 4. Crystals in large masses, from the island of Madagascar, which have a simple refraction. II. With regard to their color, as being either diaphanous, reddish, smoky, or blackish. III. With regard to accidental changes, some are hollow; some contain water within one or more cavities; some are cased one within the other; some are of a round form, as the pebbles of the Rhine; some have a crust of metallic calces or of a pyrites; some are found crystallised in the inside of a cavity, while some seem to contain amiantus or asbestos; and others contain shirls. M. Fourcroy reckons among crystals the oriental topaz, the hyacinth, the oriental sapphire, and the amethyst. Mr. Daubenton has always looked upon this last as a quartz of a crystal.

i. The forms or orders into which pure crystals have been divided are three: Perfect columnar crystals, with double pyramids, composed of eighteen planes, in an hexangular column, terminated by an hexangular pyramid at each end. ii. Perfect crystals with double pyramids, without a column, composed either of twelve or sixteen planes, in two hexangular pyramids, joined closely base to base, without the intervention of any column. iii. Imperfect crystals, with single pyramids, composed either of twelve or ten planes, in an hexangular or pentangular column, affixed irregularly at one end to some solid body, and terminated at the other by an hexangular or pentangular pyramid. Under these there are almost infinite varieties in the number of angles, and the length, thickness, and other accidents of the columns and pyramids. iv. When crystal is blended with metalline particles at the time of its formation, it assumes a variety of figures wholly different from these, constituting a fourth order, under the name of metalline crystals: when the metal is lead, the crystal assumes the form of a cube; when it is tin, of a quadrilateral pyramid, with a broad base; when iron, the crystal is found conereted in rhomboidal figures: these crystals are very common about mines; but the common spars,

which are liable to be influenced in the same manner by the metals, and to appear in the very same form, are to be carefully distinguished from them. There is one very easy test; viz. that all spars are subject to be dissolved by aqua-fortis, and effervesce violently only on its touching them: but it has no such effects on crystal.

v. When crystals are found in the form of round pebbles, which is occasioned by their being tossed about and rubbed against one another by floods or by the sea, they are called by the English lapidaries pebble crystal. They come from the Indies, Siberia, and other places.

vi. The pebble crystal is common in all parts of the world; but that which is formed of hexangular columns, affixed to a solid base at one end, and terminated by an hexangular column at the other, is infinitely more so: this is called sprig or rock crystal, and is the species described by most authors, under the name of crystal of the shops, or that kept for medicinal uses. When the rock crystals are semitransparent, or intermixed with opaque veins, they are called by the Swedish lapidaries milk crystals. According to Bomare, they are generally formed upon or among quartz, which shows their great affinity, and are to be found in all parts of the world. The greatest quantity of them is brought from moun: Saint Gothard, in Switzerland. Large pieces of these, weighing from 500 to 800 pounds, were found there at Grimselberg; another of about 1200 pounds weight was found some years ago at Fisback in the Wallais; and a piece six feet long, four wide, and equally thick, was found in the island of Madagascar, where these natural productions are of the most extraordinary size and perfection. In the imperial collection at Vienna, there is a pyramidal crystal vase two ells in height, cut wholly out of one piece. It is usual with the largest crystals of the German mountains to be full of cracks and flaws, and to be so constructed internally as to show all the prismatic colors; but the above mentioned ones were quite free from these blemishes, and resembled columns of the purest glass, only much clearer than any glass can be made.

Natural crystal may be reduced by calcination into a state proper for making glass with alkaline salts, and thus becomes a very valuable frutt. The method is this: calcine natural crystal in a crucible; when it is red-hot, throw it into cold water. Repeat this eight times, covering the crucible that no dust or ashes may get in among the crystal. Dry this calcined mass, and reduce it to an impalpable powder.

Crystal is frequently cut; and lustres, vases, and toys, are made of it as of other beautiful stones. For this purpose it is to be chosen perfectly clear and transparent. It may be tried by aqua-fortis, or by drawing it along a pane of glass. The genuine crystal will not be affected by the acid, and will cut glass almost like a diamond. When any piece of workmanship of natural crystal is become foul and dark, the following method is to be used for recovering its brightness without hurting the polish:—Mix together six parts of common water and one part of brandy; boil these over a brisk fire, and let the crystal be kept in it, in a boiling state, a

quarter of an hour; then take it out and rub it carefully over with a brush dipped in the same liquor; after this wipe it with a napkin, and thus its surface will be perfectly cleaned, and rendered as bright as at first, without any injury to the points of the cutting, or the polish of the planes or faces, which would probably happen, were the cleaning attempted by mere rubbing with a cloth.

CRYSTALLISATION, (*κρυσταλλος*, ice,) is that process of nature by which the particles of a body are arranged systematically in passing from a liquid to a solid state. The Greeks first applied it to ice, as the most obvious transformation of this kind; and the Roman naturalists transferred it to rock crystal and similar bodies, which they considered as only mere permanent formations of the same description as ice. Then it being observed that nitre and certain other salts were capable, by particular management, of exhibiting a similar prismatic form, the word crystal assumed a more general meaning, and was finally applied to all such saline substances and metallic ores as exhibit this tendency to symmetrical arrangement. Crystallography is a term that has been used for the science which discourses of crystallisation. This process is in a vast number of cases completed by nature in the bodies presented to our view. Modern naturalists observe that 'most of the solids which compose the mineral crust of the earth, are found in the crystallised state. Thus granite consists of crystals of quartz, felspar, and mica. Even mountain masses like clay-slate, have a regular tabulated form.' It is also imitated by art. The chemist produces it both by igneous fusion, and by solution in a liquid. When the temperature is slowly lowered in the former case, or the liquid slowly abstracted by evaporation in the latter, the attractive forces resume the ascendancy, and arrange the particles in symmetrical forms. And, if few of the crystallisations that are performed by nature have been successfully accomplished by art, chemistry has been able on the other hand, to effect the crystallisation of a variety of substances, chiefly salts, which are not found crystallised naturally; and, by taking proper advantage of this circumstance, has succeeded in obtaining them in a state of greater purity than they can be procured in by any other method. M. Le Blanc in a paper in the *Journal de Physique*, gives instructions for obtaining crystals of large size. His method is to employ flat glass or China vessels: to pour into these the solutions boiled down to the point of crystallisation: to select the neatest of the small crystals formed, and put them into vessels with more of the mother-water of a solution that has been brought to crystallise confusedly; to turn the crystals at least once a day; and to supply them from time to time with fresh mother-water. If the crystals be laid on their sides, they will increase most in length; if on their ends, most in breadth. When they have ceased to grow larger, they must be taken out of the liquor, or they will soon begin to diminish. It may be observed in general, that very large crystals are less transparent than those that are small.

The crystals of metals may be obtained by fusing them in a crucible with a hole in its bottom, closed by a stopper, which is to be drawn out after the vessel has been removed from the fire, and the surface of the metal has begun to congeal. The same effect may be observed if the metal be poured into a plate or dish, a little inclined, which is to be suddenly inclined in the opposite direction, as soon as the metal begins to congeal round its edges. In the first method, the fluid part of the metal runs out of the hole, leaving a kind of cup lined with crystals; in the latter way, the superior part, which is fluid, runs off, and leaves a plate of metal studded over with crystals.

The phenomena of crystallisation have much engaged the attention of modern chemists, and a vast number of experiments have been made with a view to determine exactly the different figures assumed by salts in passing from a fluid to a solid form. It does not, as yet, however, appear, that any certain rule can be laid down in these cases, as the figure of saline crystals may be varied by the slightest circumstances. Thus, sal-ammoniac when prepared by a mixture of pure volatile alkali, with spirit of salt, shoots into crystals resembling feathers; but if, instead of a pure alkali, we make use of one just distilled from bones, and containing a great quantity of animal oil, we shall, after some crystallisations of the feathery kind, obtain the very same salt in the form of cubes. Such salts as are sublimable, crystallise not only in the aqueous way by solution and evaporation, but also by sublimation; and the difference betwixt the figures of these crystals is often very remarkable. In nature also we find frequently the same chemical substance crystallised in forms apparently very dissimilar. Thus, carbonate of lime assumes the form of a rhomboid, of a regular hexahedral prism, of a solid terminated by twelve scalene angles, or of a dodecahedron with pentagonal faces, &c. Bisulphuret of iron or martial pyrites produces sometimes cubes and sometimes regular octohedrons, at one time dodecahedrons with pentagonal faces, at another icosahedrons with triangular faces, &c. And while one and the same substance lends itself to so many transformations, it meet with very different substances, which present absolutely the same form. Thus fluete of lime, muriate of soda, sulphuret of iron, sulphuret of lead, &c. crystallise in cubes, under certain circumstances; and in other cases, the same minerals, as well as sulphate of alumina and the diamond, assume the form of a regular octohedron.

Linnaeus, in his bold attempt to arrange the whole of nature's works, could not fail to observe a resemblance more or less perfect between the forms of various salts, and those of several crystallised minerals. He however, considered the faculty of crystallising to be peculiarly characteristic of saline substances, and hence concluded that all the crystallised earthy minerals were compounded of earth and some particular salt, which gave them outward form. Thus, because both nitre and quartz crystallise in the form of hexahedral prisms, terminated by hexahedral pyramids, he regarded the former as the type of

a whole genus, of which the latter was one of the species; observing again that alum and the diamond crystallise in pyramidal octohedrons, he arranged the latter as a species of the genus alum. Wallerius very soon proved that this hypothesis was untenable; nothing more correct, however, was offered as a theory of crystallisation until that of M. Romé de Lisle appeared. This able philosopher first arranged the study of crystallisation on the simple basis of facts. He examined all the crystalline forms that fell under his observation, delineated them with accuracy, ascertained the measurement of their principal angles, and arranged them with great sagacity, into species and varieties. Among the different forms belonging to each species, he chose one as the most proper, from its simplicity, to be regarded as the primitive form; and by supposing it truncated in different ways, he deduced the other forms from it, and determined a gradation or series of transitions between this same form and that of polyhedrons, which seemed to be still farther removed from it. In this way he discovered that the principal of the angles formed by the incidence of the circumscribing planes on each other, are always of the same dimensions, notwithstanding the truncatures and other modifications undergone by the primitive figure; and also that the dimensions of these angles vary in every different species, although the general figure of the crystals may be the same.

The illustrious Bergman followed the same line of observation; until he became convinced that the varieties in crystallisation are not owing to truncations of the primitive figure, but to the superposition of secondary laminae upon its faces, either in regular, or variable and decreasing proportions. According to this hypothesis, however, it would still follow, that if the external laminae of any crystals were taken off in regular succession, the remaining nucleus would be constantly approaching to the primitive form, and at last arrive at it. Bergman demonstrated this his principal discovery in the formation of the dog-tooth spar, by an actual dissection of the crystal. Removing the different crystalline laminae in succession, he arrived at a rhomboidal solid, divisible only by planes parallel to its surfaces, and therefore unsusceptible of undergoing any further change of form. In attempting, however, to apply this discovery to other varieties of calcareous spar, he was not equally successful.

It was reserved for M. Haüy, to unfold with mathematical accuracy, the profound but simple laws of nature on this subject. He has confirmed the general principles of de Lisle and Bergman with regard to the primitive formation of crystals; and has rendered it highly probable, that the integrant particles of crystallising substances always combine in the same body in the same way; or in other words, that the same faces, or the same edges, always attach themselves together; but that these differ in crystals produced from different substances; a fact which can scarcely be accounted for, without supposing that the particles of bodies are endowed with a certain polarity, which makes them attract one

part of another particle, and repel every other part. His next improvement in the study of the laws of crystallisation, however, was the submitting to regular calculation. He produced a mathematical theory, reduced to analytical formulae, representing every possible case; and the application of which to known forms leads to the accurate valuations of angles, and has hitherto agreed with all the recorded observations and experiments upon this subject.

We cannot, therefore, better exhibit the present state of science with regard to this interesting part of nature, than by submitting to the reader, I. M. Haiiy's Theory of the Structure of Crystals. II. Of the Laws of Crystallisation; and III. The Observations of Dr. Wollaston and more modern philosophers on the same subject.

SECT. I.—M. HAUY'S THEORY OF THE STRUCTURE OF CRYSTALS.

This may be conveniently considered in three parts. 1. His theory of primitive forms: 2. Of secondary forms; and 3. Of integrant molecules, or constituent particles.

1. The *primitive* form is, according to this theory, the nucleus of the crystal; or a solid of a constant form, engaged symmetrically in all the crystals of one and the same species, and the faces of which follow the directions of the laminae which form these crystals. The primitive forms of all crystals which have been hitherto examined are six. 1. The parallelepiped, bounded by six planes, the opposite planes being parallel. This includes the cube, and varieties of the rectangular prism, the oblique angular prism, and the rhomboid. 2. The octahedron. This is a double four-sided pyramid. When the triangular faces are equilateral, it is called a regular octahedron. There are, besides this, other varieties of the primitive octahedron, in which the pyramids are longer or shorter than the regular one, or have a rhomboidal base, or a rectangular base, longer in one direction than the other. 3. The regular tetrahedron bounded by four equilateral triangles. 4. The regular hexahedral prism, or equiangular six-sided prism. 5. The rhomboidal dodecahedron, bounded by twelve equal rhombs. 6. The pyramidal dodecahedron, consisting of two six-sided pyramids joined base to base.

The primitive forms which most frequently occur are, the parallelepiped and the octahedron. The tetrahedron and dodecahedron are very rare as primitive forms, though common as the secondary forms of crystals.

By this mechanical division of minerals we ascertain their true primitive form, and prove that this is invariable while we operate upon the same substance; however diversified or dissimilar the forms of the crystals belonging to that substance may be. Two or three examples will suffice to demonstrate this. If we take a regular hexahedral prism of carbonate of lime (plate I. CRYSTALLISATION, figs. 1 and 2), and try to divide it parallel to the edges, from the contours of the bases, we shall find, that three of these edges taken alternately in the upper part, for instance, the edges lf' , cd , bm , may be referred to this division: and in order to succeed in the same way with respect to the inferior base, we must choose

not the edges lf' , $c'd'$, $b'm'$, which correspond with the preceding, but the intermediate edges $d'f'$, $b'c'$, $l'm'$. The six sections will uncover an equal number of trapeziums. Three of the latter are represented upon fig. 2; viz. the two which intercept the edges, lf , cd , and are designated by $ppoo$, $aakk$, and that which intercepts the lower edge lf' , and which is marked by the letters $niii$. Each of these trapeziums will have a lustre and polish; from which we may easily ascertain in general cases that it coincides with one of the natural joints of which the prism is the assemblage. We shall attempt in vain to divide the prism in any other direction. But if we continue the division parallel to the first sections, it will happen, that on one hand the surfaces of the bases will always become narrower, while, on the other hand, the altitudes of the lateral planes will decrease; and at the term at which the bases have disappeared, the prism will be changed into a dodecahedron, fig. 3, with pentagonal faces, six of which, such as $ooiOe$, $oIkii$, &c. will be the residues of the planes of the prism; and the six others $EAlOO$, $OA'Kii$, &c. will be the immediate result of the mechanical division.

Beyond this same term, the extreme faces will preserve their figure and dimensions, while the lateral faces will incessantly diminish in height, until the points o , k , of the pentagon $oIkii$, coming to be confounded with the points ii , and so on with the other points similarly situated, each pentagon will be reduced to a simple triangle, as we see in fig. 4. The points which are confounded, two and two, upon this figure, are each marked with the two letters which served to designate them when they were separated, as in fig. 3. And when new sections have obliterated these triangles, so that no vestige of the surface of the prism remains, fig. 1, we shall have the nucleus or the primitive form, which will be an obtuse rhomboid, fig. 5, the grand angle of which EAl or EOI , is $101^\circ 32' 13''$. It is observed, that each trapezium, such as $ppoo$, fig. 2, uncovered by the first sections, is very sensibly inclined from the same quantity, as well upon the residue $ppdebm$ of the base, as upon the residue $ooj'l'$ of the adjacent plane. Setting out from this equality of inclinations, we deduce from it, by calculation, the value of the angles with the precision of minutes and seconds, which mechanical measurements are not capable of attaining.

If we try to divide a crystal of another species, we shall have a different nucleus. For instance, a cube of fluuate of lime will give a regular octahedron, which we succeed in extracting by dividing the cube upon its eight solid angles, which will in the first place discover eight equilateral triangles, and we may pursue the division, always parallel to the first sections, until nothing more remains of the faces of the cube. The nucleus of the crystals of sulphate of barytes will be a straight prism with rhombous bases; that of the crystals of phosphate of lime, a regular hexahedral prism; that of sulphureted lead, a cube, &c.; and each of these forms will be constant, relative to the entire species, in such a manner, that its angles will not undergo any appreciable variation.

2. *Secondary* forms are those in which the

laminæ of a crystal divide in any other direction than parallel to its faces; and are sometimes called secondary crystals. The division of secondary crystals by sections in the direction of the laminæ is, in some cases, easily effected; in others, the joints are indistinct, and require the crystal to be heated and plunged into cold water to make them visible. The direction of the laminæ is frequently rendered obvious by turning a mineral slowly round in the sunshine, when the reflections from the internal parts will show the structure. Where no joints are discoverable, Haüy determines their direction and the form of the primitive nucleus by conjecture, from the appearances offered by the secondary crystal.

3. *Of integrant molecules.* According to M. Haüy the nucleus of a crystal is not the last term of its mechanical division. It may always be subdivided parallel to its different faces, and sometimes in other directions also. The whole of the surrounding substance is capable of being divided by strokes parallel to those which take place with respect to the primitive form. If the nucleus be a parallelepipedon, which cannot be subdivided except by blows parallel to its faces, like that which takes place with respect to carbonated lime, it is evident that the integrant molecule will be similar to this nucleus itself. But it may happen that the parallelepipedon admits of further sections in other directions than the former.

The forms of the integrant molecules of all crystals may be reduced to three, the tetrahedron, or the simplest of the pyramids; the triangular prism, or the simplest of all the prisms; and the parallelepipedon, or the simplest among the solids, which have their faces parallel two and two. And since four planes at least are necessary for circumscribing a space, it is evident that the three forms in question, in which the number of faces is successively four, five, and six, have still, in this respect, the greatest possible simplicity.

To recapitulate.—The constituent particles of all crystals Haüy denominates their integrant molecules, and conceives them to be arranged in rows; a number of these rows forming thin laminæ or plates. When these laminæ are parallel with all the faces or planes of a crystal, they may be removed without changing the form of the crystal; but if the laminæ divide in any other direction than that which is parallel to the faces, a change of form will be produced by every division, until at last we obtain a nucleus which is divisible in a direction parallel to its sides. In the former case, the primitive form is the form of the crystal itself. Hence if a cubic crystal be divisible only by laminæ parallel to its six sides, we may continue diminishing the magnitude of the crystal, as long as mechanical division is possible without any change of form. When the laminæ of a crystal divide in any other direction than parallel to its faces, it is called a secondary form or derivative crystal.

SECT. II.—OF THE LAWS OF CRYSTALLISATION.

'If,' says M. Haüy, 'we consider attentively the figures of the plates which successively cover again the nucleus of a crystal, and which we

shall call laminæ of superposition, it will be perceived that proceeding from the nucleus they go on by a progressive diminution or decrement, sometimes on all sides at once, sometimes in certain parts only. But the difference between each lamina and that which precedes it, can only arise from the retrenchment of a certain quantity of integrant particles that are taken from the first till it is equal to the second; and, since the edges of the decreasing laminæ are constantly right lines parallel one to another upon the different laminæ, it results that the differences of which we have spoken are measured by the subtractions of one or many ranges of integrant particles. This, therefore, is the enunciation of the problem presented for solution: a secondary crystal being given, and the figure of its nucleus and of its integrant particles being likewise given—supposing, moreover, that each of the laminæ that will be added to the nucleus does not project so far as the preceding, in certain parts, by a quantity equal to one, two, three, &c. ranges of molecules—to determine among the different laws of diminution those from which a similar form to that proposed will result, with respect to the number, the figure, and the disposition of its faces, and to the measure of both its plane and solid angles. This sort of problems can only be resolved by the aid of a rigid calculus.'

The decrement in question, then, is effected by regular subtractions of one or more rows of integrant molecules; and the theory, in determining the number of these rows by means of calculation, succeeds in representing all the known results of crystallisation, and even anticipates future discoveries, indicating forms which, being still hypothetical only, may one day be presented to the enquiries of the philosopher.

1. *Of Decrements on the Edges.*—Let s, s' , fig. 6, plate I. CRYSTALLISATION, be a dodecahedron with rhombic planes. This solid, which is one of the six primitive forms of crystals, also presents itself occasionally as a secondary form, and in this case it has, as a nucleus, sometimes a cube and sometimes an octohedron. Supposing the nucleus to be a cube:—In order to extract this nucleus, it is sufficient successively to remove the six solid angles composed of four planes, such as s, r, t , &c., by sections adapted to the direction of the small diagonals. These sections will display as many squares, $AEOI, EOO'E, IOO'I$, fig. 7, &c., which will be the faces of the cube.

Now, let us conceive that each of these faces is subjected to a series of decreasing laminæ solely composed of cubic molecules, and that every one of these laminæ exceeds the succeeding one, towards its four edges, by a quantity equal to one course of these same molecules. Afterwards we shall designate the decreasing laminæ which envelope the nucleus, by the name of laminæ of superposition. Now, it is easy to conceive that the different series will produce six quadrangular pyramids, similar in some respects to the quadrangular steps of a column, which will rest on the faces of the cube. Three of these pyramids are represented in fig. 8, and have their summits in s, t, r' . As there are six quadrangular pyramids, we shall have twenty-four triangles, such as, $O s I, O t I$, &c. But because the de-

crement is uniform from s to t , and so on with the rest, the triangles taken two and two are on a level, and form a rhomb $s O t I$. The surface of the solid will therefore be composed of twelve equal and similar rhombs; i. e. this solid will have the same form with that which is the subject of the problem. This structure takes place, although imperfectly, with respect to the crystals called *boracic spars*. The dodecahedron now under consideration is represented by fig. 8 in such a way that the progress of the decrement may be perceived by the eye. On examining the figure attentively, we shall find that it has been traced on the supposition that the cubic nucleus has on each of its edges seventeen ridges of molecules; whence it follows, that each of its faces is composed of 289 facets of molecules, and that the whole solid is equal to 4913 molecules. On this hypothesis, there are eight laminae of superposition, the last of which is reduced to a simple cube, whose edges determine the numbers of molecules which form the series 15, 13, 11, 9, 7, 5, 3, 1, the difference being 2, because there is one course subtracted from each extremity. If instead of this coarse kind of masonry, which has the advantage of speaking to the eye, we substitute in our imagination the infinitely delicate architecture of nature, we must conceive the nucleus as being composed of an incomparably greater number of imperceptible cubes. In this case, the number of laminae of superposition will also be beyond comparison greater than on the preceding hypothesis. By a necessary consequence, the furrows which form these laminae by the alternate projecting and re-entering of their edges, will not be cognizable by our senses; and this is what takes place in the polyhedra which crystallisation has produced at leisure, without being disturbed in its progress.

2. M. Haüy calls *decrements in breadth*, those in which each lamina has only the height of a molecule; so that their whole effect, by one, two, three, &c., courses, is in the way of breadth. *Decrements in height* are those in which each lamina, exceeding only the following one by a single course in the direction of the breadth, may have a height double, triple, quadruple, &c., to that of a molecule: this is expressed by saying that the decrement takes place by two courses, three courses, &c., in height.

SECT. III.—OF SUBSEQUENT OBSERVATIONS ON CRYSTALLISATION.

Dr. Wollaston communicated to the Royal Society in 1813 some observations on the *ultimate* cause of crystalline forms, equally ingenious and profound.

Among the known forms of crystallised bodies, there is no one common to a greater number of substances than the regular octohedron, and no one in which a corresponding difficulty has occurred with regard to determining which modification of its form is to be considered as primitive; since in all these substances the tetrahedron appears to have equal claim to be received as the original from which all their other modifications are to be derived. The relation of these solids to each other is most distinctly exhibited to those who are not much conversant with crystallo-

graphy, by assuming the tetrahedron as primitive; for this may immediately be converted into an octohedron by the removal of four smaller tetrahedrons from its solid angles. Plate II. CRYSTALLISATION, fig. 1.

The substance which most readily admits of division by fracture into these forms, is fluor spar; and there is no difficulty in obtaining a sufficient quantity for such experiments. But it is not, in fact, either the tetrahedron or the octohedron, which first presents itself as the apparent primitive form obtained by fracture. If we form a plate of uniform thickness by two successive divisions of the spar, parallel to each other, we shall find the plate divisible into prismatic rods, the section of which is a rhomb of $70^{\circ} 32'$ and $109^{\circ} 28'$ nearly; and, if we again split these rods transversely, we shall obtain a number of regular acute rhomboids, all similar to each other, having their superficial angles 60° and 120° , and presenting an appearance of primitive molecule, from which all the other modifications of such crystals might very simply be derived. And we find, moreover, that the whole mass of fluor might be divided into, and conceived to consist of, these acute rhomboids alone, which may be put together so as to fit each other without any intervening vacuity.

But, since the solid thus obtained (as represented in fig. 2) may be again split by natural fractures at right angles to its axis, fig. 3, so that a regular tetrahedron may be detached from each extremity, while the remaining portion assumes the form of a regular octohedron; and, since every rhomboid that can be obtained must admit of the same division into one octohedron and two tetrahedrons, the rhomboid can no longer be regarded as the primitive form; and, since the parts into which it is divisible are dissimilar, we are left in doubt which of them is to have precedence as primitive. In the examination of this question, whether we adopt the octohedron or the tetrahedron as the primitive form, since neither of them can fill space without leaving vacancies, there is a difficulty in conceiving any arrangement in which the particles will remain at rest: for, whether we suppose, with the abbé Haüy, that the particles are tetrahedral with octohedral cavities, or, on the contrary, octohedral particles regularly arranged with tetrahedral cavities, in each case the mutual contact of adjacent particles is only at their edges; and, although in such an arrangement it must be admitted that there may be an equilibrium, it is evidently unstable, and ill adapted to form the basis of any permanent crystal.

With respect to fluor spar, and such other substances as assume the octohedral and tetrahedral forms, all difficulty is removed, says Dr. Wollaston, by supposing the elementary particles to be perfect spheres, which, by mutual attraction, have assumed that arrangement which brings them as near to each other as possible. The relative position of any number of equal balls in the same plane, when gently pressed together, forming equilateral triangles with each other (as represented respectively in fig. 4), is familiar to every one; and it is evident that, if balls so placed were cemented together, and the stratum

thus formed were afterwards broken, the straight lines in which they would be disposed to separate would form angles of 60° with each other. If a single ball were placed any where at rest upon the preceding stratum, it is evident that it would be in contact with three of the lower balls (as in fig. 5), and that the lines joining the centres of four balls so in contact, or the planes touching their surfaces, would include a regular tetrahedron, having all its equilateral triangles.

The construction of an octohedron, by means of spheres alone, is as simple as that of the tetrahedron. For, if four balls be placed in contact on the same plane, in form of a square, then a single ball resting upon them in the centre, being in contact with each pair of balls, will present a triangular face rising from each side of the square, and the whole together will represent the superior apex of an octohedron; so that a sixth ball similarly placed underneath the square will complete the octohedral group, fig. 6. There is one observation with regard to these forms that will appear paradoxical, namely, that a structure, which in this case was begun upon a square foundation, is really intrinsically the same as that which is begun upon the triangular basis.

But if we lay the octohedral group, which consists of six balls, on one of its triangular sides, and, consequently, with an opposite triangular face uppermost, the two groups, consisting of three balls each, are then situated precisely as they would be found in two adjacent strata of the triangular arrangement. Hence, in this position, we may readily convert the octohedron into a regular tetrahedron, by addition of four more balls (fig. 7). One placed on the top of the three that are uppermost forms the apex; and if the triangular base, on which it rests, be enlarged by addition of three more balls, regularly disposed around it, the entire group of ten balls will then be found to represent a regular tetrahedron.

For the purpose of representing the acute rhomboid, two balls must be applied at opposite sides of the smallest octohedral group, as in fig. 9. And if a greater number of balls be placed together, fig. 10 and 11, in the same form, then a complete tetrahedral group may be removed from each extremity, leaving a central octohedron, as may be seen in fig. 11, which corresponds to fig. 3.

We have seen that, by due application of spheres to each other, all the most simple forms of one species of crystal will be produced, and it is needless to pursue any other modifications of the same form, which must result from a series of decrements produced according to known laws. Since then the simplest arrangement of the most simple solid that can be imagined, affords so complete a solution of one of the most difficult questions in crystallography, we are naturally led to inquire what forms would probably occur from the union of other solids most nearly allied to the sphere. And it will appear, that, by the supposition of elementary particles that are spheroidal, we may frame conjectures as to the origin of other angular solids well known to crystallographers.

With respect to the obtuse rhomboid, if we suppose the axis of our elementary spheroid to

be its shortest dimension a class of solids will be formed which are numerous in crystallography. It has been remarked above, that by the natural grouping of spherical particles, fig. 10, one resulting solid is an acute rhomboid, similar to that of fig. 2, having certain determinate angles, and its greatest dimension in the direction of its axis. Now, if other particles having the same relative arrangement be supposed to have the form of oblate spheroids, the resulting solid, fig. 12, will still be a regular rhomboid; but the measures of its angles will be different from those of the former, and will be more or less obtuse according to the degree of oblateness of the primitive spheroid. It is at least possible that carbonate of lime and other substances, of which the forms are derived from regular rhomboids as their primitive form may, in fact, consist of oblate spheroids as elementary particles.

As to the hexagonal prisms, if our elementary spheroid be on the contrary oblong, instead of oblate, it is evident that, by mutual attraction, their centres will approach nearest to each other when their axes are parallel, and their shortest diameters in the same plane (fig. 13). The manifest consequence of this structure would be, that a solid so formed would be liable to split into plates at right angles to the axes, and the plates would divide into prisms of three or six sides with all their angles equal, as occurs in phosphate of lime, beryl, &c. It may farther be observed, that the proportion of the height to the base of such a prism, must depend on the ratio between the axes of the elementary spheroid.

And in regard to the cube: let a mass of matter be supposed to consist of spherical particles all of the same size, but of two different kinds in equal numbers, represented by black and white balls; and let it be required that, in their perfect intermixture, every black ball shall be equally distant from all surrounding white balls, and that all adjacent balls of the same denomination shall also be equidistant from each other. The doctor shows, that these conditions will be fulfilled if the arrangement be cubical, and that the particles will be in equilibrio. Fig. 14 represents a cube so constituted of balls, alternately black and white throughout. The four black balls are all in view. The distances of their centres being every way a superficial diagonal of the cube, they are equidistant, and their configuration represents a regular tetrahedron; and the same is the relative situation of the four white balls. The distances of dissimilar adjacent balls are likewise evidently equal; so that the conditions of their union are complete, as far as appears in the small group: and this is a correct representative of the entire mass, that would be composed of equal and similar cubes.

There remains one observation with regard to the spherical form of elementary particles, whether actual or virtual, that must be regarded as favorable to the foregoing hypothesis, namely, that many of those substances which we have most reason to think simple bodies, as among the class of metals, exhibit this further evidence of their simple nature, that they crystallise in the octohedral form, as they would do if their particles were spherical. But it must, on the

contrary, be acknowledged, that we can at present assign no reason why the same appearance of simplicity should take place in fluor spar, which is presumed to contain at least two elements; and it is evident, that any attempts to trace a general correspondence between the crystallographical and supposed chemical elements of bodies, must, in the present state of these sciences, be premature. Any sphere when not compressed will be surrounded by twelve others, and, consequently, by a slight degree of compression, will be converted into a dodecahedron, according to the most probable hypothesis of simple compression.

M. Beudant has lately made experiments to discover why a saline principle of a certain kind sometimes impresses its crystalline form upon a mixture in which it does not, by any means, form the greatest part; and also with the view of determining why one saline substance may have such an astonishing number of secondary forms as we sometimes meet with. The presence of urea makes common salt take an octohedral form, although in pure water it crystallises in cubes similar to its primitive molecules. Sal-ammoniac, which crystallises in pure water in octohedrons, by means of urea crystallises in cubes. A very slight excess or deficiency of base in alum, causes it to assume either cubical or octohedral secondary forms; and these forms are so truly secondary, that an octohedral crystal of alum, immersed in a solution which is richer in respect to its basis, becomes enveloped with crystalline layers, which give it at length the form of a cube. The crystalline form in muddy solutions acquires greater simplicity, losing all those additional facets which would otherwise modify their predominant form. In a gelatinous deposit, crystals are rarely found in groups, but almost always single, and of a remarkable sharpness and regularity of form, and they do not undergo any variations but those which may result from the chemical action of the substance forming the deposit. Common salt, crystallised in a solution of borax, acquires truncations at the solid angles of its cubes; and alum crystallised in muriatic acid takes a form which M. Beudant has never been able to obtain in any other manner. Thirty or forty per cent of sulphate of copper may be united to the rhomboidal crystallisation of sulphate of iron, but it reduces this sulphate to a pure rhomboid, without any truncation either of the angles or the edges. A small portion of acetate of copper reduces sulphate of iron to the same simple rhomboidal form, notwithstanding that this form is disposed to become complicated with additional surfaces. Sulphate of alumina brings sulphate of iron to a rhomboid, with the lateral angles only truncated, or what M. Haiiy calls his *variété unitaire*; and whenever this variety of green vitriol is found in the market, where it is very common, we may be sure, according to M. Beudant, that it contains alumina. Natural crystals mixed with foreign substances are in general more simple than others, as is shown in a specimen of axinite or violet schorl of Dauphiné, one extremity of which, being mixed with chlorite, is reduced to its primitive form; while the other end, which is pure,

is varied by many facets produced by different decrements. In a mingled solution of two or more salts, of nearly equal solubility, the crystallisation of one of them may be sometimes determined by laying or suspending in the liquid a crystal of that particular salt.

M. Le Blanc states, that on putting into a tall and narrow cylinder crystals at different heights, in the midst of their saturated saline solutions, the crystals at the bottom increase faster than those at the surface, and that there arrives a period when those at the bottom continue to enlarge, while those at the surface diminish and dissolve. Those salts which are apt to give up their water of crystallisation to the atmosphere, and of course become efflorescent, may be preserved by immersion in oil, and subsequent wiping of their surface. In the Wernerian language of crystallisation the following terms are employed: When a secondary form differs from the cube, the octohedron, &c. only in having several of its angles or edges replaced by a face, this change of the geometrical form is called a truncation. The alteration in the principal form produced by two new faces inclined to one another, and which replace by a kind of bevel, an angle, or an edge, is called a bevelment. When these new faces are to the number of three or more, they produce what Werner termed a pointing, or acumination. When two faces unite by an edge, in the manner of a roof, they have been called culmination. Replacement is occasionally used for bevelment.

Professor Mohs, successor to Werner in Freyberg; Dr. Weiss, professor of mineralogy in Berlin; and M. Brochant, professor of mineralogy in Paris, have each recently published systems of mineralogy. Pretty copious details, relative to the first, are given in the third volume of the Edinburgh Philosophical Journal.

For the instrument that measures the angles of crystals, see GONIOMETER.

CTESIAS, a native of Cnidos, who accompanied Cyrus, the son of Darius, in his expedition against his brother Artaxerxes, by whom he was taken prisoner; but curing Artaxerxes of a wound he received in the battle, he became a great favorite at the court of Persia, where he continued practising physic for seventeen years, and was also employed in several negociations. He wrote the history of Persia in twenty-three books, and a History of the Indies: but these works are now lost, and all we have remaining of them is an abridgment compiled by Photius. Several of the ancients considered Ctesias as a fabulous writer; yet other historians, as well as some modern writers, have adopted in part his chronology of the Assyrian kings.

CTESIBIUS, a mathematician of Alexandria who flourished about A.A.C. 120. He was the first who invented the pump. He also invented a clepsydra, or water clock, which, by a continual supply of water and a waste pipe, was kept very regular. See CLEPSYDRA.

CTESIPHON, a celebrated Greek architect, who furnished the designs for the famous temple of Ephesus, and invented a machine for bringing thither the columns to be used in that noble structure. He flourished A.A.C. 544.—Also the

name of an Athenian, who advised his fellow-citizens to honor Demosthenes with a golden crown for his probity and virtue.

CIESIPHON, in ancient geography, a large city of Chalonitis, the most southern province of Assyria. It was situated on the east side of the Tigris, opposite to Seleucia: and built by the Parthians as a rival to that city. Here the kings of Parthia passed the winter, as they did the summer at Ecbatana.

CUB, *v. a. & n. s.* ? Minsheu is of opinion **CUBLESS**, *adj.* That cub is derived from *Lat. cubo*, because it does not go out as the elder animals do, but lies close in its den. Cub is a young beast, particularly the offspring of a bear or fox; the young of a whale; contemptuously, a boy or girl; a stall for cattle. To cub is to bring forth; to shut up.

I would outstare the sternest eyes that look,
Pluck the young sucking *cubs* from the she-bear.

Shakespeare.

O thou dissembling *cub!* what wilt thou be,
When time hath sowed a grizzle on thy case?
Or will not else thy craft so quickly grow,
That thine own trip shall be thine overthrow? *Id.*

This night, wherein the *cub*-drawn bear would couch,
The lion, and the belly-pinched wolf,
Keep their fur dry. *Id. King Lear.*

Was never fox but wily *cubs* begets;
The bear his fierceness to his brood besets. *Hall.*
To be *cubbed* upon a sudden, how shall he be perplexed?
what shall become of him? *Burton.*

Two mighty whales, which swelling seas had tost,
One as a mountain vast, and with her came
A *cub*, not much inferior to his dame. *Waller.*

In the eagle's destroying one fox's *cubs*, there's power
executed with oppression. *L'Estrange.*

Cubbed in a cabin, on a mattress laid,
On a brown george with lousy swabbers fed:
Dead wine, that stinks of the Borrachio, sup
From a foul jack, or greasy maple cup.
Dryden's Persius.

O most comical sight! a country squire, with the
equipage of a wife and two daughters, came to Mr.
Suipwel's shop last night; but, such two unlicked
cubs! *Congreve.*

The love of offspring's nature's general law,
From tigresses and *cubs* to ducks and ducklings.
Byron. Don Juan.

The *cubless* tigress in her jungle raging
Is dreadful to the shepherd and the flock;
The ocean when its yeasty war is waging
Is awful to the vessel near the rock. *Id.*

CUBA, the most considerable of the West India islands, is situated opposite to the entrance of the Gulf of Mexico, extending from 19° 48' to 23° 15' N. lat.; and between 74° 2' and 84° 55' W. long. Its length, from east to west, is 764 miles, and its greatest breadth 134 miles; the superficial extent of the whole island being estimated at 56,000 square miles. A chain of lofty mountains traverses it from east to west, and divides it into two parts. These mountains are covered with the most luxuriant forests of cedar, mahogany, ebony, &c. and give rise to 158 rivers, which pour their liquid treasures into the plains below. They also abound in mines of copper, iron, loadstone, rock-crystal and gold; particles of the latter metal are often washed down by the

rapid mountain torrents. At the foot of these mountains the country spreads out into fertile plains and extensive meadows, which afford pasturage to innumerable herds of cattle, both tame and wild, thousands of which are killed annually for their skins, which are considered of a very superior quality, and furnish one of the principal exports of the island.

The climate of Cuba is hot and dry, but it is considered more healthy than that of St. Domingo, owing to the refreshing gales with which it is occasionally visited from the north and east. The rainy season commences in July, and continues till September, during which time the country is almost deluged with water. The winter, however, is unknown, the ground everywhere presenting a rich carpet of beautiful flowers and odoriferous plants, and the trees retaining all their foliage throughout the year. The soil, though but partially cultivated, produces, in abundance, ginger, long pepper, and a variety of other spices, maize, aloes, mastic cassia, manioc, fistula, sugar, coffee, cocoa, cotton, tobacco, &c. The tobacco of Cuba is considered superior to that grown in any other country, and is exported to Europe in the various forms of leaf, snuff and cigars. Tobacco has always been a royal monopoly in the Spanish transatlantic dominions; the planters here have been exposed to such vexatious restrictions, that the cultivation of it has greatly decreased. In the year 1794, the quantity produced was about 8,000,000 of pounds; but in 1803 it did not amount to 4,000,000. The cultivation of sugar, however, has greatly increased; from the commencement of the present century to 1810, the quantity exported amounted to an average of 644,000 cwt. per annum. Whilst St. Domingo remained in the possession of the Spaniards, coffee was principally cultivated in that island; on the destruction of their plantations there, however, they transferred this culture to Cuba, where it has risen to about 20,000,000 of pounds annually. Cotton is also profitably cultivated in this island. In 1764 a straggling band of emigrants from Florida introduced bees, and this useful insect has multiplied to such an extent, that the inhabitants not only receive an ample supply of honey and wax for their own consumption, but annually export great quantities of both. In some parts of the island mineral waters, possessing valuable medicinal properties, are found; and there are also many productive salt ponds. The rivers, none of which are navigable, abound with a variety of fish.

The Spaniards divided Cuba into two governments, viz. Cuba towards the eastern, and Havannah towards the western part of the island; and these are again subdivided into jurisdictions and districts. Cuba, or San Jago, is considered to be the capital; but the Havannah has long been the place of residence of the governor, and most of the principal officers of the island. The other chief towns are Puerto del Principe, Halquin, Trinidad, Bayamo, and Batabane. The island is indented with several bays, the principal of which visited by shipping, is Nuenitas.

Cuba was discovered by the celebrated Christopher Columbus in his first voyage in the

year 1492. Yet so earnest was the voyager in his pursuit of gold, that although he admired the great beauty of the scenery, and the luxuriant fertility of the soil, he sailed on to Hayti, in the expectation of finding a greater abundance. The island of Cuba did not submit to the Spanish jurisdiction until 1511, when it was conquered by Valasquez. About eight years after this event, a pilot having discovered that the channel which flows between the northern part of Cuba and the continent, was the most convenient passage for vessels sailing from Mexico to Europe, the Havannah was built as a port for their reception. At first this town was an insignificant place, but its rapid increase in wealth and importance soon attracted the cupidity of the English and French pirates, who repeatedly pillaged it. The noted freebooter Morgan succeeded in taking the Havannah in the year 1669. In the year 1741 Admiral Vernon established a fort, &c., on the southern coast; but the heat of the climate soon obliged him to evacuate it. In 1762 the English, under admiral Pocock and lord Albemarle, again took the Havannah, and found vast quantities of booty in it; but it was restored to the Spaniards in the following year, since which time they have kept possession of it, and have endeavoured to render it impregnable. Of late this important part of the island has made a movement towards independence of the mother country; and has requested, we believe, to be placed under the protection of Colombia; but the progress and present hope of this result is not known at this time (1826) in England. See HAVANNAH. According to the latest estimates, the population of Cuba amounted to 423,000, which is about eight persons for every square mile. Humboldt considers that this population comprises 234,000 whites, 90,000 free people of color, and 108,000 slaves.

CUBA, a city in the island of the same name. It is situated in $76^{\circ} 3' W.$ long., and $20^{\circ} 1' N.$ lat. It has a good port, protected by a castle named the Morra. This city was once the capital of the island, and still retains that nominal honor. Since the commerce, however, has centered in the Havannah, Cuba has been deserted by its principal inhabitants, and is at present chiefly occupied by the proprietors of neighbouring estates. It contains no buildings worthy of notice.

CUBÆA, in botany, a genus of plants of the class decandria, and order monogynia: CAL. turbinate, five-parted, unequal: COR. five-petalled, nearly equal, with the stamens inserted into the calyx, the three upper ones being shorter; the legume villous and six or seven seeded; species two, both natives of Guinea: one, a tree sixty feet high, with spiked terminal flowers.

CUBAGUA, an island of South America, eight miles long, near Cumana, between Margarita and Terra Firma, discovered by Columbus. It originally abounded with pearls; but in 1524 the pearl banks disappeared. The soil is dry, barren, and nitrous, without fresh water, and producing little else but rushes. LONG. $63^{\circ} 30' W.$, lat. $10^{\circ} 42' N.$

CUBAN. See KUBAN.

CUBATION, *n. s.* } Lat. *cubatio*. The act
CUBATORY, *adj.* } of lying down. Recumbent.

CUBATURE, *n. s.* From *cube*. The finding exactly the contents of any solid body.

CUBE, *n. s.* } *Κυβος*, a die. A cube
CUBE-ROOT, *n. s.* } is a regular solid body,
CUBICK-ROOT, *n. s.* } consisting of six square
CUBICAL, *adj.* } and equal faces or sides,
CUBICK, *adj.* } and the angles all right,
CUBICALLY, *adv.* } consequently all equal.
CUBICALNESS, *n. s.* } Cube root and cubic
CUBIFORM, *adj.* } root signify a number,
by whose multiplication into itself, and again into the product, any given number is formed: thus two is the cube root of eight. See ARITHMETIC, and GEOMETRY. Cubical and cubic denote having the properties of a cube. These adjectives are also applied to numbers. Cubiform is cube-shaped.

The number of ten hath been as highly extolled, as containing even, odd, long and plain, quadrate and cubical numbers. *Browne's Vulgar Errors.*

The number of four multiplied into itself, produceth the square number of sixteen; and that again multiplied by four, produceth the cubick number of sixty-four. If we should suppose a multitude actually infinite, there must be infinite roots, and square and cubick numbers; yet, of necessity, the root is but the fourth part of the square, and the sixteenth part of the cubick number. *Hale's Origin of Mankind.*

All the master planets move about the sun at several distances, as their common centre, and with different velocities. This common law being observed in all of them, that the squares of the times of the revolutions are proportional to the cubes of their distances. *Grew's Cosmologia.*

A close vessel, containing ten cubical feet of air, will not suffer a wax candle of an ounce to burn in it above an hour before it be suffocated.

Wilkin's Math. Mag.

It is above a hundred to one, against any particular throw, that you do not cast any given set of faeces with four cubical dice; because there are so many several combinations of the six faces of four dice.

Bentley's Sermons.

If urged by a stronger fire, salt fuses or forms large cubes. *Darwin.*

Oft in wide lakes, around their warmer brim,
In hollow pyramids the crystals swim;
Or, fused by earth-born fires, in cubic blocks
Shoot their white forms, and harden into rocks. *Id.*

CUBE. See GEOMETRY.

CUBE ROOT. See ALGEBRA and ARITHMETIC.

CUBEB, *n. s.* A small dried fruit resembling pepper, but somewhat longer, of a grayish brown color on the surface. It has an aromatic smell, and is acrid to the taste. Cubebs are brought from Java.

Aromatics, as *cubebs*, cinnamon, and nutmegs are usually put into crude poor wines, to give them more oily spirits. *Floyer on the Humours.*

CUBICULAR, *adj.* } Old Fr. *cubiculaire* ;
CUBICULARY, *adj.* } Lat. *cubicularis*. Belonging to the bed chamber. Fitted for the posture of lying down.

Custom, by degrees, changed their cubicular beds into discubitory, and introduced a fashion to go from the baths unto these. *Browne's Vulgar Errors.*

Being the inseparable *cubicular* companion the king took comfort in, in the height of his troubles. *Howell*.

CUBIDIA; from *κυβος*, a die; in mineralogy, a genus of spars, so named from their being of the shape of a common die, or of a cubic figure. These bodies owe this shape to an admixture of lead, and there are only two known species of the genus. 1. A colorless crystalline kind, with thin flakes, found in the lead mines of Yorkshire, and some other parts; and, 2. A milky white species, with thicker crusts, found in the lead mines of Derbyshire and Yorkshire, but usually small, and not very plentiful.

CUBIT, *n. s.* } Lat. *cubitus*; *κύβιστον*. A
CUBITAL, *adj.* } measure in use among the
 ancients; which was originally, says Calmêt, the distance from the elbow bending inwards, to the extremity of the middle finger. This measure is the fourth part of a well-proportioned man's stature. Some fix the Hebrew cubit at twenty inches and a half, Paris measure; and others at eighteen. Cubital signifies, that which is only the length of a cubit.

This proude king let make a statue of gold
 Sixty cubites long and seven in brede.

Chaucer. Cant. Tales.

That like a litle lake it seemd to bee,
 Whose depth exceeded not three cubits height.

Spenser. Faerie Queene.

The watchmen of Tyre might well be called pygmies, the towers of that city being so high, that unto men below they appeared in a cubital stature.

Broune's Vulgar Errors.

From the tip of the elbow to the end of the long finger, is half a yard, and a quarter of the stature; and makes a *cubit*, the first measure we read of, the ark of Noah being framed and measured by *cubits*.

Holder on Time.

Measured by *cubit*, length, and breadth, and height.

Milton.

The Jews used two sorts of *cubits*; the sacred, and the profane or common.

Arbutnot on Measures.

When on the goddess first I cast my sight,
 Scarce seemed her stature of a *cubit* height.

CUBIT, ENGLISH, according to Dr. Arbutnot, is equal to eighteen inches.

CUBIT, JEWISH, one foot, 9.888 inches.

CUBIT, ROMAN, one foot, 5.406 inches.

CUBITUS, in anatomy, the same with *Ulna*. See **ANATOMY**. Some use the word for all that part of the arm between the elbow and the wrist, including the *ulna* or *cubitus*, properly so called, and the *radius*.

CUBOIDES Os, or Os **CUBIFORME**, in anatomy, the seventh bone of the foot, so called from its being in the form of a cube. See **ANATOMY**.

CUCKFIELD, a market town of Sussex, on the road from London to Brighton. It has a market on Friday, and fairs on Whit-Thursdays and September 16th. It is fourteen miles north of Brighton, and thirty-seven south by west of London.

CUCKINGSTOOL, *n. s.* Hiekes derives it from *coquina*, anciently *cockaigna*, an idle; jade, a base woman. Mr. Todd refers it to the Germ. *kuckha*, a sort of pillory. An engine invented

for the punishment of scolds and unquiet women, which, in ancient times, was called *tumbrel*.

We'll ship them out in *cuck-stools*, there they'll sail
 As brave Columbus did.

Beaumont and Fletcher.

These mounted on a chair-curule,
 Which moderns call a *cucking-stool*,
 March proudly to the river's side.

Hudibras.

CUCKINGSTOOL, an ancient instrument of punishment described in Domesday book as *cathedra stercoris*; it was in use even in the Saxon time. The delinquents, consisting of scolds, cheating bakers or brewers, and other petty offenders, were led to this stool and immersed over head and ears in *stercore*, or stinking water. Some think it a corruption from *ducking stool*; others from *choaking stool*, because the delinquents were nearly suffocated in the water.

CUCKOLD, *v. u. & n. s.* } Fr. *cocu*; Dut.
CUCKOLDLY, *adj.* } *kochoer*; Germ.
CUCKOLDOM, *n. s.* } *kuckcuck*; Icel.
CUCKOLD-MAKER, *n. s.* } *quonkall*.

The last of these words, which is derived from *quona*, a woman, and *kala*, to blemish, is considered by Serenius, to be the parent of the English word; and there is some plausibility in his conjecture. But the question as to the etymon seems to be set at rest by Horne Tooke: 'The Italian *cucolo*, a cuckow; says he, gives us the word *cucol*, (without the terminating *d*) as the common people rightly pronounce it, and as the verb was formerly and should still be written. To *cucol* is to do as the cuckow does; and *cucol-ed*, *cucol'd*, *cucold*, its past participle, means cuckow-ed, i. e. served as the cuckow serves other birds.' A *cuckold* is one whose wife is false to his bed. To *cuckold* is to seduce a wife to be unfaithful to her husband; to wrong a husband by unchastity. A *cuckold-maker* is an habitual seducer of married women. *Cuckoldom* signifies the act of adultery; the state of being a *cuckold*. *Cuckoldly* is, *cuckold-like*; *abject*; *sneaking*; *cowardly*.

This drunken miller spake ful sone again,
 And sayde, Leve brother Osewold,
 Who hath no wif he is no *cuckewold*.

Chaucer. Cant. Tales.

If thou canst *cuckold* him, thou do'st thyself a pleasure, and me a sport.

Shakespeare. Othello.

But for all the whole world; why, who would not make her husband a *cuckold*, to make him a monarch? I should venture purgatory for't.

Id.

Poor *cuckoldly* knave, I know him not: yet I wrong him to call him poor; they say the jealous knave hath masses of money.

Id. Merry Wives of Windsor.

If I spared any that had a head to hit, either young or old, be or she, *cuckold*, or *cuckoldmaker*, let me never hope to see a chine again.

Id. Henry VIII.

But suffer not thy wife abroad to roam,
 Nor strait in streets with amazonian pace;
 For that's to *cuckold* thee before thy face.

Dryden's Juvenal.

She is thinking on nothing but her colonel, and conspiring *cuckoldom* against me.

Id. Spanish Friar.

One Hernando, *cuckoldmaker* of this city, contrived to steal her away.

Id.

It is a true saying, that the last man of the parish hat knows of his *cuckoldom*, is himself.

Asbnokot's John Bull.

Cæsar and Pompey, Mahomet, Belisarius,

Have much employ'd the muse of history's pen ;

Their lives and fortunes were extremely various,

Such worthies Time will never see again ;

Yet to these four, in three things, the same luck holds,

They all were heroes, conquerors, and *cuckolds*.

Byron. Don Juan.

CUC'KOO, or } Fr. *coucou*; Ital. *cuculo*;
CUC'KOW, n. s. } Span. *cuco*, *cuclillo*; Ger.
cuckuk; Dut. *koekoek*; Dan. *kuckuk*; Sw. *kuku*;
Welsh *gwccw*; Lat. *cuculus*; *κοκκοῦ*. A bird
which appears in the spring, and is said to suck
the eggs of other birds, and to lay her own to be
hatched in their place: from which practice, it
was usual to alarm a husband, at the approach
of an adulterer, by calling cuckoo; and the warn-
ing became at last a name for the husband so
warned. See CUCULUS. Cuckoo is also a term
of contempt.

————— Jalousie,

That wored of yelwe golde a gerlond,
And hedde a *cuckow* sitting on hire hond.

Chaucer. Cant. Tales.

Finding Mopsa, like a *cuckoo* by a nightingale,
alone with Pamela, I came in. *Sidney.*

The merry *cuckoo*, messenger of spring,
His trumpet shrill hath thrice already sounded.

Spenser.

The pain song *cuckoo* gray,
Whose note full many a man doth mark,
And dares not answer, nay.

Shakspeare.

Why, what a raseal art thou, then, to praise him so
for running!—A horseback, ye *cuckoo*;—but a-foot,
he will not budge a foot. *Id. Henry IV.*

Strives for a court and for a college name,
Yet nought within but lousy coules doth hold,
Like a scabbed *cuckow* in a cage of gold.

Hall.

I deduce,
From the first note the hollow *cuckoo* sings,
The symphony of spring; and touch a theme
Unknown to fame; the passion of the grove.

Thomson.

They have no more notes in their song than the
cuckow.

Burke.

Chides with her duleet voice the tardy Spring,
Bids slumbering Zephyr stretch his folded wing;
Wakes the hoarse *cuckoo* in his gloomy cave,
And calls the wondering dormouse from the grave.

Darwin.

CUC'KOO, or CUCKOW. See CUCULUS.

CUC'KOO-BUD, n. s. } Lat. *cardaminus*.
CUC'KOO-FLOWER, n. s. } The name of a flower

When dazies pied, and violets blue,
And *cuckoo-buds* of yellow hue,
Do paint the meadows much bedight.

Shakspeare.

Nettles, *cuckoo-flowers*,
Darnel, and all the idle weeds. *Id. King Lear.*

CUC'KOO-SPITTLE, n. s. Cuckoo and spit-
tle.

Cuckoo-spittle, or woodseare, is that spumous dew or
exudation, or both, found upon plants, especially
about the joints of lavender and rosemary; observable
with us about the latter end of May.

Browne's Vulgar Errors.

CUC'QUEAN, n. s. From *cuck*, a cuck-
old-maker, and *quene*, a wife, says Minsheu;
and, therefore, a cucquean is a cuckold-maker's
wife; a she cuckold. This derivation is borne
out by the authority of our old writers. Mr.
Todd, however, derives the word from French
coquaine, and defines it, a vile woman; a prosti-
tute. Minsheu is clearly nearer to the mark.

He loves variety, and delights in change;

And I heard him say, should he be married,

He'd make his wife a *cucquean*. *Hayward.*

CUCUBALUS, berry bearing chickweed: in
botany, a genus of the trigynia order and de-
candria class of plants, natural order twenty-
second, caryophillei: CAL. inflated; petals five,
unguiculated, without a nectariferous corona at
the throat; CAPS. trilocular. There are thirteen
species, the most remarkable of which are: 1. *C.*
behen, Swedish lychnis, or gum sepungar, a
native of several parts of Europe. The em-
palement of its flower is curiously wrought like
network, and is of a purplish color. The leaves
have somewhat of the flavor of peas. The
Gotlanders apply the leaves to erysipelatous
eruptions. Horses, cows, sheep, and goats, eat
this plant. 2. *C. noctiflora*, the night flowering
lychnis, growing naturally in Spain and Italy.
It is a perennial plant, rising with an upright
branching stalk, a foot and a half high, garnished
with very narrow leaves placed opposite. The
upper part of the stalk branches very much: 3. *C.*
otites, the catch-fly, a native of Britain and
other European countries. It has a thick, fleshy,
perennial root, which strikes deep into the
ground, from whence rises a jointed stalk three
or four feet high. At the joints there exudes
a viscous clammy juice, that sticks to the fingers
when handled; and the small insects which
settle upon those parts of the stalks are thereby
so fastened that they cannot get off. The flowers
are small, and of a greenish color. The plant is
propagated by seeds.

CUCULLARIA, in botany, a genus of plants
of the monandria class, and monogynia order,
CAL. four-parted; COR. four petalled, unequal, and
spurred; filaments petal-like; anthers with dis-
tinct cells. Species one only; a tall tree of Gui-
ana, having pale yellow flowers.

CUC'ULATE, *adj.* } Lat. *cuculatus*. Hood-
CUC'ULATED, *adj.* } ed; covered, as with a
hood or cowl; having the resemblance or shape
of a hood.

They are differently *cuculated*, and capuched upon
the head and back. *Browne's Vulgar Errors.*

CUCULUS, the cuckoo, in ornithology, a ge-
nus belonging to the order of pitee. The cha-
racters are: the bill smooth, and more or less
bending; the nostrils bounded by a small rim;
the tongue short and pointed; the feet and toes
formed for climbing. There are fifty-five species,
of which the following are the most remarka-
ble:—

1. *C. canorus*, the common cuckoo, weighs
about five ounces, and is in length fourteen
inches: in breadth twenty-five. The bill is
black, and about two-thirds of an inch in length.
The head, hind part of the neck, coverts of the
wings and rump, are of a dove color; darker on

the head and paler on the rump. The throat and upper part of the neck are of a pale gray; the breast and belly white, crossed elegantly with undulated lines of black. The tail consists of feathers of unequal lengths; the middle tail-feathers are black, tipped with white; the others are marked with white spots on each side their shafts. The legs are short, and the toes disposed two backwards and two forwards, like those of the wood-pecker, though it is never observed to run up the sides of trees. The female differs in some respects.—The neck before and behind is of a brownish red; the tail barred with the same color and black, and spotted on each side the shaft with white. The young birds are brown mixed with black, and in that state have been described by some authors as old ones. These birds appear in our country early in spring, and make the shortest stay with us of any bird of passage. The cuckoo is silent for some time after his arrival; his note is a call to love, and used only by the male, who sits perched generally on some dead tree or bare bough, and repeats his song, which he loses as soon as the amorous season is over. His note is so uniform, that his name in all languages seems to have been derived from it. The song of the female is widely different, and has been so little attended to, that few are acquainted with it. It resembles the cry of the dab-chick. Unlike the generality of birds, cuckoos do not pair. When a female appears on the wing, she is often attended by two or three males, who seem to be earnestly contending for her favors. She does not begin to lay till some weeks after her arrival. It is almost universally allowed, that the cuckoo does not hatch its own eggs. The hedge sparrow, the water wagtail, or the titlark, is generally the nurse of them. Buffon enumerates twenty sorts of nests at least in which they have deposited their eggs. When the hedge sparrow has sat her usual time, and disengaged the young cuckoo and some of her own offspring from the shell, her own young ones, and any of her eggs that remain unhatched, are soon turned out, the young cuckoo remaining possessor of the nest, and sole object of her future care. The young birds are not previously killed, nor are the eggs demolished; but all are left to perish together, either being entangled about the bush which contains the nest, or lying on the ground under it. A cuckoo, says Dr. Jenner, in a paper published in the Philosophical Transactions, laid her egg in a water wagtail's nest in the thatch of an old cottage. The wagtail sat her usual time, and then hatched all the eggs but one, which, with all the young ones except the cuckoo, was turned out of the nest. The young birds, consisting of five, were found upon the rafter that projected from under the thatch, and with them was the egg not in the least injured. The cuckoo was reared by the wagtails till it was nearly capable of flying, when it was killed by an accident. The same writer mentions a similar case of a hedge sparrow, in which the young sparrow, having returned alive, was a second and third time turned out. Cuckoos may be, and often are brought up tame, so as to become familiar. They will eat in this state bread and milk, fruits, insects, eggs, and flesh either cooked

or raw; but in a state of nature, chiefly live on caterpillars. When fat, they are said to be as good eating as a land rail. The French and Italians eat them, and the ancient Romans admired them greatly. Pliny says that there is no bird that can be compared to them for delicacy. In migrating, the major part of these birds are supposed to go into Africa, as they are observed to visit the island of Malta twice a year. They are well known also at Aleppo, and are said to be common in Sweden, but not to appear so early by a month as with us. Russia is not destitute of it, and Latham has seen a specimen of it brought from Kamptschatka, formerly in the possession of Sir Joseph Banks.

2. *C. honoratus*, or the sacred cuckoo, is somewhat less than our cuckoo; the general color is blackish ash on the upper parts, marked with two spots of white on each feather; beneath, white transversely spotted with ash-color: the quills are cinereous, transversely spotted with white: the tail is much cuneated, five inches and a half long, and of the same color as the quills; the outer feather only three inches long; the legs and claws are of a pale ash-color. This species inhabits Malabar, where the natives hold it sacred, as it feeds on reptiles.

3. *C. indicator*, or the honey-guide, is a native of Africa. This curious species of cuckoo is found at a considerable distance from the Cape of Good Hope, in the interior parts of Africa, being entirely unknown at that settlement. The Dutch settlers have given this bird the name of honiguyzer, or honey-guide, from its quality of discovering wild honey to travellers. Its color has nothing striking or beautiful. Its size is considerably smaller than that of our cuckoo in Europe; but in return, the instinct which prompts it to seek its food in a singular manner is truly admirable. Not only the Dutch and Hottentots, but likewise a species of quadruped named ratel (probably a new species of badger), are frequently conducted to wild bee-hives by this bird, which, as it were pilots them to the very spot. The honey being its favorite food, its own interest prompts it to be instrumental in robbing the hive, as some scraps are commonly left for its support. The morning and evening are its times of feeding, and it is then heard calling in a shrill tone, cherr, cherr; which the honey-hunters carefully attend to as the summons to the chase. From time to time they answer with a soft whistle; which the bird hearing, always continues its note. As soon as they are in sight of each other, the bird gradually flutters towards the place where the hive is situated, continually repeating its former call of cherr, cherr. At last the bird is observed to hover for a few moments over a certain spot, and then silently retiring to a neighbouring bush or resting place, the hunters are sure of finding the bees' nest in that identical spot; whether it be in a tree or in the crevice of a rock, or, as is most commonly the case, in the earth. While the hunters are busy in taking the honey, the bird is seen looking on attentively to what is going forward, and waiting for its share of the spoil. The bee-hunters never fail to leave a small portion for their conductor: but commonly take care

never to leave so much as would satisfy its hunger. The bird's appetite being whetted by this parsimony, it is obliged to commit a second treason, by discovering another bees' nest, in hopes of a better salary. It is about seven inches in length, and is of a rusty brown color on the back, with a white breast and belly. A nest which was shown to Dr. Sparrman for that of this bird, was composed of slender filaments of bark woven together in the form of a bottle; the neck and opening hung downwards, and a string, in an arched shape, was suspended across the opening fastened by the two ends, perhaps for the bird to perch on.

4. *C. vetula* is a little bigger than a blackbird; the bill above an inch and a half long: the upper mandible black, the lower whitish; crown of the head brown, the feathers of it soft and silky; the upper parts of the body and the quills cinereous olive; throat and forepart of the neck whitish; the rest of the under parts rufous; the tail is much cuneated; the two middle feathers cinereous olive, the others dusky black tipped with white; the outer feather very short; legs blue black. It feeds on seeds, small worms, and caterpillars, and is very tame. Besides insects, it will also eat lizards, small snakes, frogs, young rats, and sometimes even small birds. The snakes they swallow head foremost, letting the tail hang out of the mouth till the foreparts are digested. Its gait is that of leaping, like a magpie; being frequently seen on the ground; and its flight but short, chiefly from bush to bush. At the time when other birds breed, they likewise retire into the woods, but their nests have never yet been found. It has the name of rainbird, as it is said to make the greatest noise before rain. It is common all the year at Jamaica. In another variety, also, common in Jamaica, the feathers on the throat appear like a downy beard, whence probably the name of old man rain beard, given it there, and by Ray, Sloane, &c.

CUCUMBER, *n. s.* Fr. *concombre*; Ital. *cocomero*; Lat. *cucumer*. The name of a creeping plant, and also of its fruit.

How cucumbers along the surface creep,
With crooked bodies and with bellies deep.

Dryden's Virgil.

The southern wits are like cucumbers, which are commonly all good in their kind; but at best are an insipid fruit: while the northern geniuses are like melons, of which not one in fifty is good; but when it is so, it is an exquisite relish. *Berkeley.*

Pardon then,

Ye sage dispensers of poetic fame,
The' ambition of one meaner far, whose powers,
Presuming an attempt not less sublime,
Pant for the praise of dressing to the taste
Of critic appetite, no sordid fare,

A cucumber, while costly yet and scarce. *Cowper.*

CUCUMBER. See CUCUMIS.

CUCUMBER, WILD. See MOMORDICA.

CUCUMIS, in botany, a genus of the syngenesia order, and monœcia class of plants; natural order thirty-fourth, cucurbitaceæ. Male CAL. quinquecanted: cor. quinquepartite; the filaments three. Female CAL. quinquecanted: cor. quinquepartite, pistil trifid; the sides of the apple sharp-pointed. There are thirteen

species, of which the following are the most remarkable: 1. *C. chata*, the round-leaved Egyptian cucumber. According to Hasselquist, this grows in the fertile earth near Cairo, after the inundation of the Nile, and not in any other place in Egypt, nor in any other soil. It ripens with the water melons. The fruit is a little watery; the flesh almost of the same substance with the melons; it tastes somewhat sweet and cool; but is far from being as cool as the water-melons. This the grandes and Europeans in Egypt eat as the most pleasant fruit they find, and that from which they have the least to apprehend.

2. *C. colocynthis*, the colocynth, coloquintida, or bitter apple of the shops, is brought to us from Aleppo and the island of Crete; the leaves of the plant are large, placed alternate, almost round, and stand upon foot-stalks four inches long; the flowers white, and succeeded by a fruit of the gourd kind, of the size of a large apple, and which is yellow when ripe; the shelly or husky outside enclosing a bitter pulp interspersed with flattish seeds.

3. *C. elaterium*, the wild, or ass's cucumber, affords the elaterium of the shops; which is the inspissated fœcula of the juice of this species.

4. *C. sativa*, the common cucumber, has roots, composed of numerous, long, slender, white fibres; long slender stalks, very branched at their joints, trailing on the ground, or climbing by their claspers, adorned at every joint by large angular leaves on long erect foot-stalks, with numerous and monopetalous bell-shaped flowers of a yellow color, succeeded by oblong rough fruit. The principal varieties of this kind are, 1. The common rough green prickly cucumber; a middle-sized fruit, closely set with very small prickles; the plant is of the hardiest sort, but does not show its fruit early. 2. The early green cluster cucumber is a short fruit, remarkable for growing in clusters, and appearing early. 3. The long smooth green Turkey cucumber, is a smooth green-rinded fruit, growing from ten to fifteen inches in length, without prickles. The plants are strong growers with very large leaves. 4. The large smooth green Roman cucumber is a very large and long smooth green fruit, produced from a strong growing plant. 5. The long white prickly Dutch cucumber is a white fruit, eight or ten inches long, set with small black prickles; the plants are but bad bearers in this country. The first four varieties are those chiefly cultivated in this country. They are raised at three different seasons of the year: on hot-beds for early fruit; or under bell or hand-glasses, for the middle crop; or on the common ground, which is for a late crop, or to pickle. The cucumbers which are ripe before April are unwholesome, being raised wholly by the heat of the dung without the assistance of the sun. Those raised in April are good, and are raised in the manner with which all our gardeners are well acquainted. The cucumber is chiefly used as a refrigerant, or condiment, to accompany animal food. They have a bland insipid juice, without acidity or sweetness, approaching, as appears by their ripening, to a farinaceous matter. When used green they have no nourishment, so they are only to be used in

the summer season, and only by the sedentary. Although cucumbers are neither sweet nor acid, yet they are considerably acescent, and produce flatulency, cholera, diarrhœa, &c. Their coldness and flatulency may be likewise in part attributed to the firmness of their texture. Oil and pepper, the condiments commonly employed, are very useful to check their fermentation. The skin, which is bitter, may supply the place of aromatics; but should only be used when young.

CUCURBITA, the gourd, a genus of the syngenesia order, and monœcia class of plants; natural order thirty-fourth, cucurbitaceæ. Male, *CAL.* quinque-dentate: *cor.* quinquefid; the filaments three. Female, *CAL.* quinque-dentate: *cor.* quinquefid: *PIST.* quinquefid; the seeds of the apple with a tumid margin. There are seven species: the chief are, 1. *C. lagenaria*, the bottle gourd, with thick trailing downy stalks, branching into many spreading runners, and extending along the ground sometimes fifteen or twenty feet in length. The leaves are large, roundish, heart-shaped, indented and woolly. The flowers are large and white, succeeded by long incurvated whitish yellow fruit, growing from about two to five or six feet in length, and from about nine to twenty-four inches in circumference, having a ligneous and durable shell. 2. *C. lignosa*, the ligneous shelled gourd, or calabash. It has trailing stalks, branching into runners, which extend far every way; the leaves are large, lobated, and rough; the flowers yellow, succeeded by roundish smooth fruit of a moderate size, with hard woody shells. 3. *C. melopepo*, or erect gourd, or squash. This rises with an erect strong stalk, several feet high, rarely sending forth side runners, but becoming bushy upward. It is adorned with large lobated leaves; and the flowers are succeeded by depressed knotty fruit, both white and yellow, commonly of a moderate size. 4. *C. papo*, the pompion, or pumpkin, has strong trailing, rough stalks, branching into numerous runners. These extend from ten to forty or fifty feet each way, and are garnished with large, roundish, lobated, rough leaves, and yellow flowers; succeeded by large, round, smooth fruit, of different forms and sizes; some as big as a peck or half-bushel measure; some considerably less, and others not exceeding the bulk of an orange; ripening to a yellow, and sometimes to a whitish color. This species is the most hardy of any, as well as the most extensive in their growth. A single plant, if properly encouraged, will overspread ten or fifteen roods of ground, and produce a great number of fruit, which, when young, are generally a mixture between a deep blue and a pale white, but change as they increase in bulk.

CUCURBITACEOUS, *adj.* From Lat. *cucurbita*, a gourd.

Cucurbitaceous plants are those which resemble a gourd; such as the pumpkin and melon. *Chambers.*

CUCURBITE, *n. s.* Lat. *cucurbita*. A chemical vessel, commonly called a body, made of earth or glass, in the shape of a gourd, and therefore called cucurbite. It is used in the place of a still for distillation. See the article **ALEMBIC**.

Cucurbites and *alembikes* *ec.*,

And other swiche ger. *Chaucer. Cant. Tales.*

I have for curiosity's sake distilled quicksilver in a *cucurbite*, fitted with a capacious glass head.

Boyle on Colours.

Let commou yellow sulphur be put into a *cucurbite* glass, upon which pour the strongest aquafortis.

Mortimer.

CUCURBITIVE, *adj.* From *cucurbite*. An epithet applied to small worms shaped like a gourd-seed.

CUD, *n. s.* Ang.-Sax. *cud*. That food which is reposit in the first stomach in order to rumination, or to be chewed again.

Many times, when my master's cattle came hither to chew their *cud* in this fresh place, I might see the young bull testify his love.

Sidney.

You range the pathless wood,

While on a flowery bank he chews the *cud*.

Dryden.

CUDBEAR, a dye-stuff, procured from the lichen *Tartarius*, thus named from Dr. Cuthbert Gordon the inventor, or rather the improver, of it; for it had been known and used in the Highlands of Scotland by the name of *crottel*, for several centuries before. The method there practised is this; after the moss is scraped from the rocks, and cleaned, it is steeped in urine for three months; then taken out and made into cakes, which are hung up in bags to dry. These cakes are afterwards pulverised, and the powder is used, with the addition of alum, to impart the beautiful red color which it gives. Dr. Gordon and his brother first set up this manufacture at Leith; but considerable improvements have been made in it, since its establishment in Glasgow, by Mr. George M'Intosh.

CUDDALORE, a town of Hindostan, in the Carnatic, on the west shore of the bay of Bengal, and district of Gingee. It is very near the place where Fort St. David once stood, and was possessed by the English so far back as 1681. It was reduced by the French in 1782; and in 1783 underwent a severe siege by the British forces commanded by general Stuart; nor did the enemy resign it until the peace of 1783. The neighbouring country suffered much during the wars with Hyder Ali. It is now rapidly recovering, and comprehended in the collectorship of Arcot. The factory is the residence of the commercial agent.

CUDDAPAH, **CURPA**, or **CRIPA**, a considerable district in the province of Golconda, Hindostan. It was once governed by a nabob, from the court of Dehly, but, falling under the dominion of the nizam of Deccan, it was ceded to the British in 1800, and is now subdivided into the two collectorships of Cuddapah and Bellary, or Balhary, under the Madras government. The valleys are fruitful in grain, sugar, cotton, &c. Its principal towns are Cuddapah, Combam, and Wandicotta. The first of them is the residence of the British judge and collector.

CUDDEN, *n. s.* } Without etymology, says

CUDDY, *n. s.* } Johnson; but Serenius refers it to the Islandic, *kutte*, a dwarf. Mr. Todd, on the other hand, derives it from Teut. *kudde*, a herd of cattle, and also a pig; and this seems

the most likely etymon. A clown; a stupid rustic; a low dolt; a low bad word.

The slaving *cudden*, propped upon his staff, Stood ready gaping with a grinning laugh. *Dryden*.

CUDDLE, *v. n.* Dr. Johnson calls it a low word, and believes it to have no etymology. Dr. Jamieson suggests that the parent may perhaps be found in the Ger. *kudden*, to meet, to come together. Mr. Todd suggests that 'it may be from the Welsh *cuddio*, to hide;' which, however, ought to be *cudliu*. His etymology is by no means an improbable one. The Welsh substantive, *cuddigyl*, which means a retreat, a private place, a private room, a bed-room, comes still nearer in sound to the English word. To lie close; to squat; to embrace closely.

Have you marked a partridge quake,
Viewing the towering falcon high?
She *cuddles* low behind the brake;
Nor would she stay, nor dares she fly. *Prior*.
They hopped from spray to spray,
They billed, they chirped all day,
They *cuddled* close all night;
To bliss they waked each morn,
In every bush and thorn.
Gay scenes of new delight. *Somerville*.

CUDDUM RUSOUL, or the Footstep of the Prophet, a town of Bengal, in the district of Chittagong. Here is a handsome cenotaph or dirga containing a stone, on which there is the impression, it is said, of Mahomet's foot, to visit which his followers come once a year from all parts of the district, thereby constituting a fair.

CUDDY, *n. s.* A fish which is found on the Scotch coasts; the cole-fish.

The *cuddy* is a fish, of which I know not the philosophical name. It is not much bigger than a gudgeon, but it is of great use in these islands, as it affords the lower people both food and oil for their lamps. *Johnson*.

CUDDY, in a first-rate man of war, is a place lying between the captain-lieutenant's cabin and the quarter-deck; and divided into partitions for the master and other officers. It denotes also a kind of cabin near the stern of a lighter or barge of burden.

CUDGEL, *v. a. & n. s.* } Dut. *kudse*, *kod-*
CU'DGELLER, *n. s.* } *se*; Scot. *cu'd*. A
CU'DGELLING, *n. s.* } cudgel is any stick
CUDGEL-PLAY, *n. s.* } or staff, lighter than
CU'DGEL-PLAYER, *n. s.* } a club, shorter than
CUDGEL-PLAYING, *n. s.* } a pole, carried for
CU'DGEL-PROOF, *adj.* } the purpose of of-
fence or defence; a similar weapon, used by cudgel-players, in the exercise of cudgel-play, or cudgel-playing. To cudgel is, to beat with a stick; to drub; to beat in general. Cudgel-proof signifies being able to resist a beating given by a stick. To cross the cudgels means to forbear the contest, from the practice of cudgel players, to lay one over the other.

My lord, he speaks most vilely of you, like a foul-mouthed man as he is; and said he would *cudgel* you. *Shakspeare*. *Henry IV.*

Cudgel thy brains no more about it; for your dull ass will not mend his pace with beating. *Id.* *Hamlet*.

All we have seen, compared to his experience,
Has been but *cudgel-play* or cock-fighting.

Beaumont and Fletcher.
Vine twigs, while they are green, are brittle; yet the wood, dried, is extreme tough; and was used by the captains of armies, amongst the Romans, for their *cudgels*. *Bacon*.

They were often liable to a night-walking *cudgeller*, or the emptying of a urinal. *Milton*.

Do not provoke the rage of stones
And *cudgels* to thy hide and bones:
Tremble and vanish. *Hulibras*.
His doublet was of sturdy buff,
And though not sword, yet *cudgel-proof*. *Id.*

This, if well reflected on, would make people more wary in the use of the rod and the *cudgel*. *Locke*.

It is much better to give way, than it would be to contend at first, and then either to cross the *cudgels*, or to be baffled in the conclusion. *L'Estrange*.

The ass courting his master, just as the spaniel had done, instead of being stroked and made much of, is only rated off and *cudgelled* for all his courtship.

South.
The wise Cornelius was convinced, that these, being polemical arts, could no more be learned alone than fencing or *cudgel-playing*. *Arbutnot and Pope*.
Three duels he fought, thrice ventured his life,
Went home, and was *cudgelled* again by his wife. *Swift*.

The *cudgel* in my niece did shake,
Each bristled hair stood like a stake,
When wi' an eldritch stour, quaiçk—quaiçk—
Among the springs,
Awa ye squattered, like a drake,
On whistling wings. *Burns*.

CU'DLE, *n. s.* A small sea-fish.
Of round fish there are britt, sprat, *culdes*, eels. *Carew*.

CU'DWEED, *n. s.* From cud and weed.
A plant. See **GNAPHALUM**.

There is a plant which our herbalists call herbam impiam, or wicked *cu'dweed*, whose younger branches still yield flowers to overtop the elder. *Hall*.

CUDWORTH (Ralph), a learned English divine of the seventeenth century. He was one of the persons nominated in 1657 by a committee of the parliament, to be consulted about the English translation of the Bible. In 1678 he published his True Intellectual System of the Universe; a work which met with great opposition. He likewise published a treatise, entitled, Deus Justificatus, or The Divine Goodness of God vindicated against the Assertions of Absolute and Unconditionate Reprobation. He embraced the mechanical or corpuscular philosophy; but with regard to the Deity, spirits, genii, and ideas, he followed the Platonists. He died at Cambridge in 1688, and left several manuscripts, one of which bishop Chandler published in 1731, with this title, A Treatise concerning Eternal and Immutable Morality. The rest, after having been plundered by Dodd, for his Commentary on the Bible, were purchased by the trustees of the British Museum.

CUE. Old Fr. *coüe*; mod. Fr. *queue*, a tail. The tail or end of anything, as the long tail of a wig; the last words of a speech on the stage, which are the token for an entrance or answer; a hint; an intimation; the part which any man is to play in his turn; humor; temper of mind;

a mark denoting half a farthing, in the buttery books of Oxford and Cambridge; an instrument used in the game of billiards.

P; ymus, you begin : when you have spoken your speech, enter into that brake : and so every one according to his cue.

Shakspeare. Midsummer Night's Dream.

What's Hecuba to him, or he to Hecuba,
That he should weep for her? What would he do,
Had he the motive and the cue for passion
That I have? He would drown the stage with tears.
Id. Hamlet.

Hold your hands,

Both you of my inclining, and the rest :

Were it my cue to fight, I should have known it

Without a prompter. *Id. Othello.*

Neither is Otto here a much more taking gentleman : nothing appears in his cue to move pity, or any way make the audience of his party.

Rymer's Tragedies of the last Age.

Let him know how many servants there are, of both sexes, who expect wails ; and give them their cue to attend in two lines, as he leaves the house.

Swift.

CUENCA, or LA SIERRA DE CUENÇA, a province of Spain, forming the eastern part of New Castile. In the north and east it is mountainous, and fit only for sheep pasture, but in the west and north it is fertile in corn, hemp, pulse, saffron, fruit, and honey. The province exports large quantities of fine wool, and manufactures a kind of coarse camlet, in considerable request. The capital is Cuença, a bishop's see, situated on an eminence between two mountains, at the foot of which flow the rivers Huëcar and Xucar. The walls rise from the valley to a great height ; and the streets are uncommonly steep and irregular. It is entered by six gates. The episcopal palace is a respectable edifice, and the city has five gates, thirteen parishes, six monasteries, and six nunneries, beside a seminary, three colleges, and an hospital. The cathedral is in the Gothic style, upwards of 300 feet long and 180 broad, and was founded in the twelfth century by Alphonso IX. A bridge across the Huëcar consists of five arches, the pillars of which alone are said to have cost 63,000 ducats. The earl of Peterborough took this place for Charles III. in 1706. Population 6000. It is seventy-five miles east of Madrid, and 100 W. N. W. of Valencia.

CUENÇA, a district of the presidency of Quito, Colombia, bounded north by the province of Riobamba, south by that of Jaen de Bracamoros, east by that of Guayaquil, west by that of Quixos and Macas, north-east by that of Chimbo, and south-east by that of Loxa. It is of a mild temperature, but subject to dreadful storms ; and fertile in grain, sugar, and cotton. Its minerals are gold, silver, copper, quicksilver, and sulphur ; but the mines, for want of capital, are very partially worked. Cotton cloth is largely manufactured.

This district is subdivided into two departments, Cuença and Alausi ; the former including ten villages, and the latter, which borders on Riobamba, having four. Cuença is famed for the many remains of Peruvian architecture it contains, as the ruins of the Fort of Cannar, near the village of Atun-cannar, or Great Cannar, &c.

Alausi, the chief town of the grand department, is an inconsiderable place. In this district Atabalipa is said to have put to death 60,000 of the adherents of his brother Huëscar.

CUENÇA, SANTA ANNA DE, the capital of the above district, is situated in a valley celebrated for its pleasantness and fertility. The streets run in parallel lines, and the city has a beautiful appearance, but the Indian huts of the suburbs are very mean. It is 180 miles south of Quito. Population 20,000.

CUERENHERT (Theodore Van), a celebrated engraver, born at Amsterdam in 1522. Early in life he travelled into Spain and Portugal, but was afterwards obliged to have recourse to engraving for his support. His works are slight and hastily executed with the graver alone ; but in an open careless style, so as greatly to resemble designs made with a pen. He was established at Haerlem ; and there pursuing his favorite studies in literature, he was made secretary to that town, from whence he was sent several times as ambassador to the prince of Orange, to whom he addressed a famous manifesto, which that prince published in 1566. He at length openly avowed his opinion—deism, maintaining that all religious communions being corrupted, no person, without a supernatural mission, had a right to administer in any religious office. For these sentiments he was several times imprisoned, and at last sentenced to banishment. He died at Dergoude in 1590, aged sixty-eight. His works were published in 3 vols. fol. in 1630.

CUERPO, *n. s.* Span. To be in cuerpo is to be without the upper coat or cloak, so as to discover the true shape of the cuerpo or body

Exposed in cuerpo to their rage,

Without my arms and equipage. *Hudibras.*

CUFF, *v. a., v. n., & n. s.* Swed. *kuff* ; Per. *kuffan* ; Scot. *gouf*, from Icelandic, *kuffwa*. Skinner derives the word from *κόπρω* ; Junius from *κόλαρος* ; and Dr. Johnson from Ital. *zuffa*, a battle. To cuff is to strike with the fist, talons, or wings ; to fight ; to scuffle. Cuff, in its widest sense, signifies any stroke or blow ; but is usually applied to a blow with the fist.

Now cuffing close, now chasing to and fro,

Now hurtling round advantage for to take.

Spenser. Faerie Queene.

The Sarazin, sore daunted with the buffe,
Snatcheth his sword, and fiercely to him flies,
Whom well it wards, and guyleth cuffe with cuffe.

Id.

I'll after him again, and beat him.—

—Do, cuff him soundly ; but never draw thy sword.

Shakspeare.

The priest let fall the book,

And as he stooped again to take it up,

The mad-brained tridegroom took him such a cuff,

That down fell priest and book, and book and priest.

Id. Taming of the Shrew.

Those lazy owls, who, perched near fortune's top

Sit only watchful with their heavy wings

To cuff down new-fledged virtues, that would rise

To nobler heights, and make the grove harmonious.

Otway.

Hovering about the coasts, they make their moan,

And cuff the cliffs with pinions not their own.

Dryden's Æneid.

He gave her *cuff* on the ear, and she would prick him with her knitting-needle. *Arbutnot's John Bull.*

When a man's fancy gets astride on his reason, when his imagination is at *cuffs* with the senses; and common understanding, as well as common sense, is kicked out of doors; the first proselyte he makes is himself, &c. *Swift.*

CUFF, *n. s.* Ar. and Per. *kuff*; Goth. and Swed. *knuffe*; Ger. *kuff*. Johnson, however, derives it from Fr. *coëffe*. The cuff is that part of the sleeve which is next the hand. Byron uses the word in the sense of a handcuff.

With ruffs and *cuffs* and fardingales and shirs. *Shakspeare. Taming of the Shrew.*

He railed at fops; and, instead of the common fashion, he would visit his mistress in a morning gown band, short *cuffs*, and a peaked beard.

Arbutnot.

He had chained

His prisoners, dividing them like chapters

In numbered lots; they all had *cuffs* and collars,
And averaged each from ten to a hundred dollars.

Byron. Don Juan.

CUFF (Henry), the unfortunate secretary of the earl of Essex, was born at Ilinton St. George in Somersetshire, about 1560, of an honorable and opulent family. In 1576 he was entered of Trinity College Oxford, where he soon acquired considerable reputation as a Grecian and disputant. He obtained a fellowship, but was expelled for speaking disrespectfully of the founder. He was, however, soon after admitted of Merton College, and in 1588 took the degree of M.A. Some time after he was elected Greek professor, and in 1594 proctor of the university. When the earl of Essex was made lord-lieutenant of Ireland, Mr. Cuff was appointed his secretary, and continued intimately connected with him until his confinement in the Tower. Before his execution the earl charged him with being the author of all his misfortunes, and Cuff was subsequently tried for high treason, and executed at Tyburn, 30th of March 1601. Lord Bacon, Sir Henry Wotton, and Camden, speak of him in very harsh terms; but he was certainly a man of learning and abilities. He wrote 1. The Differences of the Ages of Man's Life; published after his death. 2. De Rebus Gestis in Sancto Concilio Nicæno.

CUIABA, a town and river of Brasil, in the province of Mattogrosso, ninety-six leagues from its confluence with the Paraguay. The town is large, and computed to contain 30,000 inhabitants. It is well provided with fish, meat, and all sorts of vegetables. In the neighbourhood are some mines of the finest gold, which have yielded according to Mr. Mawe £500 annually. It is 288 miles east of Villa Batta.

CUJACIUS, or *CUJAS* (James), a celebrated civilian, born at Toulouse, in 1520. He studied polite literature and history; and acquired great knowledge in the ancient laws, which he taught at Toulouse, Cahors, Bourges, and Valence, in Dauphiné. Emanuel Philibert, duke of Savoy, invited him to Turin, and gave him singular marks of his esteem. Cujas afterwards refused very advantageous offers from pope Gregory XIII. who invited him to teach at Bologna, choosing rather to fix at Bourges, where he had a large number of scholars; whom he took great

pleasure in instructing, and was called the Father of his Scholars. He died at Bourges in 1590, aged seventy. His works are in high esteem among the civilians.

CUINAGE, *n. s.* The making up of twine into such forms as it is commonly framed into for carriage to other places.

CUIRASS, *n. s.* Fr. *cuirasse*, from *cuir*, *CUIRASSIER*, *n. s.* leather; Ital. *coraccia*. A breast-plate. A man at arms; a soldier in armour, or with a cuirass.

The picture of St. George, wherein he is described like a *cuirassier*, or horseman completely armed, is rather a symbolical image than any proper figure.

Broune's Vulgar Errors.

The field, all iron, east a gleaming brown,
Nor wanted clouds of foot, nor on each horn
Cuirassiers, all in steel, for standing fight. *Milton.*

The lance pursued the voice without delay,
And pierced his *cuirass*, with such fury sent,
And signed his bosom with a purple tint. *Dryden.*

CUIRASS, a piece of defensive armour, made of iron plate, well hammered, serving to cover the body, from the neck to the girdle, both before and behind. It was not brought into use till about A. D. 1300, though it was known both to the ancient Greeks and Romans in different forms. The use of the cuirass has been lately revived in the British and French armies: the cuirassiers of the latter were very conspicuous in the battle of Waterloo.

CUISH, *n. s.* Fr. *cuïsse*. The armour that covers the thighs.

I saw young Harry, with his beaver up,
His *cuishes* on his thighs, gallantly armed,
Rise from the ground like feathered Mercury.

Shakspeare. Henry IV.

But what had our author to wound Æneas with at so critical a time? And how came the *cuishes* to be worse tempered than the rest of his armour? *Dryden.*

CULDEES, *n. s.* Lat. *colidei*. Monks in Scotland.

CULERAGE, *n. s.* The same plant with arse-smart.

CULEX, the gnat: in entomology, a genus of insects belonging to the order of diptera. The mouth is formed by a flexible sheath, enclosing bristles pointed like stings. The antennæ of the males are filiform; those of the females feathered. There are fourteen species. Before they turn to flying insects, they have been in some manner fishes, under two different forms. One may observe in stagnating waters, from the beginning of May till winter, small grubs with their heads downwards, their hinder part on the surface of the water; from which part arises sideways a kind of vent-hole, or small hollow tube like a funnel, and this is the organ of respiration. The head is armed with hooks, that serve to seize on insects and bits of grass on which it feeds. On the sides are placed four small fins, by the help of which the insect swims about, and dives to the bottom. These larvæ retain their form during a fortnight or three weeks, after which period they turn to chrysalides. After three or four days fasting they pass to the state of gnats. A moment before, water was its element; but now, become an aerial insect, he can no longer exist in it. He swells his head, and bursts his

enclosure. The robe he lately wore, turns to a ship, of which the insect is the mast and sail. He now seeks to pump the alimentary juice of leaves, or the blood of man and beasts. The sting which our naked eye discovers, is but a tube, containing five or six spicula of exquisite minuteness; some dentated at their extremity like the head of an arrow, others sharp-edged like razors. The insect injects a small quantity of liquor into the wound, by which the blood becomes more fluid, and is seen through the microscope passing through those spicula. The liquor it has injected causes by its fermenting that disagreeable itching which we experience; and which may be removed by volatile alkali, or by scratching the part newly stung, and washing it instantly with cold water; for if later, the venom ferments, and the tumor and the itching are only increased by friction.

C. pipiens, the musquito fly, is the most troublesome species of the whole genus; and swarms in South America, and the West Indies. In the day time or at night they come into the houses; and when the people are gone to bed they begin their disagreeable humming, approach always nearer to the bed, and at last suck up so much blood that they can hardly fly away. Their bite causes blisters in people of a delicate complexion. When the weather has been cool for some days, the musquitoes disappear; but when it changes again, and especially after rain, they gather frequently in such quantities about the houses, that their numbers are astonishing. In sultry evenings they accompany the cattle in great swarms, from the woods to the houses or to town; and when they are driven before the houses, the gnats fly in wherever they can. In the greatest heat of summer, they are so numerous in some places that the air seems to be quite full of them, especially near swamps and stagnant waters, such as the river Morris in New Jersey. The inhabitants therefore make a fire before their houses to dispel these disagreeable guests by the smoke.

CULIACAN, a province of Guadalaxara, in Mexico, part of the intendancy of Sonora. It has Cinaloa on the north, New Biscay and the Zacatecas on the east. Chiametlan on the south, the gulf of California on the west. It abounds with all sorts of fruit, and has silver mines. The soil is fertile and the air healthy. It is about 200 miles long and 150 broad.

CULINARY, *adj.* Lat. *culina*. Relating to the kitchen; relating to the art of cookery.

Great weight may condense those vapours and exhalations, as soon as they shall at any time begin to ascend from the sun, and make them presently fall back again into him, and by that action increase his heat; much after the manner that, in our earth, the air increases the heat of a *culinary* fire. *Newton.*

To those who, by reason of their northern exposition, will be still forced to be at the expence of *culinary* fires, it will reduce the price of their manufacture. *Arbuthnot.*

Hard fare! but such as boyish appetite
Disdains not; nor the palate, unimproved
By *culinary* arts, unsavoury deems. *Cooper.*
CULL, *v. a.* ? Fr. *cuillir*; Ital. *colligere*;
C'LLER, *n. s.* Lat. *colligere*. To select from;
to make choice of the best. One who culls.

The best of every thing they had being *culled* out for themselves; if there were in their flocks any poor diseased thing not worth the keeping, they thought it good enough for the altar of God. *Hooker.*

Our engines shall be bent
Against the brows of this resisting town.
Call for our chiefest men of discipline,
To *call* the plots of best advantage.

Shakspeare. King John.

I do remember an apothecary
In tattered weeds, with overwhelming brows,
Culling of simples. *Id. Romeo and Juliet.*

When the current pieces of the same denomination are of different weights, then the traders in money *cull* out the heavier, and melt them down with profit. *Locke.*

When false flowers of rhetorick thou wouldst *cull*,
Trust nature, do not labour to be dull. *Dryden.*

The various offerings of the world appear:
From each she nicely *culls* with curious toil,
And decks the goddess with the glittering spoil. *Pope.*

To trim the ringlets of his scented hair;
To aim, insidious, Love's bewitching glance;
Or *cull* fresh garlands for the gaudy fair,
Or wanton loose in the voluptuous dance:
These were his arts; these won Enone's love,
Nor sought his fettered soul a nobler aim. *Beattie.*

Be silent, Conrad—dearest! come and share
The feast these hands delighted to prepare;
Light toil to *cull* and dress thy frugal fare.

Byron. The Corsair.

CULLEN (Dr. William), one of the most celebrated physicians of his age and country, was born of a respectable family in Lanarkshire in 1712. After serving his apprenticeship to a surgeon at Glasgow, he went several voyages to the West Indies as a surgeon; but at last settled as a surgeon at the village of Shotts, where he became acquainted with Archibald duke of Argyll. About this period Mr. Cullen formed a connexion in business with William Hunter, afterwards a celebrated lecturer on anatomy in London. It was agreed that, in order to improve their medical knowledge, one of them should alternately be allowed to study in what college he should choose, during winter, while the other should carry on business for their common benefit. Accordingly Cullen was allowed to study first for one winter in the University of Edinburgh; but next winter, when it came to Hunter's turn, he preferred London, where his singular dexterity in dissecting, and making anatomical preparations, recommended him so effectually to Dr. Douglas, who then lectured upon anatomy and midwifery, and whose chair he afterwards filled, that he engaged him as his assistant. On hearing this Mr. Cullen freely gave up the articles, and the two partners ever after kept up a friendly correspondence. In September, 1740, Mr. Cullen took the degree of M. D. at Glasgow, and about the same time removed to Hamilton, with a view to practise as a physician; and a vacancy not long after occurring in the University of Glasgow, the duke of Hamilton procured Dr. Cullen the appointment. In 1746 he became professor of chemistry in that University; and his eminent abilities as a public lecturer now began to appear. His practice as a

physician also daily increased; and a vacancy occurring, in 1751 he was appointed by the king professor of medicine in that University. In 1756, on the death of Dr. Plumber, professor of chemistry in the University of Edinburgh, Dr. Cullen was unanimously called to the vacant chair; and removing to that metropolis continued a successful career there until his death. Among many useful reforms for which the students in Edinburgh are indebted to Dr. Cullen, the following has been noticed, that before he came to Edinburgh, it was the custom of the medical professors to accept of fees from the students; but Cullen would never take one from them. Dr. Cullen published his First Lines of the Theory and Practice of Physic; and his Institutions of Medicine, his Lectures on the Materia Medica, &c. are universally known. He was first physician to the king for Scotland; F. R. S. of London, Edinburgh, and Paris; Fellow of the Royal College of Physicians of Edinburgh and Madrid; Member of the American Philosophical Society at Philadelphia; of the medical societies of Dublin and Copenhagen; of the Royal Medical and Royal Physical Societies of Edinburgh, &c.

CULLEN, a royal burgh in a parish of the same name, which joins with Banff, Kintore, Elgin, and Inverary, in electing a representative to parliament. By the patriotic exertions of the late earl of Finlater, it carries on a considerable linen manufacture. It has a post-office, and several good schools.

CULLICE, or \int Fr. *coulis*. Broth; rich CULLIS, *n. s.* Jelly.

CULLODEN Moor, a heath in Invernesshire, memorable for a victory gained over the adherents of the house of Stuart, on the 16th of April 1746, by the royal army, commanded by the duke of Cumberland. A total defeat of the rebel forces took place, with the loss of 2500 killed, wounded, and prisoners; while the royalists did not lose above 200 men. Prince Charles had his horse shot under him during the engagement; and after the battle retired to the house of a factor of lord Lovat, about ten miles from Inverness, where he staid that night. Next day he set out for Fort Augustus, whence he pursued his journey, with great difficulty and distress, till at last he reached the coast and entered a vessel provided for him by the court of France. See ENGLAND.

CULLY, *v. a., n. s. & adj.* } Fr. *couillon*,
CULLYISM, *n. s.* } *coaille*; Ital. *cog-*
CULLIBULITY, *n. s.* } *lione*; Lat. *colaus*.
CULLION, *n. s.* } To cully is, to
CULLIONLY, *adj.* } befool; to trick;

to impose on. A cully is one who is in a state of cullyism, that is, egregiously led by the nose by sharpers or a strumpet. A cullion is a scoundrel; a mean wretch. Cullionly is mean; despicable. Cullibility signifies credulity; facility of being imposed upon.

Such a one as leaves a gentleman,
And makes a god of such a cullion.

Shakspeare. Taming of the Shrew.

Up to the breach, you dogs; avaunt you cullions.

Shakspeare.

I'll make a sop o' th' moonshine of you: you whoreson, cullionly, barber-monger, draw.

Id. King Lear.

Why should you, whose mother-wits

Are furnished with all perquisites,

Be allowed to put all tricks upon

Our cully sex, and we use none? *Hudibras.*

Yet the rich cullies may their boasting spare:

They purchase but sophisticated ware. *Dryden.*

He takes it in mighty dudgeon, because I won't let him make me over by deed as his lawful cully.

Arbutnot.

What is this but being a cully in the grave? Sure this is being hen-pecked with a vengeance! But without dwelling upon these less frequent instances of eminent cullism, what is there so common as to hear a fellow curse his fate that he cannot get rid of his passion to a jilt, and quote an half line out of a miscellany poem, to prove his weakness is natural?

Spectator.

Providence never designed Gay to be above two-and-twenty, by his thoughtlessness and cullibility.

Swift.

CULLUMBINE, *n. s.* More properly spelt COLUMBINE. The flowers of this plant are beautifully variegated with blue, purple, red, and white.

Her goodly bosom, like a strawberry bed;

Her neck, like to a bunch of *collumbines*. *Spenser.*

CULLI, or CULLUM, a market town of Bohemia, in the circle of Saatz, belonging to the knights of the Red Star, near which the French army, under Vandamme, was attacked and routed by the allies on the 29th and 30th of August, 1813, and the general taken prisoner. Another engagement took place in the neighbourhood on the 16th and 17th of September, when the French found it necessary to retreat. It is eight miles north-east of Egra.

CULM, in mineralogy, is thus distinguished by M. Magellan: 'It should be an easy matter for any person to distinguish culm from small caking coal, either by trying to make fire with it in a common grate, without interposing any other fuel between it; when if it kindles, it is a caking coal; if not it is culm: or by putting some of these small fragments of coal on an ignited iron shovel: if they melt and run together, they belong to the caking kinds; if not, they are culm. But it seems that coal merchants are now in the custom of calling culm the powdery parts of pit coal, of whatsoever kind they may happen to be. The reason of this is, that there is a difference in the duty payable by culm and by caking coals. There never was any difficulty, however, on the subject; nor would there be any difficulty in collecting the tax, were it not for the insufferable ignorance and love of despotic oppression, which generally pervades the underling officers of the revenue.'

CULMBACH, a town of the Bavarian states, situated on the river White Maine. Population 3700 Fifteen miles N. N. W. of Bayreuth.

CULMEN, *n. s.* Lat. The summit.

At the *culmen* or top was a chapel.

Sir T. Herbert.

CULMIFEROUS, *adj.* Lat. *culmus* and *fero*. See BOTANY.

Culmiferous plants are such as have a smooth jointed stalk, and usually hollow; and at each joint the stalk

is wrapped about with single, narrow, long, sharp-pointed leaves, and their seeds are contained in chaffy husks. *Quincy.*

There are also several sorts of grasses, both of the *Cyperus* and *culmiferous* kind; some with broader, others with narrower leaves. *Woodward on Poissils.*

The properest food of the vegetable kingdom is taken from the farinaceous or mealy seeds of some *culmiferous* plants; as oats, barley, wheat, rice, rye, maize, panic, millet. *Arbutnot.*

CULMINATE, *v. n.* } Lat. *culmen*. To be
CULMINATION, *n. s.* } vertical; to be in the
 meridian. Culmination is the transit of a planet through the meridian; the top or crown.

We upbraid the end with the beginning, the harvest with the spring, and wonder how that which in its putting forth was a flower, should in its growth and *culmination* become a thistle. *Farrindon.*

Far and wide his eye commands;
 For sight no obstacle found here, or shade,
 But all sunshine; as when his beams at noon
Culminate from the' equator. *Milton. Par. Lost.*

CULNA, a town in the district of Jessore, Bengal, standing on the north bank of one of the innumerable branches of the Ganges. Boats generally lay in a stock of fresh water and provisions here, and take a pilot to convey them through the navigation of the Sunderbunds.

CULPABLE , <i>adj.</i>	} Old. Fr. <i>culpable</i> ; Ital. <i>colpevole</i> ; Span. <i>culpable</i> ; Lat. <i>culpabilis</i> , from <i>culpa</i> , a fault. Culpable is, criminal; guilty of; blamable.
CULPABLENESS , <i>n. s.</i>	
CULPABLY , <i>adv.</i>	
CULPABILITY , <i>n. s.</i>	
CULPE , <i>n. s.</i>	
CULPRIT , <i>n. s. & adj.</i>	
CULPATORY , <i>adj.</i>	

Culpe is used, by Hall, to denote a fault. *Culprity* is attributing blame. 'Adjectives in *osus*, as *famosus*, &c. (says Horace Walpole), were most commonly used by Latin authors in a culpatory sense.' The word is not in the dictionaries, but it deserves to be admitted. About *culprity* (says Johnson) there is great dispute. It is used by the judge at criminal trials, who, when the prisoner declares himself not guilty, and puts himself upon his trial, answers, 'Culprity, God send thee a good deliverance.' It is likely that it is a corruption of 'qu'il paroit,' 'May it so appear;' the wish of the judge being that the prisoner may be found innocent. Barrington agrees with Johnson in this derivation. Blackstone considers the word to have arisen from two abbreviations, *cul* for culpable, and the Fr. *pret*, ready to prove him so; others derive it from the first of these abbreviations, and Fr. *prist*, taken; Mr. Tyrwhitt looks for the origin in *cul*, the hind parts, and *prist*, one seized by the skirts; and, lastly, the Ency. Met. says, 'Culprity appears merely to be a compound and contraction of *culpe*, a fault; a crime; a transgression of the law; and Fr. *pris*, part. of *prendre*, to take; one taken; a prisoner, for a transgression of the law.'

And as Saint Gregory saith, that precious clothing is *culpable* for the dertth of it, and for his softnesse, and for his strangenesse and disguising, and for the superfluitie, or for the inordinate scantnesse of it.

Chaucer. Cant. Tales.

These being perhaps *culpable* of this crime, or favourers of their friends. *Spenser's State of Ireland.*

The wisdom of God setteth before us in Scripture so many admirable patterns of virtue, and no one of them without somewhat noted wherein they were *culpable*; to the end that to Him alone it might always be acknowledged, Thou only art holy, Thou only art just. *Hooker.*

Proceed no straighter 'gainst our uncle Glo'ster,
 Than from true evidence of good esteem
 He be approved in practice *culpable*.

Shakespeare. Henry VI.

If we perform this duty pitifully and *culpably*, it is not to be expected we should communicate holily.

Taylor.

Though prudence be reckoned among the cardinal virtues, yet I do not remember any professed treatise of morality, where it is treated in its full extent, and with that accuracy that it ought. For which possibly this may be a reason, that every imprudent action does not make a man *culpable* 'in foro conscientia.'

Locke.

All such ignorance is voluntary, and therefore *culpable*; forasmuch as it was in every man's power to have prevented it. *South.*

The knight appeared, and silence they proclaim;

Then first the *culprity* answered to his name;

And, after forms of law, was last required

To name the thing that woman most desired.

Dryden.

An author is in the condition of a *culprity*; the publick are his judges; by allowing too much, and condescending too far, he may injure his own cause; and by pleading and asserting too boldly, he may displease the court. *Prior's Preface to Solomon.*

Like other *culprity* youths he wanted grace,
 But could have no self-interest in the case.

W. Whitehead.

J. SURF. The license of invention some people take is monstrous indeed.

MARIA. 'Tis so; but, in my opinion, those who report such things are equally *culpable*. *Sheridan.*

CULPEE, a town in the district of Hoogly, Bengal, on the east bank of the Bhagarutty. It stands at the mouth of a creek, or small harbour, which gives shelter for boats from the impetuosity of the tides. Opposite the town is a place of anchorage for large vessels. It is said to be nearly certain death to an European to sleep on shore here, and coverings are recommended to be used during the night on all ships which anchor here, to keep off the heavy dews from the people.

CULROSS, a royal borough of Scotland, on the river Forth, about twenty-three miles north-west of Edinburgh. Its charter was granted by James VI. in 1588. The town is built on the abrupt ascent from the water, one street running direct north, while the other intersects it at right angles. The situation of the town gives it, especially on the approach from the harbour, a very picturesque and grand appearance. By two royal grants from James IV. and Charles II. the inhabitants of Culross possessed the exclusive privilege of making girdles (a kitchen utensil well known in Scotland for baking oat-cakes, &c.) It formerly carried on a very considerable trade in salt and coal, but this also has decayed; and at present it has no manufacture of any note. This borough joins with those of Stirling, Dun-

fermling, Innerkeithing, and Queensferry, in electing a representative in parliament.

CULTER, *n. s.* Lat. *cutter*. The iron of the plough perpendicular to the share. It is commonly written **COLTER**. See that word.

Her fallow lees

The darnel, hemlock, and rank fumitory,
Both root upon; while that the *cutter* rusts
That should deracinate such savagery.

Shakspeare. Henry V.

CULTIVATE, *v. a.*

CULTIVABLE, *adj.*

CULTIVATION, *n. s.*

CULTIVATING, *n. s.*

CULTIVATOR, *n. s.*

CULTURE, *v. a. & n. s.*

Fr. *cultiver*; Ital. *cultivare*; Span. *cultivar*; Lat. *colere*. To till the soil; to make the soil prolific; to improve; to meliorate. These meanings are common to both verbs; to culture, however, seems to be of comparatively recent introduction. Cultivation is the art of improving soils, and forwarding and improving the growth of vegetables; generally, improvement. Culture is, the art of cultivation; tillage. Cultivable is a word of modern coinage, denoting that which has the capacity of being cultivated.

Give us seed unto our heart, and culture to our understanding, that there may come fruit of it.

2 Esdras viii. 6.

These three last were slower than the ordinary wheat of itself, and this culture did rather retard than advance.

Bacon.

Were we but less indulgent to our faults,
And patience had to cultivate our thoughts,
Our muse would flourish.

Waller.

He, who appropriates land to himself by his labour, does not lessen, but increases the common stock of mankind; for the provisions serving to the support of human life, produced by one acre of inclosed and cultivated land, are (to speak much within compass) ten times more than those which are yielded by an acre of land of an equal richness lying waste in common.

Locke.

It has been lately complained of, by some cultivators of clover grass, that from a great quantity of the seed not any grass springs up.

Boyle.

An innate light discovers the common notions of good and evil, which, by cultivation and improvement, may be advanced to higher and brighter discoveries.

South.

A foundation of good sense, and a cultivation of learning, are required to give a seasoning to retirement, and make us taste the blessing.

Dryden.

To make man mild and sociable to man,

To cultivate the wild licentious savage

With wisdom, discipline, and liberal arts,

The' embellishments of life, *Addison's Cato.*

One might wear any passion out of a family by culture, as skillful gardeners blot a colour out of a tulip that hurts its beauty.

Tatler.

Where grows?—Where grows it not? If vain our toil,

We ought to blame the culture, not the soil,
Fixed to no spot is happiness sincere.

Pope.

They rose as vigorous as the sun;
Then to the culture of the willing glebe.

Thomson.

In countries cultured high,

In ornamented towns, where order reigns,
Free social life, and polished manners fair.

Id.

It is therefore our business carefully to cultivate in our minds, to rear to the most perfect vigour and

maturity, every sort of generous and honest feeling that belongs to our nature.

Burke.

To a mind thus disposed no part of creation is indifferent. In the crowded city and howling wilderness; in the cultivated province and solitary isle; in the flowery lawn and craggy mountain; in the murmur of the rivulet, and in the uproar of the ocean; in the radiance of summer, and gloom of winter; in the thunder of heaven, and in the whisper of the breeze; he still finds something to rouse or to sooth his imagination, to draw forth his affections, or to employ his understanding.

Beattie.

Delights which would leave, that has a heart susceptible of pity, or a mind cultured and capable of sober thought, For all the savage din of the swift pack, And clamours of the field?

Cowper.

The beauties of the wilderness are his,
That makes so gay the solitary place,
Where no eye sees them. And the fairer forms,
That cultivation glories in are his.

Id.

CULVER, *n. s.* Ang.-Sax. *culfre*; Lat. *columba*. A pigeon. The word is almost disused.

Right as the lambe that of the wolf is bitten,
Or as the culver that of the eagle is smitten.

Chaucer. The Legend of Philomela.

Live as the culver on the bared bough
Sits mourning for the absence of her mate.

Spenser. Sonnet lxxxviii.

Whence borne on liquid wing,

The sounding culver shoots. *Thomson's Spring.*

CULVERIN, *n. s.* Fr. *coulevrine*; Ital. *colubrina*; Span. *culebrina*, from Lat. *coluber*. A species of ordnance: originally a hawk.

As three great culverings for batterie bent,
And leveld all against one certaine place,
Doe all attonee their thunders rage frith-rent.

Spenser. Faerie Queene.

Here a well polished mall gives us the joy
To see our prince his matchless force employ:
No sooner has he touched the flying ball,
But 'tis already more than half the mall;
And such a fury from his arm 't has got,
As from a smoaking culverin 'twere shot.

Waller.

A whole cannon requires, for every charge, forty pounds of powder, and a bullet of sixty-four pounds; a culverin, sixteen pounds of powder, and a bullet of nineteen pounds; a demy-culverin, nine pounds of powder, and a bullet of twelve pounds.

Wilkins's Math. Magic.

CULVERIN, a long slender piece of ordnance or artillery, serving to carry a ball to a great distance. There are three kinds of culverins: the extraordinary, the ordinary, and the least sized. 1. The culverin extraordinary has 5½ inches bore; its length 32 calibres, or 13 feet; weighs 4800 pounds; its load above 12 pounds; carries a shot 5½ inches diameter, weighing 20 pounds weight. 2. The ordinary culverin is 12 feet long; carries a ball of 17 pounds 5 ounces; calibre 5½ inches; its weight 4500 pounds. 3. The culverin of the least size, has its diameter 5 inches; is twelve feet long; weighing about 4000 pounds; carries a shot 3¾ inches diameter, weighing 14 pounds nine ounces.

CULVERKEY, *n. s.* A flower.

Looking down the meadows, I could see a girl cropping culverkeys and cowslips to make garlands.

Walton's Angler.

CULVERTAIL, *n. s.* In carpentry, synonymous with dove-tail.

CUMÆ, or **CUMA**, in ancient geography, a city of Campania near Puteoli, founded by a colony from Chalcis and Cumæ of Æolia before the Trojan war. The inhabitants were called Cumæi. One of the Sibyls fixed her residence in a cave in the neighbourhood, and was called the Cumæan Sibyl. There is still a decayed town of this name on the spot, about four miles north-west of Pozzuolo.

CUMA, a small island in the Mediterranean, off the coast of Italy, five miles west of Naples.

CUMA, **St. ANTONIO DE**, a town of Brasil, in the province of Maranham.

CUMANA, a province in the department of the Oronoco, and state of Vénézuëla, Colombia. It is bounded by the Caribbean Sea on the north and east, the river Unara on the west, and on the south by the wide-spreading Oronoco. It thus includes New Barcelona, as well as New Andalusia, properly so called. The extent of the territory of Cumana, the fertile soil of the interior, and the nature of its boundaries, render it one of the most important divisions of the republic.

This province is extremely mountainous; a branch from the main chain of the Andes stretches across its whole extent to the gulf of Paria. It abounds in highly picturesque scenery, and gives birth to numerous rivers; some flowing towards the north and emptying themselves into the Caribbean Sea, others taking a southerly direction and discharging themselves into the broad expanse of the Oronoco. The principal of these are the Unara, the Neveri (on which Barcelona is built), the Manzanares, which encompasses the city of Cumana on the south and west, the Guarapiche, the Mamo, the Pao, and the Suara. These rivers are again joined by others of lesser importance, which intersect the territory in all directions, affording every possible facility to the erection of mills, and admirably adapted to the purposes of irrigation.

The province of Cumana presents every variety of soil: from the river Unara to the city of Cumana the land is moderately fertile; from the Point of Araya for about twenty-eight leagues to the east the coast is dry and sandy, the soil offering nothing but an inexhaustible mine of salt, both mineral and marine. The banks of the Oronoco consist chiefly of extensive commons, over which numerous herds of cattle are allowed to range. The remaining parts of the province are every where fertile. The guaiacum, anacardium, Brasil, and Campeachy woods flourish down to the coast of Paria, whilst their branches are thronged with innumerable flocks of birds of the rarest kinds and most brilliant plumage. Yet these regions are left so entirely to the inheritance of beasts of prey, that the panthers, tigers, and even the apes, evince little alarm or dread at the approach of man. Of the mountains in the interior, Tumeriquisi deserves particular mention. It is 935 toises above the level of the sea, and is the Hartz of the province, being associated with equally wild and superstitious ideas in the minds of the Cumanese. It contains an immense cavern, famous in the tradition of the country, which serves as a habitation for thousands of

nocturnal birds, from whose fat is procured a valuable oil. Its site is truly majestic; a river of considerable magnitude issues from its mouth, which is every where surrounded by the richest verdure; and the roar of the waters, joined to the mournful cries of the birds within, is believed by the natives to proceed from the souls of the dead, who are forced to enter this cavern as a vestibule to the other world. The climate of the territory of Cumana varies according to the situation of its districts; it may, in fact, be said to concentrate every variety of the habitable globe.

The city of Cumana, the most ancient of all the towns on this continent, is situated near the gulf of Cariaco, on an arid and sandy plain. No towering steeple or dome attracts the eye of the traveller from afar off; only a few trunks of tamarind, cocoa, and date trees rising above the flat roofs of the houses.

The river Manzanares separates it from the suburbs; the population is a European and mixed race. The appearance of the coast from the mouth of this river is thus described by Humboldt: 'We anchored opposite the mouth of the Manzanares at break of day. Our eyes were fixed on the groups of cocoa trees that border the river, and the trunks of which, more than sixty feet high, towered over the landscape. The plain was covered with tufts of cassias, capers, and those arborescent mimosas, which, like the pine of Italy, extend their branches in the form of an umbrella. The pennated leaves of the palms were conspicuous on the azure of a sky, the clearness of which was unsullied by any trace of vapor. The sun was rapidly ascending towards the zenith; a dazzling light was spread through the air, along the whitish hills strewed with cylindrical cactuses, and over a sea ever calm, the shores of which were peopled with alcatras, egrets, and flamingoes. The splendor of the day, the vivid coloring of the vegetable world, the forms of the plants, the varied plumage of the birds, every thing announced the grand aspect of nature in the equinoctial regions.'

The castle of St. Antonio is built on the eastern extremity of a white, solitary hill of the same name, and forms the only bulwark to Cumana.

The city, as we have intimated, contains no remarkable buildings, the frequency of earthquakes obliging the inhabitants to sacrifice architectural beauty and elegance to personal security. There is a theatre constructed after the plan of the one at Caraccas. The pit, where the men are separated from the women, is uncovered, so that the audience may at once behold the actors and the stars. The heat of the climate precludes the possibility of these theatres being built in the European fashion; besides, rain is a greater rarity in this city than it even is at Caraccas. The other amusements of the Cumanese consist in bull-baiting, cock-fighting, and ropedancing. There is only one church and two convents. The suburbs are equally populous with the ancient city. They are three in number; the Serritos on the road to the Plaga Chica, on the north of the city, St. Francis on the south-east, and the great suburb of the Guayquerias. This latter one increases with great rapidity, there being no space for additional buildings on

the site of the old town, and also from the nature of the soil, which is supposed to be less exposed to the violent shocks of earthquakes. The population of Cumana has been variously estimated: M. Depons states it to have amounted to nearly 28,000 in the year 1802; other travellers have carried this number to 30,000; but Humboldt, who was favored with the sight of all the statistical memoirs of the country, pronounces it not to exceed 18,000 or 19,000.

The climate though excessively hot here is remarkable for its purity and healthiness. The town is only fifty-three feet above the level of the sea; but the breezes which have to pass over the lofty hills, which stretch along its whole eastern side, seem greatly to moderate the heat of the day. From June to the end of October Fahrenheit's thermometer usually rises to 90° and sometimes to 95°; and during these months it rarely descends to 80° during the night. The mean temperature of the whole year, according to observations on the centigrade thermometer, is 27.7°. The mean temperature of the hottest month at Paris is 19° or 20°, consequently several degrees less than the coldest day at Cumana. There is scarcely ever any rain in the plains of Cumana, whilst the storms are seen to accumulate and burst in torrents among the inland mountains. The hygrometer of De Luc is commonly at about 50° during the winter, and marks the utmost degree of dryness from the beginning of November to June. The sky contains 24° of blue, according to Saussure's cyanometer, whilst in Europe it seldom exceeds 14°. The arid and dusty plains of the neighbourhood are infested with thousands of gabinazo vultures, crocodiles, rattle-snakes, coral-vipers, centipedes, &c. A most singular phenomenon is presented on these plains after violent showers of rain:—the earth, drenched with moisture and heated again by the rapid rays of the sun, emits gaseous emanations, which are the vehicles of that musky odor, which, under the torrid zone, is common to the jaguar, tiger-cat, thick-nosed tapir and various other animals. These emanations are evolved in proportion as the mould, mixed with the remains of innumerable reptiles, worms, and insects, becomes saturated by the rain. Humboldt says he has 'seen Indian children, of the tribe of the Chaymas, draw out from the earth and eat millepedes, or scolopendras, eighteen inches long and seven lines broad. Whenever the soil is turned up we are struck with the mass of organic substances, which by turns are developed, transformed, and decomposed.' The Cumanaese are represented as an economical, and industrious people; generally they cultivate the mechanical arts with success, while the fisheries and commercial pursuits unite them in intercourse with all the neighbouring colonies. The Creoles are distinguished by their penetration, judgment, and application to every thing they undertake. One of the most singular customs which prevail here is that of sitting on chairs placed in the river. Humboldt gives a very lively description of it.—He was one of a party comprising several very respectable inhabitants of the suburb of Guayquerias, who met in a

fine moonlight night in the water of Manzanara, to smoke cigars and discuss the news of the day. The ladies of his friends who accompanied them displayed not the least apprehension or fear of the baras or small crocodiles, and the troops of dolphins which spouted the waters around them. Indeed so frequently do they bathe that the whole of the inhabitants, even the women of the most opulent families, are expert swimmers. The Cumanaese are said to be excessively polite, sober, and abstemious.

The most dreadful scourge of the territory of Cumana is the earthquake. The natives have a tradition that the gulf of Cariaco was formed by an earthquake a short time previously to the third voyage of Columbus. They say that towards the end of the sixteenth century the whole coast was shaken, and the shores frequently inundated by the sea's rising fifteen or twenty fathoms above its usual level. As no record exists at Cumana, however, of an older date than 150 years (a species of the white ant entirely destroying all the treasures of the bibliomanist) the precise date of these phenomena rests on mere hypothesis. On the 21st October, 1766, after a remarkable drought of fifteen months, the whole city was overthrown, and vast numbers perished. The oscillations of the earth continued hourly for fourteen months afterwards. The earth in many places ejected sulphureous waters; and a most singular feature of this earthquake is, that whilst the ground was externally oscillating the rain fell in torrents, and the harvest was unusually abundant. Another tremendous convulsion was experienced in 1794, and on the 19th December, 1797, four-fifths of the city were utterly destroyed. In this dreadful earthquake the ground was for the first time at Cumana felt to heave perpendicularly. About half an hour before the first shock there was a strong sulphureous smell near the castle, and a loud subterranean noise, resembling the explosion of a mine at a great depth: flames were also seen to rise from the banks of the river, and in several other places. Flames are not unfrequently observed near the city of Cumana; they do not burn the herbage, neither do they appear to issue from any crevices or fissures in the earth: the people call them the soul of the tyrant Aguirre, a tyrannical Spanish governor, who attempted to raise the standard of independence in this neighbourhood, in 1561. He was killed at Barquisimeto, after having been abandoned by his own men. At the moment he fell he plunged a dagger into the bosom of his only daughter, 'that she might not have to blush before the Spaniards at the name of the daughter of a traitor.' Ever since his death the above superstition has been connected with his memory, the natives believing that his soul wanders about the earth in the appearance of a flame which shuns the approach of man.

The port of Cumana is capable of containing all the navies of Europe: indeed the whole of the gulf of Cariaco, which is thirty-five miles long and sixty-eight broad, affords excellent anchorage. The West Indian hurricanes are never felt in these regions, the Caribbean Sea being as

calm and pacific as the great ocean which laves the coasts. The only danger in this part of Peru is a shoal called Morro Rexo, which is 900 toises broad, and so very steep that vessels are aground on it before they have the least warning. Immense flocks of fishing-herons and alcatras of a most unwieldy form frequent its shores. The principal exports from this harbour are cattle, smoked meat (*tosajo*), and salted fish. Of this latter commodity the Cumanees make large shipments to Caraccas, &c. and to the windward islands, in return for which they receive provisions, implements of husbandry, and contraband goods. Amongst the exports, cocoa-nuts and oil extracted from the pulp they contain deserve to be mentionel. The province contains innumerable medicinal plants and aromatics, which might become more important than they are in the list of their commercial articles. The retail trade of Cumana is vested almost entirely in the hands of the Biscayans, Canarians, and Catalans. These last-mentioned first established rape manufactories at Cumana, where they make excellent cobbis of the bark of the mahet (genus bombax), and cords and twine from the aloe, &c.

Seven nautical leagues to the south-west of the city of Cumana is the valley of Cumanacoa, celebrated for its plantations of tobacco. The principal other towns of Cumana are situated on the western coast, as Barcelona, Paritus, Clarinas, &c. On the coast, along the gulf of Paria, several villages have been established by the French and Spanish refugees who removed from Trinidad in 1797, when that island fell into the possession of the British. The progress which cultivation has made in this short time, induces the belief that this district will speedily become the richest in the province. The whole number of the inhabitants of this extensive territory, according to a recent official statement of the population, and distribution of the representatives at the congress of Colombia, amounts to 70,000 souls. But, as Colonel Hale says, the population is everywhere extremely disproportioned to the territory of the republic. 'In the time of its greatest prosperity,' he adds, 'the country was comparatively a desert, but this desolation has been fearfully augmented during the revolutionary war. The fertile provinces of Guiana, Cumana, and Barcelona, are almost abandoned, and the flourishing towns and villages of the plains reduced to a grass-grown wretchedness, which scarcely leaves room to conjecture their former prosperity. Could 20,000,000 of inhabitants be transferred from Europe, they would find land to cultivate, and abundance to recompense their labor.' He elsewhere observes that 'above half of the inhabitants of Venezuela are supposed to have perished in the late wars.' The city of Cumana is situated in 10° 27' 52" N. lat., and 64° 9' 47" W. long.

CUM'BENT, *adj.* Lat. *cumbens*, *cumbere*. Lying down; in a recumbent posture.

Too cold the grassy mantle of the marl,
In stormy winter's long and dreary night,
For *cumbent* sheep.

Dyer.

CUMBER, *v. a. & n. s.* } Goth. *gaumbera* ;
CUMBERSOME, *adj.* } Swed. *kumber*; Dan.
CUMBERSOMELY, *adv.* } *kommer*; Dut. *kom-*
CUMBERSOMENESS, *n. s.* } *mercu*. The ancient
CUMBRANCE, *n. s.* } spelling was *com-*
CUM'BROUS, *adj.* } ber. To embarrass;
CUM'BROUSLY, *adv.* } to obstruct; to im-
pede by the addition of something useless; to involve in difficulties; to busy; to distract with multiplicity of cares; to harass; to crowd or load with something useless. The kindred words closely follow the various meanings of the primitive word.

How can I myself alone bear your *cumbrance*, and your burden, and your strife?
Deut. i. 12.

Martha was *cumbered* about much serving.
Luke x. 40.

Behold these three years I come seeking fruit on this fig-tree, and find none: cut it down; why *cumbereth* it the ground?
Id. xiii. 7.

The began Beryn to drede inwardlick sore,
And thought thus in his hert, shall I be *cumberid*
more?
Chaucer. Cant. Tales.

Thus fade thy helps, and thus thy *cumbers* spring.
Spenser.

They waste bignesse but *cumbers* the ground,
And dirks the beauty of my blossoms round.
Id. Shepherd's Calendar.

A cloud of *cumbrous* knattes do him molest,
All striving to infix their feeble stinges,
That from their noyance he can no where rest.
Id. Faerie Queene.

By the occasion thereof I was brought to as great *cumber* and danger, as lightly any might escape.
Sidney.

Domestick fury, and fierce civil strife,
Shall *cumber* all the parts of Italy.
Shakspeare. Julius Cæsar.

Let it not *cumber* your better remembrance.
Id. Timon.

The greatest ships are least serviceable, go very deep in water, are of marvellous charge and fearful *cumber*.
Raleigh.

Extol not riches then, the toil of fools,
The wise man's *cumbrance*, if not snare; more apt
To slacken virtue, and abate her edge,
Than prompt her to do aught may merit praise.
Milton.

Henceforth I fly not death, nor would prolong
Life much! Bent rather, how I may be quit,
Fairest and easiest, of this *cumbrous* charge.
Id.

There are scarce any of them that are not *cumbered* with some difficulties (such is the imperfection of human knowledge), which they have been fain to cover with obscurity of terms, and to confound the signification of words, which, like a mist before people's eyes, might hinder their weak parts from being discovered.
Locke.

Hardly his head the plunging pilot rears,
Clogged with his clothes, and *cumbered* with his years.
Dryden.

They reared him from the ground,
And from his *cumbrous* arms his limbs unbound;
Then lanced a vein.
Id.

Very long tubes are *cumbersome*, and scarce to be readily managed.
Newton's Opticks.

What is a lordling's pomp? a *cumbrous* load,
Disguising oft the wretch of human kind,
Studied in arts of hell, in wickedness refined!

Burns.

Of late, with *cumbersome*, though pompous show,
Edwin would oft his flowery rhyme deface,
Through ardour to adorn.

Beattie.

So Time's strong arms with sweeping sith ebase
Art's *cumbrous* works, and empires, from their base.

Darwin.

CUMBERLAND, a county of England, situate between $2^{\circ} 13'$ and $3^{\circ} 30'$ W. long., and $54^{\circ} 6'$ and $55^{\circ} 7' N.$ lat. It is bounded on the west by the Irish sea, which washes its coasts for nearly seventy miles; on the north by the Solway frith, the river Liddal and Adrian's wall, which separate it from Scotland for thirty miles; on the south by Westmoreland and Lancashire for sixty-nine miles; and on the east by Northumberland and Durham for fifty-eight miles. Its greatest length is about seventy-three miles, but its mean extent is not more than sixty; its greatest breadth thirty-eight; and its circumference 224. Thus it includes 1516 square miles, or 970,240 acres, and of these about 312,000 comprise the mountainous districts. According to an agricultural survey, which was made in the latter end of the last century, this county was found to contain 470,000 acres of old enclosures; 150,000 of improvable common; and 8000 acres covered by lakes and waters. No county in England affords more instances of beautiful and sublime scenery than Cumberland; indeed every turn of the roads presents a new combination of the picturesque. Nature here indeed unites her most sublime with her most alluring appearances. Even the monotony of that level tract which stretches along the north and north-western borders of the county is frequently broken by the interesting scenery of the margins of the rivers. These, though very numerous, are but partially navigable; the names of the principal are, the Eden, Derwent, Esk, Eamont, Duddon, Greata, Cocker, Caldew, Irthing and Liddal; and almost every farm in the county enjoys the benefit of a clear spring. The rivers abound with salmon, trout, &c., and the smaller brooks with eels and a variety of other fish. But the chief attractions of Cumberland are its beautiful and extensive lakes. A lake poet very characteristically describes them: 'I know not,' says Mr. Wordsworth, 'how to give the reader a distinct idea of these more readily, than by requesting him to place himself with me in imagination on some given point; let it be the top of Great Garel or Scaw-fell; or rather let us suppose our station to be a cloud, hanging midway between these two mountains, at not more than half a mile's distance from the summit of each, and not many yards above their highest elevation; we shall then see stretched at our feet a number of valleys, not fewer than eight, diverging from the point on which we are supposed to stand, like the spokes from the nave of a wheel. First we note lying to the south-east the vale of Longdale, which will conduct the eye to the long lake of Windermere, stretched nearly to the sands of the vast bay of Morecomb, serving here for this imaginary wheel—let us trace it in a direction from the south-east towards the south, and we shall next fix our eyes upon the vale of Coniston, running up likewise from the sea, but, not as the other valleys do, to the nave of the wheel, and

therefore it may not be unaptly represented as a broken spoke sticking in the rim. Looking again, with an inclination towards the west, immediately at our feet lies the vale of Duddon, in which is no lake, but a winding stream among fields, rocks and mountains, and terminating its course in the sands of Duddon. The fourth vale, that of the Esk, is of the same general character as the last, yet beautifully discriminate from it by peculiar features. Its stream passes under the woody steep on which stands Muncaster castle, the ancient seat of the Penningtons; and, after forming a short and narrow estuary, enters the sea below the little town of Ravenglass. Next, almost due west, we should look down into and along the deep valley of Wastdale, with its little chapel and a few neat dwellings, scattered upon a plain of meadow and corn ground, intersected with stone walls almost imperceptible. Beyond this fertile little plain, within its bed of steep mountains, lies the long, narrow, stern, and desolate lake of Wastdale, and beyond this a dusky tract of level ground conducts the eye to the Irish Sea. The stream, issuing from Wast-water, is called the Irt, and falls into the estuary of the river Esk, Ennerdale comes next in view, with its lake of bold and somewhat savage shores. Its stream, the Ehen, or Enna, flowing through a soft and fertile country, passes the town of Egremont, and the ruins of the castle; then, seeming to break through the barrier of sand thrown up by the winds on this tempestuous coast, enters the Irish Sea. The vale of Buttermere, with the lake and village of Crummock-water beyond, next present themselves. We will now follow the main stream, the Cocker, through the fertile and beautiful vale of Lorton, till it is lost in the Derwent, below the noble ruins of Cockermouth Castle. Lastly, Borrowdale, of which the vale of Keswick is only a continuation, stretching due north, brings us to a point nearly opposite to the vale of Windermere, with which we began. From this it will appear, that the image of a wheel, thus far exact, is little more than one-half complete; but the deficiency on the eastern side may be supplied by the vales of Wytheburn, Uls-water, Haws-water, Crasmere, and Rydal; none of these, however, run up to the central point between Great Garel and Scaw-fell. From this, hitherto our central point, if we take a flight, not more than three or four miles eastward, to the ridge of Helnelyn, we shall look down upon Wytheburn and St. John's vale, a branch of the vale of Keswick. Upon Uls-water, stretching due east, and not far beyond to the south-east, though from this point not visible, lie the vale and lake of Haws-water, and lastly the vales Crasmere, Rydal, and Ambleside, bring you back to Windermere; thus completing, though on the eastern side in a somewhat irregular manner, the representative figure of a wheel.'

Besides the lakes mentioned above there are several others; and a multitude of taras. The only difference between a tara and a lake is, that the former is smaller or found in a circular recess. The loftiest of the English Appenines, which extend from Derbyshire to Linlithgow, separate the eastern from the western coasts, and bound the east side of this county. The mountains of

Cross-fell, Geltsdale forest, Spariadam Waste, and Hartside-fell, abound in limestone, slate, sandstone, clay, coal, and lead ore; but are no ways remarkable for their general appearance. The other range occupies the south-western part of the county; the majesty and grandeur of these mountains, some of them towering from 1100 to 3166 feet above the level of the sea, form the most striking features in the romantic scenery of the lakes. The valley bounded by this range, and extending from the Solway frith to Westmoreland, abounds with strata of red sandstone, mixed with beds of limestone, sandstone, coal, &c.

This county is rich, therefore, in mineral productions, the principal of which are, coal, lime, lead ore, black lead, copper, gypsum, lapis calaminaris, and excellent slate. Its copper-mines were formerly very productive, but of late years have sunk into neglect. The chief lead-mines are situate in Aldston Muir. This muir was vested in the hands of the commissioners and governors of Greenwich Hospital on the attainer of James, earl of Derwentwater (who was lord of the manor) in the year 1715. The number of mines in course of working and belonging to the hospital, in 1814, was 102, and the annual produce amounts to 4598 tons. On the eastern side of a mountain at the head of Borrowdale, the celebrated mines of black lead are situate: from the produce of these mines black lead pencils are made, known in France by the name of crayon d'Angleterre; these mines, however, are only opened occasionally to answer the demand, the quantity annually sold not amounting to more in value than £3000. The appearance of the mountains on which these mines are found, is excessively desolate and waste; the horrid projections of the vast promontories, the vicinity of the clouds, the thundering explosions in the mines and quarries, and their total nudity, inspiring the beholder with the idea that he is surveying the ruins of a world which he has survived. The principal coal-mines in the county are situated in the neighbourhood of Workington and Whitehaven. From the former place upwards of 300 tons are shipped every day: there are sixteen mines from forty to ninety fathoms deep. The collieries near Whitehaven are perhaps the most astonishing of any in the world. These mines are sunk to the depth of 130 fathoms, and extend under the sea, sufficient depth of water to bear the largest ships rolling over them. A steep descent leads down to the lowest vein of coal, through long galleries hewn out of the solid rock. Of its limestone, which abounds in various parts, nearly 700,000 bushels are yearly exported to Scotland. Its export of coal, which is sent principally to Scotland and Ireland, is said to amount to about 90,000 chaldrons.

The height of its mountains, and the great extent of its sea-coast, render the climate of Cumberland extremely variable. In the valleys, and low grounds, the snow seldom lies for more than twenty-four hours, whilst on the mountains it continues for six or eight months. Thus the lower parts of the county are mild and temperate, whilst the more elevated are extremely

severe. This county is also subject to heavy falls of rain, especially during the autumnal months, which render the harvest very precarious. Yet, as a proof of the general salubrity of the air, it may be stated, that no county in England affords more instances of remarkable longevity. The soil may be classed under the four following heads:—1. Rich loam and fertile clays, which extend over a very small portion of the county; 2. Dry loams, including the various degrees from bright brown loam to the light sandy soil which extend over the lower districts and the sides of some of the mountains; 3. Black peat earth; and 4. Wet loams. Till latterly the Cumberland farmers attended rather to grazing than tillage; since the recent enclosure of 200,000 acres, however, considerable quantities of flour, oatmeal, &c., are exported. Cranberries are so plentiful in this county as to furnish an important branch of the export trade. The only fish exported hence are, cured cod for the Liverpool market, and salmon and potted shad for London. The principal manufactures of this county are calicoes, corduroys, ginghams, and various kinds of cotton goods; carpets, sail-cloth, paper, glass bottles, and pottery. Cumberland is deficient in harbours; its commerce, however, is rapidly improving, upwards of 300 vessels, from sixty to 120 tons burden, being employed in the coast trade alone. The chief ports are Workington, Whitehaven, Harrington, and Maryport.

Cumberland is divided into five wards, or hundreds, and 104 parishes. It contains one city, and eighteen market towns. Its only boroughs are Carlisle and Cockermouth. The city of Carlisle is beautifully situate in a forest near the confluence of the rivers Eden and Caldew. It is of very ancient date, and abounds with good buildings. Its distance from London is 306 miles. This city confers the title of earl on the Howard family; Whitehaven that of viscount and baron to the Lowthers. The village of Ellenborough gives the same to the Law family. Cumberland sends six members to parliament; two for the county, two for the city of Carlisle, and two for the borough of Cockermouth.

Its most interesting antiquities are a perfect Druidical circle, called by the country people Long Meg and her daughters, and the celebrated Picts' wall. The first of these is situated about two miles and a half distant from the village of Salkeld; it consists of a circle, about eighty yards in diameter, formed of sixty-seven rude, unhewn, and massy stones. What renders this vestige of the 'olden time' more astonishing, is the circumstance that no quarry of stone, similar to that of which it is constructed, is found within a great distance of this place, and how such immense masses could be moved is not easily determined when we reflect on the low state of mechanical knowledge in early ages. The celebrated Roman wall, begun by Adrian and repaired and rebuilt by Severus, extended from Tinemouth in Northumberland, to Solway frith in this county, dividing the kingdom from sea to sea. Its remains may easily be traced for upwards of seventy miles, in some places still entire to the height of five feet, and in others to the height of eight feet.

Cumberland derives its name from the Cimbri, or Cumbri, the aboriginal inhabitants. Ptolemy, however, calls the inhabitants of this county, in common with those of Yorkshire, Lancashire, Westmoreland, and Durham, Brigantes. They are supposed not to have been conquered by the Romans till the time of Vespasian, from which period their country was the constant residence of several Roman legions. When the Saxons subdued the Roman power, in Britain, Cumberland became part of the kingdom of Northumberland, and was then first called Lumbra-land or Lumer-land, the land or country of the Cumbri. From the time when the Danes broke the power of the Saxons, until 946, this country had petty kings of its own. About this time, however, Edmund, brother to king Ethelstane, in conjunction with Leontine king of South Wales, overran the country and, having subdued the inhabitants, granted it to Malcolm, king of Scotland, upon condition that he should defend the northern parts of England against all invaders. It was by virtue of this grant that the eldest sons of the Scottish kings were styled governors of Cumberland. The Saxons, subsequently to this, again reduced it under their government; but, at the time of the Norman conquest, it was so much impoverished that William the Conqueror remitted all its taxes. From this circumstance Cumberland is not rated in Domesday Book, as all the other counties of England are.

CUMBERLAND, a county of North America, in New Brunswick, which comprehends the lands at the head of the bay of Fundy, on the basin called Chebecton, and the rivers which fall into it. It has several settled townships; as Cumberland, Sackville, Amherst, Hillsborough, and Hopewell; and is watered by the rivers Au Lac, Missiquash, Napan, Macon, Memramcook, Petcouidia, Chepodie, and Herbert.

CUMBERLAND, a county of the United States, in the district of Maine, between York and Lincoln counties. It has the Atlantic ocean on the south, and Canada on the north. Its sea coast, formed into numerous bays and lined with a multitude of fruitful islands, is nearly forty miles in extent in a straight line. Cumberland is divided into twenty-four townships, of which Portland is the chief.

CUMBERLAND, a county of the United States, in New Jersey, bounded on the south by Delaware Bay, on the north by Gloucester county, on the south-east by Cape May, and on the west by Salem county. Fairfield and Greenwich are the chief townships.

CUMBERLAND, a mountainous county of Pennsylvania, bounded on the north and north-west by Millin; on the east and north-east by the Susquehanna, which divides it from Dauphin; or the south by York, and on the south-west by Franklin county. It is forty-seven miles in length and forty-two in breadth, and has ten townships, of which Carlisle is the chief.

CUMBERLAND, a county of Virginia, on the north side of Appamatox River, which divides it from Prince Edward.

CUMBERLAND, a county of North Carolina, in Fayette district, containing, in 1816, 9382 inhabitants.

CUMBERLAND, a considerable fort of North America in New Brunswick, at the head of the bay of Fundy, on the east side of the northern branch.

CUMBERLAND, a harbour on the east side of Washington's Isles, on the north-west coast of North America. It lies south of Skittikiss, and north of Cummasawaa.—Also a bay on the south-east coast of the island of Cuba.

CUMBERLAND, an island and bay of the United States, on the coast of Camden county, Georgia, twenty miles south of the town of Frederica.

CUMBERLAND ISLANDS, a cluster of islands so called by captain Cook, in 1770, and situated near the north-east coast of New Holland. They form a passage, called, from the day of its discovery, Whitsunday Passage; in long. 211° 28' W., lat. 20° 36' S.

CUMBERLAND MOUNTAINS, a ridge of mountains in North America, about thirty miles broad, which extend from the Tennessee River, and join the Allegany Mountains in Virginia.

CUMBERLAND RIVER, a river of North America, rising in the Cumberland Mountains on the western borders of Virginia, and falling, after a course of 450 miles, into the Ohio, ten miles above the mouth of the Tennessee. It is navigable for loaded batteaux 800 miles without interruption, and at its mouth is 300 yards wide.

CUMBERLAND STRAIT, a strait in the North Sea, west of Davis's Straits, beginning in long. 65° 30' W., lat. 63° 35' N.

CUMBERLAND (Richard), D.D., a learned divine of the seventeenth century, was the son of a citizen of London, and educated at Cambridge. In 1672 he published his excellent Treatise of the Laws of Nature; and in 1685 An Essay upon the Jewish Weights and Measures. After the Revolution he was nominated by king William to the bishopric of Peterborough. At the age of eighty-three he applied himself to the study of the Coptic language, of which he made himself master. He was as remarkable for humility as for his extensive learning. He died in 1718, aged eighty-seven.

CUMBERLAND (Richard), a celebrated dramatic and miscellaneous writer, was born in 1732, in the master's lodge of Trinity College, Cambridge, under the roof of his grandfather Dr. Bentley. When about six years of age he was sent to the school of Bury St. Edmunds, where, at twelve years old, he produced a dramatic piece of some merit entitled Shakspeare in the Shades. He was next sent to Westminster, and at the age of fourteen removed to Trinity College, under the care of Dr. Morgan; who, however, entirely neglected him, as did also his second tutor, Dr. Philip Young. But Dr. Smith succeeding Dr. Bentley shortly after, and finding the little progress he had made, excited him to industry, and so far succeeded that young Cumberland soon obtained a bachelor's degree. A fellowship next presented itself to his hopes; but he was induced to decline it for the time, by a prospect of preferment which was offered him by lord Halifax, to become his private secretary in the colonial office. Here he found leisure to prosecute his academical studies with so much success, that, in the first recess after coming to town, he

repaired to Cambridge, and gained his college honors in competition with candidates of older standing. From his official services, which were never burdensome, he was, soon after the settlement of his father at Fulham, entirely released by the resignation of his patron. At the beginning of the reign of George III. brighter days of official dignity opened upon lord Halifax; and the beams of royal favor which shone upon the patron were as usual reflected upon his satellites. His lordship was appointed to the high office of representing Majesty in Ireland, and was required to open the king's first parliament in that kingdom. Now our author anticipated a reward for his long and faithful services, and that his golden dreams of advancement would be realised. He had adhered to the new lord-lieutenant when in an office of less importance, and when in no office at all; and hoped in return for the post of chief secretary. He was, however, obliged to content himself with the secondary post of Ulster-secretary; Single-Speech Hamilton, without the lord-lieutenant's interference or concurrence, having been appointed to the higher dignity. After remaining in this situation for some time, he returned from Ireland, and as the final reward for his long services, was appointed to £200 a year from the crown agency of Nova Scotia. Some benefit, however, accrued to his father from this Irish expedition, as he was soon after our author's return nominated bishop of Clonfert. The son now returned to his old office in the board of trade, and began to write for the theatre. His first attempt which met with approbation was a musical drama, in three acts, entitled *The Summer's Tale*. In the following winter he brought out the comedy of the Brothers at Covent Garden theatre; and its success encouraged him to proceed in a career thus auspiciously commenced. The *West Indian*, the most popular of all his plays, was the next offering he made to the stage. It was represented for twenty-eight successive nights to crowded houses, without an after-piece; and, when published, 12,000 copies of it were sold. To this succeeded the *Fashionable Lover*; a performance which he seems inclined himself to rate higher, in many respects, than the one which gave him such celebrity. It is needless to add that the public were of a different opinion. The comedy of the *Choleric Man* was brought forward soon afterwards, and was honored with a prologue by Garrick. In the meantime lord George Germain became chancellor of the board of trade, and by his influence, upon the resignation of Mr. Pownall, Cumberland was advanced to the post of chief secretary, which very considerably increased his income. In 1780 he went on a mission to Lisbon and Madrid, but was recalled the year following, having, as was said, exceeded his powers. He was also deprived of his situation at the board of trade, and from this time his circumstances were much embarrassed. He retired to Tunbridge Wells, where losing his wife, he came to London, and died at the house of Mr. Henry Fry, in Bedford Place, Russel Square, at the advanced age of nearly eighty. He was interred in Poets' Corner, Westminster Abbey, between the monuments of Dryden and Addison. He wrote, besides his

comedies above mentioned, a periodical work, entitled the *Observer*; *Memoirs of his own Life*; *Calvary*, and the *Exodiad*, epic poems; *Retrospection*, a poem; and some sermons, novels, &c.

CUMBRAY, GREAT, a small island on the Scottish coast, in the frith of Clyde, annexed to the county of Bute. It is separated from Little Cumbray by a strait three-fourths of a mile broad. Its length is two miles and a half, and breadth one and a half; its surface containing about 2500 acres, which produce grain, turnips and potatoes. There are few trees on the island, but abundance of freestone and limestone, the former of which is exported. On the east side are two remarkable basaltic rocks, called *Reppel Walls*, having seams like those of Staffa, but not columnar. Milnport, on the south-west shore, has safe anchorage, and a small manufacture of thread and coarse linens is carried on in the village.

CUMBRAY, LITTLE, also annexed to the county of Bute, contains a light-house, and on the south side the remains of an ancient castle, surmounted by a ditch and rampart. Here are also some singular caves. The floor of one of them is thirty-two feet square, and six feet in height; and the largest penetrates so far that it has never yet been explored. The general appearance of the islands is also remarkable; they are nearly horizontal, and rise above one another like stairs as they recede from the shore.

CUMFREY, *n. s.* A medicinal plant.

CUMIN, *n. s.* Lat. *cuminum*. A plant.

Rank smelling rue, and *cumin*, good for eyes.

Spenser. Muiputnos.

When a dove-house is empty, there is *cumin*-seed used to purloin from the neighbours.

Beaumont and Fletcher.

CUMIN, in botany. See **CUMINUM**.

CUMINUM, *cuminum*, a genus of the digynia order, and pentandria class of plants; natural order forty-fifth, umbellatae. The fruit is ovate and striated; there are four partial umbels, and the involucre are quadrifid. There is but one species, viz. *C. cyminum*, an annual plant, perishing soon after the seed is ripe. It rises nine or ten inches in the warm countries where it is cultivated, but seldom rises above four in this country. The leaves are a deep green, divided into long narrow segments, like those of fennel, but much smaller, and generally turned backward at their extremity; the flowers grow in small umbels at the top of the stalks; they are composed of five unequal petals, of a pale bluish color, which are succeeded by long, channeled, aromatic seeds.

CUMLY, a small maritime district of the province of Malabar, in Southern India, situated between the twelfth and thirteenth degrees of north latitude. It was formerly subject to a rajah of the Klutrix tribe, who adopted the Nair custom of preferring to the succession the son of the eldest daughter.

CUMLY, the capital, is a small place, inhabited by Hindoos and Mahomedans, and very pleasantly situated between two rivers. Here the rajah still resides, but possesses no power.

CUMMAZEE, or **COOMASSIE**, a large town and district of Western Africa, the capital of the Ashantee territory. It has been made known to

Europeans, only by a British mission sent some few years ago from Cape Coast Castle, and of the results of which we have given an account in the article *ASIANTEE*, which see.

CUMULATE, *v. a.* } Lat. *cumulus*. To
CUMULATION, *n. s.* } heap or pile together;
CUMULATIVE, *adj.* } the act of heaping to-
 gether. Consisting of parts heaped together.

For *cumulation*, I must confess I never liked it.

Abp. Laud.

A man that beholds the mighty shoals of shells, bedded and *cumulated*, heap upon heap amongst earth, will scarcely conceive which way these could ever live.

Woodward.

CUN, *v. a.* Ice. *kunna*; Goth. *kunnan*. To have knowledge of; to learn thoroughly; to direct the course of a ship. See *COND* and *CUND*.

CUNCTATION, *n. s.* } Lat. *cunctatio*. De-
CUNCTATOR, *n. s.* } lay; procrastination.
 One who has a habit of procrastinating; an idler; a sluggard.

It is most certain, that the English made not their best improvements of these fortunate events; and that especially by two miserable errors, *cunctation* in prosecuting, and haste in departure.

Hayward.

The swiftest animal, conjoined with a heavy body, implies that common moral, *festina lentè*; and that celerity should always be contempered with *cunctation*.

Browne.

Others, being unwilling to discourage such *cunctators*, always keep them up in good hope, that, if they are not yet called, they may yet, with the thief, be brought in at the last hour.

Hammou's Fundamentals.

To *CUND*, *v. n.* Dut *konnen*, to know. To give notice; a provincial or obsolete word. See *COND*.

They are directed by a balker or huer on the cliff, who, discerning the course of the pilchard, *cundeth*, as they call it, the master of each boat.

Carew's Survey of Cornwall.

CUNNEAL, *adj.* } Lat. *cuneus*. Relating
CUNNEATED, *adj.* } to a wedge; of a wedge-
CUNNEIFORM, *adj.* } like form.

CUNEIFORM BONES, *n. s.* The fourth, fifth, and sixth bones of the foot; thus called from their wedge-like shape, being large above and narrow below.

CUNEUS, in antiquity, a company of infantry drawn up in form of a wedge, the better to break through the enemy's ranks.

CUNICULUS, in mining, a term used by authors in distinction from *puteus*, to express the several sorts of passages and cuts in these subterranean works. The *cuniculi* are those direct passages in mines where they walk on horizontally; but the *putei* are the perpendicular cuts or descents. The miners in Germany call these by the names *stollen*, and *schachts*; the first word expressing the horizontal, and the second the perpendicular cuts.

CUNILA, in botany, a genus of the monogynia order, and monandria class of plants; natural order forty-second, verticillata: cor. ringent, upper lip erect and plain; there are two filaments, castrated, or wanting antheræ: SEEDS four. There are five species, none of which has any remarkable property.

CUNITZ (Mary), a lady of considerable genius of the sixteenth century, was born in Silesia. She acquired languages with amazing facility; and understood Polish, German, French, Italian, Latin, Greek, and Hebrew. She attained a knowledge of the sciences with equal ease; and was skilled in history, anatomy, and the fine arts. She more particularly applied herself to the mathematics, and was ranked amongst the most able astronomers of her time. Her Astronomical Tables acquired her great reputation: she printed them in Latin and German, and dedicated them to the emperor Ferdinand III. She married Elias de Lewin, M.D., and died at Pistehen in 1604.

CUNNER, *n. s.* Lepas. A kind of fish less than an oyster, that sticks close to the rocks.

CUNNING, *n. s. & adj.* } Goth. *kunnan*;
CUNNINGLY, *adv.* } Ang.-Sax. *connan*;
CUNNINGNESS, *n. s.* } Dut. *konnen*. These
CUNNINGMAN, *n. s.* } words are among

those of our language which have gradually lost their good meaning, and acquired, or been confined to, a bad one. Anciently *cunning*, though also used in a sinister sense, was more frequently indicative of something praiseworthy. It implied superior skill; knowledge; proficiency in any thing; and in these meanings its derivatives, of course, participated. Now, this use of the word is nearly, if not quite, disused; and *cunning* denotes artifice; deceit; slyness; dissimulation; fraudulent dexterity; something meanly deceptious. *Cunning* is the vice and resource of a mean and dastardly mind. A *cunning-man* is a fortune-teller; one who deludes the vulgar by pretending to a knowledge of the future.

Send me now therefore a man *cunning* to work in gold and in silver, and that can skill to cut and to grave.

2 *Chronicles.*

If I forget thee, O Jerusalem, let my right hand forget her *cunning*.

Psalms cxxxvii. 5.

For wondir thin; it semith me,
 Thus many fresh ladies to se
 So faire, so *cunning*, and so yong,
 And no man dwelling them among.

Chaucer's Dreame.

The queene her self full *cunningly*,
 With soite wordis in gode wise,
 Said to the ladis yong and wise.

Id.

The Memphite Zoroas, a *cunning* clerke,
 To whom the heaven lay open as his booke.

Songes and Sonnettes.

And there beside of marble stone was built
 An altar, carved with *cunning* imagery;
 On which true Christians' blood was often spilt,
 And holy martyrs often done to die.

Spenser. Faerie Queene.

Faire Venus' sonne, that with thy cruell dart
 At that good knight so *cunningly* didst rove,
 That glorious fire it kindled in his heart.

Id.

The more he protested, the more his father thought
 He dissembled, accounting his integrity to be but a
cunning face of falsehood,

Sidney.

What if I be not so much the poet, as even that
 miserable subject of his *cunning*, whereof you speak?

Id.

Schoolmasters will I keep within my house,
 Fit to instruct her youth,—To *cunning* men
 I will be very kind; and liberal
 To mine own children, in good bringing up,

Shakspeare.

Wherein is he good, but to taste sack and drink it ?
Wherein *cunning*, but in craft ? Wherein crafty, but
in villainy ? *Id. Henry IV.*

I do present you with a man of mine,
Cunning in musick and the mathematicks,
To instruct her fully in those sciences. *Shakspeare.*

Once put out thy light,
Thou *cunning'st* pattern of excellent nature,
I know not where is that Promethean heat,
That can thy light relumine. *Id. Othello.*

We take *cunning* for a sinister or crooked wisdom ;
and certainly there is a great difference between a
cunning man and a wise man, not only in point of
honesty, but in point of ability. *Bacon.*

These small wares and petty points of *cunning*
are infinite, and it were a good deed to make a
list of them ; for nothing doth more hurt than that
cunning men pass for wise. *Id.*

Amongst other crimes of this nature, there was diligent
enquiry made of such as had raised and dispersed
a bruit and rumour, a little before the field
fought, that the rebels had the day, and that the
king's army was overthrown, and the king fled ;
whereby it was supposed, that many succours were
cunningly put off and kept back. *Id. Henry VII.*

I must meet my danger, and destroy him first ;
But *cunningly* and closely. *Denham's Sophy.*

He sent him for a strong detachment
Of beadle, constable, and watchmen,
T' attack the *cunningman* for plunder
Committed falsely on his lumber. *Hudibras.*

Discourage *cunning* in a child ; *cunning* is the ape of
wisdom. *Locke.*

Or if confidence or *cunning* come once to mix with
vice, and support his miscarriages, he is only the surer
lost,—and you must undo again, and strip him of that
he has got from his companions, or give him up to ruin.
Id.

Men will leave truth and misery to such as love it ;
they are resolved to be *cunning* : let others run the
hazard of being sincere. *South.*

When Pedro does the lute command,
She guides the *cunning* artist's hand. *Prior.*

When stock is high, they come between
Making by second-hand their offers ;
Then *cunningly* retire unseen,
With each a million in his coffers. *Swift.*

A proper secrecy is the only mystery of able men ;
mystery is the only secrecy of weak and *cunning* ones.
Chesterfield.

Such fate to suffering worth is given,
Who long with wants and woes has striven,
By human pride or *cunning* driven
To misery's brink,
Till wrenched of every stay but Heaven,
He, ruined sink ! *Burns.*

ANT. Hark ye, Isaac, do you dare to complain of
tricking ?—Don Jerome, I give you my word, this
cunning Portuguese has brought all this upon himself,
by endeavouring to overreach you, by getting your
daughter's fortune without making any settlement in
return. *Sheridan.*

Oh ! she was perfect past all parallel—
Of any modern female saints comparison ;
So far above the *cunning* powers of hell,
Her guardian angel had given up his garrison :
Even her minutest motions went as well
As those of the best time-piece made by Harrison.
Byron. Don Juan.

CUNNINGHAM (Alexander), a Scotch
writer of some celebrity, was born about the
year 1654. His father was minister at Ettrick,
in Selkirkshire. He was educated in Holland,
where he lived amongst the English and Scottish
refugees before the Revolution, particularly with
the earls of Argyle and Sunderland. He came over
to England with the prince of Orange, and enjoyed
the confidence and intimacy of many leading men
of that period. He was travelling companion and
tutor ; first to the earl of Hyndford, and his
brother ; then to John lord Lorne, afterwards
duke of Argyle ; and afterwards to lord viscount
Lonsdale. Sir Robert Walpole, on the accession
of George I., sent him as British envoy to the
republic of Venice, where he continued till
1720, when he returned, and died in London
1737. His History of Great Britain, from the
Revolution of 1688 to the accession of George
I., was published in two vols. 4to. in 1787. It
was written in Latin, but translated into English
by the Rev. William Thompson, LL.D.

CUNNINGHAM (John), an ingenious English
poet, was born in 1729 at Dublin, and educated at
Drogheda. At the age of seventeen he wrote a
farce, called *Love in a Mist*, on which Garrick
founded the *Lying Valet*. His success made him
so attached to the theatre that he now commenced
performer, and entered into various companies
of strolling players in England. In 1761 he
produced, at Edinburgh, his *Elegy on a Pile of
Ruins* ; and, in 1762, published *The Contem-
platist*. This was succeeded by *Fortune*, an
Apologue, which contains many poetical beauties ;
and the following year he published a
volume of his poems by subscription. He con-
tinued earning a scanty subsistence in his pro-
fession, until his death, which took place in 1773
at Newcastle-upon-Tyne. His *Landscape* is con-
sidered beautifully descriptive.

CUNOCEPHALI, in mythology, from *κυνω*,
dog, and *κεφαλη*, head, a kind of baboons, or ani-
mals with heads like those of dogs, which were
wonderfully endowed, and were preserved with
great veneration by the Egyptians in many of
their temples. It is fabled that, by their assistance,
the Egyptians found out the particular periods
of the sun and moon ; that one-half of the animal
was often buried, while the other half survived ;
and that they could read and write !

CUNODONTES, a people mentioned by
Solinus and Isidorus, and by them supposed to
have had the teeth of dogs. They were probably
denominated, says Bryant, from the object of
their worship, the deity Chan-Adon, which the
Greeks expressed *Κυνοδον*, and thence called his
votaries *Cunodontes*.

CUNONIA, in botany, a genus of the digy-
nia order, and decandria class of plants : cor.
pentapetalous : cal. pentaphyllous : cap. bilo-
cular, acuminate, polyspermous ; the styles
longer than the flower. Species, one only, a
Cape shrub.

CUP, *v. a. & n. s.* } Fr. *coupe* ; It. *coppa* ;
CU'PBEARER, *n. s.* } Sp. *copa* ; Ang.-Sax.
CU'PBOARD, *v. a. & n. s.* } *cupp* ; Welsh *cup* ;
CU'PPER, *n. s.* } Dut. *kop* ; Isl. *kupp* ;
CU'PPING-GLASS. } Per. *kub, kubba* ; *κὺβ-*
βα. To cup is, to supply with cups, but this

meaning is disused; to fix a cupping glass on the skin, for the purpose of extracting blood. Johnson derives the verb, in the latter sense, from Fr. *couper*, to cut; but it seems rather to have its origin in the shape of the glass which is employed. Cup is, primarily, a small vessel to drink out of; thence, the liquor drank from it; a social entertainment, in which case the plural only is used; anything cup-like; a glass to draw blood. Cup and can signify familiar companions, the cup being the necessary associate of the can. Cupper is one who performs the operation of cupping. Cupbearer is, an officer of the king's household; the attendant who carries round the cup to the guests at a feast. A cupboard is a case with shelves; and to cupboard is, to store in a cupboard; to treasure up.

Thou shalt deliver Pharaoh's *cup* into his hand,
after the former manner when thou wast his butler.

Genesis.

Hire over lippe wiped she so clene,
That in her *cuppe* was no ferthing sene
Of grese when she dronken hadde hire draught.

Chaucer. Prot. to Cant. Tales.

Pipen he coude, and fishe, and nettes bete,
And turnen *cuppes*, and wrastlen wel and shete.

Chaucer. Cant. Tales.

His drinke the running streame: his *cup* the bare
Of his palve closed: his bed the hard colde ground.

Sackville.

Which when the vile enchantress perceived,
With *cup* thus charmed imparting she deceived.

Spenser.

Plumpy Bacchus, with pink eyne,
In thy vats our cares be drowned;
With thy grapes our hairs be crowned!
Cup us, till the world go round.

Shakspeare. Antony and Cleopatra.

Will 't please your lordship, drink a *cup* of sack?

Shakspeare. Henry IV.

Then shall our names,
Familiar in their mouth as household words,
Be in their flowing *cups* freshly remembered.

Id. Henry V.

The belly did remain
I' the midst o' the body, idle and unactive,
Still *cupboarding* the viand, never bearing
Like labour with the rest.

Id. Coriolanus.

It was near a miracle to see an old man silent,
since talking is the disease of age; but, amongst
cups, makes fully a wonder. *Ben Jonson's Discoveries.*

Homer, to whom the Muses did carouse

A great deep *cup* with heavenly nectar filled
The greatest deepest *cup* in Jove's great house.

Some trees are best for planchers, as deal; some
for tables, *cupboards*, and desks, as walnut.

Bacon's Natural History.

They that never had the use
Of the grape's surprising juice,
To the first delicious *cup*
All their reason render up.

Wallcr.

Amidst his *cups* with fainting shivering seized,
His limbs disjointed, and all o'er diseased,
His hand refuses to sustain the bowl.

Dryden's Persius.

Codrus had but one bed; so short, to boot,
That his short wife's short legs hung dangling out:
His *cupboard's* head six earthen pitchers graced,
Beneath them was his trusty tankard placed.

Id. Juvenal.

The clotted blood lies heavy on his heart,
Corrupts, and there remains in spite of art;
Nor breathing veins, nor *cupping* will prevail;
All outward remedies and inward fail.

Id. Fables.

A bubo, in this case, ought to be drawn outward
by *cupping-glasses*, and brought to suppuration.

Wiseman.

You have quartered all the foul language upon me,
that could be raked out of the air of Billingsgate,
without knowing who I am, or whether I deserve to
be *cupped* and sacrificed at this rate.

Spectator.

The best, the dearest favourite of the sky
Must taste that *cup*; for man is born to die.

Pope's Odyssey.

Hippocrates tells you, that in applying of *cups*, the
scarification ought to be made with crooked instru-
ments.

Arbutnot.

There is conveyed to Mr. Villiers an intimation of
the king's pleasure to wait and to be sworn his ser-
vant, and shortly after his *cupbearer* at large; and
the summer following he was admitted in ordinary.

Wotton.

Ye heavenly powers, that guard
The British isles, such dire events remove
Far from fair Albion; nor let civil broils
Ferment from social *cups*.

Philips.

You boasting tell us where you dined,

And how his lordship was so kind;

Swear he's a most facetious man;

That you and he are *cup* and can:

You travel with a heavy load,

And quite mistake preferment's road.

Swift.

Yet their wine and their victuals these curmud-
geon-Jubbards

Lock up from my sight, in cellars and *cupboards*.

Id.

Now stir the fire, and close the shutters fast,

Let fall the curtains, wheel the sofa round,

And, while the bubbling and loud hissing urn

Throws up a steamy column, and the *cups*,

That cheer but not inebriate, wait on each,

So let us welcome peaceful evening in.

Cowper.

Each widening scale and bursting film unfold,

Swell the green *cup* and tint the flower with gold.

Darwin.

Or conjures up aerial forms

To marshal all the fairy swarms

That quaff their acorn *cups*, and sing

And frisk, and dance in sportive ring,

Tinging, where'er their tracks are seen,

The circled sward with richer green.

Huddesford.

The virgin Nine in terror fly the bower,

And matron Juno claims despotic power;

Soon Gothic hags the classic pile o'erturn,

A candle *cup* supplants the sacred urn.

Sheridan.

A land of slaves shall ne'er be mine—

Dash down you *cup* of Samian wine!

Byron. Don Juan.

And with a stretch attaining

A certain press or *cupboard* niched in yonder,

In that remote recess which you may see—

Or if you don't the fault is not in me.

Id.

CUP, in botany, calyx. See BOTANY.

CUPANIA, in botany, a genus of the mono-
delphia order, and monoclea class of plants;
natural order forty-eighth, tricoecae. Male, CAL.
tryphyllous: cor. pentapetalous; stamina five.
Female, CAL. triphyllous: cor. tripetalous; the
style trifid: SEEDS two. There is but one spe-
cies, a native of America, which possesses no
remarkable property.

CUPAR OF FIFE, a royal borough in the
centre of a parish of that name, beautifully si-

tuated on the north bank of the Eden, on the spot where it joins the water of St. Mary. It boasts of very high antiquity. The Thanes of Fife, from the earliest times of which we have any account, held their courts in it. It is governed by a provost, three baillies, a dean of guild, and thirteen counsellors, who choose one, with eight deacons, who are elected by the incorporations. Here is an excellent grammar-school. In conjunction with Perth, Dundee, St. Andrew's, and Forfar: it sends a representative to parliament. It is a well-built town; and a considerable manufacture of coarse linen is carried on in the neighbourhood. It is eight miles north by east of Falkland, and seven south of Dundee.

CUPEL, in metallurgy, a small vessel, which absorbs metallic bodies when changed by fire into a fluid scoria; but retains them as long as they continue in their metallic state. One of the most proper materials for making a vessel of this kind is the ashes of animal bones; there is scarcely any other substance which so strongly resists vehement fire, which so readily imbibes metallic scoria, and which is so little disposed to be vitrified by them. The bones, burnt to perfect whiteness, so that no particle of coaly or inflammable matter may remain in them, and well washed from filth, are ground into moderately fine powder; which, to form into cupels, is moistened with just as much water as is sufficient to make it hold together, when strongly pressed between the fingers. The cupel is formed in a brass ring, from three-quarters of an inch to two inches diameter, and not quite so deep: the ring being filled with moistened powder, which is pressed close with the fingers, a round-faced pestle, called a monk, is struck down into it with blows of a mallet, by which the mass is made to cohere, and rendered sufficiently compact, and a shallow cavity is formed in the middle. The figure of the cavity is nearly spherical, that a small quantity of metal melted in it may run together into a bead. To make the cavity the smoother, a little of the same ashes levigated into an impalpable powder, and not moistened, is commonly sprinkled on the surface, through a small fine sieve made for this purpose, and the monk again struck down upon it. The ring or mould is a little narrower at bottom than at top; so that by pressing down on some of the dry powder spread upon a table, the cupel is loosened, and forced upwards a little; after which it is easily pushed out with the finger, and is then set to dry in a warm place, free from dust. See ASSAYING.

CUP-GALLS, in natural history, a name given by authors to a very singular kind of galls found on the leaves of the oak and some other trees. They are of the figure of a cup or drinking-glass, without its foot, being regular cones adhering by their point or apex to the leaf; and the top or broad part is hollowed a little way, so that it appears like a drinking-glass with a cover, made so small as not to close it at the mouth, but fall a little way into it. This cover is flat, and has in the centre a very small green protuberance; the rim round the top is of a scarlet color, and very beautiful. Besides this

species of gall, oak-leaves furnish several others, some of which are oblong, some round, and others flattened. They all contain the worm of some small fly; and this creature passes all its chances in this habitation, being sometimes found in the worm, sometimes in the nymph, and sometimes in the fly state.

CUPID, in pagan mythology, the god of love. There were two cupids; one the son of Jupiter and Venus, whose delight it was to raise sentiments of love and virtue; and the other the son of Mars and the same goddess, who inspired base and impure desires. The first of these, called eros, or true love, bore golden arrows, which caused real joy, and a virtuous affection; the other, called anteros, had leaden arrows, that raised a passion founded only on desire, which ended in satiety and disgust. Cupid was always drawn with wings, to represent his inconstancy; and naked, to show that he has nothing of his own. He was painted blind, to denote that love sees no fault in the object beloved; and with a bow and quiver of arrows, to show his power over the mind. Sometimes he is placed between Hercules and Mercury, to show the prevalence of eloquence and valor in love; and at others is placed near Fortune, to signify that the success of lovers depends on that inconstant goddess. Sometimes he is represented with a helmet on his head and a spear on his shoulder, to signify that love disarms the fiercest men; he rides upon the backs of panthers and lions, and uses their manes for a bridle, to denote that love tames the most savage beasts. He is likewise pictured riding upon a dolphin, to signify that his empire extends over the sea no less than the land.

CUPPIDITY, *n. s.* Fr. *cupidité*; Lat. *cupiditas*. Concupiscence; unlawful or unreasonable longing.

This sharpens the curiosity, while he suggesteth the *cupidity*. *Ed. Montague.*

CUPOLA, *n. s.* } Fr. *cupole*; Ital. *cupola*.

CUPOLAE, *adj.* } A dome; the semi-globe which crowns a building. Having a cupola.

Cupolaed, compassed with walls, and open to the air.

Sir T. Herbert.

Nature seems to have designed the head as the *cupola* to the most glorious of her works; and when we load it with supernumerary ornaments, we destroy the symmetry of the human figure.

Addison's Spectator.

CUPPEL, *n. s.* See COPPEL.

There be other bodies fixed, as we see in the stuff whereof *cuppels* are made, which they put into furnaces, upon which fire worketh not.

Bacon's Natural History.

CUPREOUS, *adj.* Lat. *cupreus*. Coppery; consisting of copper.

Having by the intervention of a little sal ammoniac made copper inflammable, I took some small grains and put them under the wick of a burning candle, whereby they were with the melted tallow so kindled, that the green, not blue, flame of the *cupreous* body did burn. *Boyle.*

Hard dies of steel the *cupreous* circles stamp.

And with quick fall his massy hammers stamp.

The Harp, the Lily, and the Lion, join,

And George and Britain guard the sterling coin.

Darwin.

The stalactites formed on the roofs of caverns are often coloured in concentric strata, by their coats being spread over each other at different times; and some of them, as the *cupreous* ones, possess great beauty. *Id.*

CUPREOUS STONES are the turquoise and lapis armenus. The latter has calcareous earth, or gypsum, for its base; whence it sometimes effervesces with acids, and sometimes not. It is used in painting, when ground to a fine powder, under the name of bice.

CUPRESSUS, in botany, the cypress-tree; a genus of the monadelphia order and monœcia class of plants, natural order fifty-first, coniferae. Male, CAL. a scale of the catkin: cor. none; the antheræ are four, sessile, and without filaments. Female, CAL. a scale of the strobilus, and uniliferous; instead of styles there are hollow dots; the fruit is an angulated nut. There are seven species, the most remarkable are the following, 1. *C. disticha*, the deciduous American cypress, has an erect trunk, retaining a large bulk, branching wide and regular; grows fifty or sixty feet high, fully garnished with small spreading deciduous leaves, arranged distichous or along two sides of the branches. All these species are raised from seeds, and will sometimes also grow from cuttings; but those raised from seeds prove the handsomest plants. 2. *C. sempervirens*, with an upright straight stem, closely branching all around, almost from the bottom upwards, into numerous quadrangular branches, rising in the different varieties, from fifteen to forty or fifty feet in height, and very closely garnished with small, narrow, erect, evergreen leaves, placed imbricatin; and flowers and fruit from the sides of the branches. The wood of this species is said to resist worms, moths, and putrefaction, and to last many centuries. The coffins in which the Athenians were wont to bury their heroes were made, says Thucydides, of this wood; as were likewise the chests containing the Egyptian mummies. The same tree is, by many eminent authors, recommended as improving and meliorating the air by its balsamic and aromatic exhalations; upon which account, many ancient physicians of the eastern countries used to send their patients, who were troubled with weak lungs, to the island of Candia, where these trees grew in great abundance; and where, from the salubrious air alone, very few failed of a perfect cure.

CUPROSE, *n. s.* A name given to the poppy in the north of England.

CUR, *n. s.* } *Dut. korre.* A worth-
 CURRISH, *adj.* } less degenerate dog; a
 CURRISHLY, *adv.* } good-for-nothing man.
 CURRISHNESS, *n. s.* } Currish is brutal; quar-
 CURSHIP, *n. s.* } relsome; malignant;
 churlish; untractable. Curship is, dogship; mean-
 ness; scoundrelship.

For lo the gentill kinde of the lion!
 For whan a fie offendeth him or biteth,
 He with his taile awaie the fie ysmitheth
 Al esily, for of his genterie
 Him deineth not to wreke him on a fie,
 As doeth a curre or els another best.

Chaucer. The Legend of Good Women.

Like dastard cures, that having at a bay
 The salvage beest embost in wearie chace,
 Dare not adventure on the stubborne pray.

Spenser. Faerie Queene.

Yet would he not persuaded be for ought,
 Ne from his currish will a whit reclame. *Id.*
 Sweet speaking oft a currish heart reclaims.

Sidney.

Currishly, without all order of law or honesty. *J. For.*

'Tis a good dog.
 —A cur, Sir. —
 —Sir, he's a good dog, and a fair dog.

Shakspeare.

She says your dog was a cur; and tells you, *currish* thanks is good enough for such a present. *Id.*

What would ye have, ye curi,

That like not peace nor war? *Id. Curiolanus.*

O lawlesse paunch! the cause of much despight,
 Through raunging of a *currish* appetite. *Hall.*

Hell's porter, Cerberus,

That *currishness* into our heads dost put. *May.*

How durst th' I say, oppose thy *curship*
 'Gainst arms, authority, and worship.

Hudibras.

Here's an old drudging cur turned off to shift for himself, for want of the very teeth and heels that he had lost in his master's service. *L'Estrange.*

A cur may bear

The name of tiger, lion, or what'er
 Denotes the noblest or the fairest beast.

Dryden's Juvenal.

This knight had occasion to inquire the way to St. Anne's Lane; the person, whom he spoke to, called him a young popish cur, and asked him, who made Anne a saint? *Addison.*

Hidden as it is, and far remote

From such unpleasing sounds as haunt the ear
 In village or in town, the bay of *curis*
 Incessant, clinking hammers, grinding wheels,
 And infants clamorous whether pleased or pained,
 Oft have I wished the peaceful covert mine.

Cowper.

CURA, ST. LEWIS DE, a town of South America, in the Caraccas, surrounded by mountains. It is sixty-six miles south-west of Caraccas. The temperature hot and dry. Population 4000.

CURACOA, an island in the Caribbean Sea, about seventy-five miles from the coast of the Caraccas, South America. It has several excellent harbours, and is thirty miles long and ten broad. Its soil, in general, is not fertile, and it is almost entirely dependent on the rains for water; but it produces sugar and tobacco, and feeds a breed both of large and small cattle. Its ports were formerly much frequented by vessels from Carthagenæ and Porto Bello, in the slave-trade. It is, in general, well supplied with the manufactures both of Europe and the East Indies. It was twice captured by the British during the late wars, but was restored to the Dutch at the peace of 1814. Its exports, in 1810, amounted, in value, to £263,996, and its imports to £236,181. Long. 69° 2' W., lat. 12° 6' N.

CURAOA, the capital of the above island, is a large and well-built city, has a good port, and is fortified by a castle.

CURATE, *n. s.* } *Lat. curator.* A cler-
 CURATESHIP, *n. s.* } gyman who performs for
 CURACY, *n. s.* } hire the duties of another;
 a parish priest; one who holds a perpetual cu-

racy. Curacy and curateship signify, employment of a curate; a benefice known by the name of a perpetual curacy

—— he had power of confession,
As said himselfe, more than a *curat*,
For of his order he was a licentiat.

Chaucer. Prol. to Cant. Tales.

Bishops and *curates*, and all congregations.

Common Prayer.

I thought the English of *curate* had been an ecclesiastical hireling.—No such matter; the proper import of the word signifies one who has the cure of souls.

Collier on Pride.

He spared no pains; for *curate* he had none,
Nor durst he trust another with his care.

Dryden's Fables.

They get into orders as soon as they can, and, if they be very fortunate, arrive in time to a *curacy* here in town.

Swift.

And in truth to this *curate*, old Nick owed a grudge;
For—although in the pulpit as grave as a judge—
Yet folks, who his conduct have narrowly scanned,
Say he did not put quite enough starch in his hand.

Huddeford.

CURATE, is an ecclesiastical term, sometimes applied to the incumbent of a parish, as having the care or cure of souls, but generally denoting the lowest degree of the clergy in the church of England, who represent the incumbent of a church, parson or vicar, and perform divine service in his stead. He is to be licensed and admitted by the bishop of the diocese, or by an ordinary having episcopal jurisdiction: and the bishop often appoints the salary; in such case, if he be not paid, the curate has a proper remedy in the ecclesiastical court, by a sequestration of the profits of the benefice; but if the curate is not licensed by the bishop, he is put to his remedy at common law, where he must prove his agreement, &c. A curate having no fixed estate in his curacy, or not being instituted and inducted, may be removed at pleasure by the bishop or incumbent. But there are perpetual curates as well as temporary, who are appointed where tithes are impropriate, and no vicarage endowed; these are not removable, and the impropriators are obliged to find them; some whereof have certain portions of the tithes settled on them. Every clergyman that officiates in a church, whether incumbent or substitute, in the liturgy is called a curate. Curates must subscribe the declaration according to the act of uniformity, or are liable to imprisonment, &c. It is provided by the canons that no curate shall remove from one diocese to another, without testimonials from the bishop or ordinary of his honesty, ability, and conformity to the ecclesiastical laws of the church of England; and that none should serve more than one church or chapel upon one day, except that chapel be a member of the parish church, or united thereto, and unless such church or chapel, where such minister should serve in two places be not able, in the judgment of the bishop or ordinary to maintain a curate. By the 12 Anne, cap. 12, the bishop or ordinary first had the power of appointing the curate's stipend at the time of granting his license, that is, admission to the curacy, such stipend not to exceed £50 per

Vol. VI.

annum, nor to be less than £20. By the 36 George III. cap. 18, this was increased to £75 per annum; and the curate was, in certain cases, to be allowed the use of the parsonage-house, or an allowance of £15 per annum instead. The 53 George III. cap. 149, much enlarged the powers of the bishops or ordinaries. They were authorised to appoint and license curates with salaries, in the event of non-resident incumbents neglecting to appoint, and the salary so made payable was not limited, as theretofore, to the sums of £50 or £75 per annum, but was to be in proportion to the value of the benefice and population of the parish.

CURATELLA, in botany, a genus of the digynia order and polyandria class of plants: cal. is pentaphyllous; the petals four; the styles two: caps. bipartite, with the cells dispermous.

CURATOR, *n. s.* Lat. One who has the superintendance of any thing; a guardian appointed by law.

The *curators* of Bedlam assure us, that some lunatics are persons of honour.

Swift.

A minor cannot appear as a defendant in court but by his guardian and *curator*.

Ayliffe's Parergon.

CURATOR, in Roman antiquity, an officer under the emperors, who regulated the prices of all kinds of merchandise and vendible commodities, in the cities of the empire. They had likewise the superintendance of the customs and tributes; whence, also, they were called logiste.

CURATOR, in the civil law, a trustee nominated to take care of the affairs of a person emancipated or interdicted. In countries where the Roman law prevails, between the age of fourteen and twenty-four years, minors have curators assigned them; till fourteen, they have tutors.

CURATOR OF AN UNIVERSITY, in the civedant United Provinces, was an elective office, to which belonged the direction of the affairs of the university; as the administration of the revenues, the inspection of the professors, &c. The curators were chosen by the states of each province; the university of Leyden had three, the burghermasters of the city a fourth.

CURB, *v. a. & n. s.* Fr. *courber*. A curb is, primarily, 'an iron chain made fast to the upper part of the branches of the bridle, in a hole called the eye, and running over the beard of the horse.' The purpose of it is, to check the horse; to retain him in subjection. Hence, curb is, generally, restraint; opposition; hindrance. It is also the name of a hard callous tumor running along the inside of a horse's hoof; so called because it impedes his motion. To curb signifies, to guide a horse by means of a curb; to restrain; to hold back; to prevent from going beyond proper bounds. It sometimes takes *from* after it. In the quotation from Ray, Dr. Johnson thinks that the verb is used, as in French, in the sense of to bend.

Were not the jaws planted amongst them at the first, and had they not governors to curb and keep them still in awe and obedience? *Spenser on Ireland.*

His angry steede did clude his foaming bit,
As much disdainyng to the curb to yelde.

Id. Faerie Queene.

Yet you are *curbed* from that enlargement by
The consequence of the crown. *Shakspeare. Cymbeline.*

The ox hath his bow, the horse his *curb*, and the falcon his bells; so man hath his desires.

Id. As You Like It.

The Roman state, whose course will on
The way it takes, cracking ten thousand *curbs*
Of more strong links asunder, than can ever
Appear in your impediment. *Id. Coriolanus.*

Shall the controller of proud Nemesis
In lawless rage upbraid each other's vice,
While no man seeketh to reflect the wrong,
And *curb* the range of his misruly tongue? *Hall.*

Then thou, the mother of so sweet a child,
Her false imagined loss cease to lament,
And wisely learn to *curb* thy sorrows wild. *Milton.*
Part wield their arms, part *curb* the foaming steed.
Id.

We remain

In strictest bondage, though thus far removed,
Under the inevitable *curb*, reserved
His captive multitude. *Id. Paradise Lost.*

By these men, religion, that should be
The *curb*, is made the spur to tyranny.

Denham. Sophy.

Though the course of the sun be *curbed* between the
tropics, yet are not those parts directly subject to his
perpendicular beams uninhabitable or extremely hot.

Ray.

On the other side, if the mind be *curbed* and
humbled too much in children; if their spirits be
abashed and broken much, by too strict a hand over
them; they lose all their vigor and industry, and
are in a worse state than the former. *Locke.*

So four fierce coursers, starting to the race,
Scour through the plain, and lengthen every pace;
Nor reins, nor *curbs*, nor threatening cries they fear.

Dryden.

Warm in the raptures of divine desire,
Bursts the soft chain that *curbs* the aspiring mind;
And fly, where Victory, borne on wings of fire,
Waves her red banner to the rattling wind. *Beattie.*

Honour and shame are much more liberal motives;
and experience proves, that they may, for the most
part, if not always, be more effectual. These indeed
may be employed, with good success, through the
whole of life, as a preservative from vice, and a *curb*
to every inordinate passion. *Id.*

Stretch the silk rein, and champ the silver *curb*.

Darwin.

It seems as if we Britons were ordained,
By way of wholesome *curb* upon our pride,
To fear each other, fearing none beside. *Cowper.*

And from his chief withdrawn, he wandered lone,
Brief were his answers, and his questions none;
His walk the wood, his sport some foreign brook;
His resting-place the bank that *curbs* the brook.

Byron. Lara.

Yet again, ye shadowy heroes,
Yield not to these stranger Neros!
Though the son who slew his mother,
Shed Rome's blood, he was your brother:
'Twas the Roman *curbed* the Roman.

Id. The Deformed Transformed.

CURB, in the menage, consists of these three
parts; the hook, fixed to the eye of the branch;
the chain of SS's, or links; and the two rings,
or mailles. Large *curbs*, provided they be round,
are always most gentle; but care is to be taken,
that it rest in its proper place, a little above the
beard, otherwise the bit-mouth will not have the
effect that may be expected from it. English
watering bits have no *curbs*: the Turkish bits,
called genettes, have a ring that serves instead of
a *curb*.

CURCULIO, in zoology, a genus of insects
belonging to the order of coleoptera. The feelers
are subclavated, and rest upon the front, which
is prominent and horny. These insects are di-
vided into the following families, 1. Those
which have the rostrum longer than the thorax,
and whose thighs are simple. 2. Those which
have the rostrum longer than the thorax, and
the thighs thicker and made for leaping. 3.
Those which have the rostrum longer than the
thorax, and the thighs dentated. 4. Those
which have dentated thighs, and a rostrum shorter
than the thorax. 5. Those whose thighs are
without teeth or spines, and the rostrum shorter
than the thorax. There are no less than ninety-
five species, principally distinguished by their
color. The larvæ of the curculiones differ not
from those of most coleopterous insects. They
bear a resemblance to oblong soft worms. They
are provided anteriorly with six scaly legs, and
their head is likewise scaly. But the places
where those larvæ dwell, and their transforma-
tions, afford some singularities. Some species
of them, that are dreaded for the mischief they
do in granaries, find means to introduce them-
selves, while yet small, into grains of corn, and
there make their abode. Other larvæ of curcu-
liones are not so fond of corn, but fix in the
same manner on several other seeds; and a species
are lodged in the inside of plants. The heads
of artichokes and thistles are often bored through
and eaten away by the larvæ of large curcu-
liones. Another species smaller, but singular,
pierces and inwardly consumes the leaves of
elms. It frequently happens that almost all the
leaves of an elm appear yellow, and as it were
dead, towards one of their edges, while the
whole remainder of the leaf is green. Upon
inspecting those leaves, the dead part appears to
form a kind of bag or small bladder. The two
laminae, or outward pellicles of the leaf, as well
above as below, are entire, but distant and sepa-
rated from each other, whilst the parenchyma
that lies between them has been consumed by
several small larvæ of the curculio, that have
made themselves that dwelling, in which they
may be met with. After this transformation,
they come forth, by piercing the kind of bladder,
and give being to a curculio that is brown, small,
and hard to catch, by reason of the nimbleness
with which it leaps. The property of leaping,
allotted to this single species, depends on the
shape and length of its hinder legs.

CURCUMA, turmeric, in botany, a genus
of the monogynia order, and monandria class
of plants, natural order eighth, scitamineæ. It
has four barren stamina, with a fifth fertile.
The species are, 1. *C. longa*, with long fleshy
roots, of a deep yellow color, which spread
under the surface of the ground like those of
ginger; they are about the thickness of a
man's finger, having many round knotty cir-
cles, from which arise four or five large spear-
shaped leaves, standing upon long foot-stalks.
The flowers grow in loose scaly spikes on the
top of the foot-stalks, which arise from the larger
knobs of the roots, and grow about a foot high;
they are of a yellowish-red color, and shaped
somewhat like those of the Indian reed

2. *C. rotunda*, with a round root. It has a fleshy jointed root like that of ginger, but round; and sends up several spear-shaped oval leaves, which rise upwards of a foot high, and of a sea-green color. From between these arises the flower-stalk, supporting a loose stalk of flowers of a pale yellowish color, enclosed in several different spathe, or sheaths, which drop off. The flowers are never succeeded by seeds in this country. Both these species grow naturally in India, from whence the roots are brought to Europe for use. They are very tender, and will not live in this country unless kept constantly in a stove. They are propagated by parting the roots. The root communicates a beautiful but perishable yellow dye, with alum, to woollen, cotton, or linen. In medicine it is esteemed aperient, and emmenagogic; and of singular efficacy in the jaundice.

CURD, *v. a. & n. s.* } Thomsor. derives
CURDLER, *v. a. & v. n.* } curd from Fr. *cailler*,
CURDY, *adj.* } *caille*, a derivation which does not seem to be very plausible. Lemon, with his usual positiveness, says, 'by transposition evidently derived à *κρυος*, quasi; *κρυος*, frigus, et *κρυος*, frigidus, unde *cruror*.' Skinner looks for its origin in the verb to crowd, whence crowdle. The old spelling, cruddle, or cruddle, perhaps, suggested this etymology. To curd is to turn to curds; to cause to coagulate. To curdle is to coagulate; to shut together; to concreate; to force into coagulation, or concretions. Curd signifies, coagulated milk; the concretion of the thicker parts of any liquor.

Which when as Una saw, through every vein,
The *cruddled* cold ran to her well of life.

Spenser. Faerie Queene.

For she would call him often heam,
And give him *curds* and clouted cream.

Id. Shepherd's Calendar.

Maiden, does it *curd* thy blood,
To say I am thy mother?

Shakespeare. All's Well that Ends Well.

Powder of mint, and powder of red roses, keep the milk somewhat from turning or *curdling* in the stomach. *Bacon.*

Mixed with the sixth part of a spoonful of milk, it burnt to the space of one hundred pulses, and the milk was *curdled*. *Id.*

Milk of itself is such a compound of cream, *curds*, and whey, as it is easily turned and dissolved. *Id.*

My soul is all the same,
Unmoved with fear, and moved with martial fame;
But my chill blood is *curdled* in my veins,
And scarce the shadow of a man remains.

Dryden's Virgil.

This night, at least, with me forget your care;
Chesnuts, and *curds* and cream, shall be your fare.

Dryden.

Let Sporus tremble.—What! that thing of silk?
Sporus, that mere white *curd* of ass's milk?

Pope.

Even now a fatal draught works out my soul:
Even now it *curdles* in my shrinking veins
The lazy blood, and freezes at my heart.

Smith.

It differs from a vegetable emulsion, by coagulating into a *curdy* mass with acids.

Arbutnot on Aliments.

Some to the house,
The fold, and dairy, hungry bend their flight.
Sip round the pale, or taste the *curdling* cheese.

Thomson's Summer.

CURDISTAN. See **KURDISTAN**.

CURDLING, the coagulating or fixing of any fluid body; particularly milk. See **CHEESE**. Pausanias says, that Aristæus son of Apollo, and Cyrene daughter of the river Peneus, were the first who found out the art of curdling milk. At Florence they curdle their milk for making cheese with artichoke flowers instead of rennet. The Bisaltæ, a people of Macedonia, Rochfort observes, live wholly on curds.

CURE, *v. a. & n. s.* } Lat. *cura*. Cure was
CUR'LESS, *adj.* } anciently synonymous
CUR'ER, *n. s.* } with care, as will be
CUR'ABLE, *adj.* } seen in one of the il-
CUR'ABLENESS, *n. s.* } lustrations from Chau-
CUR'ATIVE, *adj.* } cer, and it still retains
this meaning in the 'cure of souls,' the charge committed to a clergyman. To cure is, to heal; to restore to health; to remedy; to recover; to prepare with antiseptics, so as to preserve from corruption. Cure signifies, remedy; act of healing; the benefice or employment of a curate or clergyman. Curable is that which may be cured; curative that which relates to curing.

I do *cures* to-day and to-morrow. *Luke viii. 32.*

Of studie toke he most *cure* and hede;
Not a word spake he more than was nede.

Chaucer. Prolog. to Cant. Tales.

And will ye knowe that of a sursanure
In surgerie is perilous the *cure*. *Id. Cant. Tales.*

But I wol leve it at this time, than Faunus also well
Was aftir sent in hert, of sekner to be *curyd*. *Id.*

Thus every way you see wythe absence how I
burne,
And for my wound no *cure* I fynde, but hoape of good
returne. *Skreeg.*

In depe wyde wound, the deedly stroke doth turne
To *curless* skarre that never shall returne. *Wyatt.*

For in yourself you only help doth lie
To heale yourselves, and must proceed alone
From your owne will to *cure* your maladie:
Who can *cure* him that will be *cured* of none?

Spenser. Faerie Queene.

And being such, were now much more increast
For want of taking heede unto the same,
That now corrupt and *curless* they became. *Id.*

It easeth some, tho' none it ever *cured*,
To think their delour others have endured.

Shakespeare. The Rape of Lucrece.

O hateful, vaporous, and foggy night!
Since thou art guilty of my *curless* crime,
Muster thy mists to meet the eastern light. *Id.*

This league that we have made
Will give her sadness very little *cure*;
Brother of England how may we content
This widow lady?

Id. King John.

He is a *curer* of souls, and you a *curer* of bodies:
if you should fight, you go against the hair of your
professions. *Id. Merry Wives of Windsor.*

We study speech, but others we persuade;
We leacheraft learn, but others *cure* with it. *Davies.*

The bones, in sharp colds, wax brittle; and therefore all contusions of bones, in hard weather, are more difficult to *cure*. *Bacon's Natural History.*

The therapeutick or *curative* physick, we term that which restores the patient unto sanity.

Brounè's Vulgar Errors.

A consumption of the lungs, at the beginning, herein differs from all other *curable* diseases, that it is not to be worn away by change of diet, or a cheerful spirit.

Cold, hunger, prisons, ills without a *cure*,
All these he must, and guiltless oft, endure.

Dryden's Fables.

If, said he,

Your grief alone is hard captivity,
For love of heaven, with patience undergo
A *careless* ill, since fate will have it so.

Id.

If his *care* lies among the lawyers, let nothing be said against entangling property, spinning out causes, squeezing clients, and making the laws a greater grievance than those who break them.

Collier.

The beef would be so ill chos'n, or so ill *cured*, as to stink many times before it came so far as Holland.

Temple.

Horace advises the Romans to seek a seat in some remote part, by way of a *cure* for the corruption of manners.

Swift.

Hear what from love unpractis'd hearts endure,
From love, the sole disease thou canst not *cure*.

Pope.

There may be taken proper useful indications, both preservative and *curative*, from the qualities of the air.

Arbutnot.

That certain bodily pains might be alleviated by certain sounds, was believed by the Greeks and Romans; and we have it on the best authority, that one species at least of madness was once *curable* by melody.

Beattie.

His unsuspecting sheep believe it pure;
And, tainted by the very means of *cure*,
Catch from each other a contagious spot,
The foul forerunner of a general rot.

Cowper.

Grief's *careless* wounds with lenient balms assuage,
Or prop with firmer staff the steps of age.

Darwin.

— their Politic Doctors assure her,

That they know where her malady lies,
And their grand panacea shall *cure* her.

Huddesford.

CURETES, in antiquity, ancient priests of the Isle of Crete, called also Corybantes. They are said to have been originally of Mount Ida, in Phrygia; for which reason they were also called Idæi Dactyli. According to Pezron, and others, the curetes were in the times of Saturn, &c. and in the countries of Crete and Phrygia, what the Druids were afterwards among the Gauls, &c. i. e. they were priests who had the care of what related to religion and the worship of the gods. Hence, as in those days it was supposed there was no communication with the gods but by divinations, auguries, and the operations of magic, the curetes passed for magicians; to these they added the study of the stars, of nature, and poetry; and so were philosophers, astronomers, &c. Vossius, de Idolatria, distinguishes three kinds of curetes, those of Ætolia, those of Phrygia, and those of Crete, who were originally derived from the Phrygians. The first, he says, took their name from *κεφα*, tonsure, because from the time of a combat, wherein the enemy seized their long hair, they always kept it cut. Those of Phrygia and Crete he supposes were so called from *κρηρος*, young man, because they were young, or because they nursed Jupiter when he was young.

CURFEW. Old Fr. *couvre-feu*. An evening-peal, says Cowell, by which the Conqueror willed that every man should rake up his fire, and put out his light; so that in places, at this day, where a bell is customarily rung towards bed-time, it is said to ring curfew. The custom, however, appears to have been in existence, at least in the convents of the north, before the time of William the Conqueror. Curfew is also the name of a cover for the fire; a fire plate.

The dede slepe for wery besinesse,
Fell on this carpenter, right as I gesse,
Abouten *curfew* time, or litle more.

Chaucer. Cant. Tales.

You, whose pastime
Is to make midnight mushrooms, that rejoice
To hear the solemn *curfew*.

Shakspeare. Tempest.

Who ever gives a pair of velvet shoes
To the Holy Rood, or liberally allows
But a new rope to ring the *curfew* bell,
But he desires that his great deed may dwell
Or graven in the chancel window glasse,
Or in the lasting tomb of plated brass?

Hall.

But now for pans, pots, *curfews*, counters, and the like, the beauty will not be so much respected, so as the compound stuff is like to pass.

Bacon.

Oft on a plat of rising ground
I hear the far off *curfew* sound,
Over some wide-water'd shore,
Swinging slow with sullen roar.

Milton.

The *curfew* tolls the knell of parting day.

Gray.

Soothed by the lulling sound of grove and stream,
Romantic visions swarm on Edwin's soul:
He minded not the Sun's last trembling gleam
Nor heard from far the twilight *curfew* toll;
When slowly on his ear these moving accents stole.

Beattie.

Till, summoned by the *curfew*'s sound,
While falling dews embathe the ground,
Again I seek the friendly shade
From whence my devious steps have strayed,
Repass the lawn, and hawthorn dell,
Regain thy shelter, Lowly Cell!

Id.

CURIA, among the ancient Romans, denoted a portion or division of a tribe. In the time of Romulus, a tribe consisted of ten curiæ, or 1000 men; each curia being 100. The legislator made the first division of his people into thirty curiæ. Afterwards curia became used for the place where each curia held its assemblies, as well as for the senate-house; and hence the moderns use the word curia, a court, for a place of justice, and for the judges, &c. there assembled. Varro derives the word from cura, care, q. d. an assembly of people charged with the care of public affairs. Others deduce it from the Greek; maintaining, that at Athens they called *κρυια* the place where the magistrate held his assizes, and the people used to assemble: *κρυια*, again, may come from *κρηρος*, authority, or power; because it was here the laws were made.

CURIA, or DOMUS CURIALIS, the place where the curiæ used to assemble. Each of the thirty curiæ of old Rome had a temple or chapel assigned to them for the common performance of their sacrifices, and other offices of their religion; so that they were not unlike our parishes. Some remains of these little temples seem to have subsisted many ages after on the Palatine hill,

where Romulus first built the city, and always resided.

CURIA, in our ancient customs. It was usual for the kings of England to summon the bishops, peers, and great men of the kingdom, to some particular place, at the chief festivals in the year; and this assembly is called by our historians curia; because there they consulted about the weighty affairs of the nation: whence it was sometimes also called solennis curia, generalis curia, augustalis curia, and curia publica, &c. See **WITTEXAGEMOT**.

CURIA CLAUDENDA, in law, is a writ that lies against him who should fence and enclose the ground, but refuses or defers to do it.

CURIALITY, *n. s.* From Lat. *curialis*. The privileges, prerogatives, or perhaps retinue, of a court.

The court and *curiality*. *Bacon to Villiers.*

CURIATI, three brothers of Alba, who maintained the interest of their country against the Romans who had declared war against those of Alba. See **HORATI**.

CURIET, **CURRET**, or **CURAT**. Old Fr. *currace*, from *cuir*, leather, because breast-plates were originally made of that material. A corslet; a breast-plate.

Instead whereof she made him to be dight
In woman's weeds that is to manhood shame,
And put before his lap an apron white,
Instead of *curiets* and bases lit for fight.

Spenser. Faerie Queene.

CURIO, in the Roman customs, the chief and priest of a curia. Romulus, upon dividing the people into curiæ, gave each division a chief, who was to be priest of that curia, under the title of curio and flamen curialis. His business was to provide and officiate at the sacrifices of the curia, which were called curionia: the curia furnishing him with a sum of money on that consideration, which pension was called curionium. Each division had the election of its curio; but all these particular curios were under the direction of a superior or general.

CURIO MAXIMUS, the head of the curios, elected by the whole body assembled in the comitia curialis. All these institutions were introduced by Romulus, and confirmed by Numa, as Dionysius Halicarnassæus relates.

CURIOSUS, an officer of the Roman empire during the middle age, appointed to take care that no frauds and irregularities were committed; particularly in what related to the posts, the roads, &c., and to give intelligence to the court of what passed in the provinces. This made the curious people of importance, and put them in a condition of doing more harm than they prevented, on which account Julian cashiered them; as did also Honorius, at least in some parts of the empire, A. D. 415.

CURIOSUS, *adj.* } Old Fr. *curios*, *cu-*
CURIOSLY, *adv.* } *rious*; mod. Fr. *curieux*;
CURIOSITY, *n. s.* } Lat. *curiosus*. Curious
CURIOSNESS, *n. s.* } signifies, inquisitive;
CURIOSO, *n. s.* } anxious for information;
prone to enquiry; prying; attentive to, sometimes with *after*, and sometimes with *of*; careful to avoid error; fastidious; solicitous of perfec-

tion; exact; nicely diligent; elegant; highly finished; rigid; severe. Curiosity is, inquisitiveness; nicety; exactness; a nice experiment; an object particularly worthy of notice; a rarity. Curioso is synonymous with virtuoso.

Understanding to devise *curious* works to work in gold. *Exodus.*

Be not *curious* in unnecessary matters; for more things are shewn unto thee than men understand. *Ecclesi. iii. 23.*

And for to fasten his hood under his chinne
He hadde of gold wrought a *curious* pinne.
Chaucer. Prol. to Cant. Tales.

Worship not Jove with *curious* fancies vaine,
Nor him despise; hold right atweene these twaine.
Songes and Sonnettes.

And therewithal came *curiousness*, and carpet out of frame. *Id.*

But ho, to shifte their *curious* request,
Can cause why she could not come in place.
Spenser. Faerie Queene.

He looked very *curiously* upon himself, sometimes fetching a little skip, as if he said his strength had not yet forsaken him. *Sidney.*

Till Arianism had made it a matter of great sharpness and subtlety of wit to be a sound believing Christian, men were not *curious* what syllables or particles of speech they used. *Hooker.*

For *curious* I cannot be with you,
Signior Baptista, of whom I hear so well.
Shakespeare.

When thou wast in thy guilt, and thy perfume, they mocked thee for too much *curiosity*; in thy rags thou knowest none, but art despised for the contrary. *Id. Timon.*

There hath been practised also a *curiosity*, to set a tree upon the north side of a wall, and at a little height to draw it through the wall, and spread it upon the south side; conceiving that the root and lower part of the stock should enjoy the freshness of the shade, and the upper boughs and fruit the comfort of the sun; but it sorted not.

Bacon's Natural History.

A vail obscured the sunshine of her eyes,
The rose within herself her sweetness closed;
Each ornament about her seemly lies,
By *curious* chance, or careless art, composed.
Fairfax.

Ee'n then to them the' spirit of lies suggests
That they were blind, because they saw not ill,
And breathed into their incorrupted breasts
A *curious* wish, which did corrupt their will.
Davie.

A temperate person is not *curious* of fancies and deliciousness; he thinks not much, and speaks not often, of meat and drink. *Taylor.*

Our senses, however armed or assisted, are too gross to discern the *curiosity* of the workmanship of nature. *Ruy.*

Curiosity in children is but an appetite after knowledge, and therefore ought to be encouraged in them, not only as a good sign, but as the great instrument nature has provided to remove the ignorance they were born with, and which without this busy inquisitiveness, will make them dull and useless creatures. *Locke.*

Nor is it the having of wheels and springs, though never so *curiously* wrought, and artificially set, but the winding of them up, that must give motion to the watch. *South.*

If any one too *curious* should enquire
After a victory which we disdain,
Then let him know the Belgians did retire
Before the patron saint of injured Spain.

Dryden.

Then thus a senior of the place replies,
Well read, and *curious* of antiquities. *Id. Fables.*

At first I thought there had been no light reflected
from the water in that place; but, observing it more
curiously, I saw within it several smaller round spots,
which appeared much blacker and darker than the rest.

Newton's Opticks.

We took a ramble together to see the *curiosities* of
this great town. *Addison's Freeholder.*

It is pity a gentleman so very *curious* after things
that were elegant and beautiful, should not have been
as *curious* as to their origin, their uses, and their nat-
ural history. *Woodward.*

In proportion that credulity is a more peaceful pos-
session of the mind than *curiosity*, so far preferable is
that wisdom which converses about the surface, to
that pretended philosophy which enters into the depth
of things, and then comes back gravely with inform-
ations and discoveries, that in the inside they are
good for nothing. *Siciff.*

This, Sir, is *curious*; and what hardly would be
expected in so reduced a court as that of Charles the
Second, and in so improved a country as England
might then be thought. But so it was. *Burke.*

His work on this last subject is the only one in
which that antique piece of *curiosity* has been pre-
served to us. *Id.*

Meanwhile, what'er of beautiful, or new,
Sublime, or dreadful, in earth, sea, or sky,
By chance, or search, was offer'd to his view,
He scanned with *curious* and romantic eye.

Beattie.

Then *Curiosity* with tracing hands
And meeting lips the line of form demands,
Buoyed on light step, o'er ocean, earth, and sky,
Rolls the bright mirror of her restless eye.

Darwin.

Oh, couldst thou speak,
As in Dodona once thy kindred trees
Oracular, I would not *curious* ask
The future, best unknown, but at thy mouth
Inquisitive, the less ambiguous past. *Cæsar.*

Books, for his volume heretofore was Man,
With eye more *curious* he appeared to scan,
And oft, in sudden mood, for many a day
From all communion he would start away.

Byron. Lara.

Vain was all question asked her for the past,
And vain e'en menace—silent to the last;
She told nor whence, nor why she left behind
Her all for one who seemed but little kind.
Why did she love him? *Curious* fool!—be still—
Is human love the growth of human will? *Id.*

I loathe that low vice *curiosity*,
But if there's any thing in which I shine,
'Tis in arranging all my friends' affairs,
Not having of my own domestic cares.

Id. Don Juan.

CURISCH-HAFF, or the GULF OF COUR-
LAND, a lake or gulf of Prussia, alongside of
the Baltic, from which it is separated by the Cu-
risch-Nerung, extending from Menel to Lablau,
about seventy miles. The breadth is very un-
equal, being wide to the south and narrow to-
wards the north.

CURL, *v. a, v. n., & n. s.* } Dan. *krülle, knor-*
CURLINESS, *n. s.* } *la*; Dut. *krollen*;
CURLINGLY, *adv.* } Ang.-Sax. *cyrran*;
CURLY, *adj.* } from Isl. *kra*, a
CURL-HEADED, *adj.* } crook, a turn; Ital.
CURLLED-PATE, *adj.* } *ciurlo*; Lat. *circulo*;
CURLING-IRONS, *n. s.* } *Fragoo*. To curl is,

to form the hair into ringlets; to dress with curls;
to writhe; to twist; to raise into waves or undu-
lations; to shrink up into ringlets; to twist
round; to shrink back. Curl signifies, a ringlet
of hair; an undulation; a wave; a sinuosity.
Curliness, which means the state of being curled,
is a word of modern coinage, but has a legiti-
mate claim to form a part of the language, as no
other word expresses the same meaning. Of the
other words under this head, the meaning is ob-
vious.

Before the threshold dreadful Cerberus
His three deformed heads did lay along,
Curled with thousand adders venomous.

Spenser. Faerie Queene.

She apparelled herself like a page, cutting off her
hair, leaving nothing but the short curls to cover that
noble head. *Sidney.*

If she first meet the curled Antony,
He'll make demand of her a kiss. *Shakspeare.*

His browny locks did hang in crooked curls,
And every light occasion of the wind
Upon his lips their silken parcels hurls.

Id. A Lover's Complaint.

The visitation of the winds,
Who take the ruffian billows by the top,
Curling their monstrous heads. *Id. Henry IV.*

Make curled-pate ruffians bald.
Id. Timon of Athens.

Letting them curl themselves about my limbs.
Beaumont and Fletcher.

The very thinking it
Would make a citizen start; some politic tradesman
Curl with the caution of a constable. *Id.*

They, up the trees
Climbing, sat thicker than the snaky locks
That curled Megara. *Milton's Paradise Lost.*

Those slender aerial bodies are separated and
stretched out, which otherwise, by reason of their
flexibleness and weight, would flag or curl. *Boyle.*

To every nobler passion of the town
The curling billows rowl their restless tide;
In parties now they straggle up and down,

As armies, unopposed, for prey divide. *Dryden.*

Then round her slender waist he curled,
And stamped an image of himself, a sovereign of the
world. *Id. Alexander's Feast.*

Just as in act he stood, in clouds enshrined,
Her hand she fastened on his hair behind,
Then backward by his yellow curls she drew;
To him, and him alone, confessed in view.

Id. Fables.

Thus it happens, if the glass of the prisms be free
from veins, and their sides be accurately plain and
well polished, without those numberless wares or
curls, which usually arise from the sand holes.

Newton's Opticks.

While curling smooks from village tops are seen.
Pope.

Here, on the sharp spear, mad with mortal pangs,
The bird transfixed in bloody vortex whirls,
Yet fierce in death the threatening talon curls:
There, while the life-blood bubbles from his wound,
With little feet the pigmy beats the ground. *Beattie.*

With starting eyes, wide throat, and gaping teeth,
Carl his redundant folds, and writhe in death.

Darwin.

Love culls a flaming shaft of broadest wing,
And rests the fork upon the quivering string;
Points his arch eye aloft, with fingers strong
Draws to his *curled* ear the silken thong;
Loud twangs the steel, the golden arrow flies,
Trails a long line of lustre through the skies. *Id.*

SERJ. Full bottomed heroes thus, on signs, unfurl
A leaf of laurel in a grove of *curl!*

Yet tell your client, that, in adverse days,
This wig is warmer than a bush of bays. *Sheridan.*

Love shows all changes—hate, ambition, guile
Betray no further than the bitter smile;
The lips' least *curl*, the lightest paleness thrown
Along the governed aspect, speak alone
Of deeper passions, and to judge their men,
He, who would see, must be himself unseen. *Byron. The Corsair.*

And further on a group of Grecian girls,
The first and tallest her white kerchief waving,
Were strung together like a row of pearls;
Linked hand in hand, and dancing; each too
having
Down her white neck long floating auburn *curls*.
Id. Don Juan.

She came into the cave, but it was merely
To see her bird reposing in his nest;
And she would softly stir his locks so *curly*,
Without disturbing her yet slumbering guest,
Breathing all gently o'er his cheek and mouth,
As o'er a bed of roses the sweet south. *Id.*

CURLREW, *n.s.* Fr. *corleu*. A kind of water fowl, with a large beak of a gray color, with red and black spots; a bird larger than a partridge, with longer legs, frequent in Spain and Sicily, and sometimes found in France.

Among birds we reckon creysers, *curlcws* and puf-fins. *Carew.*

I never hear the loud, solitary whistle of the *curl-rew*, in a summer moon, without feeling an elevation of soul like the enthusiasm of devotion or poetry. *Burns.*

Mourn, ye wee songsters o' the wood;
Ye grouse that crap the heather bud;
Ye *curlcws* calling through a clud;
Ye whistling plover;
And mourn, ye whirring patriick brood;
He's gane for ever! *Id.*

CURLEW. See SCOLOPAX.

CURMI, a name given by the ancients to a sort of malt liquor or ale. It was made of barley, and was drunk by the people of many nations instead of wine, according to Dioscorides' account. He accuses it of causing pains in the head, generating bad juices, and disordering the nervous system. He also says, that in the western part of Iberia, and in Britain, such a sort of liquor was, in his time, prepared from wheat instead of barley.

CURMU'DGEON, *n.s.* } An unknown
CURMU'DGEONLY, *adj.* } correspondent
suggested to Dr. Johnson, that this word is probably derived from the Fr. *cœur mechant*. Dr. Johnson adopted the idea, and stated in what manner he obtained it. In Ash's Dictionary the ludicrous mistake was committed, of giving the words an 'unknown correspondent,' as a

translation of *cœur mechant*, and this blunder has afforded abundant food for laughter. Mr. Todd doubts the correctness of the derivation itself, and refers the origin of the word either to Ger. *curmede*, a sort of vassalage, or to *car* and the Ang.-Sax. *myrnang*, a complaint, a murmuring; but he inclines to the former. Thomson says, Ang.-Sax. *car modig*, from *carc*, care, and *mod*, the mind. *Curmudgeon* means, an avaricious, churlish fellow; a close-fisted churl; a niggard; a griper.

And when he has it in his claws,
He'll not be hide-bound to the cause;
Nor shalt thou find him a *curmudgeon*,
If thou dispatch it without grudging. *Hudibras.*

A man's way of living is commended, because he will give any rate for it; and a man will give any rate rather than pass for a poor wretch, or a penurious *curmudgeon*. *Locke.*

In a country where he that killed a hog invited the neighbourhood, a *curmudgeonly* fellow advised with his companions how he might save the charge. *L'Estrange.*

CURRAH, a small district in the province of Allahabad, between the twenty-fifth and twenty-sixth degrees of north latitude, and bounded by the Ganges and Jumna. The country from Currah to Benares on the east side abounds with a species of earth called *sujee imtee*, impregnated with alkali, from one to three inches thick, which is sold at the close of the rainy season, to the soap manufacturers.

CURRAH, the chief place of the district of Allahabad, is situated on the south-west side of the Ganges, forty-five miles north-west from Allahabad, and extends a mile along the banks of the Ganges. Here is an old fort in ruins, and a new one with an unfinished stone gate-way. There are also many Hindoo temples.

CURRANT, *n.s.* Thomson says, 'cranberry, and hindberry, seem to have included this fruit; which was afterwards confounded with the small raisins brought from Corinth.' The fruit of a species of *grossularia*; a small dried grape, now principally imported from Zante, but which takes its name from Corinth.

They huttered *currants* on fat veal bestowed,
And rumps of beef with virgin honey stewed;
Insipid taste, old friend, to them who Paris know,
Where rocombele, shallot, and the rank garlick grow. *King.*

Lewenhoeck assures us, that in the bud of a *currant* tree he could not only discover the ligneous part, but even the berries themselves, appearing like small grapes. *Darwin.*

CURRENTS, or **CURRANS**, are the fruit of a species of *grossularia*. See **GROSSULARIA**. The white and red sort are mostly used; for the black, and chiefly the leaves upon first coming out, are in use to flavor English spirits, and counterfeit French brandy. *Currants* greatly assuage drought, cool and fortify the stomach, and help the digestion; and the jelly of black currants is said to be very efficacious in curing inflammations of the throat.

CURRENT, *n.s. & adj.* } Fr. *courant*; Ital.
CURRENTLY, *adj.* } *corrente*; Sp. *corri-*
CURRENTNESS, *n.s.* } *ente*; Lat. *currere*.
CURRENTY, *n.s.* } *currrens*. That which

runs or flows onward continuously, is the idea which is here conveyed. Hence, current as a noun, signifies a running water; a particular direction of the waters of the ocean towards certain parts, of which the Gulf-stream affords an instance; course; progression. As an adjective, it means, that which passes from hand to hand; generally received; allowed to pass without contradiction; general; popular; fashionable; allowable; that which is now passing, as, the current year. Currency is, the mass of money in a country; power of passing from hand to hand; general belief and reception of; fluency of speech; constant flow; general esteem; the papers which were formerly stamped in the English colonies by authority, and which passed as money.

Shakels of silver, *current* money with the merchant. *Genesis* xxiii. 16.

O rodie rosier, flowring without spine,
Fountain filthlesse, as biril *currant* clere! *Chaucer.*

Like as the tide that comes from the ocean mayne,
Flows up the Shenar with contrarie forse,
And over-ruling him in his own rayne,
Drives back the *current* of his kindly course.

Spenser. Faerie Queene.

The very cause which maketh the simple and ignorant to think they even see how the word of God runneth *currently* on your side, is, that their minds are forestalled, and their conceits perverted beforehand.

Hooker. Preface.

The *current*, that with gentle murmur glides,
Thou knowest, being stopped, impatiently doth rage;
But when his course is not hindered,
He makes sweet musick with the' enamelled stones.

Shakespeare.

Fouler than heart can think thee, thou canst make
No excuse *current*, but to hang thyself.

Id. Richard III.

When substantialness combineth with delightfulness, and *currentness* with stayedness, how can the language sound other than most full of sweetness?

Camden's Remains.

He that thinketh Spain to be some great overmatch for this estate, assisted as it is, and may be, is no good mintman, but takes greatness of kingdoms according to their bulk and *currency*, and not after their intrinsic value.

Bacon.

Heaven her Eridanus no more shall boast,
Whose fame in thine, like lesser *current*, 's lost;
Thy noble streams shall visit Jove's abodes,
To shine among the stars, and bathe the gods.

Denham.

We are also to consider the difference between worth and merit, strictly taken: that is a man's intrinsic, this his *current*, value; which is less or more, as men have occasion for him.

Grew's Cosm.

Not fabled Po more swells the poet's lays,
While through the sky his shining *current* strays.

Pope.

Oft leaving what is natural and fit,
The *current* folly proves our ready wit;
And authors think their reputation safe,
Which lives as long as fools are pleased to laugh.

Id.

That there was *current* money in Abraham's time, is past doubt, though it is not sure that it was stamped; for he is said to be rich in cattle, in silver, and in gold.

Arabian.

The *currency* of those half-pence would, in the universal opinion of our people, be utterly destructive to this kingdom.

Swift.

They despaired of giving any very general *currency* to their opinions. They considered them as a reserved privilege for the chosen few.

Burke.

Fain would I sing what transport stormed his soul,
How the red *current* throbed his veins along,
When, like Pelides, bold beyond control,
Without art graceful, without effort strong,
Homer raised high to Heaven the loud, the' impetuous
song.

Beattie.

On the flood,
Indurated and fixed, the snowy weight
Lies unperceived; while silently beneath,
And unperceived, the *current* steals away.

Cowper.

Four sparkling *currents* laved with wandering tides
Their velvet avenues, and flowery sides;
On sunbright lawn unclad the Graces strayed,
And guiltless Cupids haunted every glade.

Darwin.

J. SURF. P' faith, that's true, lady Sneerwell:
Whenever I hear the *current* running against the characters of my friends, I never think them in such danger as when candour undertakes their defence.

Sheridan.

Before the mansion lay a lucid lake,
Broad as transparent, deep, and freshly fed
By a river, which its softened way did take
In *currents* through the calmer water spread
Around: the wild fowl nestled in the brake
And sedges, brooding in their liquid bed.

Byron. Don Juan.

CURRENCY. See MEDIUM CIRCULATING.

CURRENTS, in navigation, are either natural and general, as arising from the diurnal rotation of the earth about its axis; or accidental and particular, caused by the waters being driven against promontories, or into gulfs and straits, where, wanting room to spread, they are driven back, and thus disturb the ordinary flux of the sea. Currents are various, and directed towards different parts of the ocean, of which some are constant, others periodical. Perhaps the most extraordinary current of the sea, is that of the Atlantic Ocean, which we have already noticed, and which extends from Guinea round by the coast of America. See ATLANTIC.

'This grand movement of the ocean from east to west,' says Mr. Tuckey, 'has a complicated origin; and the trade winds, so far from being the cause, as has been supposed by some, are probably in part the effect of this current. Buffon thought that the sun and moon advancing continually to the west, in regard to a fixed point on the earth, must draw the mass of waters after them, and occasion a constant movement of the ocean from east to west; but this explanation not being found satisfactory, the following has been offered:—The heat of the sun and the rotation of the earth constantly tend to diminish the density of the equatorial waters, and evaporation draws from that region a much greater quantity of the fluid than is restored to it by rivers or meteors; hence, as we have observed, the waters of the polar regions move towards the equator to restore the equilibrium; but these polar waters are specifically heavier than the tropical waters, and, besides, their rotative movement is infinitely slower, but their inertia prevents them from getting suddenly rid of their original movement, and there-

for they cannot follow with equal velocity the increased rapidity of the rotatory movement of the globe in the equatorial regions. Heavy and motionless, they fall at once into a sphere of the most active movement, but preserve, for some time, their original character.

A variety of other shifting currents do not last, but return at certain periods; and most of these depend upon and follow the anniversary winds, which by blowing in one place may cause a current in another. Between the island of Celebes and Madura, when the western monsoons set in, viz. in December, January, and February, or when the winds blow from the north-west, or between the north and west, the currents set to the south-east, or between the south and east. At Ceylon, from the middle of March to October, the currents set to the south, and in the other parts of the year to the north, because at this time the southern monsoons blow, and at the other the northern. Between Cochin China and Malacca, when the western monsoons blow, viz. from April to August, the currents set eastward against the general motion; but the rest of the year they set westward, the monsoon conspiring with the general motion. They run so strongly in these seas, that unexperienced sailors mistake them for waves that beat upon the rocks, known usually by the name of breakers. So for some months after the 15th of February, the currents set from the Maldives towards India on the east, against the general motion of the sea. On the shore of China and Cambodia, in October, November, and December, the currents set to the north-west, and from January to the south-west, when they run with such rapidity about the shoals of Parcel, that they seem swifter than an arrow. At Pulo Condore, upon the coast of Cambodia, though the monsoons are shifting, yet the currents set strongly towards the east, even when they blow to a contrary point. Along the coasts of the bay of Bengal, as far as the Cape Romania, at the extreme point of Malacca, the current runs south in November and December. When the monsoons blow from China to Malacca, the sea runs swiftly from Pulo Cambi to Pulo Condore on the coast of Cambodia. In the bay of Sans-Bras, not far from the Cape of Good Hope, there is a current peculiarly remarkable, where the sea runs from east to west to the landward; and this more vehemently as it is opposed by winds from a contrary direction. This is undoubtedly owing to some adjacent shore which is higher than this. In the straits of Gibraltar, the currents almost constantly drive to the east, and carry ships into the Mediterranean: they are also found to drive the same way into St. George's Channel. The setting or progressive motion of the current may be either quite down to the bottom, or to a certain determinate depth. As the knowledge of the direction and velocity of currents is a very material article in navigation, it is highly necessary to discover both, in order to ascertain the ship's situation and course with as much accuracy as possible.

CURRICLE, *n. s.* Old Fr. *curicule*; Lat. *curriculus*. This word formerly meant a course: it is now the name of a two-wheeled open chaise, drawn by two horses abreast.

Upon a *curricie* in this world depends a long course of the next, and upon a narrow scene here an endless expansion hereafter. *Browne.*

CURRIE (Dr. James), was born at Kirkpatrick, in Scotland, in 1756. He received the rudiments of learning at the parish school of his native place, whence he was transferred to the grammar-school of Dumfries. His original destination was for a commercial life, and he passed some years of his youth in a mercantile station in Virginia. Disliking his profession, and unwilling to be a witness of the impending troubles in the American colonies, he quitted that country in 1776, and in the following year commenced a course of medical study at the university of Edinburgh. A prospect of an appointment in the medical staff of the army, which would not admit of the usual delay of an Edinburgh graduation, induced him to take the degree of doctor of physic at Glasgow; but, being disappointed in his hopes, he finally settled in Liverpool in 1781. In 1783 he married the daughter of W. Wallace, esq. a merchant of that town, by whom he had several children. His professional employment now rapidly increased, and he was elected one of the physicians of the infirmary. In 1790 he became a member of the London Medical Society, and communicated to it a paper On Tetanus and Convulsive Disorders, published in the third volume of its Memoirs. In 1792 he became a fellow of the Royal Society. A very curious and instructive Account of the Remarkable Effects of a Shipwreck, communicated by him to that body, was published in the Philosophical Transactions of that year. A pamphlet which appeared in 1793, under the title of A Letter, Commercial and Political, addressed to the Right Hon. William Pitt, by Jasper Wilson, Esq. on the subject of the war with revolutionary France, and which excited considerable attention, was also generally understood to come from his pen. In 1797 his reputation was further extended by a publication entitled Medical Reports on the Effects of Water, Cold and Warm, as a Remedy in Febrile Diseases, with Observations on the Nature of Fever, and on the Effects of Opium, Alcohol, and Inanition. The practice of affusion of cold water in fevers, which is the leading topic in this work, was suggested to the author by Dr. Wright's narrative in the London Medical Journal, of his successful treatment of a fever in a homeward-bound ship from Jamaica. Dr. Currie, however, greatly extended it, and investigated the principles by which its use should be directed.

On a visit to his native country, in 1792, he had become personally acquainted with that rustic son of genius Robert Burns. This extraordinary but unfortunate man having at his death left his family in great indigence, a subscription was made in Scotland for their immediate relief, and at the same time a design was formed of publishing an edition of his printed works and remains, for their emolument. Mr. Syme of Ryedale, an old and intimate friend of Dr. Currie, strongly urged him to undertake the office of editor. In 1800, therefore, he published in 4 vols., 8vo., The Works of Robert Burns, with an Account of his Life, and a Criticism on his

Writings; to which are prefixed some Observations on the Character and Conditions of the Scottish Peasantry. This work passed through repeated editions, and produced a balance of profit that formed a welcome assistance to the destitute family. Dr. Currie, though possessed of a frame naturally vigorous, was subject to violent pulmonary attacks, and, his health beginning to decline visibly in 1804, he was compelled to leave Liverpool. Spending the following winter alternately at Clifton and Bath, he thought himself in the month of March in a state of convalescence, and, taking a house in Bath, recommenced the practice of his profession. But his disease had now obtained a permanent hold on his constitution, and he was obliged to relinquish the attempt. As a last resource he went in August to Sidmouth, where, after much suffering, which he bore with manly fortitude and resignation, he expired August 31st, 1805, in the fiftieth year of his age. His disease was ascertained to be a great enlargement and flaccidity of the heart, accompanied with a remarkable wasting of the left lung, but without ulceration, tubercle, or abscess.

CURRIERS, COMPANY OF. This company was incorporated in 1438 by Henry I., and their arms are *sable*, a cross engrailed, or between four pair of shares in saltire *argent*. The crest, two arms embowed, holding a share: the motto, *Spes nostra Deus*

CURRITUCK, a county of North Carolina, on the sea-coast of Edenton district, forming the north-east corner of the state, being bounded on the east by Currituck Sound, north by the state of Virginia, south by Albemarle Sound, and west by Camden county, it contains upwards of 5000 inhabitants, and the celebrated Dismal Swamp, one of the best rice estates in America.

CURRITUCK, or **CARATUNK**, a township of the United States, in the district of Maine, twenty-eight miles above Norridgewalk.

CURRODREPANUS, from *currus*, a chariot, and *ῥεπανον*, a scythe, in antiquity, a chariot armed with scythes. The driver of these chariots was obliged to ride on one of the horses, as there was no other seat for him. There were no scythes pointing down to the earth, either from the beam or axle-tree; but these were fixed at the head of the axle-tree in such a manner as to be movable by means of a rope, and thereby could be raised or let down, and drawn forward or let fall backward, by relaxing the rope.

CURRUCKDEAH, a hilly district of Hindostan, in the province of Bahar, covered generally with wood, and containing no important place except Curruckdeah, the capital, in long. 86° 13' E., lat. 24° 26' N.

CURRUCKPORE, also a district of the province of Bahar, in which are found hot springs, of no mineral taste, but keeping as well as the Bristol water. Curruckdeah is the capital.

CURRY, *v. a.* Fr. *curroyer*; Lat. **CURRYCOMB**, *n. s.* } *corium*, leather. To dress **CURRYING**, *n. s.* } leather, so as to render it **CURRIER**, *n. s.* } fit for use; to drub; to rub a horse with a currycomb, which is an iron

instrument, consisting of several parallel ridges, indented with small teeth; to wheedle. To curry favor, is to become a favorite by petty officiousness, slight kindnesses, or flattery; it always implies meanness in the person who resorts to it; favor is a corruption of favel, a name anciently given to yellow-colored horses. Currier is one who dresses leather. Curryng is the operation of dressing leather; of rubbing down a horse with a currycomb.

So from her parting, she thenceforth did labour
By all the means she might to *curry* favour,
With the Elfin knight, her ladies best beloved.

Spenser. Faerie Queene.

If I had a suit to master Shallow, I would humour his men; if to his men, I would *curry* with master Shallow.

Shakespeare.

Frictions make the parts more fleshy and full; as we see both in men, and in the *currying* of horses: the cause is, for that they draw a greater quantity of spirits and blood to the parts.

Bacon.

He has a clearer idea from a little print than from a long definition; and so he would have of strigil and sistrum, if instead of a *currycomb* and cymbal, he could see stamped in the margin small pictures of these instruments.

Locke.

This humour succeeded so with the puppy, that an ass would go the same way to work to *curry* favour for himself.

L'Estrange.

A *currier* bought a bear-skin of a huntsman, and laid him down ready money for it.

Id.

Warned by frequent ills, the way they found
To lodge their loathsome carrion under ground;
For useless to the *currier* were their hides,
Nor could their tainted flesh with ocean tides
Be freed from filth.

Dryden's Virgil.

I may expect her to take care of her family, and *curry* her hide in case of refusal.

Addison's Spectator.

CURRY. Hind. *quorma*, to stew. An East Indian savoury powder, used in cookery.

CURRYING is the art of dressing or preparing leather for shoes, and a variety of other purposes, after it has undergone the process of tanning.

It is a trade conducted under a license which is taken out annually from the Board of Excise, and curriers are obliged to specify in the entry, every room in which leather is deposited, as well as the vats and tubs in which it is soaked. Their premises are, of course, subject to the inspection of excise-officers; and any hide or skin not having the tanner's duty-mark, is liable to seizure.

The premises of a currier usually consist of a shaving-shop, scouring-house, and rough leather warehouse, on the ground floor; above these are erected the drying sheds, which are weather-boarded, and calculated to admit a free draught of air, where the wet leather is hung on hooks fixed in rails, which are placed horizontally in rows. The stuffing-tables, which are of mahogany, are also fixed here; the lower floors are differently arranged by different persons, according to the extent of the premises, and the business to be carried on. Where a choice of situation offers, that will be preferred in which the air has free access to the sheds, and at a proper distance from foundries and steam-engines, the smoke

and smuts issuing from these buildings being a great annoyance to the currier, and injurious to saddle and boot-top leather in particular; the value of which depends much on the brightness and regularity of its color. An open yard is a useful appendage, and in extensive concerns cannot well be dispensed with. The coach and saddle currying is in many instances a distinct trade in London, but it is sometimes connected with the shoe trade, and in the country they are generally united.

The skin or shoe trade will come first under consideration, in which is comprehended the dressing of calf, seal, horse, and dog-skins, with the lightest ox and cow hides, for shoe upper-leathers; and to this is usually attached the business of a leather-cutter, which implies the cutting up heavy tanned hides, called crop leather, for soles, and curried goods for shoe upper leathers, welts, &c., for the retailer and consumer. It is a general practice to weigh the skins, and mark them singly before they are put into work, which enables the master to ascertain his profit on every lot of goods, or on every skin, if he wishes to be so particular; and also assists his judgment in buying and assorting the different kinds of goods, and in applying them to the particular purposes for which they are calculated. This requires as much experience as any part of the trade. In laying-in rough goods, the buyer should be well informed in the varieties of tannage, as well as the growth peculiar to different parts of the country, which are as readily distinguishable as the cattle themselves to an experienced dealer. Tanned goods are sold chiefly by weight, and the buyer must have in view the quality of the leather, pattern, and substance; the latter is unequal, and varies in the same lot of goods, and in different parts of the same skin. The proportion of thin loose leather to the middle or prime parts of the skin, is a principal consideration with the buyer, and he always finds the skin of the cow, or any other female animal more level, of a finer texture, and consequently more valuable than that of the male; the firmness and fineness of leather depends much on the treatment it has had in the tanner's pits. It is part of his duty to contract and fill the looser parts of the skin, which will be seen in its proper place; the gashing of the skin by the butcher is also a matter of much consequence to the buyer, and requires all his caution, as the extent of the mischief does not always appear, until the fibrous matter adhering to the flesh side, and which connects the skin to the carcase, is removed by the currier's knife.

An act was passed in the year 1800, inflicting certain penalties on the butcher, in proportion to the damage done to the skin; and persons have been appointed to the markets throughout the kingdom, to inspect the skins, and levy the fines by information before a magistrate, in proportion to the damage; but it has been found inefficient from the total negligence of the inspectors in some places, and more so from the good understanding the tanner finds it his interest to keep up with the butcher. Unfortunately, the currier, and not the tanner, who is the only

check on the butcher, is the principal sufferer by his negligence. A late repeal of statute 1st, James I., has relieved the trade from a vexatious tax, by abolishing the useless offices of searchers and sealers of leather. Until the year 1808, Leadenhall Market was subject to the troublesome interference of these officers, who were obliged to compromise a duty it was impossible to execute; and we believe the most strenuous among those who at that time assisted in supporting such a regulation, now consider their own judgment well substituted for the obnoxious statute. The country leather dealers had long before wisely relieved themselves of its restrictions. Experience soon teaches the buyer to discriminate between well-tanned and well-dried leather, and the contrary; and according as a deficiency in either deteriorates the value, so is the price given.

To return to practical currying: the dressing of a calf-skin for shoe upper-leathers will give a good general idea of the process; we will, therefore, take one as it is received from the tanner, and pursue the operation through the hands of the workman to its finished state. The offal parts, such as the face, tail, and shanks, being first taken off, which is called rounding the skin, it is delivered into the journeyman's hands, who throws it into a vat, or tub of water, to soak, preparatory to the operation of shaving, which is performed by a knife of a peculiar make, and it will be necessary to give a description of this tool, as well as the beam on which the leather is shaved.

The beam, so called by the curriers, is a post about three feet high, fixed in a slightly inclined position, on a firm stage or platform, which is raised eight or ten inches from the floor, for the man to stand upon; this post is about four inches thick and eight inches wide, and is faced with a board of lignum vite of the same breadth.

The knife has two edges; the blade is rectangular, about twelve inches long, and from four to six inches wide, and varies in size and weight, according to the work to be performed; one end has a straight, and the other a cross handle, in the plane of the knife. It is brought to a wire-edge, by rubbing on a stone of a coarse grit, which is afterwards taken off, and a finer edge produced by a finer and softer stone. The cross-handle of the knife is then firmly fixed between the workman's knees, and while in a kneeling posture he turns the edges to an angle with their former position, by means of a polished steel, similar in shape to a butchers' steel. They are kept in order, chiefly by a smaller steel, which the man holds constantly between his fingers, and passes along the knife, the point within, and the side without the groove, formed by the turned edge, as occasion requires, and, as often as the edges are worn, they are renewed in the same way. The name of Cox, of Gloucester, is known throughout Europe as the principal maker of curriers' knives. Mr. Bingley, of Birmingham, who has obtained a patent for an improvement in their manufacture, rivets a plate of steel, properly tempered, between two iron plates, instead of welding the whole together, which is the case with other makers;

and, thereby, as he properly observes, making the thicker and thinner parts unequal in temper, according to the unequal influences of the same degree of heat on the thicker and thinner parts of the knife.

Having prepared the knife, the wet skin is thrown over the beam, with the flesh-side outwards, and the man keeps it in its position by the pressure of his knees as he leans over the beam. The knife is then applied, horizontally, to the leather, and by repeated strokes downwards, it is reduced to the substance required. The angular edge does not merely scrape the skin; but, in the hands of a skilful man, takes off a shaving, the full breadth of the beam, at every stroke of the knife. The man's whole strength is exerted in shaving, and great care, as well as ingenuity, is necessary to avoid galling, or reducing the skin more in some parts than others. In order to keep the substance of the skin equal, the man frequently examines it, in every part, in the course of shaving, by passing it double through his fingers; and, when sufficiently reduced, he throws it, a second time, into a tub of fresh water, to be scoured and extended: for this purpose, it is laid on a stone table, to which the flesh-side adheres, and worked with the edge of a small square stone fixed in a stock or handle. Pumice-stone is used, but not so much as formerly. The skin is cleansed with a brush, from a whitish substance called the bloom, which all leather, tanned with bark, is found to contain. The natural folds of the grain disappear in the extension of the skin; and, to effect this completely, it is sometimes scoured a second time, for which the workman makes an extra charge. Changing the water has, of itself, a good effect in recovering dead, or stale leather, and the trifling additional expense is well laid out. The skin is then removed to the drying-shed, to be stuffed with a mixture of cod-oil and tallow, called dubbing, which is applied to both sides of the leather, but in larger quantities on the flesh than the grain side.

The dubbing is composed of about two parts of oil, and one part of tallow, melted and well stirred together in cooling, so as to be perfectly incorporated in a smooth, butter-like consistence. In conjunction with this mixture, sod-oil, which is a mixture of the cod-oil with the grease expressed from sheep-skins, &c., by the skinners and felmongers, is sometimes used, but is never applied to bright-colored leather. Leather, lightly stuffed, will not wear so well as when it is rendered soft and flexible with the oil and tallow; and, on the other hand, if over stuffed, the color of the grain is darkened, and the oil itself, which, moderately used, is so great a preservative, becomes a cause of decay. The only motive for using more oil than adds to the quality of the leather is, to increase the weight; but, to admit of a good polish, less is usually applied than is really beneficial to the leather. The firmer and stronger parts of the skin require more than the looser parts to make them soft, which must be attended to in laying it on. In this state it is hung on the hooks to dry. In the course of drying, most of the oily

matter will be absorbed, and what remains on the surface, still feeds the leather, and is suffered to continue until the skin is wanted for finishing. Severe frosty weather will, of course, suspend the scouring, drying, and stuffing, and is apt to injure the texture of the leather, when frozen in the sheds, at the same time that it brightens the color; and the kinds of leather, which are valuable on account of color, are consequently improved. The shed-drying not being sufficient in winter, the leather is afterwards dried off in a stove, and then follows the boarding or bruising.

The board used for this purpose is toothed or grooved, similar to the crimping-board used by the ladies, and is slung on the hand by a leather strap. The skin is doubled and worked with a coarse board of this description, until well softened, and is then whitened, or lightly shaved over again, with a half-worn pair of edges, which leaves the flesh-side clean, and in a proper state to receive the color used in waxing. Before it is waxed, however, it is boarded a second time, and the impression of the board often remains, particularly if the leather be not perfectly dry. The skin is now said to be finished russet, in which state it keeps best; and, when wanted for sale, it is again given out to be waxed. In London, this work is chiefly done by apprentices, being the most simple, but the dirtiest part of the whole process. The blacking, usually termed color, is a composition of oil, lamp-black, and tallow, which is well rubbed into the flesh-side with a hard brush, great care being taken to keep the grain-side clean.

A coat of strong size and tallow is then laid on with a soft brush, and is afterwards rubbed with a smoothing-glass; and, lastly, it receives the finishing gloss from a little thin size laid on with a sponge. After the first coat of size, the skin is hung up a few hours to allow the size and color to dry and incorporate, and a lump of hard tallow is rubbed lightly over the surface. The skin is thus completely finished for the consumer, and leather so dressed is found superior in point of appearance and durability. Indeed, the blacking of the prime parts of calf-leather on the grain has almost entirely given way to waxing; an additional reason for which may be, that it is much better adapted for the polish it is afterwards to receive from the destructive shining blacking now in general use.

The middle and firmer part of the skin only is fit for the better purposes; the outer and thinner portion being thrown by and sold at inferior prices. These offal parts, indeed, are frequently cut off before the skin is put into work, and dressed separately from the butt or middle, and when that is the case, it is usually blackened on the grain-side. Horse, seal, and dog-skins are also blackened on the grain, which varies the latter part of the process materially. After shaving, the leather is well washed with urine, as a mordant, on the scouring stone, to prepare it for the first application of a solution of copperas, which is given it in the course of scouring, and communicates the black dye. It is then stuffed in the manner before described, but more plentifully than waxed leather, and hung in the shed to dry; when

taken down, the remains of the oily matter, adhering to the surface of the leather, are scraped off with a thin iron, formed and storked like the stone before-mentioned, and which is afterwards made use of to stone or set the leather smooth on the table. Here it receives a second application of copperas and bullocks' gall, which produces a complete black, and this part of the process is called seasoning. The copperas is applied with caution, lest by a too plentiful use of it the leather be injured. It should scarcely penetrate the cuticle or grain of the skin, and, if used too strong, the grain is burnt up and destroyed. While the leather is damp with this liquid, and in the course of seasoning, the graining-board is applied as before; only, as the grain is now to be worn outwards, the workman is more particular in giving that side a neat appearance, by raising the grain neatly and regularly. The coarser kinds of grain-leather are also, at this time, hardened with a tooth-slicker, called a dicing-iron, which leaves a lasting impression, or an artificial grain is imprinted by means of an engraved roller to imitate seal-skin, which is found to answer better than the board covered with fish-skin, formerly in use. This is not done so much with a view to increase its value, by imitating a better description of leather, as to harden and compress the looser parts of offal leather. It is now finished off with a little clear cod-oil, and is termed grained offal. The thin parts of the horse-hide are dressed in this manner, and are called cordovan, being probably in imitation of the manufacture of leather at Cordova, in Spain.

The act of James, already referred to, prohibited the use of horse-leather, clearly from ignorance of the legislators of that day, and the infant state of the manufactures of the country, horse-leather having been found quite as useful as some other descriptions of leather, and little inferior to calf-skin. It is now in very general use. The middle and stouter parts are cut out for boot-legs; and as leg-dressing is as curious, whether of calf or cordovan, as any part of the currying business, we shall be particular in describing the process.

The piece intended for a leg being cut of a proper length, and tapering a little towards the small, is first soaked and scoured, having been already shaved in the hide: it is then marked and numbered to match its fellow of a corresponding size and substance. The breadth of the small is measured, and the number of inches marked with a piece of copperas, which writes legibly on wet leather, as a guide for the bootmaker in fitting it to the leg. It is then blackened, if cordovan; but instead of again extending it on the scouring-stone, it is worked inwards with the slicker, and the width partially reduced in that part which is to form the small. The wet leather is then placed on a plain mahogany board, between two curved irons, approaching to a semicircle, the convex sides of which are made to approach to and recede from each other, and are screwed down at a distance, according to the size required for the small of the leg. The slicker is then employed to work the leather and contract it within the limits of the frame, by

which the breadth is reduced from two to four inches, and the leather thickened in proportion, or so much of the surface transferred to the substance; the leg, thus treated, will be elastic when dry; and, after giving out sufficiently to admit the foot, closes to the shape of the wearer. This, however, is not so much a matter of attention since the introduction of Hessian boots, which are cut out of the finished skin, and stand hollow without regard to shape; but though the other description of legs, called draft legs, are not so much taken in, they continue to be dressed in the same way. The advantage of this method is nothing more than as it regards the fitting of a new pair of boots; frequent exposure to wet will soon destroy the effects of the currier's ingenuity. Leg-dressing is the lightest and most profitable work to the journeyman in the shoe-currying; it requires superior workmanship, and generally is given to the man most distinguished as a complete and able currier. The leg is stuffed, dried, and finished in the usual manner. Some few years since cordovan legs were exported, in large quantities, to North America; but, from the recent improvements in the art of currying in that part of the world, the demand has entirely failed; and, cordovan having given way to calf legs for home consumption, the horse-hide is now used chiefly for ladies' shoes. The Spanish American horse-hides have lately been dressed thin and smooth on the grain, to imitate kid leather, for which, as far as respects durability, it is a good substitute.

There are several other processes in shoe currying, such as preparing binding, welt leather &c. &c. which we have not space to describe minutely; we pass on therefore to the hide trade, which includes the dressing of ox and cow hides, for coach, harness, saddle, and military purposes; this, as was before observed, forms a distinct branch of the currying trade.

Harness leather is dressed from the strongest and heaviest dressing hides, and the substance is not reduced in shaving, but merely the rough flesh taken off; for reins, the butt is reduced to a level with the thinner parts, and for both these uses the hide is first divided, or slit down the back, from head to tail, for the convenience of the workman; and, after being shaved and scoured, is blackened in the same manner as grain shoe leather. But before it is stuffed it is hung on the poles and semi-dried, and then stoned or set, in order to make the surface smooth, preparatory to receiving the dubbing, which is now laid on in quantities proportioned to the substance of the hide, which is then replaced on the poles until nearly dry. The grain being cleansed with the urine and ox galls, it receives the last application of copperas. A roll of hard tallow is then rubbed over the grain, which the man works into the leather with a stone, and after a second coat of tallow it hangs up till completely dry; it now only remains to be finished with a smoother stone, or a glass of the same form. Brown harness differs only in the omission of the copperas and the tallow in finishing, and, perhaps, is not quite so much stuffed in the first place.

Japan hides, for the roofs and bodies of

coaches, are shaved down to a thin substance, and carefully levelled, then stoned and set, and they are fit for the coachmaker's use; the japaning is the coachmaker's province, after the hide is fitted to the coach-body. Hides for the heads of open carriages are selected from light, roomy, and the least defective hides, and require the best of workmanship; they are blackened on the grain-side, and the leather is softened, and the grain is raised in the same manner as black grain shoe-leather. These hides, for the thinner purposes, being so very much reduced from their original substance, and the shavings of no other use than for fuel, an engine was invented, and has been many years in use, for splitting the hide into two parts, so as to divide the substance, and thereby obtain a useful piece of leather, which would otherwise be wasted in shavings.

The thinnest of all the hide-leather is that which is used for the lining of carriages; it is dressed bright russet, but the colored goat-skins, called Morocco-leather are more generally applied. The seats of army-saddles are cut out of thin hide-leather, of this description, as being less expensive, and quite as durable as hog-skins; but the hunting-saddles in general use are universally made of hog-skins; the skirts and flaps are cut out to pattern, usually from the rough tanned hide, and go through the top-skin process to improve the color. Bridle-leather is cut into pairs of butts and middlings, which signify the middle and butt of the hide; the neck and belly-parts being used for inferior purposes. The army consumes vast quantities of leather for harness, saddles, caps, and accoutrements, which all go through the curriers' hands; and the government contracts for accoutrements, &c., are great objects of contention in that line of business. The belts and straps are cut out of light cow-hides, which are curried much after the manner the same kind of hides are done for strong shoe-leather.

CURRYRURY, a frontier province of Bengal, on the eastern side of the Brahmapoetra river, composed of lands formerly belonging to the territories of Assam and Bahar. it is mountainous and overrun with wood.

CURSE, <i>v. a., v. n. & n. s.</i>	} Swed. <i>korsa</i> ; Ang.-Sax. <i>cur-</i> <i>sian</i> . To wish evil to; to call down maledic- tions upon; to execrate; to de- vote; to do mis-
CURSED, <i>part. adj.</i>	
CURSEDLY, <i>adv.</i>

CURSTNESS, <i>n. s.</i>	

chief to; to torment; to afflict; to imprecate; to deny or affirm with imprecation of divine vengeance. Curse is, malediction; torment; vexation. Cursed is, that which is deserving of a curse; hateful; wicked; blasted by a curse; vexatious; annoying. Cursedly is a vulgarism, signifying miserably; shamefully. Curst and curstness denote the quality, and the state, of being froward; shrewish; peevish; snarling; malignant.

Curse me this people, for they are too mighty for me. *Numbers.*

He read all the words of the law, the blessings and cursings. *Joshua viii. 26.*

Thy silver about which thou cursedst, and spakest of also in mine ears, behold, the silver is with me. *Jud. xvii. 2.*

Neither have I suffered my mouth to sin, by wishing a curse to his soul. *Job.*

Full loth were he to curse for his tithes,
But rather wolde he yeven out of doute
Unto his poure parishers aboute
Of his offering, and eke of his substance.

Chaucer. Prol. to Cant. Tales.

Well may we curse our abbis and our place,
Our statutes sharpe to singe in copis witt.

Id. The Court of Love.

Hire thoughte hire cursed herte brast atwo;
She wolde not that hire sone hed do so.

Id. Cant. Tales.

The remenant were anhangd, more and lesse,
That were consentant of this cursedness. *Id.*

And first within the portche and jaws of hell,
Sate diepe Remorse of Conscience, al besprent
With teares; and to herselfe oft would she tell
Her wretchedness, and cursing never stent
To sob and sigh. *Sackville.*

The gold is good, and though she curse or banne
Yet where thee list thou mayst lye good and warme
Wyatt.

Horribly then he gan to rage and rayle,
Cursing his gods, and himselfe damning deep.
Spenser. Faerie Queene.

O piteous worke of mutabilitie!
By which we all are subject to that curse,
And death, instead of life, have sucked from our
nurse. *Id.*

After Solymán had looked upon the dead body,
and bitterly cursed the same, he caused a great weight
to be tied unto it, and so cast into the sea. *Knolles.*

The untented woundings of a father's curse,
Pierce every sense about thee.

Shakspeare. King Lear.

Merciful powers!

Restrain in me the cursed thoughts that nature
Gives way to in repose. *Id. Macbeth.*

I pray you, though you mock me, gentlemen,
Let her not hurt me: I was never curst;
I have no gift at all in shrewishness;
I am a right maid, for my cowardice;
Let her not strike me.

Id. Midsummer Night's Dream.

Then, noble partners,
Touch you the sourest points with sweetest terms,
Nor curstness grow to the matter.

Id. Antony and Cleopatra.

Come, lady, while heaven lends us grace,

Let us fly this cursed place,
Lest the sorcerer us entice
With some other new device. *Milton.*

The curser's punishment should fright the curse.
Dryden.

I never went from your lordship, but with a long-
ing to return, or without a hearty curse to him who
invented ceremonies, and put me on the necessity of
withdrawing. *Id.*

What, yet again? the third time hast thou curst
me?

This imprecation was for Laius' death,
And thou hast wished me like him. *Dryden and Lee.*

One day, I think, in Paradise he lived;
Destined the next his journey to pursue,
Where wounding thorns and cursed thistles grew. *Prior.*

There are very few who can bear to grow old among the *curses* of a whole people.

Burke.

O the supreme *curse* of making three guineas do the business of five! Not all the labours of Hercules; not all the Hebrews' three centuries of Egyptian bondage, were such an insuperable business.

Burns.

But days, like this, with doubting *cursed*,

I will not long endure—

Am I disdain'd—I know the worst,

And likewise know my cure. *Sheridan.*

But pause one moment more, and take

The *curse* of him thou didst forsake;

And look once more to heaven, and see

Its love for ever shut from thee.

Byron. Siege of Corinth.

CURSING AND SWEARING. See **SWEARING.**

CURSITOR, *n. s.* Lat. An officer or clerk belonging to the chancery, that makes out original writs. They are called clerks, of course, in the oath of the clerks of chancery. Of these there are twenty-four in number, which have certain shires allotted to each of them, into which they make out such original writs as are required. They are a corporation among themselves.—*Cowell.*

Then is the recognition and value, signed with the handwriting of that justice, carried by the *curditor* in Chancery for that shire where those lands do lie, and by him is a writ of covenant thereupon drawn, and ingrossed in parchment.

Bacon.

CURSORY, *adj.* Lat. *cursorius*. **CUR-**

CURSORY, *adj.* } sory signifies, hasty;

CURSORILY, *adv.* } transient; inattentive;

CURSORINESS, *n. s.* } not stationary. **Cursor-**

rarily, which seems of Shakspeare's coinage, has the same meaning. **Cursorily** is, hastily; without much heed: **cursoriness**, slight attention.

I have but with a *cursorious eye*

O'rglanced the articles. *Shakspeare. Henry V.*

Besides their *cursorie* men, as Gorrard, &c.

Proceedings against Garnet.

The first, upon a *cursorious* and superficial view, appeared like the head of another man. *Addison.*

This power, and no other, Luther disowns, as any one that views the place but *cursorily* must needs see.

Atterbury.

Whoever takes a view of this kingdom in a *cursorious* manner, will imagine that he beholds a solid, compact, uniform system of monarchy, in which all inferior jurisdictions are but as rays diverging from one centre.

Burke

CURT, *adj.* } Fr. *court*; Ital and

CURTAL, *n. s. & adj.* } Span. *corto*; Per. *kor*,

CURTLY, *adv.* } *cord*; Welsh, *cor*; Sw.

CURTAL, *v. a.* } *kort*; Dan. *kurt*; Ang.

CURTAILER, *n. s.* } Sax. *sceort*; Dutch,

CURTAILING, *n. s.* } *kortz*; Lat. *curtus*.

CURTAL-DOG, *n. s.* } Curt, curtly; short,

briefly. To *curtail* is, to cut off; to abbreviate: it has *of*' before the thing cut off. A *curtail-dog* is a dog lamed, or mutilated according to the forest laws, whose tail is cut off, and who is therefore hindered from coursing. **Curtal**, as a noun, is a horse with a docked tail; as an adjective, brief, or abridged.

I, that am *curtailed* of all fair proportion,

Deformed, unfinished, sent before my time

Into this breathing world.

Shakspeare. Richard III.

My shepherd's pipe can sound no deal,

My wether's bell rings doleful knell;

My *curtail-dog*, that wont to have played,

Plays not at all, but seems afraid.

Id. The Passionate Pilgrim.

Hold my stirrup, my one laquey, and look to my curtail, the other. *Ben Jonson.*

Yet pury Euclis cheerly smiling prayed

That my sharp words might *curtail* their vile trade.

Hall.

Neither are they to be determined here by essays and *curtal* aphorisms, but by solid proofs of Scripture.

Milton.

Curtly, succinctly, and concisely.

Gayton.

Then why should we ourselves abridge,

And *curtail* our own privilege? *Hudibius.*

Scribblers send us over their trash in prose and verse, with abominable *curtailings* and quaint modernisms. *Swift.*

This conduct of theirs served to show, that the Latins had not been interpolators of the breed, but that the Greeks had been *curtailers*. *Id.*

The count assured the court, that Fact his antagonist, had taken a wrong name, having *curtailed* it of three letters; for that his name was not Fact, but Faction. *Addison.*

Let the rule be general; let not the splendour of one be *curtailed*, while that of another is extended.

Sheridan.

CURTAIN, *v. a. & n. s.* } Fr. *courtine*; It.

CURTAIN-LECTURE, *n. s.* } *copertino*; Lat. *cor-*

tina. To enclose with curtains; to conceal as

by curtains. A curtain is a cloth to be con-

tracted or expanded at pleasure, to admit or ex-

clude the light from a bed or room; in fortifica-

tion, that part of the rampart between two

bastions. To draw the curtain is either to

close or unclose it. A curtain-lecture signifies,

a scolding given by a wife to her husband when they are in bed.

And Pandarus, that led her by the lappe,

Came nere, and gan in at the *curtain* pike.

Chaucer. Troilus and Crescide.

Now when as darksome Night hed all displayd

Her cole blacke *curtain* over brightest skye,

The warlike youthes, on dayntie couches layd

Did chace away sweet sleepe from sluggish eye.

Spenser. Faerie Queene.

The governour, not discouraged, suddenly of tim-

ber and boards raised up a *curtain* twelve foot high, at

the back of his soldiers. *Knolles.*

Now o'er one half the world

Nature seems dead, and wicked dreams abuse

The *curtained* sleep. *Shakspeare. Macbeth.*

Even so the *curtain* drawn, his eyes begun

To wink, being blinded with a greater light.

Id. Rape of Lucrece.

So soon as the all-cheering sun

Should in the farthest east begin to draw

The shady *curtain* from Aurora's bed.

Id. Romeo and Juliet.

What endless brawls by wives are bred!

The *curtain-lecture* makes a mournful bed.

Dryden's Juvenal.

I must draw a *curtain* before the work for awhile,

and keep your patience a little in suspense.

Burnet's Theory.

But, in her temple's last recess inclosed,

On Dulness' lap the anointed head reposed:

Him close she *curtained* round with vapours blue,

And soft besprinkled with Cimmerian dew. *Pope.*

Thy hand, great Dulness! lets the *curtain* fall,
And universal darkness buries all. *Id.*

Now stir the fire, and close the shutters fast,
Let fall the *curtains*, wheel the sofa round,
And, while the bubbling and loud hissing urn
Throws up a steamy column, and the cups,
That cheer but not inebriate, wait on each,
Se let us welcome peaceful evening in. *Cowper.*

He said; and leading from her ivory seat
The blushing beauty to his lone retreat,
Curtained with night the couch imperial shrouds,
And rests the crimson cushions upon clouds. *Darwin.*

CURTAIN, CURTIN, or COURTIN, in fortification, that part of the wall that lies between two bastions. It is bordered with a parapet, behind which the soldiers stand to fire upon the covered way and into the moat.

CURTATE DISTANCE, *n. s.* In astronomy, the distance of a planet's place from the sun, reduced to the ecliptic.

CURTACTION, *n. s.* From Lat. *curto*, to shorten. The interval between a planet's distance from the sun and the curtate distance.

CURTAXE, CURTELASSE, or CURTELAX, *n. s.* See **CUTLASS**.

With *curtare* used Diamond to smite.

Spenser. Faerie Queene.

CURTSEY OF ENGLAND, Jus Curialitatis Anglie, in English law, is where a man taketh a wife seised in fee-simple, or fee-tail general, or as heires in special tail, and hath issue by her, male or female, born alive, which by any possibility may inherit, and the wife dies: the husband in this case holds the lands during his life; and is called *tenens per legem Angliae*, or tenant by the curtesy of England. This appears to have been also the established law of Scotland, where it was called *curialitas*. It is likewise used in Ireland, by virtue of an ordinance of Henry III.

CURTFEYN, CURTANA, a name of Edward the Confessor's sword, or the first sword carried before the kings of England at their coronation: the point of which is broken or taken off as an emblem of mercy.

CURTLAGE, *n. s.* Old Fr. *courtillage*. A garden, field, or piece of ground, in the vicinity of, or belonging to, a message.

CURTIS (William), a late distinguished botanist, was born in Hampshire in 1746. He was apprenticed to an apothecary of Alton, and at the age of twenty became assistant to a Mr. Talwin, in Gracechurch Street, London, whom he succeeded in business. His love of botany, however, attracted him from his professional duties, and he at length gave up his practice and became a public lecturer on that science. He engaged at this time a garden in Bermondsey, which he soon exchanged for one at Lambeth, and occupied finally still more extensive premises at Brompton. In 1771 he published, Instructions for collecting and preparing Insects; and, in the following year, a translation of the *Fundamenta Entomologie* of Linnæus, under the title of An Introduction to a Knowledge of Insects. These publications procured him considerable notice; but in 1777 the first number of

his *Flora Londinensis*, (which was completed in six fasciuli of seventy-two plates each), and shortly after his Botanical Magazine, raised him in the public estimation to the first rank of botanical authors. He wrote also a History of the brown-tailed Moth, Practical Observations on the British Grasses, and some papers in the Transactions in the Linnæan Society. He died the 7th of July, 1799. Since his death he appeared his Lectures, with coloured plates.

CURTIUS (Marcus), a Roman youth, who is said to have devoted himself to the gods' manes, for the safety of his country, about A. A. C. 360. A wide gap had suddenly opened in the forum, and the oracle had said that it never would close before Rome threw into it whatever it had most precious. Curtius immediately perceived that no less than a human sacrifice was required. He armed himself, mounted his horse, and leaped into the gulf, which it is said instantly closed over his head.

CURTIUS (Quintus), a Latin historian, who wrote the life of Alexander the Great, in ten books, of which the two first are not extant, but are well supplied by Freinshemius. When this writer was born, or even when he lived, is not known. By his style he is supposed to have flourished near the Augustan age; though some imagine the work of much later date, and that the name of Quintus Curtius was fictitiously prefixed. Cardinal du Perron was so great an admirer of this work, as to declare that one page of it was worth thirty pages of Tacitus.

CURTUSY. See **COURT**.

CURVE , <i>v. a. n. s. & adj.</i>	} Latin, <i>curvus</i> . To bend; to crook. Any thing bent, or crooked. <i>Curvation</i> is the act of bending any thing; of making it curved; of giving it curvature, or curvity; the state of being curved. <i>Curvilinear</i> signifies, consisting of a crooked line; composed of crooked lines.
CURVATED , <i>adj.</i>	
CURVATION , <i>n. s.</i>	
CURVATURE , <i>n. s.</i>	
CURVILINEAR , <i>adj.</i>	
CURVITY , <i>n. s.</i>	

As for his session, we must not look upon it as determining any posture of his body, corresponding to the *curvation* of our limbs. *Pearson.*

And the tongue is drawn back and *curved*. *Holder.*

Placeid it was beyond the activity of the muscle and *curvature* of the ossicles, to give it a due tension. *Id.*

The joined ends of that bone and the incus receding, make a more acute angle at that joint, and give a greater *curvity* to the posture of the ossicles. *Id.*

It is bent after the manner of the catenarian *curve*, by which it obtains that *curvature* that is safest for the included marrow. *Chicne.*

The impulse continually draws the celestial body from its rectilinear motion, and forces it into a *curvilinear* orbit; so that it must be repeated every minute of time. *Id.*

Unless an intrinsic principle of gravity or attraction may make it describe a *curve* line about the attracting body. *Bentley.*

And as you lead it round, in artful *curve*,
With eye intentive mark the springing game. *Thompson.*

Habit or custom, like a complex mathematical scheme, flows from a point, insensibly becomes a line, and unhappily, (in that which is evil,) it may become a *curve*. *Robinson.*

In his ingenious work, entitled *The Analysis of Beauty*, Mr. Hogarth believes that the triangular glass, which was dedicated to Venus in her temple at Paphos, contained in it a line bending spirally round a cone with a certain degree of *curvature*, and that this pyramidal outline and serpentine *curve* constitute the principles of grace and beauty. *Darwin.*

CURVE, in geometry, a line which, running on continually in all directions, may be cut by one right line in more points than one. See FLUXIONS.

CURVET, *v. n.* } Ital. *corvettare*. To leap;
CURVET, *n. s.* } to bound; to prance; to
frisk; to be licentious. A leap; a bound; a
prank.

Anon he rears upright, *curvets* and leaps,
As who should say, lo! thus my strength is tried.

Shakespeare. Venus and Adonis;
Cry holla! to thy tongue, I pry'thee, it *curvets* un-
seasonably. *Shakespeare. As You Like It.*

Himself he on an earwig set,
Yet scarce he on his back could get,
So soft and high he did *curvet*,
Ere he himself could settle. *Drayton.*

Seized with unwonted pain, surprised with fright,
The wounded steed *curvets*; and, raised upright,
Lights on his feet before: his hoofs behind
Spring up in air aloft, and lash the wind.

Dryden's Æneid.
B. Agreed. But would you sell or slay your horse
For bounding and *curvetting* in his course?

Or if, when ridden with a careless rein,
He breaks away, and seek the distant plain;
No. His high mettle, under good control,
Gives him Olympic speed, and shoots him to the goal.
Cowper.

CURVET, or CORVET, in the manege, an air in which the horse's legs are raised higher than in the demi-volt; being a kind of a leap up, and a little forwards, wherein the horse raises both his fore-legs at once, equally advanced, (when he is going straight forward, and not in a circle), and as his fore-legs are falling he immediately raises his hind-legs, equally advanced, and not one before the other; so that all his four legs are in the air at once; and as he sets them down he marks but twice with them.

CURULE, *adj.* Lat. *curulis*. Belonging to magistracy; magisterial.

We that are wisely mounted higher
Than constables in *curule* wit. *Hudibras.*
And Tully's *curule* chair, and Milton's golden lyre.
Akenside.

Who deserves the civic wreath,
Who to fill the *curule* chair?
Feast from gold, rich perfumes breathe,
And all that honour gives, to share?
The brave, the brave, the patriot brave,
Who arms his country's rights to save. *Leftley.*

CURULE CHAIR, in Roman antiquity, a chair adorned with ivory, wherein the magistrates of Rome had a right to sit and be carried. This chair was fitted in a kind of chariot, whence its name. The *curules* were carried to the senate-house in this chair, as were also those who triumphed, and such as went to administer justice, &c. See ÆDILES.

CURULES, the *curule* magistrates, were the *ædiles*, the *prætors*, *censors*, and *consuls*.

CURZOLA, an island of Dalmatia, separated from the peninsula of Sabionella by a narrow channel. It is thirty miles long and eight broad; having abundance of wood: besides which it produces excellent wine. It contains one city, and several villages, but is thinly inhabited.

CURZOLA, a town on the east end of the above island, is the see of a bishop, and residence of the governor. It was at one time well fortified, and has a good harbour. In 1507 the Turks attempted to take it, but were repulsed by the women, after the men had fled.

CUSA (Nicolas de), a learned cardinal, of mean parentage, so named from Cusa, the place of his birth. He was made a cardinal in 1448; and being appointed governor of Rome by Pope Pius II. during his absence at Mantua, he was the chief conductor of the war against the Turks. He founded a church, and a good library of Greek and Latin authors, at Cusa, and left many excellent works behind him, which were collected and published in three volumes at Basil in 1565. In these he has made no scruple to detect the traditions and sophistries of the Roman church.

CUSCO, an ancient city and intendency of Peru, and the see of a bishop, and once the capital of the Peruvian empire. In the centre was a large level place, from which four grand streets branched out towards the four quarters of the world. Each province of the empire had its peculiar quarter, in which the inhabitants were obliged to reside during life, without the liberty of changing. There was also a quarter allotted to the descendants of the Incas. They might preserve their distinct customs, but were compelled to worship the sun in a sumptuous temple, the walls of which were encrusted with gold and silver, and adorned with figures and idols of the different nations subdued by the Incas. The Spaniards under Pizarro, made themselves masters of this city in 1534, and that with a display of their usual barbarity. On a hill towards the north are the ruins of a fortress built by the Incas, which had a communication, by means of subterraneous passages, with three forts on the walls of Cusco. These walls, of an extraordinary height, were of stone cemented with astonished neatness. The Spaniards found the houses also built of stone, and amongst them a great number profusely ornamented with gold and silver. Cusco is at present a large city: the houses are of stone, and covered with tiles. The cathedral is a stately stone edifice, and of elegant and noble architecture. There are nine parish churches, and several convents and hospitals. Cusco contains about 14,000 Indians, and 16,000 whites. The intendency contains 225,000 inhabitants, and is fertile in grain and fruit; and the air temperate, but cold. The city is well watered by the rivers Apurimak and Yukai. It is 350 miles E.S.E. of Lima.

CUSCUTA, in botany, dodder; a genus of the digynia order, and tetrandria class of plants: CAL. quadrifid: COR. monopetalous: CAPS. bilocular; species two, one of which is a native of

Britain, viz. *C. europæa*, dodder. This is a very singular plant, almost destitute of leaves, parasitical, creeping, fixing itself to whatever is next to it. It decays at the root, and afterwards is nourished by the plant which supports it. Hops, flax, and nettles, are its common support; but principally the common nettle. Its blossoms are white.

CUSH, the eldest son of Ham, and father of Nimrod, Seba, Havilah, Sabtah, Raamah, and Sabtecha. Gen. x. 6—8. We know of no other person who, in scripture, is called by this name, but there are several countries called by it.

CUSH, in ancient geography, is generally reckoned the same with Ethiopia, and is so translated in the Vulgate, Septuagint, and other versions, both ancient and modern: but there are various passages where this translation seems to obscure the sense, as Gen. ii. 13.

Bochart has shown very clearly that there was a country called 'the land of Cush,' in Arabia Petræa, bordering upon Egypt; and this country extended itself principally upon the eastern shore of the Red Sea, and, at its extremity, to the point of this sea, inclining towards Egypt and Palestine.

CUSHION, *n. s.* } Fr. *coussin*; Dut. *kussen*.
CUSHIONED, *adj.* } A pillow for the seat; a
CUSHIONER, *n. s.* } soft pad placed upon a chair; a part of an electrical machine. Seated on, or supported by, cushions. A little cushion.

He braeyd hym by the myddil, and preyd hym sit adoun,

And lowly with much worshipp dressed his *cossion*.
Chaucer. Cant. Tales.

Call Claudius, and some other of my men;
 I'll have them sleep on *cushions* in my tent.
Shakspeare. Julius Cæsar.

Upon those pretty *cushionets* did lie
 Ten thousand beauties. *Beaumont.*

But, ere they sat, officious Baucis lays
 Two *cushions* stuffed with straw, the seat to raise;
 Coarse, but the best she had. *Dryden's Fables*

An eastern king put a judge to death for an iniquitous sentence; and ordered his hide to be stuffed into a *cushion*, and placed upon the tribunal, for the son to sit on.
Swift.

Many, who are *cushioned* upon thrones, would have remained in obscurity.
Bolingbroke.

There are two kinds of electric ether, which exist either separately or in combination. That which is accumulated on the surface of smooth glass, when it is rubbed with a *cushion*, is here termed vitreous ether.
Darwin.

The velvet *cushions*—for a throne more meet—
 Were scarlet, from whose glowing centre grew
 A sun embossed in gold, whose rays of tissue,
 Meridian-like, were seen all light to issue.
Byron. Don Juan.

CUSURON, in engraving, is a bag of leather filled with sand, commonly about nine inches square, and three or four thick, used for supporting the plate to be engraved.

CUSURON, in gilding, is made of leather, fastened to a square board, from fourteen inches square to ten, with a handle. The vacancy between the leather and board is stuffed with fine saw or wood, so that the outer surface may be flat and even. It is used for receiving the leaves

of gold from the paper, in order to its being cut into proper sizes and figures.

CUSP, *n. s.* Lat. *cuspis*. A term used to express the points or horns of the moon, or other luminary.

CUSPATED, *adj.* } From Lat. *cuspis*. A
CUSPIDATED, *adj.* } word expressing the leaves of a flower ending in a point.

CUSTARD, *n. s.* Welsh *custard*. A kind of sweetmeat, made by boiling eggs with milk and sugar till the whole thickens into a mass. It is a food much used in city feasts.

He crammed them, till their guts did ake,
 With cawdle, *custard*, and plum-cake. *Hudibras.*

Now may'r's and shrieves all hushed and satiate lay;
 Yet eat, in dreams, the *custard* of the day. *Pope.*

CUSPINIAN (John), a German, born at Sweinfurt, in 1473. He was first physician to the emperor Maximilian I. and employed by him in several negociations. He wrote in Latin, 1. A History of the Roman emperors from Julius Cæsar to the death of Maximilian I. Degory Wheare, in his *Methodus Legendæ Historiæ*, calls this *Luculentum sanè opus*, and omnium lectione dignissimum. 2. A History of Austria; being a kind of continuation of the preceding. 3. A History of the origin of the Turks, and of their cruelties towards Christians. Gerard Vossius praises Cuspinian as *magnum suo ævo historiæ lumen*. He died at Vienna, in 1529.

CUSTEE, a town of Bengal, in the district of Ranjeshy, situated on the western bank of the Corroi river, a branch of the Ganges, which communicates with the Sunderbunds. It is navigable at all seasons, on which account much of the traffic from the north-west provinces passes by this town during the winter months.

CUSTODY, *n. s.* Lat. *custodia*. Imprisonment; restraint of liberty; care; guardianship; charge; defence.

Under the *custody* and charge of the sons of Merari, shall be the boards of the tabernacle. *Numb. iii. 36.*

The third hed of their wardrobe *custody*,
 In which were not rich tyres nor garments gay,
 The plumes of Pride, and wings of Vanity.
Spenser. Faerie Queene.

We being strangers here, how darrest thou trust
 So great a charge from thine own *custody*?
Shakspeare.

There was prepared a fleet of thirty ships for the
custody of the narrow seas. *Bacon.*

The council remonstranced unto queen Elizabeth, the conspiracies against her life, and therefore they advised her, that she should go less abroad weakly attended; but the queen answered, she had rather be dead than in *custody*. *Id.*

For us enslaved, is *custody* severe,
 Aud stripes and arbitrary punishment
 Inflicted. *Milton's Paradise Lost.*

There is generally but one coin stamp't upon the occasion, which is made a present to the person who is celebrated on it; by this means the whole frame is in his own *custody*. *Addison.*

CUSTOM, *v. a., v. n., & n. s.* } Fr. *coutume*.
 CU'STOMABLE, *adj.* } To custom is,
 CU'STOMABLENESS, *n. s.* } to pay duty
 CU'STOMABLY, *adv.* } at the custom-
 CU'STOMARILY, *adv.* } house; to ac-
 CU'STOMARINESS, *n. s.* } custom. Cust-
 CU'STOMARY, *adj.* } tom signifies,
 CU'STOMED, *adj.* } habit; common
 CU'STOMER, *n. s.* } way of acting;
 CU'STUMARY, *n. s.* } practice of buy-
 CU'STOM-HOUSE, *n. s.* } ing from cer-
 tain persons; application from buyers; tribute;
 tax on goods exported or imported. In legal
 parlance, custom is a law or right not written,
 which, being established by long use, and the
 consent of our ancestors, has been, and is
 daily, practised. We cannot say, that this or
 that is a custom, except we can prove that it
 hath continued so 100 years; yet, because that
 is hard to prove, it is enough for the proof of a
 custom, if two or more can depose that they
 heard their fathers say, that it was a custom all
 their time; and that their fathers heard their
 fathers also say, that it was likewise a custom
 in their time. If it is to be proved by re-
 cord, the continuance of 100 years will serve.
 Custom is either general or particular: general,
 that which is current through England; particu-
 lar, is that which belongs to this or that county;
 as gavelkind to Kent, or this or that lordship,
 city, or town. Custom differs from prescription;
 for custom is common to more, and prescription
 is particular to this or that man; prescription
 may be for a far shorter time than custom. Cust-
 omary, customed, and customizable, signify, ac-
 cording to established custom; habitual; usual.
 Customer is one who goes to a place of sale for
 the purpose of purchasing; one who habitually
 purchases from another; in old writers, a com-
 mon woman; a collector of customs; but these
 senses of the word are disused. Customary is a
 book, or code, of laws and customs.

And the priest's custom with the people was, that
 when any man offered sacrifice, the priest's servant
 came, while the flesh was in seething, with a flesh-
 hook of three teeth in his hands. *1 Sam. ii.*

According to the custom of the priest's office, his lot
 was to burn incense when he went into the temple of
 the Lord. *Luke i.*

Where archbishop and archdiacre
 Vsongin full out the service
 A'ter the custome and the guise
 And holie churches' ordinance.

Chaucer's Dreame.

What ever he hath of any honest custome,
 Of her and me that holds her every whit. *Wyatt.*

For on a bridge he custometh to fight,
 Which is but narrow, but exceeding long
 And in the same are many trapfalls pight.

Spenser. Faerie Queene.

Blood and destruction shall be so in use,
 That mothers shall but smile when they behold
 Their infants quartered by the hands of war;
 All pity choaked with custom of fell deeds.

Shakspeare. Julius Cæsar.

Even now I met him

With customary compliment, when he,
 Wafting his eyes to the contrary, and falling
 A lip of much contempt, speeds from me.

Shakspeare.

No nat'ral exhalation in the sky,
 No common wind, no *customed* event,
 But they will pluck away its nat'ral cause,
 And call them meteors, prodigies, and signs.
Id. King John.

I marry her!—What a *customer*? Pr'y'thee bear
 some charity to my wit, do not think it so unwhole-
 some. *Id. Othello.*

— All the merchants, with other merchandize,
 Are safe arrived, and have sent me to know,
 Whether yourself will come and *custom* them.

Marlow.

Kingdoms have *customably* been carried away by
 right of succession, according to proximity of blood.

Hayward.

The residue of these ordinary finances be casual
 or uncertain, as be the escheats and forfeitures, the
customs, hutlerage, and imposts. *Bacon.*

To call God to witness truth, or a lye perhaps, or
 to appeal to him on every trivial occasion, in common
 discourse, *customarily* without consideration, is one of
 the highest indignities and affronts that can be offered
 him. *Ray.*

To a fond parent that would not have his child
 corrected for a perverse trick, but excused it, saying
 it was a small matter, Solon very well replied, 'Ay,
 but *custom* is a great one.' *Locke.*

Those commodities may be dispersed, after having
 paid the *customs* in England. *Temple.*

We should avoid the profane and irreverent use
 of God's name, by cursing, or *customary* swearing;
 and take heed of the neglect of his worship, or any
 thing belonging to it. *Tillotson.*

A vice which for its guilt may justify the sharpest,
 and for its *customariness* the frequentest, invectives,
 which can be made against it.

Government of the Tongue.

You say he is assiduous in his calling, and is he
 not grown rich by it? Let him have your *custom*, but
 not your votes. *Addison.*

Lord Strut has bespoke his liveries at Lewis Ba-
 boon's shop: Don't you see how that old fox steals
 away your *customers*, and turns you out of your busi-
 ness every day? *Arbutnot.*

Some *customhouse* officers, birds of passage, and
 oppressive thrifty squires, are the only thriving peo-
 ple amongst us. *Swift.*

It was drawn from the old Germanick or Gothick
customary; from the feudal institutions, which must
 be considered as an emanation from the *customary*.
Burke.

Who know'st man's frailty; with a favouring eye,
 And melting heart, behold'st a brother's fall;
 Who, unenslaved by *custom's* narrow tie,
 With manly freedom follow'st reason's call.

Beattie.

The volume closed, the *customary* rites
 Of the last meal commence. A Roman meal;
 Such as the mistress of the world once found
 Delicious, when her patriots of high note,
 Perhaps by moonlight, at their humble doors,
 And under an old oak's domestic shade,
 Enjoyed, spare feast! a radish and an egg.

Comper.

For saddle-tree scarce reached had he,
 His journey to begin,
 When, turning round his head, he saw
 Three *customers* come in.

Id.

People have a *custom* of excusing the enormities of their conduct by talking of their passions, and as if they were under the control of a blind necessity, and sinned because they could not help it. *Cumberland.*

But on my right hand and my left, instead
Of thee and Zames, and our *customed* meeting,
Was ranged on my left hand a haughty, dark,
And deadly face.—I could not recognize it,
Yet I had seen it, though I knew not where

Byron. Sardanap.

CUSTOMS, in political economy, the duties, toll, tribute, or tariff, payable to the king upon merchandise exported and imported, forming a branch of the perpetual taxes. The consideration upon which this revenue, or the more ancient part of it, which arose only from exports, was invested in the king, were said to be two: 1. Because he gave the subject leave to depart the kingdom, and to carry his goods along with him. 2. Because the king was bound of common right to maintain and keep up the ports and havens, and to protect the merchant from pirates. Some have imagined they are called with us customs, because they were the inheritance of the king by immemorial usage and the common law, and not granted by any statute; but Sir Edward Coke has clearly shown, that the king's first claim to them was by grant of parliament, 3 Edw. 1. And indeed this is in express words confessed by statute 25 Edw. I. c. 7, wherein the king promised to take no custom from merchants, without the common assent of the realm, 'saving to us and our heirs the customs on wool, skins, and leather, formerly granted to us by the commonalty aforesaid.' These were formerly called hereditary customs of the crown; and were due on the exportation only of the above three commodities, and none other: which were styled the staple commodities of the kingdom, because they were obliged to be brought to those ports where the king's staple was established. In order to be there first rated and then exported. In the barbarous Latin of our ancient records, they were denominated *custuma*, an appellation which seems to be derived from the French word *coutume*, or *coutume*, which signifies toll or tribute, and owes its own etymology to the *cost*, which signifies price, charge, or as we have adopted it in English, cost; not *consuetudines*, which is the language of our law whenever it means merely usages. The duties on wool, sheep-skins, or wool-fells, and leather, exported, were called *custuma*, *antiqua sive magna*: and were payable by every merchant, as well native as stranger: with this difference, that merchant strangers paid an additional toll, viz. half as much again as was paid by natives. The *custuma parva et nova* were an impost of three-pence in the pound due from merchant strangers only, for all commodities as well imported as exported; which was usually called 'the alien's duty, and was first granted in 31st Edw. I. But these ancient hereditary customs, especially those on wool and wool-fells, were of little account, when the nation became sensible of the advantages of a home

manufacture, and prohibited the exportation of wool by statute 11 Edw. III. c. 1. Other customs payable upon exports and imports were distinguished into subsidies, tonnage, poundage, and other imposts. Subsidies were such as were imposed by parliament upon any of the staple commodities before mentioned, over and above the *custuma antiqua et magna*; tonnage was a duty upon all wines imported, over and above the *prisage* and *butlerage* aforesaid: poundage was a duty imposed *ad valorem*, at the rate of twelve-pence in the pound, on all other merchandise whatsoever: and the other imposts were such as were occasionally laid on by parliament, as circumstances and times required. These distinctions are now in a manner forgotten, except by the officers immediately concerned in this department: their produce being in effect all blended together, under the one denomination of the customs. By these we understand, at present, a duty or subsidy paid by the merchant at the quay upon all imported as well as exported commodities, by authority of parliament; unless where, for particular national reasons, certain rewards, bounties, or drawbacks, are allowed for particular exports or imports. But few commodities pay a duty upon exportation: where a duty is not specified in the tables, and the exportation is not prohibited, all articles may be exported without payment of duty, provided they are regularly entered and shipped; but on failure thereof, they are subject to a duty *ad valorem*. To prevent frauds in the representation of the value, a simple and equitable regulation is made, viz. the proprietor shall himself declare the value; and if this should appear not to be a fair and true estimate, the goods may be seized by the proper officer, and four of the commissioners of the customs may direct that the owner shall be paid the price, which he himself fixed upon them, with an advance of £10 per cent. besides all the duty which he may have paid. They may then order the goods to be publicly sold, and if they raise any sum beyond what was paid to the owner, and the subsequent expenses, one-half of the overplus shall be paid to the officer who made the seizure, and the other half to the public revenue.

By 27 Geo. III. c. 13, called the consolidation act, all the former statutes imposing duties of customs and excise were repealed with regard to the quantum of the duty; and the two former books of rates were declared to be of no avail for the future; but all the former duties were consolidated, and were ordered to be paid according to a new book of rates annexed to that statute. The like plan has been followed in subsequent acts, as 43 Geo. III. c. 63, 49 Geo. III. c. 98, and particularly 6 Geo. IV. c. 111, which contains the duties now in force. These are so important to the merchant and general trader, and bear so directly on the price of the numerous commodities specified, both at home and abroad, that we have conceived a complete table of the imports, exports, and coast imports of this description, would be acceptable to a large majority of our readers.

TABLE I.—DUTIES OF CUSTOMS, INWARDS.

A TABLE of the DUTIES of CUSTOMS payable on Goods, Wares, and Merchandise imported into the United Kingdom from Foreign Parts, and of the Drawbacks to be allowed on the Exportation of such Goods, Wares, and Merchandise.

INWARDS.			INWARDS.

			— Ditto, Westmoreland rag slates, the ton		0 14 6
			— Ditto, slate or slates not otherwise described, for every £100 value		25 0 0

Numerous acts of parliament have been passed to prevent frauds in this branch of the revenue; but a similar measure to that pursued by the consolidation act, respecting the quantum of the duties, is yet a desideratum, with regard to the acts restraining fraud.

Officers of the customs, 13 and 14 Car. II. cap. 11, sect. 4 & 6, may search ships, and having writ of assistance, may search houses; keepers of wharfs, quays, &c. landing or shipping goods, without the presence of some officer of the customs, shall forfeit £100. Where officers of the customs are hindered in the execution of their duty by persons armed to the number of eight, the offenders, by stat. 6, Geo. I. cap. 21, are to be transported for seven years.

If any goods are put into any vessel to be carried beyond sea: or be brought from beyond sea, and unshipped to be landed, the duties not being paid nor agreed for at the custom-house; the same shall be forfeited, one moiety to the king, the other to the seizer, &c.

It is also made felony for any persons to be assembled with fire-arms, &c., or to be assisting in the running of goods; to be found passing within five miles from the sea-coasts, with any horses, carts, &c., wherein are put above six pounds of tea, or five gallons of brandy, or other foreign goods of £30 value, not having permits; and suspected persons lurking near the coasts, not giving a good account of themselves, may be sent by a justice to the house of correction for a month; and informers to have

10s. for every offender so taken. Watermen, carmen, porters, &c. in whose custody run goods are found, shall forfeit treble value, or be committed for three months. Ships and vessels from foreign parts, having on board tea, or brandy, rum, &c., in casks under sixty gallons, except for the use of seamen, found at anchor, or hovering near any port, or within two leagues (increased to eight leagues by subsequent acts) of the shore, and not proceeding in their voyages, unless in cases of unavoidable necessity, all such tea, &c. shall be forfeited. Persons offering any bribe to officers of the customs, to connive at the running of goods, to forfeit £50; and obstructing such officer, in entering or searching ships, incurs a forfeiture of £100: and if an officer be wounded or beaten on board a ship, the offenders to be transported, &c., 9 Geo. II. cap. 35, &c. See SMUGGLING.

In the year 1822 a very important act, affecting the customs, called the warehousing act, was finally revised. The great feature of this act is deferring the payment of duties due to the king at the time of importation, and allowing goods to remain in warehouses and other places, under the king and the owner's key, until it may suit the parties to remove them for exportation or home consumption, according to certain regulations. In 1825 the benefits of this act were extended to the colonies of Great Britain, who are now treated in this respect as an integral part of kingdom. In 1824 prohibitions on imports, and bounties on exports were abolished.

The produce of the customs, for the last three years, are thus given in the official returns :

Year ending 5th Jan. 1824.	Year ending 5th Jan. 1825.	Year ending 5th Jan. 1826.
